Rundstedt aimed to maneuver his opponent into a natural trap formed by the Dniester River on the west, the Dnieper River on the east, and the Black Sea on the south. After one month of fighting in Bessarabia, the Germans crossed the Dniester and, approaching Kiev, moved into the region of Vinnitsa. Budyonny ordered his troops into prepared positions near the Ukrainian capital. By falling back farther to the east and abandoning Kiev, Budyonny could probably have avoided the trap, but he might have exposed the southern flank of Smolensk's defenses. During the first month of the campaign, the Wehrmacht occupied 175,000 square miles of Russian territory.

Following the official claim that von Bock had captured Smolensk on July 17, unofficial German reports forecast the dissolution of Russian resistance and insisted that the three main cities of Russia were about to fall. The Spanish Blue Division, on its way to Russia, was believed to have come too late to take part in the fighting. The Red Army's last reserves, according to German sources, were thrown into a losing battle on the central front.

On July 17, Smolensk still remained partly in Russian hands, and total destruction of the city by bombs and shells failed tc dislodge Timoshenko's forces. Von Bock's army was drawn up in the shape of a five-pronged fork. The region offered many natural obstacles such as water courses, marshes, small lakes, and thick woods. The Red Army made perfect use of them, forming islands of resistance, defending narrow passages between lakes, and using camouflage to the utmost. The Wehrmacht's losses in armor mounted steadily, while the Russians used few tanks, relying on antitank weapons. German losses were larger than those of the enemy. Isolated concrete fortifications, built before 1937, seemed to confirm the German belief that they were about to crush the Stalin Line. On August 7, 1941, the Red Army lost the rest of the ruins of Smolensk. The Germans claimed a decisive victory and again boasted of smashing the Stalin Line and of opening the way to Moscow, which had been under air attack since July 21. Timoshensko's reserves held firm. The Germans had won a tactical victory, but not even the capture of the 300,000 prisoners they claimed could alter the fact that it was by no means decisive.

Von Bock's victory fell short of its ultimate goal of annihilating the main Russian forces. Another major battle on the central front could only be fought after thorough regroupment and after smashing the Kiev wedge which flanked the central and southern German Army Groups. This wedge virtually severed the most crucial communication line between the forces commanded by von Bock and von Rundstedt.

A major battle, fought near Uman between August 10 and 12, ended in a Russian defeat. Rundstedt's plan of driving Budyonny's army group into the water trap seemed on the verge of success. The Red Army still clung to its Kiev bridgehead across the Dnieper River, in an effort to flank the attackers, but it could not prevent Kleist's armor from overrunning the country along the Bug River, driving on to Kirovograd and the lower Dnieper River. The important industrial region of Dnepropetrovsk, with the iron ore deposits of Krivoi Rog and the manganese deposits of Nikopol, fell into German hands. On August 24, the Russians, following their scorched earth policy, blew up the great Dnieper dam at Zaporozhe. Budyonny ordered his defeated armies to fall back in order to avoid annihilation between the two rivers and the sea. This operation, carried out haphazardly, was extremely costly. Some of Budyonny's forces, unable to reach the Dnieper, retreated to the big Black Sea port of Odessa, which soon came under siege.

Budyonny had to choose between fighting the Germans at Kiev, which could hardly be held for any length of time, or falling back to better positions to await reserves and protect the industrial city of Kharkov and the Donets region. The Red marshal decided to make a stand at Kiev and suffered the worst defeat that any Russian Army commander experienced during the war. The Germans claimed 665,000 prisoners. Budyonny's army group was reduced to remnants, able only to fight rear-guard actions. It seemed doubtful that they could delay the German advance long enough to bring up reserves from far in the rear to organize effective resistance. With Timoshenko's group expecting another violent German assault, and Voroshilov's armies forced to give

ground in the north, the situation looked extremely precarious for the Red Army.

Despite their victory at Kiev and the conquest of 125,000 and 65,000 square miles respectively in the second and third months of the campaign, the Germans were faced with a critical problem. The goal of Rundstedt's armies was the Caucasus. Even discounting the resistance of the remnants of the Kiev group, the season of operational weather was considered too short in which to drive that far. A considerable portion of the armor and the planes assigned to Rundstedt's group was therefore switched back to Bock for another "Battle of Moscow."

With what he had left, von Rundstedt took up the pursuit of the beaten enemy. The speed of his advance was delayed less by actual resistance than by communication troubles. Heavy rains transformed dirt roads into seas of mud. Supply columns were held up. Despite rain and mud, Mariupol, Taganrog, Stalino, and Kharkov were taken. Odessa held out until October 16. The defenders battled for the almost unfortified port city, street by street. The bulk of their forces was finally evacuated by sea and shipped to Sevastopol.

Joseph Stalin took charge of the Commissariat of Defense, becoming the Red Army's commander-in-chief and later assuming the rank of a marshal of the Soviet Union. Budyonny and Voroshilov were relieved of their field commands and assigned to the training of reserves. General Khorzin was put in charge of the defenses of Leningrad, while Gen. Georgi K. Zhukov defended Moscow.

The Russian people shouldered the increasingly heavy burden of the war with fortitude. Fifth column activity was admitted by the Russians only in the "Volga German Republic," where farmers of German stock had lived for centuries without losing their basically Teutonic characteristics. Finally the Supreme Soviet announced the abolition of the Volga German Republic, "as a result of their failure to report on preparations for diversion being conducted by many among them." The population of the Volga Republic was deported to undisclosed destinations, and its territory was divided between two adjoining regions.

In the north, Leeb's left flank reached Narva on the Russia-Estonia border, while the right wing took Pskov, Staraya Russa, and Novgorod, overcoming dogged Red rear-guard resistance. Tallinn resisted until August 30. The drive to encircle Leningrad was on!

Leningrad and the adjoining naval base of Kronstadt were soon under fire. Leningrad could not be termed a fortress, but Marshal Voroshilov, still in command at that time, put the entire civil and military population to work preparing the city's defenses. Although the attackers' ring never closed tightly, the siege of Leningrad was one of the most protracted in modern history. The city's supplies were adequate for a short period only. Whatever was needed in addition to these supplies had to be brought in over Lake Ladoga through gaps in the blockade. Some factories worked underground, with primitive conditions, to supply the defenders with ammunition. Constant sorties attempted to press back the besiegers.

By the end of September, with Russian counterattacks halted, von Bock had massed about 60 infantry and 15 panzer divisions, the latter later increased to 20. The Luftwaffe was assembled in the greatest strength that available bases could accommodate. The Russian Air Force was outnumbered at least 3 to 1; the Red armored forces, 5 to 2. The Luftwaffe's attempts to smash the Russian Moscow group's reserves were hampered by cloudy weather and superlative camouflage. German raids on Moscow were costly and of limited effect. The great drive opened on October 2. The next day, before conclusive results were attained, Adolf Hitler delivered a speech in which he referred to the mighty attack under way and promised the imminent collapse of all Russian resistance.

The situation in the central sector was extremely critical for Russia. The German troops formed a huge semicircle, with Moscow in its center, and drew steadily nearer to the capital. The obvious aim was to close the giant pincers behind Moscow. The Red Army could no longer afford to sacrifice space in order to gain time, and fought for every inch of ground as best it could against the overwhelming mechanized might of the Wehrmacht. Guderian took Orel on October 12; Weichs captured Bryansk on October 13; the German Seventh Army took Kaluga, and two newly formed reserve armies seized Vyazma and Rzhev the next day.

When the Germans were in the outskirts of Tula, the rumble of artillery fire was audible in Moscow. The Russian government moved to Kuibyshev, farther to the east, and Stalin ordered Moscow to be defended street by street if the Germans reached the capital.

On October 23, almost one month sooner than expected, the first snow fell along the central front. The first snowfall in Russia had heralded disaster to Napoleon's *Grand Armée* in 1812. Also, the initial impact of Bock's drive had lessened. He had to gather fresh strength before attempting to administer a knockout blow. His lines, formed to meet the exigencies of the battle rather than according to a well conceived plan, were good springboards for another assault but were not well suited for defense. The German High Command had to make a crucial choice: to continue the offensive, despite the beginning of the winter season, or to take up defensive positions. Necessary defensive adjustments might have been completed without Russian interference, but failure to reach Moscow in a continued offensive was bound to lead to severe losses. The Germans chose to continue the drive, underestimating the strength of the Red Central Army Group and overestimating the results of Rundstedt's continued advance in the south. Probably Hitler urgently requested the attack, in an effort to make good his premature boasts.

The German Twelfth Army set out to conquer the Crimean Peninsula, connected to the southern Russian mainland by the narrow, bottleneck-shaped Perekop Isthmus. The improvised defenses of the isthmus could not hold back the attackers. Despite the gallant Russian defense, lack of heavy equipment and the successful use of German paratroopers accounted for the relatively quick collapse of the Russian positions. Theodosia and Simferopol fell, and the Twelfth Army moved on Kerch, gateway to the narrow straits leading toward the western foothills of the Caucasian mountains and a good base for a later drive, but still distant from the coveted oil wells. German patrols even crossed the straits but ran into superior Red reserves. An attempt to

take Sevastopol by a surprise coup ended in failure. Sevastopol was one of the strongest fortresses in the world, amply equipped with heavy artillery.

Marshal Timoshenko, now in charge in the south, had traded space for time. By not throwing many of his valuable reserves into battles which he considered premature, he succeeded in building up a considerable force east of the Don River. His opponent, von Rundstedt, planned to move to a line running from Kharkov along the Donets River, and from its mouth along the Don to the shore of the Sea of Azov. The unconquered fortress of Sevastopol remained an uncomfortable thorn in his side. To occupy this line, Rundstedt had to take Rostov-on-the-Don. General Kleist's panzer army, still at Rundstedt's disposal, was assigned to the task and occupied the city on November 23. Beyond the thickly frozen Don River, three Red armies of Timoshenko's group awaited the attack. Kleist had only three armored, one motorized, and one infantry division in line when the Reds, moving over the ice of the river, struck at Rostov. On November 30, the city was retaken, and the Germans had to retreat. The Russian drive reached Stalino on December 20 and recaptured Kerch ten days later.

The German retreat was orderly, and the Russians did not succeed in breaking through at any point. The area regained by the Red Army in the south was of moderate strategic and economic importance. The moral effect of the German setback was tremendous. For the first time during the campaign, the Russians scored a victory. For the first time, their strategic plan of retreat followed by a counter-drive of massed reserves was put into effect successfully. Stalin's statement that there were no invincible armies was confirmed.

While Timoshenko was attacking, Zhukov was engaged in a precarious defensive action on the central front, and the defenders of Leningrad were hard-pressed. The number of Bock's forces was limited only by available deployment space. The German marshal threw all the forces he could muster into the battle. Three German divisions probed the defenses of Tula, but they were severely mauled. Von Leeb tried to drive through a wilderness of forests and marshes to Tikhvin, not far from Leningrad. Even if the drive on Moscow failed, the Germans wanted to sever the Russian supply line between the main armies and Murmansk, where lend-lease and British munitions were unloaded. The attackers reached Tikhvin but were quickly repulsed. General Meretskov struck back at the German forces, recapturing Tikhvin and driving the Wehrmacht toward the Volkhov River. The pressure on Leningrad was eased, and Russia's life line remained open. During the last week of November and the first week in December, the Wehrmacht battered furiously at the Red lines before Moscow. All German movements were repulsed with heavy losses. The German panzer divisions were increasingly paralyzed by low temperatures, and the Wehrmacht's chief offensive arm, the Luftwaffe, disappeared from the skies. By December 5, German offensive power was exhausted. The Russian "spring" recoiled, although its vigor was reduced by extremely high losses. Russian armies began six different attacks, and by December 16, the German retreat became general. The Russian offensive was under way.

German territorial gains had been 80,000 square miles during the fourth month and 50,000 during the fifth month, but Russian advances gradually recaptured part of the lost ground. Losses in men and materiel were undoubtedly extremely high on both sides, but figures given by both Germans and Russians seemed unreliable, if not fantastic.

Hostilities in the Atlantic.—Because the Axis disregarded established rules, the United States had to deviate from former concepts of neutrality in the interest of its security. German and Italian merchant ships in United States ports were seized on March 30, 1941, when their crews were suspected of planning acts of sabotage. In the Atlantic, the attack on the United States freighter *Robin Moor* was followed by other German submarine attacks against vessels flying the United States flag. After the sinking of the *Sessa* on September 11, President Roosevelt, in a world-wide radio address, warned the Axis powers that American warships and planes would attack Axis warships entering waters considered vital to the defense of the United States. The question of using the United States Navy to protect ships carrying lend-lease munitions stirred up a vigorous domestic controversy, but the step was taken.

In September, the *Pink Star* was attacked off Iceland. In October, the tanker *I. C. White* and the freighter *Lehigh* were torpedied in the South Atlantic and the *Bold Venture* in the North Atlantic, all of them outside of the war zone proclaimed by the Germans.

On October 17, the House of Representatives repealed the section of the Neutrality Act of 1939 which made it unlawful to arm United States merchantmen. The Senate amended the bill by repealing the paragraphs of the Neutrality Act prohibiting American vessels from carrying goods or passengers to belligerent nations and from passing through waters designated as combat areas, but the bill and its amendment became law.

The lifting of the shipping ban had far-reaching effects upon Britain and the Soviet Union. The British were fighting a losing battle in the Atlantic, because their losses of shipping space far exceeded the possibility of replacement, even including lend-lease ship deliveries. Russia's supply of war material depended upon British supremacy at sea.

German attacks on United States shipping were not limited to merchantmen. In October the United States destroyer *Kearny,* on patrol off Iceland, was heavily damaged by a torpedo. On October 30, the destroyer *Reuben James* was torpedoed in the same waters and sunk with considerable loss of life. United States warships frequently used depth charges against lurking U-boats, but the measure of their success was not revealed by either side.

British Naval Disasters in the Mediterranean.—In the closing months of 1941, the Royal Navy suffered a series of disasters in the Mediterranean which threatened the defense of North Africa. The 33,950 ton battleship *Nelson* had her bow blown off by a torpedo and was put out of action for 6 months. The 22,000 ton aircraft carrier *Ark Royal* was sunk by a single torpedo. Aside from the gravity of the loss, responsible British circles began to question the efficiency of the construction of British carriers. The 31,000 ton battleship *Barham* was sunk by a salvo of

torpedoes off the coast of Libya with a loss of 800 men. Gibraltar no longer prevented German U-boats from entering the Mediterranean. An inland waterway linked Germany with the southern coast of France. The Wehrmacht was in virtual control of French transportation and communication facilities. U-boats were knocked down and shipped through the Rhine-Rhone canal to the Mediterranean coast where they were reassembled. On December 19, a daring raid by a handful of Italians hit the port of Alexandria, protected by anti-submarine nets, underwater mines, and other obstructions. Clad in diving suits, the Italians succeeded in entering the harbor and fixing limpet bombs on the bottoms of the battleships *Valiant* and *Queen Elizabeth* (30,600 tons each). Explosions blew large holes in the ships, flooding compartments and putting both vessels out of action for many months.

The British fleet in the Mediterranean was left without capital ships, while the Italians, after repairing the damage suffered at Taranto in 1940, had four battleships in service. As large British units had to be hurriedly dispatched to the threatened Far East, and as others were engaged in guarding precarious supply lanes, no reinforcements were immediately available. In addition, the British High Command had to be prepared for possible air and seaborne invasions of Egypt, Svria, or Palestine (which did not materialize).

British Redeployment in the Middle East.—British plans to build up an army in Egypt to deal with the situation created by the arrival of Rommel's Afrika Korps were hampered by the course of events in Russia and in the Far East. With the Germans advancing in southern Russia, the threat to the Middle East from the north increased. The recapture of Rostov-on-the-Don by the Russians lessened the threat but did not eliminate it. The British decided to build a force to defend the lifeline areas against a possible German invasion. The few available divisions were no match for the southern German Army Group in Russia, but they strained the tenuous British forces in North Africa. Australian troops were sent to hold the new defense line referred to as the Levant-Caspian front.

The forces needed to bring the Egyptian-Libyan campaign to a successful conclusion were much smaller than those used in the major European theaters of war. Scarcity of communications and of operational space restricted the number of troops, but the British were hard pressed to furnish even a relatively small number when General Auchinleck planned his drive to conquer North Africa.

Battles in Libya.—During the summer of 1941, the garrison of Tobruk was reinforced, and stores of supplies were built up in order to prepare the fortress as an offensive base for future operations. Colonial units plus the garrison of Tobruk (referred to as the 70th Division) were called the Eighth Army and put under the command of Gen. Sir Alan Cunningham of South African fame, who took his orders from Auchinleck. The 70th Division, with the 32d Tank Brigade, and imperial forces on the Egyptian border formed the Eighth Army. The Eighth was joined by the 7th Armored Division, partly equipped with United States 14-ton Honey tanks, the 22d Armored Brigade, New Zealanders, Indians, and South Africans. Most of the Axis forces, under Gen. Erwin Rommel, were concentrated around Tobruk, obviously the main obstacle to combat before fighting a major engagement on the Egyptian frontier. The Axis forces under Rommel had the German 15th and 21st Panzer and the 19th Light Infantry divisions in line, in addition to the Italian Ariete Division and six understrength Italian infantry divisions.

The British plan of attack assumed that Rommel would stage an all-out assault on Tobruk and was set for before dawn on Nov. 18, 1941. It was not postponed, even though the expected German attack on Tobruk failed to materialize, because Rommel's deployment seemed to correspond to the British blueprint. Air preparation, planned on a large scale, was hampered by a tremendous thunderstorm. The RAF was not able to function until hours after the land attack had started, following a heavy artillery barrage. The downpour also inundated German airfields and prevented dive bombers from taking off during the opening phases of the battle. Both sides suffered substantial losses in subsequent air battles, although the German Messerschmitt 109 F was superior to the Britsh fighter planes. The opening of the British drive was announced in rather exuberant terms by Prime Minister Churchill, who expected a decisive victory.

The 22d British Brigade met the Italian Ariete Division. The Italians fought harder than usual, but, after losing one third of their armor without repulsing the British, they fell back in reasonable order toward Sidi Rezegh. New Zealanders and Indians, supported by naval shelling, pressed on along the coast toward Tobruk, by-passing the Axis escarpment. The main tank battle developed badly for the Eighth Army. The strategy of splitting the 7th Armored Division into the 4th and 7th Armored Brigades proved disastrous. The 7th Brigade met the panzers at Sidi Rezegh and took a severe beating from their concentrated power for two days. The 22d and 4th Brigades, called hastily as reinforcements, were delayed. The 22d could not disengage itself from the Ariete Division in time, and the 4th was shooting up supply columns instead of racing to the danger spot. When they finally reached the battlefield, little was left of the 7th Brigade's armor, and the 5th South African Brigade had lost 3,800 men and almost completely disintegrated under a German panzer attack.

The German Mark 3 and Mark 4 tanks were superior to any the British could muster. The Mark 3 mounted a 50 mm. and the Mark 4 a 75 mm. cannon, whereas the British tanks had only 37 mm. guns. The German cannon outranged the British by about 800 yards, so the Mark 3s and 4s could fire between 12 and 15 rounds before the British came into range, thus wiping out between 20 and 30 per cent of the attackers. On November 24, Rommel's armor broke through beyond the Egyptian border, mysteriously missing the main British supply dump by about four miles.

General Auchinleck rushed to the battlefield and relieved Cunningham from his command. Realizing that the situation was critical, the British decided to resume the offensive before Rommel could move. Tanks were constantly arriving from the rear area, making up for part of the losses. The British 25-pound cannon, assigned to tank units, proved to be an outstanding antitank weapon.

Evacuating the Egyptian border area, the Germans moved back toward Tobruk, driving a wedge in the British corridor along the coast, but

the situation was soon rectified. On December 10, after costly fighting, the relief of Tobruk was completed. With his position deteriorating, Rommel decided to retreat all along the line. The tables were turned. The Axis position in the coastal border area now became a thorn in the Eighth Army's side, as Tobruk had been in Rommel's.

The Axis had well prepared positions at Gazala (not a settlement, but a geographical name for a stretch of desert). British reconnaissance disclosed that the panzers, too, had suffered serious losses, and that no more than 60 German tanks were ready for action. Superior firepower, however, made them still a formidable opponent for the depleted British armor. Once more the Eighth Army attempted to sandwich the Axis forces. Under cover of dust storms, British armor moved around the Gazala line toward Bomba, behind the Axis forces, while the infantry advanced frontally. Rommel realized the vulnerability of his position in time to pull out.

Despite heavy losses, the Royal Navy was still actively shelling coastal highways. The Axis commander decided to avoid the precarious coastal road. Abandoning Bengasi, Rommel retired across the desert to a spot 100 miles south of the city and dug in south of Agedabia. The reliability of German motorized equipment explained the small German losses. Italian losses were higher, as Italian trucks and cars were fast but unreliable. Advanced British patrols were unable to disrupt the retreat.

After taking Bengasi on Christmas Eve, the British had to try to eliminate the Axis position at the Egyptian border. On Jan. 1, 1942, South Africans attacked Bardia, held by approximately 9,000 Germans and Italians, who surrendered after a sharp engagement. Sollum was taken, and Halfaya capitulated. Churchill, hailing the Eighth Army's successes, disclosed that 11,500 Germans and 13,000 Italians had been killed or wounded and 36,500 prisoners had been captured. Axis tank losses were estimated at 386 and plane losses at 850. Chances to continue the drive toward Tripoli seemed fairly good. On January 7, Rommel withdrew to El Agheila.

In January, three German armored columns made a reconnaissance in strength and found the British extremely weak. Putting the full impact of his power into what had been planned as a reconnaissance, Rommel seized the main road to Bengasi, forcing a number of British tanks from the paved highway to the marshlands, where they had to be abandoned. Packed into one tight column, Rommel's forces thrust diagonally toward a convergence of desert tracks, 75 miles southeast of Bengasi. As little British armor was available, the RAF was called upon to stem the onslaught. Losses were inflicted upon the panzers and their supplying vehicles, but the advance could not be checked. Bengasi was retaken by Axis forces on January 28.

After losing much of the ground it had recently gained, the British Eighth Army stabilized its lines at Tmimi and Gazala. Large amounts of matériel, moved up for the drive on Tripoli, were lost in the retreat. Immediate resumption of their offensive was out of the question. Most of the Cyrenaican airfields were again under German control, giving the Axis an advantage in the air.

Each side had two large ports of supply. The Axis had Tripoli and Bengasi; the British, Tobruk and Alexandria. Both had one paved highway to carry supplies and two inland strongholds. The battle for Cyrenaica had to be fought again.

The Battle of Malta.—With the defense of the eastern Mediterranean temporarily entrusted to British submarine and destroyer flotillas with the support of a few cruisers, shore-based, torpedo-carrying aircraft from England had to be transferred to the Mediterranean.

The defense of Malta became more vitally important than before. If Malta were lost, air attacks on Axis convoys would be almost impossible, and the few British convoys which moved through the Mediterranean would be unprotected. German and Italian aircraft were concentrated to bomb out the tiny isalnd, and as many as 300 bombers a day came over Malta. The RAF on Malta was almost wiped out, but effective ground defenses made Axis losses high.

With United States support, the British attempted to replenish Malta with food, ammunition, and aircraft. In March 1942, the United States aircraft carrier *Wasp* succeeded in carrying plane reinforcements to Malta. A British convoy also reached the island, after beating off a big Italian flotilla. Despite the gallantry and sacrifice, however, Malta's offensive value was greatly reduced during the critical stage of the battles in North Africa.

JAPAN'S PATTERN FOR CONQUEST

The expansion of Japan had begun long before the 20th century dictatorships were established in Europe. The empire's ties with the Axis powers were the product of opportunism rather than kindred ideology. Japan's imperialism had highly realistic aims, although much of its strength and popular support came from such mystic beliefs as the emperor's reputed descent from the Sun Goddess and his divine mission to rule the world. Japanese ambitions grew with success and the apparent weakness of potential opponents.

From 1904 to 1941, Japan was planning to build an empire encompassing the most populated regions of Asia, taking in about one half of the world's total population and a considerable portion of its natural resources. This empire was to be organized along the lines of an industrial feudalism, based upon an economic system of low wages and colossal monopolies. It would be strong enough to defy any attempt to destroy it, and its mass production would offer overwhelming competition for industries working on the basis of relatively high wages, individual initiative, and mass consumption. The foreign trade of other nations was to be ruined by such methods.

With World War II under way, and the strength of two potential rivals in Asia, the British Empire and the USSR, threatened by German military successes, the Japanese government was anxious not only to press the advance into Asia but also to eliminate the United States as a major factor in the Pacific. The defeat of France and the Netherlands was considered an opportunity to take over those countries' Far Eastern possessions. German pressure upon the Vichy government to accede to Japanese demands was accepted as timely assistance, although some of the Japanese realized that their interests in Asia were bound to clash with those of Germany as soon as the Reich conquered Europe and expanded into Africa. Although it was frequently denied by Japanese politicians, their

distrust of Germany tended to hasten the events which led to the outbreak of the United States-Japanese war. Japan wanted to gain an impregnable position before the Germans could establish themselves in Asia.

China and India were more attractive to Japan as prospective fields of expansion than Russia's Asiatic possessions. The latter covered roughly 40 per cent of the continent's surface but was populated by only 4 per cent of its inhabitants. Potential development of this vast area was considered a difficult problem, as the average Japanese was traditionally averse to pioneering abroad. Nevertheless, Japan was anxious to weaken the Soviet Union in the Far East, since it was the Soviet Union's obvious aim to regain what czarist Russia had lost to Japan in the war of 1904–1905 and Soviet Russia had had to concede after the revolution.

In 1938 and 1939 respectively, Russia and Japan engaged in two major clashes, close to the Korean and the border region of Outer Mongolia. Large forces were involved and heavy casualties suffered, and Japan came to realize that Russia was again a great military power. The pact which had been concluded by Japanese Foreign Minister Yosuke Matsuoka in Moscow in 1941 was designed to neutralize the powerful Independent Red Banner Armies along the Manchurian and Korean borders and on Sakhalin Island until Japan could dispose of her rivals.

Prelude to Aggression.—Japan joined the Allies in World War I. Her military contribution was limited chiefly to the conquest of German-held Tsingtao and the occupation of German Pacific islands. As a result of this minor participation, the Japanese Empire, at a cost of about 300 lives, gained control of more than 600 islands and a vast expansion in the Pacific. The Japanese were also able to move temporarily into the Russian Maritime Province, including the harbor fortress of Vladivostok, and into Siberia as far as Irkutsk in 1918. In 1922, Japan forced the Russian government to grant concessions in the northern half of Sakhalin Island, amounting almost to full control of that strategically important region, and to extend Japanese fishery concession in Russian Far Eastern waters in return for the Japanese evacuation of Russian mainland areas. Most of the Siberian coast was thereafter under constant threat of seaborne invasion. This deal was followed by the Japanese purchase of Russian stock in the vital railroad running through Manchuria from Manchouli to Dairen.

Although the Japanese could not impose their will upon the United States and Great Britain. they took a strong stand at the Washington Naval Disarmament Conference of 1922. On Feb. 6, 1922, in his closing speech, Baron Kijuro Shidehara spoke of Japan's "special interests" in China. The conference agreed that the ratio of United States, British, and Japanese capital ships should be 5–5–3. This was advantageous for Japan (although hers was the ratio of 3) because her navy was concentrated in Far Eastern waters, whereas the United States had to guard both the Atlantic and the Pacific, and the British had to patrol all Seven Seas. The United States further agreed to maintain the status quo with regard to fortifications and naval bases in the Aleutians, and in all American islands west of Hawaii, which prevented any further fortification of the Philippines, Guam, Wake, and the Gilbert Islands. Britain accepted a similar obligation for British possessions east of 110° latitude, except for regions near the Dominions.

A Decade of Japanese Aggression: 1931.—With disarmament of the Western Powers in progress, Japan's military preparations were speeded up. The crucial event occurred on Sept. 18, 1931, when the Japanese marched into Manchuria. The United States minister in China, reporting to the State Department, termed this an act of aggression, long planned and carefully executed. On Sept. 22, 1931, United States Secretary of State Henry L. Stimson informed the Japanese ambassador that the responsibility for determining the course of events rested upon Japan.

On Oct. 5, 1931, the League of Nations, discussing the situation in Geneva, was advised by the United States consul there that the League should neither relax its vigilance nor fail to exert its full authority toward regulating the actions of both China and Japan. The United States government would endeavor to reinforce the league's decisions. A United States note to Japan and China called the attention of both governments to their obligations under the Briand-Kellogg Pact.

1932.—On Jan. 7, 1932, the United States government informed China and Japan that it would not admit the legality of any situation created de facto, or anything impairing the right of United States citizens in China, or any treaty brought about by methods contrary to the Briand-Kellogg Pact. The puppet government of Manchuria, installed soon after by the Japanese, was not recognized by the United States.

On Feb. 2, 1932, Sino-Japanese hostilities flared up in Shanghai. The United States offered to mediate. The Chinese accepted the proposal, but the Japanese turned it down. On Aug. 13, 1932, United States Ambassador Joseph C. Grew, in Tokyo, informed the State Department that public animosity in Japan was being built up against foreign nations in general and the United States in particular. He stated that the Japanese military machine was designed for war and would welcome war with unlimited self-confidence.

1933.—In January 1933, after consolidating their position in Manchuria, the Japanese occupied Jehol province in northern China, and the Japanese ambassador in Washington insisted that the "Manchurian incident" was closed.

On Feb. 24, 1933, the League of Nations accepted the report of the Lytton Commission to the effect that the Japanese military operation in Manchuria was not an act of legitimate self-defense, that the puppet regime had been set up contrary to the wishes of the people, and that Japan's action was incompatible with its existing international obligations. Secretary Stimson expressed the agreement of the United States government with the findings and conclusions of the League. On March 27, 1933, Japan gave notice of its intention to withdraw from the League.

1934.—Japanese Foreign Minister Koki Hirota, in a message to Secretary of State Cordell Hull on Feb. 21, 1934, claimed that no question existed between the two countries which could not be amicably solved. Hull replied that he hoped all questions could be solved to the lasting advantage of all concerned. In a further conciliatory gesture, Hirota told Ambassador

Grew that Japan was neither seeking special privileges in China nor threatening Chinese integrity. But the Japanese ambassador in Washington told Secretary Hull that Japan had a superior and special function in connection with the preservation of peace in eastern Asia.

On Dec. 27, 1934, Grew reported that things were said and written in Japan to the effect that it was Japan's destiny to rule the world. The Zaibatsu (leading Japanese industrialists) and extremists in the armed forces had clearly defined aims, while the average Japanese, who had little to gain from his country's conquests, was whipped into a state of frenzy to make him eager to die for the greater glory of his emperor.

The ambassador's report concluded that, unless the United States was prepared to subscribe to a *pax Japonica,* the United States Navy should be built up to full, treaty strength.

On Dec. 29, 1934, Hull expressed regret when the Japanese government served notice of the termination of the naval treaty of 1922. In 1934, while the Japanese embarked on a large-scale, naval building program, the United States Navy was below treaty strength.

1935–1936.—At the London Naval Conference of 1935–1936, the Japanese delegates asked for the establishment of a uniform maximum level for the fleets of the three participating nations. The United States delegates opposed the proposal on the ground that naval parity would give Japan effective naval superiority. The Japanese withdrew from the conference when Great Britain and the United States refused to accede to their demands.

On Nov. 25, 1936, Japan signed an anti-Communist pact and thus became even more closely associated with Germany. Nine days later, Ambassador Grew disclosed that foreign diplomats in Tokyo believed that a secret military understanding had already been reached between the German and the Japanese General Staff. A number of high Japanese officers, including Gen. Tomoyuki Yamashita, went to Germany to study the tactics of the new Wehrmacht.

1937.—On Jan. 8, 1937, President Roosevelt announced that he had directed the Navy Department to proceed with the construction of two replacement battleships. In 1937, the United States Army was expanded to a strength of 158,000. The Secretary of War, in his annual report for 1937, said that the army was not keeping pace with the enormous expansion of the military establishments of other powers. The Japanese considered the time ripe for a drive to conquer China. The United States was militarily unprepared, and Britain, also unprepared, was preoccupied with the constant growth of the German war machine. The Japanese believed that German aggressiveness would cause the great powers to appease Japan at China's expense.

On July 7, 1937, Japan engineered the historic "incident of the Marco Polo bridge," near Peiping in northern China, which started the Sino-Japanese war. Japan expected a swift victory, but the campaign developed into a protracted war which lasted for more than eight years and was terminated by Japan's unconditional surrender to the Allies.

Secretary Hull called in the Japanese and the Chinese ambassadors to offer the services of the United States for a peaceful settlement of the Sino-Japanese dispute. Grew reiterated Hull's offer, but the Tokyo government failed to respond.

The United States did not accept the Japanese drive into China as another fait accompli. Less than one month after the offer of mediation, the State Department declared that the existence of hostilities was a matter of serious concern to all nations and appealed again to all parties to refrain from war. The League of Nations called Japanese action in China a violation of existing treaty obligations. The United States, together with 18 other nations, held a conference at Brussels to consider a peaceable means to hasten the end of the conflict and urged that hostilities be suspended and negotiations started.

The Japanese government disregarded this appeal also. On Dec. 12, 1937, Japanese aircraft, operating in the Yangtze River area over China, attacked and destroyed the United States gunboat *Panay* and three United States merchant vessels with a loss of American lives. An immediate demand by the United States for a formal expression of regret, complete indemnification, and the assurance that no further attacks by Japanese armed forces would occur against United States nationals or property in China was accepted by Japan.

1938.—The people of the United States were anxious to preserve peace and feared that a strong stand by the government might involve the country in a war. By a close vote of 209 to 188, the House of Representatives rejected a proposal for a constitutional amendment requiring a popular referendum as a prerequisite to a declaration of war by Congress. In a special message to Congress on January 28, the president recommended the strengthening of the national defense. His recommendations, including a 20 per cent increase in the naval building program, were accepted in substance. Still United States military and naval strength lagged far behind that of potential aggressor nations. Aggressors did not fear America, and some of the governments of the threatened countries did not believe in American determination and ability to come to their aid.

Although Japanese purchases of aircraft and aeronautical instruments were still being made in the United States, the State Department notified manufacturers and exporters that the government strongly opposed sales to countries whose armed forces were using airplanes for attacks on civilian populations. This "moral embargo" was extended nine months later to materials essential to airplane manufacture and to machinery needed for the production of high quality, aviation gasoline. It did not apply to the export of ordinary gasoline or steel and iron scrap.

1939.—President Roosevelt warned Congress, on January 4, that peace was not assured.

As Chinese resistance was unexpectedly strong, the Japanese poured further reinforcements into China, constituting a threat not only to the Chinese but also to French, Dutch, and British possessions. The European countries were not in a position to attempt to stop the Japanese, because their military preparations had to concentrate on the imminent German threat in Europe. In July, the United States government notified Japan that the commercial treaty between the two countries (in existence since 1911), was to end within six months. This act removed the

main obstacle to a full embargo upon shipments to Japan.

1940.—In April, the Japanese foreign minister expressed concern about the maintenance of the status quo in the Dutch East Indies. Secretary Hull, in reply, emphasized the importance of the Dutch East Indies to world commerce. He declared that an intervention in the domestic affairs of the Indies, or any alteration of their status quo by other than peaceful processes, would be prejudicial to the stability of peace and security in the entire Pacific area. A month later, when the Netherlands was already overrun, the Japanese ambassador told Secretary Hull that his government had no intention of altering the status of the Indies.

In a discussion with the British ambassador and the Australian minister, Mr. Hull insisted that a Sino-Japanese peace should not be made at China's expense. Great Britain was then in imminent dar er of invasion. As Russia was still cooperating with Germany, the United States, if attacked by Japan, could not count upon assistance from any quarter. Neither could the United States government passively tolerate the extension of the Japanese hold on other Asiatic countries. Once Japan's position was consolidated, it might be impossible to dislodge the Japanese, and the "new order" in Asia would become a reality.

The Export Control Act, authorizing the president of the United States to prohibit or curtail the export of basic war materials, was the principal weapon to be used against Japanese expansion. Such expansion occurred when the Japanese moved into northern Indo-China. Under the Export Control Act, further exports of steel and iron scrap were prohibited. The Japanese ambassador protested to the secretary of state that this might be considered an unfriendly act. Mr. Hull replied that the external policy of Japan aimed at the conquest of all valuable territory in the Pacific area. The embargo went into effect on Oct. 16, 1940.

On July 17, Great Britain, during the period of the empire's greatest distress, had yielded to Japanese pressure and agreed to close the Burma Road for three months. With this overland supply route severed, the situation of the defenders of China was bound to suffer. After the Japanese seizure of parts of French Indo-China, the London government realized that attempts at appeasement only encouraged Japanese aggressiveness, and traffic over the Burma Road was resumed on October 17. At that time, as Prime Minister Churchill later admitted, the British government was inclined to underestimate Japan's military strength. Although the Chinese were traditionally unmilitary, and their equipment was infinitely inferior to Japan's, Japan had not succeeded in breaking Chinese resistance in more than three years of warfare, even though she had thrown a million men into the conflict. Such a poor showing by the Japanese encouraged the British to stiffen their attitude.

The Four Freedoms.—The president's budget message of January 1941, called for $11,000,000,000 for national defense. In his address to Congress on Jan. 6, 1941, the president said that the United States looked forward to a world founded upon four essential freedoms: freedom of speech and expression, freedom of every person to worship God in his own way, freedom from want, and freedom from fear, "the kind of world which is the very antithesis of the so-called new order of tyranny which the dictators seek to create."

1941—The Year of Decision.—At the end of 1940, Ambassador Grew cabled to the secretary of state that the aggressive elements in Japan saw in the world situation a golden opportunity to carry out their ambitions, that they believed the European war would be ended with a quick German victory, and that the Japanese position in "Greater East Asia" should be consolidated while Germany was still willing to cooperate. Any effective opposition from the United States was discounted. The Japanese took into consideration the possibility that a victorious Germany might constitute a new hazard to their program of expansion.

There was danger that United States sanctions, such as a drastic embargo, might bring Japanese retaliation, probably a sudden blow by the army or navy. If the United States could preserve the status quo in the Pacific by adhering firmly to its principles until Great Britain was successful in the European war, it might be possible to undertake a readjustment of the whole Pacific problem on an equitable basis.

In January, Ambassador Grew sent another alarming report, indicating that Japanese military forces planned a surprise mass attack on Pearl Harbor in the event of trouble with the United States.

Secretary Hull insisted that many people in the United States still failed to grasp the nature of the crisis and its meaning to this country. If the aggressors should win the war, they planned to make the people of other nations into serfs, to abolish their liberties, rights, laws, and religion. Behind the mask of peaceful professions, Japan had accumulated vast striking forces; they had infiltrated shock troops, disguised as travellers and businessmen, to set up organizations for spying, sabotage, and propaganda; they were endeavoring to sow hatred and discord; they were using every tool of economic attack, bribery, and corruption to weaken their prospective victims until a military movement could complete the task of subjugation. Peace on that basis was nothing more than a trap.

Referring to the question if aid to freedom-loving nations and a vigorous policy of defending our interests would give an aggressor an excuse to attack the United States, the secretary said that no nation would attack if the United States were strong enough to defend itself.

The new Japanese ambassador to the United States, Admiral Kichisaburo Nomura, presented his credentials to the president on March 8. In his opening conferences with Hull, Nomura tried to minimize his government's aims of military conquest and insisted that United States embargoes were a matter of increasing concern to Japan. The secretary blamed Japan for having taken the initiative in aggressive expansion and said that the people of the United States viewed German-Japanese movements with concern.

On May 11, Mr. Hull told Admiral Nomura that there should be no serious difficulty if Japan really desired a peaceful settlement in the Pacific. The following day, the Japanese ambassador handed a statement to the secretary which defined the Tripartite Pact as a defensive alliance, designed to prevent nations not already involved in the European war from engaging in it. The memorandum suggested that the government of the

United States should request the Chiang Kai-shek regime in China to negotiate peace with Japan. Japan would ask for the independence of Manchuria and would insist upon the right to station Japanese troops on Chinese territory for a joint defense against Communism. Japanese expansion toward the southwest Pacific area was declared to be of a peaceful nature. The memorandum also urged the resumption of normal trade relations between the United States and Japan, and that the United States should cooperate in the production and procurement of natural resources, such as oil, rubber, tin, and nickel, which Japan required. The United States and Japan were to guarantee jointly the independence of the Philippine Islands on condition that the Philippines would maintain a status of permanent neutrality.

Secretary Hull's counter-proposal, handed to Nomura on June 21, suggested that both governments should affirm that their policies were directed toward lasting peace. The United States government reiterated that its attitude toward the war in Europe would be determined by considerations of self-defense. The United States was willing to suggest that China should negotiate with Japan, provided that Japan would first discuss the terms to be proposed to China with the United States. The resumption of normal trade relations would be considered. Both governments should disclaim publicly any territorial designs in the Pacific area. Japanese-United States negotiations concerning the neutralization of the Philippines would be considered at such time as the United States might desire after Philippine independence was achieved.

On July 4, the United States government sent a message to the Japanese prime minister, referring to reports that Japan had decided to attack Russia. Such an act of aggression, the message said, would destroy any hope for peace in the Pacific. Four days later, the Japanese government denied any intention of fighting the USSR. Actually, the German ambassador in Tokyo, following Ribbentrop's orders urged the Japanese to attack Russia, but Japan was waiting for the situation on the Russo-German front to become more conclusive. Japan's primary interests lay in other directions.

Disregarding United States admonitions, the Japanese government, supported by its Tripartite partners, exerted pressure upon the French Vichy government to sanction its control of French Indo-China. On July 22, Marshal Pétain's cabinet granted Japan the right to maintain troops and to establish air and naval bases in southern Indo-China. The Japanese ambassador in Washington told Hull that his country's action was taken solely to assure an uninterrupted supply of foodstuffs and raw materials. The secretary replied that this move was regarded as evidence that Japan intended to pursue a policy of forcible conquest.

The president of the United States told Ambassador Nomura that he would do everything in his power to obtain an agreement with Great Britain, the Netherlands, and China that Indo-China would be considered a neutral area, provided Japan was ready to make a similar commitment and would refrain from occupying southern Indo-China. Roosevelt further expressed the belief that Japanese policies were due to German pressure and that Hitler was bent on world domination. He warned Nomura that if Germany succeeded in defeating Russia and in dominating Europe and Africa, it would turn next to the Far East and the Western Hemisphere, and suggested the possibility of eventual cooperation between the navies of Japan and the United States against Hitler as a common enemy. Despite Mr. Roosevelt's efforts, Japanese forces moved into southern Indo-China.

On July 26, Japanese assets in the United States were frozen by executive order. This resulted in the virtual cessation of trade between the two countries.

On August 6, the Japanese ambassador stated that his government was prepared to withdraw its troops from the southwest Pacific areas, except for Indo-China, and to withdraw from there also after a settlement of the "China incident" was reached. In return, the Tokyo government proposed that the United States should suspend its military measures in the southwest Pacific, advise Great Britain and the Netherlands to do the same, restore normal trade relations with Japan, use its good offices to initiate negotiations between the Japanese government and that of Generalissimo Chiang Kai-shek, and recognize Japan's special status in French Indo-China even after the withdrawal of Japanese troops.

On August 15, President Roosevelt handed Nomura a document containing the warning that, if the Japanese government continued military aggression, the United States government would be compelled to take all necessary steps to safeguard its legitimate rights and interests. Another document, handed to the ambassador simultaneously, stated that the United States was prepared to resume informal exploratory discussions if Japan suspended its aggressive activities, embarked on a peaceful program for the Pacific, and accepted the principles to which the United States was committed.

On August 28, the Japanese prime minister, Prince Fumimaro Konoye, suggested that a meeting be arranged between him and the president of the United States to discuss all important problems pertaining to the Pacific area. Konoye's message, delivered to the president by the Japanese ambassador, was accompanied by a declaration that Japan was ready to withdraw from Indo-China as soon as the China incident was settled and a just peace established in East Asia, and that Japan would take no action against the USSR as long as the Russians remained faithful to the Soviet-Japanese neutrality pact.

President Roosevelt's reply of September 3, expressing his desire to collaborate with the prime minister, suggested that precautions be taken to assure the success of the meeting by entering into preliminary discussions of the four principles upon which relations between nations should rest: respect for territorial integrity and sovereignty; non-interference in the internal affairs of other countries; equality, including commercial opportunity; and non-disturbance of the status quo except by peaceful means. Grew reported that Konoye claimed to enjoy the warmest support of responsible army and navy leaders.

Considering that Konoye had headed the Japanese government when the "China incident" occurred, his peaceful intentions were doubted by United States officials. It was learned that the military element was to be heavily represented in the Japanese delegation. Hopes for the success of the meeting were scant, and failure was bound to produce an immediate crisis.

A revised proposal, handed to the secretary of state by the Japanese ambassador, promised that Japan would not resort to military action against regions south of Japan "without justifiable reason." The memorandum also stated that, in the event of American participation in the European war, the "interpretation and execution of the Tripartite Pact by Japan would be independently decided"; that Japan would be ready to withdraw from China "upon the rehabilitation of general and normal relationships between Japan and China"; and that United States economic activities in China would not be restricted "as long as pursued on an equitable basis." It asked the United States to abstain "from measures and actions prejudicial to the endeavor by Japan concerning the settlement of the Chinese affair." This proposal actually gave the Japanese an opportunity to act as they pleased by interpreting the various points to suit themselves. On October 2, Secretary Hull insisted that the proposed meeting be preceded by the clarification of certain principles. The Japanese ambassador hinted that failure to arrange the meeting quickly might result in the replacement of the Konoye government by another less devoted to peace. On October 18, Prince Konoye resigned and was succeeded by Lt. Gen. Hideki Tojo.

On November 3, Ambassador Grew cabled that economic measures, such as embargoes, would not avert war and would not result in Japan's collapse. He warned of the danger of underestimating the extent of Japanese preparations or of assuming that they amounted only to saber rattling.

On November 7, the United States Cabinet was informed by Secretary Hull that relations between Japan and the United States were extremely critical. On November 11, Secretary of the Navy Frank Knox stated that the United States was confronted by the necessity of extreme measures of self-defense in the Atlantic and was likewise faced with grim possibilities in the Pacific. Undersecretary of State Sumner Welles supported the warning by saying that "at any moment war may be forced upon us."

On November 10, Prime Minister Churchill declared that, if the United States should become involved in war with Japan, a British declaration would follow within the hour.

Early in November, the Japanese government informed the United States government of its desire to send a special representative, Mr. Saburo Kurusu, to Washington to assist Nomura in his conversations. Mr. Kurusu was received by Roosevelt and Hull on November 17. The Japanese envoy failed to produce any new proposals. Another report by Mr. Grew emphasized the necessity for vigilance against a sudden Japanese attack in regions not involved in the Sino-Japanese conflict. The ambassador considered it probable that the Japanese would make use of every possible tactical advantage, including the elements of surprise and initiative. The Japanese envoy and the United States secretary of state met daily, but Kurusu was ready neither to renounce his country's association with Germany nor to budge from the basic Japanese policy in East Asia.

In discussions with high United States government officials, between November 25 and 28, the secretary of state emphasized the critical nature of United States-Japanese relations. Mr. Hull expressed the belief that Japan was likely to commit new acts of conquest. Plans for defense should be based on the assumption that the Japanese might feature the element of surprise in their strategy.

A suggestion made during the discussions, that the United States should take the initiative by opening hostilities against Japan, was rejected. It was felt that the people of the United States would not support this action.

On November 29, Cordell Hull told British Ambassador Lord Halifax that the diplomatic discussions between the United States and Japan were virtually at an end and that the matter would now be turned over to officials of the army and navy.

On December 1, the secretary of state again conferred with Nomura and Kurusu. He mentioned the belligerent attitude of Tokyo and emphasized that there was a limit of tolerance beyond which the United States could not go.

Heavy Japanese troop concentrations were reported from Indo-China. From there, the Japanese threatened the Philippines, the Dutch East Indies, Burma, Malaya, and Siam. Regrouping in China pointed to an impending attack on Hongkong. Japanese convoys, obviously carrying large bodies of troops, were sighted in the South China Sea.

On December 5, Ambassador Nomura explained that the alarming concentrations of Japanese troops were a natural sequence of Chinese troop movements along the northern border of Indo-China. The ambassador further expressed his concern about the increasing preparations of the ABCD (American, British, Chinese, Dutch) powers in Asia. Actually, the British battleship *Prince of Wales* and battlecruiser *Repulse* were on their way to Singapore, while the Dutch fleet, composed of light surface units and submarines, assembled in the waters around Java, Sumatra, Borneo, and the Celebes. Their combined strength was greatly inferior to that of the Japanese Navy in Far Eastern waters.

On December 6, President Roosevelt telegraphed a personal message to the Japanese Emperor Hirohito, stating that developments in the Pacific contained tragic possibilities. He urged that Japan and the United States should agree to eliminate any form of military threat. The presence of Japanese military, naval, and air forces in great numbers in Indo-China raised doubts as to the defensive character of their presence. The message concluded by saying that both the president and the emperor had a sacred duty to restore the traditional amity between their countries and to prevent further death and destruction in the world.

Opening of Hostilities.—On Dec. 7, 1941, at 7:50 A.M. Honolulu time, 1:20 P.M. Washington time, the Japanese opened hostilities against the United States by a surprise air attack on the naval base of Pearl Harbor, on Oahu in the Hawaiian Islands. This sneak attack followed the Japanese pattern in 1904, when a surprise raid by Japanese torpedo boats hit the Russian Far Eastern Fleet at Port Arthur, its main port and fortress. It justified the warnings of Ambassador Grew and exposed the fatal error of underestimating Japanese intentions. The attack put the main United States Fleet out of action for many months.

The Declarations of War.—While the attack on Pearl Harbor was under way, Nomura and Kurusu called on Secretary Hull to hand him

a memorandum which charged the United States with obstructing peace between China and Japan, failure to cooperate with Japan, scheming to extend the war, aiding Great Britain, and preparing to attack Germany and Italy. The memorandum claimed that the United States was ignoring actual conditions in China and that Mr. Hull's proposal of November 26 menaced Japan's existence. The United States and Great Britain were charged with conspiracy to obstruct Japanese efforts toward the establishment of peace by the creation of a new order in East Asia. "In view of the attitude of the American government," the memorandum ended, "the Japanese government must conclude that it is impossible to reach an agreement through further negotiations."

Cordell Hull's answer was: "I have never seen a document more crowded with infamous falsehoods and distortions, on a scale so huge that I never imagined until today that any government on this planet was capable of uttering them."

After the attack on Pearl Harbor, Ambassador Grew was informed by the Japanese foreign minister that Emperor Hirohito wished the memorandum presented to Hull to be regarded as the emperor's reply to President Roosevelt's message. It was added, "also as a reply," that "the establishment of peace in the Pacific, and consequently in the world, has been the cherished desire of His Majesty, for the realization of which he has hitherto made his government continue its earnest endeavors."

At 11:00 A.M., Tokyo time on December 8, (9:00 P.M. December 7, Washington time) the United States ambassador in Tokyo received a communication from the Japanese foreign minister to the effect "that there has arisen a state of war between Your Excellency's country and Japan beginning today."

During the morning of December 8, President Roosevelt asked Congress to declare a state of war between the United States and Japan. Both Houses acted immediately with only one dissenting vote. At 4:10 P.M., the president approved a joint resolution providing that the state of war between the United States and the government of Japan, which had been thrust upon the United States "is hereby formally declared." The president was authorized and directed to employ the entire military and naval forces of the United States to carry on the war against Japan, and Congress pledged all the resources of the country to bring the conflict to a successful termination.

In a radio address delivered on December 9, President Roosevelt warned the country that, as Germany and Japan conducted military and naval operations in accordance with a joint plan, Germany and Italy would probably consider themselves also at war with the United States. He added that it would be futile to eliminate the danger of Japan if the country should then find the rest of the world dominated by Hitler and Mussolini. "We are going to win the war and we are going to win the peace that follows," the president concluded.

The German government had repeatedly violated its international obligations, and it had a strong incentive to disregard its pledge to Japan. The United States would be too engrossed in hostilities with Japan to be likely to declare war on Germany and Italy of its own initiative. Moreover, the concentration of American attention in the Pacific could be expected to reduce the flow of American supplies to the nations fighting the Axis in Europe. But Hitler decided for war. No doubt he expected the collapse of the United States and was eager to share the spoils.

On December 11, Germany and Italy declared war on the United States. The same day, without a dissenting vote, Congress passed, and the president approved, resolutions declaring a state of war between the United States and Germany and between the United States and Italy.

The United Nations.—On Jan. 1, 1942, the Declaration of the United Nations was signed in Washington, D.C., by representatives of the governments of the United States, Great Britain and Northern Ireland, the Union of Soviet Socialist Republics, China, Australia, Belgium, Canada, Costa Rica, Cuba, Czechoslovakia, the Dominican Republic, El Salvador, Greece, Guatemala, Haiti, Honduras, India, Luxembourg, the Netherlands, New Zealand, Nicaragua, Norway, Panama, Poland, South Africa, and Yugoslavia. It was accepted in 1942 by Mexico, the Commonwealth of the Philippines, and Ethiopia (Abyssinia).

The declaration bound the signatory governments to subscribe to the purposes and principles of the Atlantic Charter; to defend life, liberty, and religious freedom; to preserve human rights and justice in their own lands as well as in other lands; to pledge themselves to employ their fullest resources, military and economic, in the common struggle against the members of the Tripartite Pact and its adherents; and finally, not to make separate armistice or peace with their enemies.

THE UNITED STATES AT WAR

With the United States well behind other countries in the armament race, both Germany and Japan hoped that America would be unable to overcome her disadvantage in time to prevent an Axis victory. The German General Staff maintained that armed forces could not be improvised and that military institutions of long standing and basic indoctrination of the popular mind were necessary to build an effective army. The German war lords argued that it had taken Germany more than ten years of clandestine planning and five years of open preparation to rearm, although the General Staff was always in existence, and the average German was military-minded. Experience with the United States Army in 1918 was not considered convincing. The United States forces in World War I were greatly outnumbered by the French and British, and German reports minimized their part in the German defeat. Furthermore, German industrial experts were confident that the Reich could outproduce the United States. American war industry was considered to be in an experimental stage which could not be developed quickly into mass production. Figures of airplane and tank output in the United States were discounted in Germany as propaganda. The Germans also relied strongly upon pro-German elements in the United States to sabotage the country's war effort by subversive action and propaganda.

As German submarine warfare was constantly expanding, and the United States Fleet was believed to be permanently crippled by the Japanese sneak attack, German experts doubted any American ability to transport substantial forces to the European or African theater of war.

After Pearl Harbor, the Japanese hoped that

the United States could not compensate for its severe naval losses in time to prevent the establishment of permanent control of the Pacific and the Indian oceans by the Japanese Navy. The public effect of British and Dutch naval intervention was minimized. Once Japanese forces were firmly established in vital bases, and United States, British, and Dutch strongholds were eliminated, the Allies would not be able to prevent the rapid spreading of Japanese conquests in what Tokyo propagandists termed the "co-prosperity sphere."

The comparative lack of United States preparations unquestionably jeopardized the country's defenses in the early stages of the war, but, after a badly needed breathing spell, the United States began to show its growing strength. United States production eventually proved far superior to that of enemy countries, and the fact that it was not already standardized in late 1941 allowed the United States to adapt according to the most recent tests of battle.

The U.S. Navy.—On July 1, 1940, the total tonnage of navy vessels was 1,082,000 for Great Britain, 998,000 for the United States, and 815,000 for Japan. Considering that the British had already suffered losses, and Japanese figures were not reliable, the United States Navy was substantially below parity, even as fixed by the expired Washington treaty. Prior to 1940, the United States building program was listed at 894,000 tons, the British at 736,000, and the Japanese at 441,000 (including vessels under construction). The actual Japanese program was much more extensive.

In messages of May 16 and 31, 1940, asking for military and naval appropriations of $1,182,000,000 and $1,227,000,000, President Roosevelt called for additional armaments. The first message requested the construction of 3,000 navy planes and a large increase in naval personnel. The president emphasized the necessity for a two-ocean navy, and he wanted the United States to be able to turn out at least 50,000 planes a year. Congress, in 1940, authorized a total navy of 3,049,480 tons, completion of which was not expected before 1946. Personnel for a two-ocean navy was estimated at 486,000 officers and men, including pilots for 15,000 naval aircraft.

The 1940 building program included 17 battleships between 35,000–60,000 tons. In 1941, two 35,000 ton battleships, the *North Carolina* and the *Washington,* the 20,000 ton aircraft carrier *Hornet,* 12 destroyers of an improved 1,700 ton-type, and 9 submarines joined the navy. Four more North Carolina class battleships were nearly completed. Naval craft, numbering 213, were put into service between Jan. 1, and Sept. 1, 1941, most of them small vessels, such as minesweepers, submarine chasers, and patrol boats. The conversion of 193 merchantmen took place for use as hospital ships and navy auxiliary vessels. During the war, the building program underwent a radical change, with top priority given to aircraft carriers and aircraft tenders. Warships of all types were built with unprecedented speed.

At the time of the Pearl Harbor attack, the United States had 216 major combat craft, including 17 battleships, 6 aircraft carriers, and 37 cruisers. Of these warships, 102 were stationed in the Pacific and 114 in the Atlantic. Most of the battleships were more than 20 years old. Great Britain and the Netherlands had 50 surface craft in the Pacific, mostly light units.

Two United States task forces were at sea when the Japanese struck their surprise blow, one returning from Midway, the other bound for Wake Island. Eight battleships of the Pacific fleet, 9 cruisers, and one third of the Pacific destroyer flotilla were in Pearl Harbor. Two heavy cruisers were on patrol south of the Hawaiian Islands; 2 cruisers were escorting troopships to Manila, where the light cruiser *Boise* had just arrived; 2 more cruisers and 13 destroyers of the "Asiatic Fleet" were at anchor in Manila Bay; and 3 light cruisers were on duty in southeastern Pacific waters.

The U.S. Army.—After meeting the request (July 10, 1940) for another 5 billion dollars for national defense, Congress granted the president authority to call the National Guard and Reserve personnel into active service. In 1940, the United States Army rose from 220,000 to more than 600,000 men, still far below the level of the other great powers. A further increase to 1,200,000 was authorized, and a new military organization was set up in 1940. Gen. George C. Marshall, as commanding general of the field forces and chief of staff of the army, directed and supervised the training. Supply and quartermaster duties were administered by the War Office through corps area commanders. Nine geographical corps areas were under separate tactical commands, and four field armies were established. Mechanized units and tanks were organized as armored forces, directly responsible to the chief of staff. In 1942, it was planned that 54 air combat groups, with 12,800 planes, would be an element of the field forces to operate under the direct control of General Headquarters. A mobile field army was organized under General Headquarters, made up of one armored corps of two divisions, the General Headquarters air force, and a reserve that consisted chiefly of heavy artillery and heavy tanks. Four air force divisions were set up in the continental United States, corresponding to the four field armies, and a provisional parachute group was organized.

On Oct. 9, 1941, in the last official announcement issued prior to Pearl Harbor, the total figure of army personnel was 113,000 officers and 1,475,000 enlisted men, of which 537,000 belonged to the Regular Army, 270,000 to the National Guard, 76,000 were reserve officers, and 705,000 were selective service trainees. Most of the army was stationed in the United States.

Five reorganized armored divisions were ready late in 1941. Their equipment included 158 light and 232 medium tanks, 79 armored cars, 54 self-propelled howitzers (105 mm.), 39 self-propelled howitzers (75 mm.), 27 antitank guns (37 mm.), 24 mortars (81 mm.), and 38 mortars (60 mm.) per division. In 1941, each U.S. infantry division had 162 Browning automatic rifles, 54 light machine guns (30 caliber), 72 heavy machine guns (30 caliber), 36 machine guns (50 caliber), 81 mortars (60 mm.), 36 mortars (81 mm.), and 36 antitank guns (37 mm.). The bazooka was introduced later. Infantrymen were equipped with the Garand rifle (30 caliber) and a 45-caliber tommy gun.

The U.S. light field artillery used 75-mm guns and 75-mm. and 105-mm. howitzers; medium artillery was equipped with 155-mm. howitzers and 4.7-inch guns; heavy artillery with 155-mm. guns and 8-inch and 240-mm. howitzers. The 75-mm. gun, once the backbone of the field artillery, was largely superseded by the 105-mm.

howitzer, but it remained an effective antitank weapon.

Coastal defenses used guns of 3 inch, 155-mm., 6, 8, 10, 12, 14, and 16-inch caliber, the latter capable of firing a 2,340 lb. projectile at a range of about 28 miles.

Bofors antiaircraft guns (40-mm.) and 3-inch AA guns were in use in antiaircraft defenses, with a 90-mm. gun in preparation.

U.S. Tanks.—Many types of armor were in the blueprint or experimental stage when the war began. The "Honey" and the "Mae West" (the latter a training tank) were the best known of the light models. The medium M-3 General Grants, mounting a 75-mm. cannon, were ready, and the M-4 General Shermans, mounting a 75-mm. cannon, in addition to .50-, .45-, and .30-caliber machine guns, were in production. A heavy 60-ton model, T-1, was in the blueprint stage. Self-propelled guns were developed, such as the M-7, mounting a 105-mm. howitzer, the M-12, with a 155-mm. gun on an M-3 chassis, and a light fast vehicle, mounting a 75-mm. gun.

U.S. Airplanes.—The United States Army owned 78 and the Navy, 38, of the 2,453 airports in the United States. The aircraft building program for 1941 called for 60,000 planes in 1942 and for 125,000 in 1943. Hardly more than 5,000 war planes were ready for action at the time of the Japanese attack, although monthly production rose from 630 in January to 2,700 in December 1941. The United States fighters were the Bell Airacobra, Brewster Buffalo, Curtiss Kittyhawk, Curtiss Tomahawk, Curtiss Mohawk, Douglas Havoc, Grumman Martlet, Lockheed Lightning, and North American Mustang. The bombers were the Boeing Flying Fortress, Brewster Bermuda, Consolidated Catalina, Consolidated Liberator, Curtiss Cleveland, Douglas Digby, Douglas Boston, Douglas Nomad, Lockheed Hudson, Martin Maryland, Martin Baltimore, Vega Ventura, and Chesapeake. Other types existed in blueprints or were under production.

Selective Service.—The Selective Service Act, providing for peacetime conscription, was signed Sept. 16, 1940. Under the act, male residents of the United States between the ages of 21 and 36 had to register, whether or not they were citizens of the United States. A quota was to be filled each month. Under the initial stipulations of the act, the grand total of men was limited to 900,000 serving at one time. By July 1, 1941, the planned quota was 789,000. In the first draft, the registrant's number was drawn from a large bowl. Later, selective service was handled by local draft boards. On the day set for registration (Oct. 16, 1940), 16,500,000 persons presented themselves at their local boards, which gave an estimate of the total number available for compulsory service.

National Defense Advisory Committee.—A National Defense Advisory Committee was appointed on May 28, 1940, to coordinate resources of men and material for the defense of the United States. It included the Divisions of Industrial Material, Production, Transportation, Labor, Agriculture, Price Stabilization, Consumer Protection, State and Local Cooperation, Coordination of Purchasing, Defense Housing, and the Bureau of Research and Statistics.

Prior to Dec. 7, 1941, the committee authorized contracts for, among other items, 50,000 airplanes, 130,000 engines, 55,000 guns and mortars, 9,200 tanks, 300,000 machine guns, 400,000 automatic rifles, 380 warships, and 200 merchant ships.

Office of Civilian Defense.—The Office of Civilian Defense was created on May 20, 1941, to coordinate federal, state, and local civilian defenses, to plan and execute programs for the protection of life and property in emergencies, and to train volunteers in the interest of defense. By the end of 1941, 6,000 local defense councils were organized, with one million persons trained or enrolled. Civilian defense tactics, as operated in Great Britain under German air attack, set the pattern for civil defense in the United States.

JAPAN AS AN ENEMY

In August 1940, Lieutenant General Tojo (later the Japanese prime minister) demanded that army personnel work with more efficiency. "A day of idleness at this time is as criminal as 100 years of idleness in peacetime," he proclaimed. The Japanese went to the very limit of their strength to make final preparations to attack the United States. Obedience which completely disregarded life and health was typical of the Japanese soldier, who was taught to take military orders to be divine commands. He was among the poorest paid soldiers in the world. In 1941, enlisted men received the equivalent of $2.36 a month. A lieutenant general's monthly wage was $111.09. Of the soldier's pay, 80 per cent went to his family and 1/16 into a savings fund. His diet consisted of rice, tea, dried fish, and a few pickles. Even on this meager diet, the Japanese soldier was able to endure severe hardships.

Japanese sailors weighed 40 to 50 pounds less than the average American navy men and were between 6 and 8 inches shorter. They needed less space than the crews of fighting ships of other nations, and their living quarters were even more congested. The Japanese claimed that this was why their ships could carry more fuel and ammunition than corresponding foreign craft.

Japan had compulsory military service. Approximately 13,900,000 men were subject to conscription, and a patriotic Women's Society for National Defense had 6,400,000 members, mostly belonging to the middle class. Recognizing the Japanese belief in the superiority of the male, women did not aspire to a soldier's job, but they devoted themselves to every kind of assistance they could give the fighting men.

The Japanese Army.—At the time of the Pearl Harbor attack, the Japanese had a total of 72 regular and reserve divisions ready for action, in addition to about 25 smaller auxiliary divisions and some independent brigades and cavalry divisions. Japanese regular and reserve divisions numbered about 25,000 men each, the independent brigades having half that figure. An auxiliary division was about equal to an independent brigade.

In the Chinese theater of war, there were 16½ regular and reserve divisions, 9 newly organized auxiliary divisions, 12 independent brigades, 2 cavalry brigades, and special engineering, communications, and medical units.

Beginning in 1940, another army was assembled in Japan-controlled Indo-China and on Hainan Island, close to the future theater of war. These forces were equipped with the best matériel the Japanese could muster and were specially trained in jungle warfare. The soldiers were taught to use tricks and ruses and to utilize

natural facilities to infiltrate enemy lines. Their equipment was well adapted to the jungle, much better than anything the Allies possessed during the critical period following Pearl Harbor. Later in the war, the United States Army gained full superiority in this kind of equipment.

Well hidden from observers and without interference, the Japanese massed 27 regular and reserve divisions and a small number of auxiliary divisions and independent brigades in the area adjoining the objectives of their impending drives in Asia and the Pacific.

Twenty Japanese divisions and almost twice that number of Manchurian puppet divisions stood along the Russo-Manchurian border as a strong guard and a constant threat. The fighting value of the Manchurian divisions, however, was far below that of the Japanese. Approximately 8 divisions were ready in the Japanese homeland to be shipped to any theater of war where they might be needed.

Although the Japanese General Staff accepted German tutorship, the Wehrmacht's pattern of armored warfare was not introduced in the Japanese Army. The tremendous quantities of gasoline needed were not available in China, and transport conditions in other Asiatic theaters of war did not encourage the use of panzer divisions. Airpower was well developed in Japan and used to the limit in land and sea warfare.

Japanese soldiers were equipped with the Meiji 38 rifle (Arisaka) introduced in 1905 and a 1911 model of the Arisaka carbine. The 1925 Nambu automatic pistol and the light Nambu machine gun, both closely resembling the German Mauser, and a heavy machine gun, patterned after the French Hotchkiss of 1914, were the most numerous of the automatic weapons. The infantry used trench mortars of 72-mm. (M 22) and 81-mm. (Stokes Brandt). Two types of very light, short-barrelled cannon (37-mm. and 70-mm., model 1922) accompanied the foot soldiers. They also served as antitank weapons, but their slow rate of fire and moderate muzzle velocity reduced their efficiency. Some small caliber, antitank cannon were manufactured in Osaka, Japan, by a branch of the Boehler Works of Austria and Germany.

Antiaircraft artillery used two extra light gun models of 13.2-mm. and 20-mm. caliber respectively, the first of the Hotchkiss type, the other of Swiss Oerlikon make, in addition to medium 75- and big 105-mm. guns. Attached to each infantry division was one regiment of light field artillery with 36 cannon and 12 howitzers, using 75-mm. German Krupp and French Schneider-Creuzot guns, and howitzers of 105- and 120-mm. caliber, copied from Krupp and Schneider originals. Medium artillery was equipped with 105-mm. guns and 150-mm. howitzers, from 1905 Arisaka to 1930 Schneider models. Heavy artillery (3 regiments and 8 independent battalions) had guns from 150- to 410-mm., howitzers of 240, 300, and 410-mm., and railway guns of 240-mm. caliber.

The Japanese Air Force.—The Zero fighter and the newest Mitsubishi bomber were hidden from foreign observers before their use against the Allies. The Zero, in particular, had an excellent performance. At the outbreak of hostilities, it was better than any comparable United States plane. Japanese plane production reached 600 a month.

Prior to Dec. 7, 1941, the Japanese used the Nakajima 19, the Mitsubishi Soyokaze (a two-engined naval bomber resembling the German Junkers), and two other Mitsubishis: the obsolete 92, and the light 97. Japanese warplanes were equipped with 20- and 25-mm. cannon and 25.6-caliber machine guns. As these craft were thought to be of rather poor quality, the performance of the Japanese Air Force in the early stages of the war against the Allies came as a shocking surprise.

The Japanese Navy.—On Dec. 7, 1941, the Japanese had 180 major surface fleet units in the Pacific against 152 in the Allied Pacific and Asiatic fleets combined. After Pearl Harbor, Japanese superiority was overwhelming, and the Japanese were able to mass superior naval power wherever their operational program made it advisable.

Japan's major naval units included 10 battleships, 8 aircraft carriers, and 46 cruisers. This gave the Japanese Navy an advantage in number of cruisers and aircraft carriers over the United States Fleet. A 5,401,000,000 yen building program adopted in 1940 financed the construction of three heavy cruisers of the Chichibu class (approximately 15,000 tons), with fighting capacities almost equal to those of a battleship, five battleships of the Nissin class (40,000 tons), and a number of aircraft carriers and plane tenders. Japanese battleships of the Ise, Huso, Haruna, and Kongo classes, launched between 1912 and 1916, were thoroughly modernized. Japanese naval equipment generally was excellent.

Japanese shipbuilding procedures were much slower than those developed in the United States. Unable to replace its losses to a considerable extent during the war, the Japanese Navy's position was bound to deteriorate when the war dragged on. Although the leaders of the Japanese Army discounted United States fighting strength, some high Japanese naval officers were worried about the United States shipbuilding program.

Sino-Japanese War.—On Dec. 7, 1941, the Sino-Japanese war automatically became part of World War II. The military situation in China did not change much in 1941. Wherever the Japanese invaders succeeded in gaining ground, they were soon driven back by Chinese counterattacks.

In November 1941, Chinese War Minister Ho Ying Chin gave the total number of Chinese fighting forces at 6 million, of which 4 million were said to be in action. A check on these figures is hardly possible, but apparently they were exaggerated. China could not have supplied such a large number of troops. The army had no armor, only a very few United States aircraft manned by the American "Flying Tigers," some obsolete artillery, and pathetically few heavy infantry weapons. Japanese technical superiority, generalship, and organizational abilities were beginning to be felt.

Few supplies reached China from abroad. Major Chinese ports were in Japanese hands, and the approaches to the China coast were dominated by the Japanese Fleet. The Burma Road, China's land outlet to the British Empire, was closed during part of 1941. At best, it could carry only a small fraction of the supplies that China needed. Russian aid amounted to almost nothing. The Soviet Union was not favorable to the Chungking government. In addition, the Russians needed supplies themselves and were not yet inclined to risk war with Japan

Late in 1941, aside from the whole of Manchuria (Manchukuo) and much of Inner Mongolia, the Japanese held more than 500,000 square miles of the eastern provinces of China. Unoccupied China had an area of roughly 2,300,000 square miles, with a population of 250 million. Almost 200 million lived in occupied areas.

The Japanese aimed to drive through the Yangtze River valley to Chungking, and from there via Kweiyang and Kunming to Burma. If they had succeeded in reaching their goal, unoccupied China would have been hopelessly isolated and by-passed by Japanese forces from China. These forces would then have joined the armies from Indo-China in a drive to conquer India.

The Chinese blocked the push into the Yangtze River valley, but their situation was precarious, because interior strife was reducing the country's power of resistance.

The Communist Party of China, disbanded in 1937 under the Kuomintang-Communist agreement for a united front against Japanese aggression, was reconstituted. On Jan. 17, 1941, the National Military Council ordered the dissolution of the "Fourth Route Army" because of rebellion. The Fourth Route Army defied this order and was backed by the Communist Party (then called the Central Revolutionary Military Committee) with its seat at Yenan in northern Shansi Province. The Central Revolutionary Committee presented twelve demands as the price of further cooperation with Chungking, including the abolition of the one-party Kuomintang rule. The Chungking government ignored the demands.

The Japanese, in an effort to widen the breach, concentrated their operations against the Chungking forces and did not attack the Communists. Chungking charged the Communists with inactivity in the struggle against Japan. The Communists insisted that they were still fighting the enemy, but there was little evidence to prove it.

THE DISASTER AT PEARL HARBOR

Although the United States Army and Navy in the Hawaiian Islands and other Pacific outposts knew that the situation with Japan was critical, defensive preparations were inadequate at the major naval base of Pearl Harbor. Lack of effective patrols permitted a substantial Japanese naval task force to sail within striking distance of Pearl Harbor without interference.

During the night of Dec. 6, 1941, the United States destroyer *Ward* detected a submarine in the defensive area outside of Pearl Harbor. The submarine was attacked with depth charges and subsequently sunk. This incident failed to alarm the army and navy commands. At 7:00 A.M. Sunday, Dec. 7, 1941, an army private, operating a listening device at Pearl Harbor, reported approaching planes. His warning was ignored. United States carriers were at sea, and it was assumed that they were friendly planes. United States aircraft remained grounded, and ships (including 8 of the 9 battleships of the Pacific Fleet) were moored at their berths.

The submarine sunk by the USS *Ward* was one of the midget submarines which the Japanese used in their sneak attack, and the planes reported by the listener were an armada of more than 100 Japanese, carrier-based aircraft heading for the warships in Pearl Harbor. Maps found later on dead Japanese airmen proved that the exact location of the vessels was known to the Japanese command.

In addition to a number of army planes, there were 301 United States naval planes on Oahu, of which 54 were noncombat craft and 99 were not serviceable. Half an hour after the first blow fell, only three United States planes had taken off.

The Japanese raid was divided into five phases:

Phase I lasted from 7:50 to 8:25 A.M At Hickam Field, 18 Japanese dive bombers raided the airbase, blasting army aircraft parked in orderly rows and hitting 9 dive bombers at the smaller base on Ford Island. The heavy ships of the Pacific Fleet, moored in their berths, were attacked by 21 torpedo planes that made four runs, while 30 Japanese dive bombers effected 8 strikes at the same targets, and 15 horizontal bombers executed a high level attack. The immobile targets were easy to hit.

During Phase II (8:25 to 8:40 A.M.), 15 dive bombers attacked the submarine base and some of the already damaged surface units.

Phase III (8:40 to 9:15 A.M.), 30 horizontal and 18 dive bombers raided "Battleship Row" again and then hit the smaller ships in "Middle Loch."

In Phase IV (9:15 to 9:45 A.M.), dive bombers that were out of bombs raked the docks and the decks of the stricken vessels with machine gun fire, while two other groups of dive bombers, with bomb loads, coming in from the southeast, hit the navy yard and Battleship Row. Two more groups from the northwest bombed and strafed Ford Island and the ships in Middle Loch. In Phase IV, 27 Japanese planes were engaged.

In Phase V, all enemy aircraft left. With the general confusion subsiding, numerous sortie movements of ships still navigable were under way.

Antiaircraft batteries, inactive in the opening phases, fired intensely later. Their fire hit not only Japanese but United States aircraft. The carrier *Enterprise,* which had been at sea when the raid got under way, launched 18 dive bombers, 4 of which were downed by United States antiaircraft fire. With runways blocked and blasted and approaches barred by fire and explosion, the United States Air Force was immobilized. Of the naval planes, only 52 were capable of flight after the raid. Land-based artillery mistakenly fired upon United States warships outside of Pearl Harbor. The Japanese task force off Pearl Harbor left without being intercepted.

The Japanese lost 28 planes. In addition, three midget, two-man submarines were destroyed, one of them by the *Ward,* two inside the harbor. The role of the submarines in the raid was negligible.

An official United States communiqué admitted the loss of the battleship *Arizona,* the target ship (old battleship) *Utah,* the destroyers *Cassin, Downes,* and *Shaw,* and the minelayer *Oglala.*

Actually, losses inflicted upon the United States Pacific Fleet qualified the raid as a major disaster. Of the battleships, the *Arizona* was sunk in its berth, burned and blasted in two; the *West Virginia* had settled into shallow water at its berth; the *California* was sunk at its berth; the *Nevada* ran aground; and the *Oklahoma* was sunk bottom up. In addition, the *Pennsylvania,*

Maryland, and *Tennessee* were damaged by bombs. The destroyers *Cassin* and *Downes* were twisted by fire. The destroyer *Shaw* had her bow blown off. The minelayer *Oglala* was sunk. Damage of varying degrees was inflicted upon the light cruisers *Helena, Honolulu,* and *Raleigh,* the seaplane tender *Curtiss,* and the repair ship *Vestal.* No aircraft carriers were in Pearl Harbor when the raid occurred. Casualties were 2,638 officers and men killed and 946 wounded.

Three of the damaged battleships were at sea in less than two weeks; three took several months for repair. The damaged light cruisers left port by the end of January 1942. Although salvage work was successful beyond anticipation, the United States Fleet was temporarily crippled; complete Japanese naval superiority was achieved.

No attempt was made by the Japanese task force to land troops in the Hawaiian Islands. The raid was aimed at the United States Fleet and not at the establishment of an island base so remote from Japan and the Japanese Pacific bases. The Japanese believed that, after the disaster, the United States Navy, compelled to concentrate on the American Pacific coast, would be unable to interfere with methodical expansion of Japanese conquests in the Pacific, from the Philippines to Australia. Japanese domination of the Pacific was planned to spread like a tidal wave.

In almost simultaneous attacks, the Japanese struck in a colossal arc from Hawaii to the Gulf of Siam: at Hongkong; at Siam; at Kota Bharu on the Siam-Malayan border; at the Philippines; at Midway; at Wake Island; and at Guam.

Land forces employed in the drives were not as large as those engaged in major European campaigns, but this was a colonial war, in which transportation was a major factor, and local conditions limited the number of troops to be deployed. The Japanese, in control of the Pacific, were able to gain local superiority for some time.

After recovering from the initial blow, the United States Navy was chiefly concerned with maintaining communications with Australia, then dangerously close to the theater of operations.

A committee headed by Justice Owen J. Roberts of the United States Supreme Court, reporting on the results of its investigation of the Pearl Harbor disaster, found dereliction of duty on the part of Maj. Gen. Walter C. Short, commanding the Hawaiian Department of the Army, and Rear Admiral Husband E. Kimmel, commander of the Pacific Fleet. Both officers were relieved from their commands, pending court-martial proceedings. These courts-martial did not materialize. General Short and Admiral Kimmel waited four years before they had an opportunity to present their version of the reasons for the disaster before a Congressional investigating committee. Investigation showed that cooperation between the highest offices in the nation's capital and the Pacific armed forces was not sufficiently established during the period of emergency preceding the opening of hostilities. Although told to be alert, the army and the navy were advised by the government not to do anything that might arouse Japanese resentment. Absolute responsibility for what happened at Pearl Harbor was not established.

EARLY WAR IN THE PACIFIC

The British Cabinet declared war upon Japan on Dec. 8, 1941. Similar declarations followed immediately by China, Canada, Colombia, Costa Rica, Cuba, the Dominican Republic, Guatemala, Haiti, Honduras, El Salvador, Mexico, Nicaragua, Panama, the Netherlands, the Dutch East Indies, the Union of South Africa, Australia, New Zealand, deGaulle's Free France, Poland, and Czechoslovakia. Venezuela severed diplomatic relations with Japan. Although hostilities in China were already in their fifth year, there had been no previous declaration of war by either country. Simultaneously with the declaration of war on Japan, China also declared war upon Germany and Italy.

On Dec. 22, 1941, Prime Minister Churchill, accompanied by a staff of 80 military and naval advisers, arrived in Washington, D.C., for parleys with American authorities. British Field Marshal Wavell meanwhile conferred with Generalissimo Chiang Kai-shek in Chungking, while British Foreign Secretary Anthony Eden went to Moscow to meet Joseph Stalin. Chiang Kai-shek, greatly concerned about the prospect of a Japanese invasion of Burma which would virtually isolate hard-pressed China from its Allies, offered Chinese reinforcements to the British. No agreement was reached, although the subject was thoroughly discussed. In Moscow, Stalin urged the establishment of a second front in Europe to support the Red Army's winter offensive and to prevent the Germans from preparing a dangerous counterblow in the spring and summer of 1942. At that time, all that the British could contribute actively to the war in Europe was to step up the RAF offensive against Germany and the German-occupied countries of western Europe, thus keeping substantial portions of the Luftwaffe away from the eastern front. A number of German divisions were tied up in the west by the potential threat of British concentrations in the home islands, and lend-lease supplies helped Russia substantially.

On Dec. 26, the British prime minister told the United States Congress that 1942 would be a year of preparation for a vigorous offensive in 1943. During the parleys, it was agreed that each of the major belligerents would assume responsibility for a particular theater of operations and would coordinate their plans according to a joint program. A united command of all land, sea, and air forces in the southwest Pacific was established under Field Marshal Wavell, with Maj. Gen. George H. Brett, chief of the United States Army Air Corps, as his deputy. Admiral Thomas C. Hart, commander of the United States Asiatic Fleet, was put in charge of all naval forces in the area. Generalissimo Chiang Kai-shek accepted command of the land and air forces of the United Nations in the Chinese theater of war and such parts of Siam or Indo-China as might come under Allied control. British Gen. Sir Henry Pownall was appointed Field Marshal Wavell's chief of staff. These appointments were made public on Jan. 3, 1942.

The Rape of Siam (Thailand).—The Japanese threat to Siam, increasing during the year 1941, came to a head when hostilities between the United States and Japan materialized. On March 11, 1941, some eastern areas of French Indo-China were awarded to Siam by the Tokyo government. During the following summer, Japanese political and economic infiltration became more active, while Japanese troops assembled along the Siam border. Informal warnings by the United States and British governments to

Bangkok, indicating that the presence of Japanese troops on Siamese territory would not be acceptable, had no effect. Siam, with 200,148 square miles and 15,750,000 inhabitants, could do little to defend itself. It had a very small army and no modern equipment. Although it was an empty gesture, the Siam Assembly (Dec. 6, 1941) gave Premier Luang Pibul Songgram full authority to order defensive measures.

On Dec. 8, 1941, at 2 A.M., the Japanese ambassador to Siam presented a note to the premier demanding that Siam grant the right to Japanese troops to use its territory for an attack against Malaya. Without waiting for a reply, the Japanese crossed the border from Indo-China's Cambodia Province and landed on the shores of the Gulf of Siam, investing the capital of Bangkok. Scattered resistance was quelled and, at 7:30 A.M., the Siam government acceded to all Japanese demands.

The Siam government subsequently carried out a policy of submission and collaboration, tremendously improving the Japanese position for attacks upon Malaya and Burma. It also facilitated Japanese naval campaigns in the waters east of the Indian Ocean and created favorable conditions for Japanese air supremacy in regions vital for the defense of British and Dutch possessions.

The British did not take any effective measures to protect Singapore, although the invasion of Siam could have been foreseen ever since the German victory in western Europe left the French domestic government neither able nor willing to hold Indo-China. Britain's 400 million dollar fortress of Singapore, backbone of British strength in the Far East, was designed to repulse a seaborne attack, and to protect Malaya against invasion from the south. With Siam under Japanese control, Malaya was open to land attack from the north, and Singapore's value was greatly reduced. Neglected in earlier British preparations when French Indo-China and Siam served as barriers, Burma was faced with a formidable hostile army at its borders. The distance between Japanese armies on the Asiatic mainland and India shrank dangerously. Japanese preparations were carried out methodically, and there was little the Allies could do to offset them. On Jan. 7, 1942, British and United States aircraft raided Bangkok and Japanese lines of communication in Siam in small numbers. On January 25, the Siam government declared war on the United States and Great Britain. A few ineffectual Siamese troops joined the Japanese invaders of Burma.

Guam.—On Dec. 8, 1941, the United States outpost of Guam (225 square miles and 23,500 inhabitants) was raided twice by Japanese planes. One minesweeper in the harbor was sunk. On December 10, the Japanese landed troops on Guam, and the small garrison was overwhelmed after two days of fighting.

Wake.—Wake Island (four square miles), which had been proclaimed a naval defensive area on May 15, 1941, was attacked by Japanese sea and air forces on Dec. 9, 1941. The defending force of 400 marines, under the command of Maj. James P. Devereux, upheld the finest fighting traditions of the marines. The attackers lost one cruiser and three destroyers by gun fire. A few United States fighter planes of obsolete type, kept in the air by incredibly skillful repairs, repeatedly challenged Japan's superior air force. The battle lasted until Dec. 22, 1941, when the outnumbered marines succumbed to a seaborne invasion.

Midway.—In 1939, the United States Congress authorized the construction of a naval, air, and submarine base on Midway Island (28 square miles). The island had been a station on Pan American Airway's route to Manila since 1935. In March 1941, Congress appropriated $9,707,000, and on May 15, 1941, Midway was declared a naval defensive area. The Japanese selected Midway as another early objective. Repeated air attacks failed to disrupt the island defenses, however, and no invasion was attempted.

The Fall of Hongkong. — The British Crown Colony (1700 miles from Singapore) consisted of Hongkong Island, ceded to Great Britain in 1841, and the peninsula of Kowloon opposite Hongkong, acquired 17 years later. Hongkong's area is 32 square miles with a population of 1,026,445, swollen by refugees from China to almost two million in 1941. After the capture of Canton (90 miles from Hongkong) by the Japanese on Oct. 21, 1938, the Crown Colony was virtually isolated in Japanese-occupied territory. The plan to construct a first class naval base in Hongkong was abandoned as a consequence of the Washington Conference of 1922.

The tiny minority of Britishers in the Colony (the white population numbered 23,611) were apathetic and ill-prepared. Some 10,000 men, including Royal Scots, parts of the Middlesex Regiment, Winnipeg Grenadiers, Canadian Rifles, Rajputs, Royal Artillery, Engineers, Signal Corps men and auxiliaries, in addition to the small Hongkong volunteer defense force, were faced by two Japanese divisions poised to strike along the Taipo Road leading from occupied China into Kowloon. The Japanese had considerable air support, the British almost none. The Japanese could draw on reserves; the British had none. It was rumored that Chinese forces, 13 miles from the border of the Crown Colony, might come to the rescue of the besieged, but this was doubtful, for the Chinese had been unable to push the Japanese back in this sector since the fall of Canton. In any case, no Chinese help arrived.

The Japanese Air Force raided Hongkong on Dec. 7 and 8, 1941. The Japanese crossed the border of Kowloon on December 8 and took a British strong point on December 9. After suffering heavy losses from Japanese air attacks and superior firepower, the British fell back to the island of Hongkong on December 11, leaving only small forces behind to defend Devil's Peak. The retreat was hampered by riots of pro-Japanese natives against the British.

On Dec. 12, Hongkong came under artillery fire while raids continued. British counter-battery fire was greatly inferior to Japanese firepower. On December 12 and 17, the Japanese commanders asked the British commander to surrender, a demand which was rejected.

On December 18, the Japanese crossed the narrow straits in rubber boats and invaded the northwest corner of Hongkong Island. The British were not able to prevent small Japanese detachments, equipped with automatic weapons, rifle grenades, and light machine guns, from infiltrating to points from where the defenders could be harassed from the rear and communications disrupted. The main Japanese objectives were the island's water reservoirs. Four days

after the initial landing, some of the reservoirs were in Japanese hands; Victoria City (the island's capital) was under threat of investment; and the Japanese had made another landing. On Dec. 23, all water reservoirs were lost, light and power failed, and the exhausted British garrison was under overwhelming pressure by superior forces. On Christmas Eve, stores, installations, and ships in the harbor were destroyed to prevent them from falling into the victors' hands. On Dec. 25, 1941, 5,072 British, 1,689 Canadians, 3,819 Indians, and 357 other Imperials laid down their arms.

Japanese Conquest of the Philippines.— United States grand strategy aimed to hold the Philippine Islands during a defensive phase of the war against Japan, and to maintain communications with the islands from Hawaii. East of the Philippines, the defensive arc stretched 7,000 miles from the western tip of the Aleutians through the Hawaiian Islands, the Fijis, the New Hebrides, and New Caledonia to Australia. The Philippines also guarded the Dutch East Indies against attack from the northeast. The islands were anchors and outposts of defense, as well as potential offensive bases if the war could be carried to Japan proper. The Philippines were closer to Japan than any other major United States-controlled area and also close to China. Manila was 785 miles from Canton, and the northern tip of Luzon (largest island in the archipelago) was only 200 miles from Formosa.

It was just as important to the Japanese to conquer the Philippines as for the United States to hold them, because Japanese naval forces had to pass the islands on their way to Singapore.

Douglas MacArthur, formerly chief of staff of the United States Army, who held the rank of field marshal in the Philippine Army, was authorized to organize, train, and equip a citizen army of 400,000 and to create an air force of 1,000 planes. The United States Asiatic Fleet was based in the Philippines, with Cavite (near Manila) as its main stronghold. The Asiatic Fleet was to cooperate with the Pacific Fleet at Hawaii to keep sea lanes open.

When the war broke out, the Philippine citizen army numbered only 100,000, neither fully trained nor equipped. In addition, there were 11,000 United States Army regulars, National Guardsmen, and marines, 8,000 air force men, and 12,000 Philippine scouts on Luzon Island. None of the 80 airfields in the Philippines was underground. The army air force consisted of 35 B-17 Flying Fortresses, 107 P-40 fighters, and 108 miscellaneous craft, most of which were in Luzon at Nichols Field and Clark Field outside of Manila.

After the Pearl Harbor disaster, the shuttle service between Hawaii and the Philippines could not be maintained, and the United States Asiatic Fleet's surface units were withdrawn from Philippine waters. The navy's 30 PBY patrol bombers left with the ships.

On Dec. 8, 1941, at 4:45 A.M., it was learned in the Philippines that a state of war existed between the United States and Japan. A raid on Formosa by 17 Flying Fortresses from Clark Field was considered, but it was called off before the bombers reached their objective. The United States fighter air patrol failed to interfere with the subsequent Japanese air assault. From southern Formosa and from aircraft carriers, Japanese bombers took off to attack Luzon.

At 12:15 P.M., when only four P-40s were in the air, the raiders struck at Clark Field, destroying 15 out of the 17 Flying Fortresses and many fighter planes grounded for refueling. Within a few hours, the United States Philippine air force was greatly reduced. Lack of air reconnaissance permitted Japanese invasion fleets to reach the beaches without crippling losses.

On December 10, before dawn, one reinforced Japanese brigade went ashore five miles south of Vigan in northeastern Luzon. Eight U.S. Douglas A-20 bombers were all the depleted United States Air Force could muster to bomb the invasion fleet offshore. The bombers failed to return from their mission. On land, only one United States scout car met the invaders. Another reinforced Japanese brigade landed at Legaspi, on the southern tip of Luzon, losing two out of twelve transport vessels from air attack. Smaller forces invaded the northernmost part of Luzon Island at Aparri.

A Japanese seaborne pincer developed on December 22. Eighty Japanese transports, escorted by strong naval units, poured into Lingayen Gulf, the best landing ground on Luzon's west coast. United States-Filipino forces beat off the first wave of attackers, but, under heavy air cover and naval shelling, another landing was successful. The defenders tried to contain the bridgehead by throwing in their last reserves, but the advancing Japanese brigade from Vigan threatened the rear of the American and Filipino forces and additional Japanese forces swarmed ashore under cover of darkness. Within two days, five Japanese divisions and auxiliary troops landed at Lingayen Gulf, forcing the 1st Filipino Division, the 26th Cavalry Division, Filipino Scouts, and artillery to extricate themselves and fall back to the plain outside of Manila. Under cover of delaying actions, demolition squads carried out their destruction assignments.

The other arm of the pincer developed at Lamon Bay, where beach guard units could not hold superior Japanese forces. With the situation on Lingayen Gulf rapidly deteriorating, General MacArthur had to order a retreat to Bataan Peninsula, the best defensive area in Luzon, with its tip opposite the naval fortress of Corregidor. The general planned a stand in Bataan to await relief, provided it came on time

The Japanese from Lingayen and Lamon Bay advanced in the direction of Manila, spearheaded by light tanks and cyclist infantry. The objective was to capture the capital city and to prevent American and Filipino forces from reaching Bataan. The Fourteenth Army, under the command of Lt. Gen. Masaharu Homma, numbered 200,000 men, well equipped with armor and artillery and supported by 800 aircraft. Most of the Luzon air bases were soon under their control.

General MacArthur proclaimed Manila an open city, but this did not prevent the Japanese from inflicting damage upon the town and its inhabitants.

The 26th Cavalry Division and two battalions of the 51st Infantry Regiment virtually sacrificed themselves to give a force of 40,000 Americans and Filipinos an opportunity to reach Bataan with most of their equipment. Corregidor, site of MacArthur's headquarters, suffered its first bombing on December 29, and the raids continued thereafter.

The fortress island of Corregidor blocking the entry to Manila Bay is shaped like a pollywog. Its top, 600 feet high, is the head of the pollywog (some two miles in diameter), facing west into the China Sea. The middle part, with its great barracks and storehouses, is part way down toward the neck. The lower part forms a low neck connecting the head with the long, curving, rocky tail of the pollywog. A tunnel runs straight through the hill.

The Japanese entered Manila on Jan. 2, 1942. They also established themselves in force at Davao Gulf on the island of Mindanao and steadily extended their grip upon other islands. As long as Corregidor was not captured, however, the Philippine Islands could not be fully exploited as an offensive base by the Japanese, and General Homma had to concentrate on taking Bataan and Corregidor.

The defense line on Bataan ran from Manila Bay to Subic Bay. The former minor naval base of Mariveles was used for communication with Corregidor. Bataan Peak offered an excellent observation point. A tiny airfield at Sumai was available to a pitifully small air force. General MacArthur planned to hold positions paralleling the road across the peninsula from Olongapo to Orami. Comparatively inexperienced native troops manned the front line. Better trained and equipped units were deployed in rear defensive positions to a depth of five miles. Reserves consisting of one regiment of Filipino Scouts and the 31st United States Infantry Regiment were kept near Mariveles.

The Japanese showered leaflets upon the positions, urging the Filipinos to desert. Emilio Aguinaldo, leader of the Philippine insurrection in 1899, addressed the Filipinos by radio and called for cooperation with the invaders, but the loyalty of the Filipino soldiers to the United States remained unshaken.

On January 12, following a violent artillery barrage, the Japanese opened the attack on the entire 19 mile front. The defenders' right flank temporarily gave way, but a counterattack, launched by two Filipino divisions, drove the aggressors back two miles beyond their take-off position. This success could not be followed up because, if the defenders had moved beyond the peninsula, they might have been cut off by a Japanese thrust to their rear. One week later the Japanese attacked again. Landing parties harassed the defenders' left wing. By superb fighting, the seaborne invaders were wiped out, and the Japanese drive was stopped after it had regained the ground lost on January 12. On January 25, fighting subsided again.

Japanese air raids on Bataan brought heavy losses to the attackers. By February 10, 163 planes were downed, mostly by antiaircraft fire. There were no United States bombers left in the Philippines. Those which survived the first Japanese attacks were either transferred to Java or sent to Australia for repairs. By the end of February, three planes of the fighter force were left on Bataan, in addition to two training planes held together with bamboo, wire, and glue.

On Feb. 23, 1942, Douglas MacArthur, promoted to the rank of full general, was ordered to proceed to Melbourne, Australia, to assume a command—the Southwest Pacific area. On March 10, the general left Corregidor in a PT boat for an unoccupied spot on Mindanao, from where a B-17 took him to Australia.

Maj. Gen. Jonathan Wainright, MacArthur's successor in the Philippines, was in charge of a lost patrol, although the patrol's strength was still formidable. In addition to the defenders of Bataan, 25,000 Filipinos were mobilized in Mindanao, and 20,000 in the Viscayas. Relief from Australia was out of the question. The Japanese were in almost full control of the sea lanes, and the forces then gathered in Australia were small: 25,243 United States officers and men, in addition to Australian recruits under training and one brigade of the Australian 6th Division back from the Middle Eastern theater of war. The combined air forces had 250 planes ready for action and 187 in various stages of repair.

March was a month of comparative quiet on Bataan. Japanese reports told of the efficiency of American artillery fire. Conditions for the defenders, however, deteriorated rapidly. Supplies were dwindling; disease was spreading.

Lt. Gen. Tomoyuki Yamashita, conqueror of Singapore, came to Luzon to lead the Japanese drive. It opened on April 3, after an air bombardment and artillery barrage which forced the defenders to abandon advanced positions. In a five-day battle, the Japanese, using tanks, opened a salient three miles deep in the United States-Filipino center. On the eastern flank, along the coastal road to Mariveles, the American 2nd Corps was overrun. An attempt to drive back the Japanese failed and, on April 9, Japanese armor, followed by infantry, cut the only remaining road and routed the American 2nd Corps and the Filipino Corps. Straggling soldiers and marines fled to Mariveles and tried to reach Corregidor. Before the evacuation was completed (3,500 men reached the fortress), the Japanese occupied Mariveles and Sumai. The Americans and Filipinos in the center and the right flank faced encirclement. Exhaustion doomed attempts to break the ring, and the field commander of the Bataan forces surrendered on April 10.

The tunnel through the rock on Corregidor sheltered the garrison and the fugitives from Bataan. Sick and wounded men, nurses, and fighting men crowded its caverns. Food and ammunition were short, and the physical condition of the defenders was poor. The Japanese installed heavy caliber guns on the slopes of Mount Mariveles, and Corregidor suffered heavy shelling in addition to constant air attacks. Early in May, all of the island's antiaircraft installations were out of action and its batteries almost entirely silenced, but General Wainwright refused to heed a call for surrender.

Using 20 motor-driven armed assault barges, each containing one tank and a combat team with heavy infantry weapons, to spearhead a fleet of various troop-carrying craft, the Japanese launched their final attack on May 6. Although the tanks had trouble with the debris of barricades and entanglements, infantry reinforcements were able to press the defenders into the tunnel and to the top of the hill, where resistance was no longer possible. General Wainwright was forced to surrender.

The Japanese claimed that the surrender applied to all forces still fighting in the Philippine Islands. On May 10, Mindanao capitulated. The island of Cebu was already under control of the Japanese, who landed there on April 10 and took the island capital eight days later. Organized resistance on Panay Island ended on April 24, but

the Japanese did not report the complete occupation of Mindoro until November 1942.

Although resistance by regular forces ceased in 1942 guerilla warfare continued throughout the war, despite ferocious Japanese reprisals. Central Luzon, the Viscayan Islands, Panay, Cebu, Leyte, Mindanao, and the Negros Islands were guerrilla strongholds. Most of the guerrillas were native Filipinos, but some Americans who escaped capture joined them.

The march of the defenders of Bataan to prison stockades, referred to as "the death march," and their treatment in prison camps was horrifying. (General Yamashita and General Homma, responsible for what happened to the prisoners, were tried as war criminals after the surrender of Japan and sentenced to death. General Yamashita was hanged, and General Homma was shot on Luzon.)

Upon leaving the Philippines, General MacArthur is reported to have pledged: "I shall return." At the time this pledge was made, Allied fortunes in the Pacific were at their lowest ebb.

Conquest of Malaya and British Naval Disaster.—The Japanese threw their best available troops into the conquest of Malaya. They had undergone exhaustive training in areas where the territory approximated that of Malaya. They were under the command of Lt. Gen. Tomoyuki Yamashita. The British were not much inferior in numbers but were deficient in training and morale was low. In a coordinated blow on Dec. 8, 1941, the Japanese effected three landings on Malaya's east coast. Air Chief Marshal Sir Robert Brooke Popham (the British commander) was confident that meagerness of communications in that region would impede the Japanese advance. One landing was carried out near Kota Bharu, close to the Siam border. The RAF, with a small number of bombers and torpedo-carrying aircraft, attacked the Japanese invasion armada with some success (according to British reports), but failed to interfere with the progress of Japanese operations (according to Japanese reports). British land forces at Kota Bharu opposed the invaders, but Japanese naval shelling and air attack quickly softened the defenses. One hour after the beachheads were established, the Japanese Air Force heavily raided the RAF base, destroying its installations and driving the remaining planes away from the critical area. British ground troops and supply columns suffered heavy bombing and strafing. A counterattack failed to dislodge the invaders.

Inside Siam, in Krah Peninsula, the Japanese invaded Singora and Patani, 120 and 70 miles northwest of the border respectively. British Blenheim bombers, raiding the invasion fleets, were unable to prevent the landings. From Singora a good highway led across the Malayan border to Alor Star on Malaya's crucial west coast. Once the Japanese were established on its west coast, the defense of the peninsula was gravely endangered. Two British divisions faced the greater part of four Japanese divisions in the critical sector. The Japanese Air Force raided all Malayan airdromes within range, and reconnaissance planes penetrated as far as Singapore.

In Singapore, British Vice Admiral Sir Tom Phillips, in command of the recently arrived new 35,000-ton battleship *Prince of Wales,* the 32,000-ton battle cruiser *Repulse,* and four destroyers, decided to intercept Japanese landing fleets. These capital ships were the only Allied craft of their

kind in Asiatic waters and a vital factor in naval operations against Japan.

The flotilla left Singapore on December 8. Its objective was Kuantan on Malaya's east coast, about half-way between Kota Bharu and Singapore, where Japanese invasion vessels had been sighted. Admiral Phillips had no air protection when he left port. Already at sea, he radioed for land-based fighters to stand by to cover his ships, only to learn that there were none available. The British expected to create havoc among the Japanese transports and possibly to destroy one of the Kongo class battle cruisers reported in the vicinity. On December 8, it was learned that the British Fleet had been spotted by Japanese scout planes. Phillips decided to return to Singapore, leaving the Japanese free to carry out their landings at Kuantan, far to the rear of the defenders. On December 9, at 11:00 A.M., 150 miles from Singapore, Japanese long range torpedo-carrying aircraft, accompanied by horizontal bombers, attacked the British Fleet in waves. Both capital ships received several torpedo hits and sank. Of their complement of 2,925, 2,330 were saved by the escorting destroyers. Vice Admiral Phillips was among the casualties. This action not only hastened the fall of Malaya, but it also gave the Japanese a crushing naval superiority in Asiatic waters.

The defense of Singapore was not yet organized, and reinforcements were pouring into its harbor. The British command had to keep the front as far as possible from the fortress island. In the jungle, Japanese parties, armed with automatic weapons, infiltrated and rolled up British lines.

The Japanese moves were carefully planned and brilliantly executed. Rivers were easily crossed by flotillas of inflated rubber boats. Jungles which were almost impassable to the British were used to great advantage by the Japanese. Their midget tanks went where even a foot soldier moved with difficulty.

The Japanese frequently attempted and usually succeeded in landing troops behind the rear of the retreating British columns. Such landing operations, called *Höi Jöriku Sakusen,* were standard Japanese tactics.

On December 12, the Japanese drove into Kedah Province on Malaya's vital east coast, pressing back the British defenders. Native spies aided the invaders. On December 17, the British had to abandon Penang Island offshore. Numerous small craft left behind were effectively used for landing operations. Within one week, the attackers advanced 90 miles toward Taiping, on the way to the tin-mining city of Ipoh. Without air and armored support, the British suffered heavily. Ipoh fell on December 28. A Japanese landing forced the abandonment of British positions in Lower Perak. On January 7, after constant retreats, the British narrowly escaped a Japanese trap on the Slim River. Despite reinforcements from India, a general retreat had to be carried out toward Seremban on January 11. It continued down the Johore railway, and, on Jan. 20, 1942, the British realized that the entire peninsula would have to be evacuated.

Singapore was not ready to meet a determined attack. The Japanese advance had to be delayed at all costs. A defense line was improvised in the plain of southern Malaya. Two Japanese columns raced toward Singapore while other groups landed south of the Muar River. On January 31, the defeated British 3d Corps crossed the causeway into Singapore, sacrificing its rear guards. The causeway was dynamited but not effectively destroyed. The Japanese reached Johore Baru on January 31, and completed the occupation of the Malay Peninsula.

Between January 31 and February 5, the Japanese installed huge siege guns opposite Singapore, while reinforcing their tired divisions with two new ones. The British troops were either tired and demoralized by constant retreat or, if freshly arrived, were enervated by Singapore's trying climate. Deployment was hampered by Japanese artillery fire, bombs, and the influx of refugees which increased the number of civilians to more than one million. The RAF bases were under fire and almost destroyed. Japanese propaganda, directed at anti-British feeling among Indian soldiers, had some effect. The Australians, realizing that their native continent was in danger of invasion, were less inclined than usual to fight for a rather distant outpost of the empire. The mighty British guns of Singapore, installed to fight a seaborne attack, were of little use against an invader from Johore. Coastal forts were the only permanent fortifications in the critical area. Other defenses consisted of recently constructed field fortifications, trenches, and earthworks.

On February 5 at 6:00 P.M., Japanese siege guns opened fire. British guns replied, and the artillery duel raged for three days. Later a Japanese combat team of 5,000 picked soldiers gained a foothold on the northeastern corner of the island. After engineers repaired the causeway, reinforcements poured in, boosting the number of invaders to 30,000. Despite their numerical inferiority, Japanese spearheads penetrated the poorly organized defense lines. The defenders were chopped up into isolated groups; fighting was confused and not very violent. The Japanese captured the main water reservoir in the island's center. As a result of the loss of food, water, gasoline, and ammunition, it was impossible to continue the struggle. On February 15, when the Japanese reached the outskirts of the city of Singapore, the British offered to surrender. The papers were signed, unconditionally, on that day at 7:50 P.M. at the Ford Motor Factory of Singapore. Prisoners included 32,000 Indians, 15,000 British, and 13,000 Australians. A small number of British and Australian soldiers escaped to Sumatra in the Dutch East Indies.

The fall of Singapore doomed the Indies, and the door to the Indian Ocean was opened.

Pacific Island Campaign. — Methodically carrying out a carefully prepared plan, the Japanese set out to capture the 4,000-mile arc of islands ranging from the Malay Peninsula to Australia. The anchor of the Philippines was unhinged, and strategically important islands east of Sumatra and Java and north of Australia were invaded preparatory to the final drives aimed at Java, Sumatra, and eventually at Australia proper.

The pattern of attack was uniform. After establishing airplane bases within range of each succeeding objective, invasion fleets, protected by strong naval forces, made their way offshore close to the local airfields, which were then raided and quickly captured by special landing squads. Each captured airfield was then used as a base for the next invasion. In almost every case, resistance on land was rapidly overcome.

Borneo, 350 miles from Singapore and Sumatra, and 100 miles from the Celebes and Mindanao in the Philippines, was the first target of the Japanese assault.

On Dec. 17, 1941, the Japanese landed in Sarawak with no opposition. The capital of Kuching and the damaged oilfields were quickly captured. The few British troops in the region, falling back from Sarawak, joined the Dutch in western Borneo. Tarakan Island, off Borneo's east coast, offered no serious obstacle to a Japanese invasion. The Dutch oil center of Balikpapan in Borneo also fell to the invaders. Sambas and Pontianak on the west coast of Borneo were taken and Bandjermasin in the southwestern part of the island.

Celebes, west of Borneo, was the objective of a Japanese paratroop drive. With four huge peninsulas the island was difficult to defend. The Japanese established themselves on one peninsula within a week. Another invasion hit Celebes at Kandari.

On January 23, Japanese seaborne invaders seized Rabaul in New Britain and Kavieng in New Ireland. The waters around the islands came under Japanese control from the air, thus placing Allied shipping in an increasingly precarious position.

On January 25, the Japanese seized Lae, the newly established capital of the big island of New Guinea. The Dutch East Indies were already under attack, and the capture of Lae increased the threat to Australia. Rarely were the tiny garrisons able to oppose the landings, although the Royal Australian Air Force attacked the

invasion fleets. On New Guinea, however, the defenders at first succeeded in keeping the Japanese from the mountain barrier separating Lae and Buna from Port Moresby.

On February 1, a new threat to Port Darwin in Australia materialized when the Japanese seized Amboina in the Dutch East Indies. Japanese amphibious forces also attacked and seized Laha airfield at Ceram the same day.

There was little reason to believe that the Japanese would respect the neutrality of Portugese Timor, 350 miles northwest of Australia. The British and Dutch suggested that Portugal accept their protection of Timor. On January 18, before a reply was received, the Allies moved in despite Portugal's strong protest. It was then agreed that, after adequate Portugese forces arrived on the island, the Allies would withdraw. On January 20, the Japanese invaded Timor and captured its main settlements, air bases, and installations. The Allied troops were driven into the interior, where they conducted a modestly effective guerrilla campaign. The Japanese thus gained another base close to Australia.

A relief fleet of Australians and Americans from Port Darwin, escorted by the U.S.S. *Houston* and one destroyer, left Port Darwin for Timor on February 15. As Japanese naval units, including carriers, were reported close to Timor, the relief fleet returned to Port Darwin. On February 19, 72 Japanese high level bombers and 18 dive bombers obliterated docks, warehouses, and the airport of Port Darwin, set the city ablaze, and sank every ship in the harbor, including the U.S. destroyer *Peary*.

The Japanese would have met little resistance if they had attempted to invade northern Australia, but they had planned to gain control of the Coral Sea prior to an Australian invasion. During the second week of February, well protected naval convoys carried Japanese troops to Sumatra, a large island of the Dutch East Indies group close to Malaya. Japanese airborne invaders forced their way toward Palembang in the southeastern part of the island. The Dutch defenders fell back after burning oil wells and tanks.

A Japanese invasion attempt in the lower Celebes was also successful. On February 18, the Japanese went ashore on Bali. After an airfield was established there, all of Java was within bombing range.

Naval Operations in the Western Pacific.— The Allied naval situation in the western Pacific became extremely critical. Admiral Hart commanded one heavy cruiser (the *Houston*), two light cruisers (the *Boise* and the old *Marblehead*), 13 destroyers, 25 submarines, and various lesser craft. After the Japanese invasion of Luzon, Port Darwin was first considered as an operational base, but Admiral Hart subsequently chose Soerabaja in Java as his main port. The Dutch Naval Command under Vice Admiral Conrad E. L. Helfrich was established in Batavia, also in Java. The Dutch Navy numbered 3 light cruisers, 8 destroyers, and 15 submarines. After the loss of the *Prince of Wales* and *Repulse,* the British had to gather new forces in the critical zone.

The combined Dutch and British fleets were protected by tiny air forces. The Dutch had no factories and had been unable to obtain large deliveries from the United States, and the British needed most of their small air forces for the defense of the Asiatic mainland and Australia. The United States Asiatic Fleet had only 30 patrol bombers.

At the beginning of the second week of January 1942, Admiral Hart assembled Allied surface craft in the waters south of Borneo and Celebes. Allied submarines were active against Japanese transports off Malaya. The sinking of one 17,000-ton troopship and ten lesser craft by United States submarines was reported on January 15. Dutch airmen spotted a large enemy convoy heading toward Balikpapan on January 20, and United States submarines, lurking off the port, attacked the ships without conclusive results.

A convoy of 100 transports carrying 150,000 men was reported moving down Macassar Strait on January 23, escorted by 6 cruisers and 14 destroyers. After Dutch aircraft scored hits with light bombs on two cruisers, one destroyer and four transports, two United States cruisers and four destroyers were ordered to engage the convoy. On the way to action, the U.S.S. *Boise* struck an uncharted reef and suffered such damage that the ship had to proceed to India for repairs. Engine trouble reduced the *Marblehead's* speed to 15 knots, but the cruiser and the four destroyers intercepted the convoy. Three transports were sunk on January 23 and five more, the following day. A few Flying Fortresses, which had escaped to the Dutch East Indies from the Philippines, joined the action, which lasted for five days.

The last Allied convoy to Singapore suffered heavy losses from Japanese air attacks. The liner *Empress of Japan* was sunk, and other ships, among them the *Duchess of Bedford* and the U.S.S. *Wakefield,* were damaged.

Separate actions by Allied flotillas in scattered areas were ineffectual. Potential Allied operational zones shrank as Japanese domination expanded. It was decided to unite all available ships into one fleet to operate in waters adjoining the Dutch East Indies. The united force was assembled early in February. It consisted of vessels released from convoy duty to Singapore and most of the U.S. Asiatic Fleet. The U.S. cruiser *Houston* was the heaviest unit.

Air reconnaissance reported 3 Japanese cruisers, 10 destroyers, and 20 armed transports near Balikpapan. The Allied Fleet came under air attack in Macassar Straits. The *Houston's* after-turret was knocked out, and the *Marblehead* was severely damaged. Both United States cruisers had to return for repairs. The *Marblehead,* in a most hazardous voyage, later returned to the United States.

In Batavia, an attack upon a convoy coming down from the Molucca Sea was considered. Before the fleet left port, another Japanese convoy was sighted between the Anambas Islands northeast of Singapore and two more were signaled immediately thereafter: one near Banka Island east of southern Sumatra, the other on the move from Balikpapan.

Dutch Admiral Doorman chose to go for the Anambas convoy. His fleet was reinforced by the Australian cruiser *Hobart* and the British cruiser *Exeter,* two American and some British destroyers. One Dutch destroyer ran aground and was lost, another was left behind to pick up survivors, and Japanese air attacks inflicted slight damage upon the *Hobart* and two United States destroyers. The action was given up on February 15.

During the night of February 20, a successful raid took place in Bandoeng Strait, when Admiral Doorman intercepted the Japanese off Bali. The admiral had the Dutch cruisers and torpedo boats at his disposal, in addition to six United States and one Dutch destroyer. The Japanese lost two heavy cruisers out of six, two destroyers, and two transports. A Dutch light cruiser and one United States destroyer were badly damaged, and the Dutch destroyer was sunk.

A Japanese attack on Java seemed imminent. With Java in Japanese hands, the Allied fleet would have been bottled up in the Java Sea. As the loss of Java was considered inevitable, the rescue of the ships became a paramount objective.

On February 27, at 3:00 P.M., the Allied force left Soerabaja. At 4:00 P.M. contact was established with a strong Japanese fleet. The Japanese had two *Kongo* class battle cruisers, three heavy cruisers, two light cruisers, and thirteen destroyers ready for action.

Fire was opened at a range of 30,000 yards. Aircraft took an active part. Japanese submarines joined in with torpedo attacks. At 5:10 P.M., three additional Japanese cruisers came in sight with a destroyer escort.

Already the British cruiser *Exeter* was damaged, and one Dutch destroyer was sunk against the loss of one Japanese destroyer. At 5:30 P.M., a British destroyer went down. Admiral Doorman closed in to 18,000 yards. Hits were scored on Japanese ships, including one of the battle cruisers, but the damage inflicted by the lighter Allied guns was negligible, whereas Japanese shells had a telling effect upon Allied vessels.

Shortly after 6:00 P.M., Admiral Doorman ordered his fleet to withdraw under cover of a smoke screen to attack another Japanese convoy, reported by a United States Army bomber 25 miles west of Bawean Island. Before the convoy was reached, the fleet was ordered to turn west along the northern coast of Java. Dutch and United States destroyers went to refuel and take on more torpedoes. Two British destroyers remained with the cruisers.

Visibility was poor. At 9:25 P.M., one British destroyer was torpedoed and sunk. The other stopped to pick up survivors. Japanese submarines shadowed Doorman's forces. The admiral nevertheless decided to go after the Bawean convoy. At 11:15, shots were exchanged at 9,000 yards range with two Japanese cruisers. Within a few minutes, both remaining Dutch cruisers were torpedoed and sunk. Only the U.S.S. *Houston* and the Australian cruiser *Perth* were left.

It was agreed that the crippled British cruiser *Exeter,* accompanied by one United States and one British destroyer, should proceed to Tjilatjap. On March 1, the ships reported the approach of three Japanese cruisers. This was the last message received from them. The vessels were lost. The *Houston* and the *Perth,* accompanied by one destroyer, also on their way to Tjilatjap, were likewise attacked on the night of March 1 by superior Japanese forces off St. Nicholas Point. All three ships went down. The four remaining United States destroyers left Soerabaja under violent Japanese air attack on February 28 and succeeded in reaching Australia after a four-day run.

On the morning of March 1, the Allied Naval Command in the Dutch East Indies was dissolved. Only Allied submarines were left in the Japanese-dominated waters.

The Conquest of Java.—On February 26, there were 15 Allied planes available in Java, while the Japanese assaulted the island with hundreds of planes. On February 27, one British and one United States ship (both subsequently lost) brought in 59 P-40 fighter planes. This was some help to the defense of the island.

After landing at Bawean Island, 100 miles north of Soerabaja, on February 25, the Japanese swarmed ashore on March 1 and 2 on the Javanese beaches at Serang, Indramajoe, and Rembang with three divisions, tanks, and heavy equipment. Four more divisions were brought in on March 3.

Maj. Gen. Hein ter Porten, commander of the Dutch ground forces, tried vainly to get his troops to the invasion beaches in time to contain the landings. The extreme density of the Javanese population (817 to the square mile as compared to 43 in the United States), many of whom were on the roads, slowed down troop movements. The fighting led to high civilian casualties, which did not bother the invaders, but which the defenders were anxious to avoid. Japanese tanks caught Dutch troops on the march and cut through whatever lines were being formed. They raced through the narrow island, blocking attempts at organized resistance in the mountains.

Batavia fell on March 5, Bandoeng and bomb-scarred Soerabaja on March 7. From Bandoeng, Java's military headquarters, the radio broadcast: "Goodbye till better times! Long live the Queen!" It was an occupation in force rather than a campaign. On March 7, General ter Porten surrendered 97,000 Dutch troops, in addition to 5,000 British and Australians and a few Americans, the latter mostly air force men.

The Dutch East Indies were lost, 340 years after the Dutch East India Company was created, and with them 48.6 per cent of the world's rubber, 27.8 per cent of its tin, and 2.8 per cent of its oil. Including Malayan production, most of the world's rubber supplies were in Japanese hands. Only the rapid development of synthetic rubber production in the United States prevented a most serious armament crisis. The Dutch scorched earth policy devastated oil wells and refineries at Tarakan, Balikpapan, and Palembang, the naval bases of Soerabaja and Amboina, and harbor works in the Macassar district.

U.S. Pacific Carrier Task Forces.—On Dec. 30, 1941, Admiral Ernest J. King was appointed commander in chief of the U.S. Navy. On Dec. 31, Admiral Chester Nimitz became commander in chief of the Pacific Fleet. His most urgent task was to keep sea lanes open between the United States and Australia. Convoys to Australia moved slowly, often at 6 knots. The defense of Australia and the possibility of an Allied counter-offensive depended upon their arrival. As most of the heavy units of the Pacific Fleet were still out of action, and as the United States was faced with the necessity of giving the fleet an extended range to offset the superior numbers of Japanese craft, carrier task forces were organized, each of which was built around a heavy aircraft carrier.

There were two such task forces in early January 1942; one, under Vice Admiral William F. Halsey, consisted of the carrier *Enterprise,* three cruisers, and six destroyers; the other, under Rear Admiral Frank J. Fletcher, was

composed of the carrier *Yorktown,* two cruisers, and four destroyers.

On Jan. 9, 1942, the task forces were ordered to raid the southern Marshall and northern Gilbert Islands. The Japanese had strong naval bases on the Marshalls. The purpose of the raid was to block the harbors by sinking ships and to destroy enemy aircraft and essential installations. A shuttle patrol of 12 planes, operating between Canton in the Phoenix and Suva in the Fiji Islands, reported Japanese moves. On January 25, the U.S. forces left Samoa to raid Roi, Kwajalein, Wotje, Jaluit, Mili, and Taroa in the Marshalls, and Makin in the Gilberts. United States carrier-based planes, attacking Kwajalein on January 31, sank two submarines and two transports and damaged one light cruiser, three large oilers, two cargo vessels, one steamer of about 20,000 tons and one gunboat. Damage was also inflicted upon shore installations. At Taroa, hangars, gasoline dumps, batteries, and grounded planes were hit. Wotje was bombed and shelled. Military installations on Jaluit and Makin were wiped out. One 8,000-ton transport was sunk at Jaluit, and one seaplane tender of equal size destroyed at Makin. The raids cost the Japanese a total of 73,000 tons of shipping, 35 aircraft, and considerable damage to vessels and installations.

Although the effect could not be compared with Pearl Harbor, or what happened later in the Java Sea, this action was the first successful United States naval thrust. It was also a test of the effectiveness of carrier task forces which altered the traditional concepts of naval warfare. As a result, carriers were given priority over battleships in the gigantic American shipbuilding program.

On February 11, plans were made to raid Wake Island, then in the process of being heavily fortified by the conquerors, and Eniwetok Island, guarding the approaches to the great Japanese base at Truk. Admiral Halsey's force sailed out of Pearl Harbor to attack Wake on February 14, but the attack on Eniwetok was called off. Two light patrol vessels, three aircraft, seven out of ten huge gas tanks, and other installations were destroyed on Wake Island. Proceeding to Marcus Island, 975 miles from Japan, carrier-based planes were launched 125 miles from the target on March 4. One United States plane was lost in a heavy AA barrage, but a number of fires were started and various installations damaged. The raid gave evidence of American ability to strike far behind the so-called limit of enemy sea domination.

In February 1942, another strong task force was formed under the command of Vice Admiral Wilson Brown, consisting of the carrier *Lexington,* four heavy cruisers, and ten destroyers. Admiral Brown's first objective was Rabaul on New Britain. On February 20, before the planes could be launched, the task force came under heavy Japanese air attack 225 miles from its objective. Although the *Lexington* was undamaged and 18 Japanese planes were shot down, the raid was broken up.

The Japanese continued to build up Rabaul. They consolidated their conquests by occupying all of New Britain and New Ireland and by invading Bougainville, in a thrust directed at the Solomon Islands.

In a raid on Lae and Salamaua, in New Guinea, Admiral Brown's task force was joined by Admiral Fletcher's carrier, two United States cruisers, one Australian cruiser, and six destroyers. Due to Japanese air opposition, the warships themselves did not come within firing range. But 51 planes from the *Lexington* and 52 from the *Yorktown* took off and reported the following results: five transports and cargo ships, one light cruiser, and one destroyer sunk; one heavy cruiser believed sunk; one heavy cruiser, one seaplane tender, two destroyers, and two gunboats severely damaged.

The Doolittle Raid.—On April 18, 1942, the main Japanese islands experienced their first raid. The prevailing strategic situation, and the short range of early 1942 model planes, did not permit effective bombing, but the fact that the daring action succeeded in carrying the war to the Japanese capital bolstered morale in the United States, bewildered by Allied reverses. The people of Japan, despite continued cheerful news from all theaters of war, began to realize that they were facing a formidable opponent. The raid on Japan was a joint army-navy operation. The new aircraft carrier *Hornet* carried 16 Army B-25 medium bombers. Capt. Marc A. Mitscher commanded the carrier and Col. James C. Doolittle the bombers.

The *Enterprise,* four cruisers, and eight destroyers escorted the *Hornet.* The fleet was sighted by Japanese patrol boats and radio-equipped deep sea fishing vessels 700 miles off Tokyo Bay. Bombers taking off at that distance from their target could not hope to return to the carrier. Nevertheless, it was decided to launch the bombers immediately, while the fleet returned to its bases. After carrying out their mission, the planes were to attempt to reach friendly territory on the Asiatic mainland. Loaded to capacity with fuel, the planes could carry only small bomb loads. They dropped their missiles on Tokyo, Yokohama, Nagoya, and Kobe, staying 30 seconds over the capital. The results could not be clearly observed.

Of the 80 men of the plane crews, 64, including Doolittle, eventually returned to the United States via China, five reached the Russian Maritime Province and were interned, eight were captured by the Japanese, and the fate of two was not learned. With many destructive bombings of non-military targets to their record, the Japanese denounced the raid as inhumane and reported that the United States captives would be tried and executed. Two of the American airmen were actually beheaded, arousing violent indignation in the United States.

The Loss of Burma.—None of the British campaigns during World War II was more criticized than the defense of Burma. The charges included official inefficiency, lack of interest, and lack of intelligent organization. There was actually a lack of understanding among authorities in London and India as to where the responsibility lay for the defense of Burma. It is hard to understand why the British did not accept Generalissimo Chiang Kai-shek's urgent proposal, in December 1941, that Chinese troops be assigned to reinforce the garrison of Burma. After having given Malaya priority over Burma, the British government tried to bolster its forces in Burma when Singapore was about to fall. The result was a striking example of "too little and too late."

In December 1941, British Gen. Jack Smythe, commanding in Burma, could muster only the 1st Burma Division and the 17th British Division

with little armor and 150 aircraft. Later in the campaign, some reinforcements joined the British forces, among them one Indian division. The 7th British Armored Division, with 114 tanks, arrived in Rangoon when Burma's capital city and main harbor were already under attack.

The Japanese gradually massed a total of 5 divisions, 450 planes, and a tank corps at the Siam-Burmese border. Their troops were thoroughly trained in jungle warfare and were also expert in setting up road blocks. The British troops were inadequately trained and equipped. Tommy guns, very effective weapons in jungle warfare and employed in large numbers by the Japanese, were rarely used by the British.

The Japanese waited until the Malayan campaign had progressed far enough to safeguard their southern flank. Then the British 17th Division, holding the small appendage of Burmese territory ranging southward along the Gulf of Martaban in the east of the country, was attacked. During the night of January 16, a Japanese column of two battalions made a thrust in the coastal area of Tenasserim Province toward Tavoy and Mergui. Outflanked and out-maneuvered, British flank-guards in that area were evacuated by sea to Rangoon. Tavoy was occupied by the Japanese, and another Japanese column headed for Paan, on the eastern bank of the Salween River, 40 miles north of Moulmein. A third attacked the 16th Brigade of the British 17th Division near Kawkareik. Japanese forces facing the British 16th Brigade were rather small, but their fighting skill, equipment, and air support were superior, and the British were driven back toward Moulmein.

The Japanese columns converged on Moulmein, only 200 miles from Rangoon by road and less than half that distance by air, to sever the southeastern land appendage from the rest of Burma. Neither the British airmen's tenacity nor the assistance given by American Flying Tigers from China could prevent the Japanese air force from maintaining supremacy. The Flying Tigers had 18 planes in flying condition. On January 31, the Japanese crossed the Salween river in inflated rubber boats, penetrated the screen, and forced the evacuation of Moulmein without a fight.

The defenders fell back toward the Sittang River, farther to the west. So disorderly was the retreat of the tired troops that fast Japanese columns, penetrating through rear guards, outraced a part of the British forces east of the river. There was no potential defense line covering Rangoon west of the Sittang. On February 25, British authorities ordered Rangoon evacuated and set afire. Matériel for China, including 980 trucks, was destroyed, as well as ships in the harbor. Jails and insane asylums were opened. Criminals and lunatics joined with numerous well organized fifth columnists in creating a state of chaos.

The British then concentrated at Pegu, on the railway linking Rangoon with Mandalay. The Japanese, after crossing the Sittang River, virtually trapped the British Army in Burma by cutting both railroads and highways running through the Irrawady and Sittang River valleys and establishing road blocks. The 7th Armored Division ferried the isolated groups out of the trap. The Japanese entered Rangoon on March 8, 1942.

After the fall of Rangoon, Gen. Sir Harold Alexander took over command in Burma and accepted the Chinese offer of assistance. The Chinese, expecting effective air cover for their forces, were disappointed by the RAF's inability to provide it. The Fifth and Sixth Chinese Armies, 55,000 poorly equipped but battle-hardened troops, rushed into Burma. General Alexander intended to hold a line running from Toungoo on the Sittang River to Prome on the Irrawady River. The Japanese foiled his plan by infiltrating to the rear of Toungoo and setting a road block. On March 19, United States Gen. Joseph W. Stilwell, chief of staff of the Chinese theater of war, was appointed commander of the Chinese forces in Burma. Stilwell attempted a general attack on the ground and in the air, in which the British were to join. Conditions were most unfavorable for attack, but General Stilwell realized that, with no effective means available to stop Japanese infiltration tactics, defensive action was bound to lead to disaster.

A "Burmese Freedom Army," 4,000 men trained by Japanese agents, joined the Japanese. The Burmese harassed the British right flank and rear. They served as guides to the Japanese, and so intimidated those Burmese who were still loyal to Britain that many became collaborators with the invaders or refrained from any action.

An attempt by Stilwell to drive into the flank and rear of the Japanese forces investing Toungoo failed, and a retreat had to be ordered again. Japanese road blocks ranged from well concealed machine guns to solid obstacles of huge felled trees and wrecked cars protected by machine guns, trench mortars, and light field artillery. Trench mortars, of which the Japanese had many and the Allies very few, proved highly efficient. The Allied retreat led through the Salween, Sittang, and Irrawady river valleys. There were no roads outside the valleys. Burmese collaborationists, however, repeatedly led Japanese infiltrating parties over unmapped trails behind the Allied forces. In the third week of April, heavy rains started in central Burma, converting roads into quagmires. This gave the British some hope that the Japanese, still 150 miles from Mandalay, would not reach the city before the beginning of the monsoon season, during which major operations were virtually impossible.

Mandalay was the chief supply center of the retreating armies. A Japanese incendiary raid on April 4 set the city ablaze, and fifth columnists sabotaged the fire fighting system. The city burned for 27 days. Transportation broke down in the rear of the Allied armies, looting and sniping increased, and native ground crews and helpers left air bases.

On April 15, a Japanese drive from Chiengmai in Siam, supported by armor and planes, smashed into the Burmese Shan States, engulfing the thinly spread Chinese defenders. The invaders drove toward Lashio, terminus of the Burma Road, far to the rear of the staggering Salween River front. On April 22, they took Taunggyi, 175 miles south of Lashio. On April 26, they were 30 miles from the city, which fell on April 28.

A prolonged defense of Mandalay became impossible after the fall of Lashio, and, on May 1, its smoldering ruins were in Japanese hands. This sealed the fate of Burma. All the Allies could attempt was to save as many of their shattered forces as possible. Generals Alexander and Stilwell agreed that the 38th Chinese Division and

the remnants of the British troops should cross the Ara bridge and march in the direction of India. There were 13,000 British and 35,000 Chinese left. The flight from Burma continued for months. Natural obstacles and bad weather contributed more to the hardships of the defeated forces than enemy action. Many men were lost in the jungle and many died of exhaustion, malnutrition, and disease. Groups of stragglers arrived in India from June until November of 1942.

The victors were free to choose between an attack on India and a drive along the Burma Road through China's backdoor. British-Indian defenses centered at Imphal, capital of Manipur State. The Chinese rushed forces to hold the Burma Road, but their land lifeline was cut, and supplies were desperately needed. China's chances of continuing to fight seemed slim.

Japanese Penetration of the Indian Ocean. —Following the fall of Singapore and the Dutch East Indies, the Japanese Navy could sail at will into the Indian Ocean through the Straits of Malacca and the Straits of Sunda. Ceylon was the key point the British had to hold. If the Japanese had attacked Ceylon in early March, they might have captured or at least neutralized the base, but they waited too long and the British rushed land forces, aircraft, and anti-aircraft guns to Ceylon.

Diverting ships from convoy duty, the British assembled substantial naval forces southeast of Ceylon under the command of Admiral Somerville, who had been recalled from the Mediterranean. Late in March 1942, the British noted indications that the Japanese were about to attempt an operation in the Bay of Bengal. At least two aircraft carriers, three *Kongo* class battle cruisers, and many smaller craft were reported ready for action.

On April 5, Japanese aircraft raided Colombo, suffering a loss of two thirds of the attacking planes without inflicting serious damage. British Blenheims failed to detect the Japanese carried, but Japanese reconnaissance planes sighted two British heavy cruisers under Somerville's command. Both were sunk late in the day by Japanse fighter aircraft carrying a single large bomb each. The Japanese next caught and destroyed the old carrier *Hermes* at Trincomali, and sank nearly 100,000 tons of British merchant vessels in the Bay of Bengal. They then returned to their bases to refuel and recondition their ships, giving the British a sorely needed breathing spell.

ALLIES FIGHT GERMANY BY SEA, LAND, AND AIR

In the months before Pearl Harbor, the United States Atlantic patrol kept most of the German submarines away from the western sector of the shipping lanes. This fact, coupled with improved British tactics, reduced tonnage losses to an average of 200,000 a month in late 1941. Another factor was the German Navy's decision to keep a substantial number of submarines out of action in order to have reserves available for a large-scale submarine attack on American shipping when the United States entered the war. The number of German submarines available when war was declared on the United States was estimated at 300, of which no more than 100 were at sea on Dec. 7, 1941. Immediately thereafter, the German High Command threw most of its available U-boats into a drive against shipping in the western Atlantic. On Dec. 28, 1941, a squadron of submarines, based on the Biscayan Gulf in France, sailed for the American coast. They scored their first success on January 14, sinking the tanker *Norness* 100 miles east of New York City. The next day the *Coimbra* was sunk in the same area, and the tanker *Allan Jackson* went down off North Carolina on January 18. German attacks focussed on tankers in an attempt to reduce United States oil supplies to an extent which would cut down production of planes, tanks, and other motorized equipment, and prevent United States intervention in Europe. During the first 60 days following the Pearl Harbor attack, more tonnage was lost off the United States east coast than Britain lost all over the world during the preceding 5 months. By the end of January 1942, ships were being sunk within sight of New Jersey beach resorts. A blackout was ordered in cities along the United States east coast. A small number of Italian submarines joined the Germans but were not very effective.

Antisubmarine devices and tactics had not been adequately developed in the United States. Until well into 1942, the United States Navy lacked shore-based, wheeled aircraft, and the building of small escort vessels, MT boats, and sub-chasers lagged behind the construction of larger craft. The British came to the assistance of the United States by making available all the data they had gathered concerning submarine warfare and giving full details of countermeasures. A number of experienced British naval officers went to the United States, and 30 corvettes and antisubmarine craft of the Royal Navy joined the United States Navy. Convoys were formed along the United States Atlantic coast. This was done reluctantly, as it reduced the average speed of ships. A convoy was forced to travel at the pace of the slowest ship in it, and fewer trips could be made. Despite the British contribution, there was a shortage of escort vessels. The first east coast convoy left port on May 14, 1942. Army patrol bombers were added to the navy's seaplanes and dirigibles (blimps). Old four-stacker destroyers, small cutters, subchasers, converted yachts, minesweepers, and tugs worked on convoy duty.

On Dec. 21, 1941, United States Secretary of the Navy Frank Knox claimed that, up to that day, American naval forces in the Atlantic had sunk or damaged about 14 enemy submarines. At least three sunk and four more damaged were reported as the United States score for January and February 1942. Subsequently, data of submarine sinkings were withheld from publication. Allied commercial shipping losses in 1942 rose above 7,000,000 tons compared with a construction total of 6,825,000 tons. Considering the great number of vessels laid up for repairs, available allied shipping space declined substantially in 1942. Losses were at their peak in the middle of the year, with upward of 800,000 tons a month sunk or damaged. After October 1942, losses fell below the 600,000 ton mark. Yet, on Jan. 19, 1943, a United States Navy spokesman said: "We are not winning the battle of transportation." As long as the battle of transportation was not won, no decisive victory on land or in the air was possible. Relatively safe transportation and a vast amount of shipping space were needed to carry men and matériel to the various theaters of war.

Losses suffered in the Caribbean Sea, added to losses suffered on the United States east coast, constituted a formidable total. There, too, tankers were the principal targets of German attacks. Wolf packs concentrated close to the oil fields of Maracaibo and the refineries at Curaçao, and U-boats created havoc in the passages around Cuba and San Domingo. The Antilles Air Command (U.S. Army) contributed some old B-18 bombers to fight the menace. The Navy's Caribbean Command, under Rear Admiral John Hoover, established bases at Guantanamo, Curaçao, and Trinidad. A small number of British corvettes and two Dutch vessels, joined by Brazilian craft after that country declared war on Germany and Italy on Aug. 22, 1942, assisted United States craft escorting Caribbean convoys. In July, the tide began to turn in the Caribbean Sea, and U-boat losses mounted. In the fall of 1942, the Allies gradually regained control of that area. Liberator B-24 bombers were particularly successful in the later phase of the struggle.

The Germans used an increasing number of aircraft in the battle of transportation, and their major surface units added to the threat against Allied shipping. The mere presence of these craft forced the Allies to keep capital ships on convoy duty.

The German battle cruisers *Scharnhorst* and *Gneisenau* and the heavy cruiser *Prinz Eugen,* bottled up in French harbors and under frequent air attacks, were ordered to join the bulk of the German Navy in Norwegian waters. On Feb. 2, 1942, British Intelligence reported steam trials and the arrival of 10 escort destroyers in the French harbors, indicating an imminent dash by the German ships toward safer bases. The British Admiralty had very few battleships available early in 1942 and did not want to expose these craft to an engagement in the Channel close to German airfields. The RAF was assigned to disrupt the German plans for escape by an operation called "Fuller." On February 12, the German ships succeeded in making the Channel run under cover of fighter aircraft. Failure of "Operation Fuller" was attributed to a breakdown in the night patrols of the RAF, weakness of available forces, failure to fly a strong morning patrol on that day, poor weather conditions, and German jamming of radar reception.

Late in February, the Germans assembled the super battleship *Tirpitz,* the battle cruiser *Scharnhorst,* the pocket battleships *Admiral Scheer* and *Lützow,* and the heavy cruisers *Prinz Eugen* and *Admiral Hipper* in Norwegian fjords, and 300 to 500 bombers—many of them torpedo-carrying Heinkel III's—on northern Norwegian airfields.

Four of the newest British battleships did convoy duty on the shipping lane to Murmansk, where the Germnas were preparing to stop Allied supplies to Russia. At the same time, the Wehrmacht prepared for another attempt to win in the east. Late in December 1941, one German pocket battleship and one heavy cruiser had intercepted a Murmansk-bound convoy but were driven off. During the dark season in Arctic waters from November to February, shipping was comparatively safe, but the situation became critical during the period of long daylight. In March, the *Tirpitz* lurked close to the Murmansk lane but, under attack by British torpedo bombers, had to return to Norway. On May 20, an Allied convoy left Iceland for Russia, and lost 50 per cent of its ships en route. Another convoy, leaving Iceland on June 29, lost 32 ships out of 38. Not only were many lives lost in these disasters, but also a great quantity of supplies urgently needed by the Red Army. These attacks were carried out mostly by submarines and airplanes.

In the late spring of 1942, the Germans revived and improved their wolf-pack tactics in the Atlantic. In addition to increased air reconnaissance to spot targets, the usual type of 520 and 740 ton U-boats were supplied by large, cruiser-type submarines carrying reserve stores, including torpedoes, to keep the attacking craft longer at sea than ever before. Wolf-packs were arrayed in a diagonal line across the anticipated path of a convoy, spreading over hundreds of miles and keeping the ships under attack from four to six days.

The First Russian Winter Offensive.—In a speech delivered to his Reichstag on Dec. 11, 1941, Hitler announced that "the advance of the German forces might be hampered or stopped by winter conditions." He reported German losses in the east during the period prior to December 1 as 162,314 killed, 577,767 wounded, and 33,334 missing. United States official circles estimated the figure at 1,380,000 killed and 2,820,000 wounded. On December 21, the German führer announced that he now combined in his hands the leadership of all armed forces with the supreme command of the army. Field Marshal Gen. von Brauchitsch was dismissed. In a frantic appeal to the German population, Joseph Goebbels called for warm clothes for the troops on the eastern front. Lack of warm clothing was aggravated by the record cold during the winter of 1941–1942. The temperature dropped to 61 below zero as compared to a minimum of 13 below during Napoleon's retreat in 1812.

When the Russian armies hit back, late in November and early in December 1941, the situation became critical for the Wehrmacht. Had the Russian drive gained momentum, the German armies might have collapsed. Some German units showed signs of panic and disintegration. But after the Red Army failed to exploit its initial advantages in full, German officers regained control of their men and forestalled disaster by rushing reserves to staggering sectors. On December 21, Hitler had reason to believe that the Wehrmacht would eventually regain the initiative.

Due to enormous losses in men and matériel, the Soviet counteroffensive was not as strong as the Russian High Command had hoped. The Russians were handicapped by poor communications. The Wehrmacht controlled most of the railways in a semicircular line with a radius of 110 miles around Moscow. The Germans also controlled a transverse line from Bryansk to Vyazma and two reasonably good highways, one linking Moscow and Kiev, the other running parallel to the Moscow-Smolensk railway. The Russians had only three railroad lines and no first class highways to the rear, greatly hampering the deployment of troops and transportation of heavy matériel. Russian ski troops and large bodies of mounted cavalry, superlatively mobile even on roadless territory, were effective in the pursuit of a routed enemy but of limited value in the assault of positions manned by determined defenders. The Russian High Command failed to gain adequate "elbow room" for transportation,

although 100,000 square miles of the lost total of 527,000 were recovered. The success of the Russian counteroffensive was therefore not decisive.

The Germans claimed that their carefully planned "hedgehog" system frustrated the Russian drive. It is true that, after capturing Orel, Kaluga, Vyazma, and Rzhev, the Wehrmacht had built up and defended these cities as strong bases, but this was a normal procedure, especially since cities afforded shelter for freezing soldiers and blocked enemy communications. In reality, the hedgehogs were no innovation, and the praise given by the Germans to Field Marshal Gen. von Kluge as their inventor was decidedly exaggerated.

Two exposed salients—remnants of the pincers that failed to close behind Moscow—existed in the German lines on both flanks of the central front.

The southern German salient, in eastern Tula Province, thrust toward the Yaroslavl road. On Dec. 9, 1941, the Germans were hit hard there by Red ski troops and cavalry. The panzers were hampered by engine trouble due to extreme cold. The outskirts of Tula were cleared of Germans, and Venev, Epifan, Mihailov, and Yelets were captured. In five days, the Germans lost 30,000 men killed, 658 tanks, 4,878 trucks, and 397 guns. After heavy street fighting, Kalinin fell on December 15.

After eliminating the German wedges, Russian operations were carried out frontally, and the lack of good communications became a serious handicap. The winter offensive developed into a series of actions on a much smaller scale than previous German offensives. Although this was due to prevailing circumstances and not to lack of strategic planning, the High Command of the Wehrmacht underestimated the enemy and believed that hazardous operations could be carried out against the Russians without much risk.

The Russians did not capture many German prisoners. German propaganda warned that capture meant torture and slavery in Siberia. Many German soldiers had shown great cruelty in Russia and had much to fear from Russian investigation. According to Russian reports, an order was found in Klin, signed by Field Marshal Gen. von Reichenau calling for the "merciless annihilation of the cunning and cruel enemy." On Jan. 12, 1942, a Russian note sent to all governments having diplomatic relations with the Soviet Union stated that the liberation of Russian territory had disclosed universal robbery, devastation, and massacre by the invaders.

After clearing the Germans from Tula, the Reds thrust toward Kaluga, entering there on December 26. A German counterattack momentarily recovered the devastated city but, on Dec. 30, 1941, the Russians again took Kaluga.

In an effort to keep springboard positions for another assault on Moscow, the Wehrmacht dug in for the defense of Mozhaisk (another hedgehog), but it fell to the Russians on January 18.

In the central sector, the Germans concentrated on defending the key points of Bryansk, Smolensk, Vitebsk, and Velikie Luki. If the Russians had succeeded in capturing those cities, they would have had communication advantages in central Russia. The Red offensive reached Kholm in a move to cut the railway linking the German besiegers of Leningrad with the armies in the central sector. Lack of matériel prevented the Russians from scoring a complete victory in the northern and central sectors.

During January and February, Marshal Timoshenko's army groups in the south pushed toward Kharkov, bypassing German hedgehogs at Taganrog, Stalino, and Artemovsk. After capturing Losovaya, the Russian drive on Kharkov came to a halt. An effort to take Dnepropetrovsk also failed. An attempt to reinforce the garrison of Sevastopol by landing in Evpatoria was equally unsuccessful.

On the Leningrad front, the German siege continued. On February 22, a Russian advance on the south shore of Lake Ilmen virtually encircled the German Sixteenth Army, but the Germans held out until thaws forced the Russians back from marshy ground.

In March, the Germans staged local counterattacks all along the front. Their planes returned to the air again, and increasing numbers of Wehrmacht divisions were rehabilitated and reformed. Early in April, the Russian offensive faded out.

The number of German divisions remained at 200, but their average strength was reduced by one third, and artillery losses could not be fully replaced. The Wehrmacht had to rely more and more on heavy infantry and automatic weapons. The equipment of the panzer divisions was reduced from 400 to 250 tanks. The Luftwaffe also showed a diminution of strength, due rather to increased RAF activities in the west and the growing number of aircraft engaged in the battle of transportation than to losses suffered on the eastern front. Even allowing for the troops of satellite states, German fighting strength in 1942 was about 25 per cent below the 1941 level.

Russian casualties ran somewhat higher than those of the Germans. The Red Army lost many tanks and planes, as their armor and air force had fought incessantly. Russian domestic production lagged behind the German, and Allied supplies could not fully make up the difference. Russian manpower was numerically greater than Germany's, but the Germans compensated for it by using millions of persons in conquered territory as slave laborers. Transportation advantages also remained in German hands, and German organizing abilities, highly important in the regroupment of huge armies, rated higher than the Russian. The Russian loss of fighting strength was proportionately no smaller than the German.

The Wehrmacht High Command realized that offensive operations could not be carried out all along the 2,000-mile front. With the strategic situation in front of Moscow changed in Russia's favor, the Germans decided to focus their main efforts in the southern and central sectors. The central move, referred to as the Volga drive, aimed at penetrating far to the southeast of the Russian capital to cut off the Red armies from the Ural industries. The southern drive, into the Caucasus, was to bring the Russian oilfields (the richest were at Baku on the Caspian Sea) under German control. From Baku, northern Iran faced invasion. A German drive through Iran could lead to India to meet or, as the Germans preferred, to outrace the Japanese. Cut off from their oil, industries, and most of their communications, the Russians would have been unable to carry on.

Before starting major operations, the Wehrmacht had to eliminate the fortress of Sevastopol

and recover Kerch, the gateway to the Caucasian foothills. The principal Russian hope lay in attempting to disrupt the German timetable, to stem the Wehrmacht's advance, and to inflict as many casualties as possible upon the enemy until the strain on German communications and exhaustion of the troops would bring the advance to a halt. The outlook was not bright for the Red Army, despite its winter successes.

Crimean Campaign and Battle for Kharkov.—Sevastopol's garrison of 75,000 was isolated from other Russian land forces. It was also without air support, as all Crimean airfields were in German hands. The Russian Black Sea Fleet, though obsolete and rather small, was still superior to naval forces the Axis could muster in the Black Sea. With German aircraft based nearby, and the best remaining Red naval base at Batum more than 400 miles away, the Red Fleet could only keep loose contact with the beleaguered garrison. On the easternmost tip of the Crimean Peninsula, at Kerch, three Russian divisions held a precarious bridgehead.

On May 7, 1942, the German Twelfth Army turned against this bridgehead with eight German and five Rumanian infantry divisions, two German panzer divisions, and substantial Luftwaffe detachments. The Red divisions, hemmed in an ever narrowing space, had to fall back across the straits into Taman Peninsula after six days of fighting. The fighting strength of the former defenders of Kerch was greatly reduced and available reserves hardly adequate for a successful defense of the gateway to the Caucasus.

With huge German forces massed west of Kharkov, Marshal Timoshenko decided to take a calculated risk to forestall the German offensive. He ordered a drive aimed at Kharkov, and as far beyond the city as possible, in order to disorganize the Wehrmacht's deployment. Timoshenko did not have enough men or equipment to carry out an ambitious offensive, but he relied on the element of surprise and believed that, even if the Germans resisted strongly, he could improve his own positions. Timoshenko's offensive opened on May 12. Pressure was exerted chiefly against the outer defenses of Kharkov along the upper Donets River, and from Losovaya along the railroad linking Kharkov and Poltava. In four days of slow advances, the Russians captured Merefa and Krasnograd and penetrated the defenses of Kharkov. A wedge was formed in the triangle Krasnograd-Losovaya-Merefa. The Wehrmacht, throwing some of its ample reserves into the critical area, counterattacked on May 17. In an effort to extricate his forces, Timoshenko lost 80,000 prisoners and some of his matériel. The Wehrmacht launched improvised attacks against the Red armies to hamper their regroupment for defense. All Russian offensive attempts ended by June 1. Ten days later, the German Seventeenth Army not only recaptured all the ground previously lost in the Kharkov sector, but succeeded in establishing a bridgehead across the Donets at Izyum.

On June 5, after careful preparation, Field Marshal General Mannstein attacked the defenses of Sevastopol with outposts at Belbek Valley and Balaklava 20 miles away from the city. Sevastopol suffered constant air attack and its forts were heavily damaged. The defenders' courage was worthy of the highest praise. Lack of matériel, however, doomed the garrison. Contesting every inch of ground with bayonets, the Russians were pressed back; the city, reduced to a shambles, could not be defended. On July 1, the German Twelfth Army completed the conquest of Sevastopol and, with it, of the Crimean Peninsula. A small group of the defenders made their escape by sea to the Caucasus. The Twelfth Army was still fighting for Sevastopol when, on June 22, 1942, first anniversary of the attack on Russia, the Wehrmacht opened its second great offensive in the Soviet Union.

British Debacle in North Africa.—Late in May 1942, the British Eighth Army held a line running straight south from the Bay of Gazala. Its northern sector was manned by the 1st South African Division, the center by the British 50th Division, and the southern flank—fading into the desert at the Bedouin well known as Bir Hacheim—by a Free French brigade. The British 1st and 7th Armored Divisions were kept to the rear, close to the sea, as a mobile counterattacking force. One New Zealand division garrisoned Tobruk, and the 4th Indian Division was on its way to the front.

British equipment, though improved, was still not adequate. The production of British Churchill tanks, the only British tank type matching the German Mark 3 and 4, had been temporarily slowed down while changes in design were made. United States General Grants were already available in substantial numbers, but still more were needed. The new British 6-pound antitank guns could not be shipped to the Middle East in quantity until midsummer. In the air, the development of the fighter bomber proved to be the answer to the German Stukas. The Germans had gained strength in armor and had also brought in 90 more 88-mm. cannon.

Rommel attacked during the night of May 26. His plan, which was risky, was to have both German panzer divisions and the Italian Ariete Division sweep through the desert past Bir Hacheim toward Tobruk to envelop the British position. The armor would have to travel a long distance, and supply columns could not keep up with the initial drive. If the push failed to reach its objective within the three day period for which the attackers carried supplies, the tanks would be immobilized and probably lost. A British counter-move against Axis lines deprived of armor might have led to their annihilation.

The Ariete, with 70 tanks, on the northern wing close to Bir Hacheim, was badly battered by French 75-mm. guns and lost 50 per cent of its vehicles. The German armored divisions swept through the desert without opposition. The 21st, in the center, attacked "Knightsbridge," a fortified and mined compound behind the British lines. The 15th, on the right wing, aimed at the airfield of El Adem. The Germans thrust deep into the British rear to within one mile of the main supply dump at El Duda, but the panzers were turned back after a sharp armored engagement. The Eighth Army's armor showed considerable fighting strength, and the RAF, although hampered by sandstorms, played an important part in the battle. Rommel's supplies ran low, and a determined British counterattack could have led to a German rout, but no counterattack developed.

In an effort to avoid disaster, Rommel tried to open a gap in the Eighth Army's lines north of Bir Hacheim, through which the panzers might retreat by a shorter route. He succeeded by using Italian infantry as sappers and laborers.

The British 150th Brigade, manning the critical sector, had no armored support and was overrun by the panzers. Quickly throwing infantry into the gap created by the 150th Brigade's defeat, Rommel established a wedge in the British position which isolated the French at Bir Hacheim and opened a shorter route to the panzers when the attack was resumed. British inactivity gave the commander of the Afrika Korps an opportunity to rally his forces. His next aim was to dislodge the French from Bir Hacheim, which would further expose the British Eighth Army's southern flank.

On June 8, Rommel ordered the 90th Light Infantry Division, the 155- and 210-mm. guns, and a large part of his dive bombers to attack the French. The RAF carried out fruitless raids against German spearheads far to the rear of the French Brigade. June 10 saw the Germans in control of Bir Hacheim. Remnants of the French forces made their way through enemy lines to join the British. Rommel, under greatly improved conditions, resumed his original plan for a drive of encirclement toward Tobruk. British armor was still intact when it was caught in a German trap.

On June 13, under cover of sandstorms, Rommel grouped his armor in a semi-circle close to his 90th Division, placing 88-mm. guns in front. Then he ordered the 90th to send out radio calls for aid. The British, hearing the calls, rushed the bulk of their armor to annihilate the "distressed" German infantry. They ran headlong into prepared German gun emplacements and tanks. Before the British could recover, only 70 of their 300 tanks were left.

Nothing but hasty retreat could save the British Eighth Army from encirclement and annihilation. No mobile engagement was possible before the depleted armor was replenished. Two infantry divisions were hemmed in on the former Gazala line. Three to five parallel lines of vehicles moved, bumper to bumper, on a road built only for two. The South African Division fled along the coastal road, while the 50th made its way through the desert, already dotted with German and Italian camps. The RAF worked in 20-minute sorties to protect the jammed areas from German attack. As the Libyan airfields were overrun by the advancing Axis forces, sustained air cover could not be provided for any length of time.

The British decided to hold Tobruk to delay the victor's advance. To reinforce Tobruk's garrison, three brigades were left behind with 80 field guns, a small number of antitank guns, and a few tanks.

Rommel immediately attacked the fortress, throwing most of the Afrika Korps and practically all of his Italian forces into the battle. Stukas and Savoia Marchettis bombed gaps through the minefields. The RAF, moving its bases, could not counter effectively. Forty German tanks penetrated the fortifications through a gap. In their wake, the German 90th Light Infantry, the 15th Panzer Division, the Ariete Division, and the Trieste Celere Division entered the fortress and annihilated small defense forces on its perimeter, including all the tanks that had been mustered. The Coldstream Guards attempted a counterattack but were engulfed. During the night, more Axis units poured through other breaches. Early in the morning of June 14, the confused resistance collapsed, and Tobruk, with 28,000 prisoners, was in the hands of the Axis armies.

Rommel immediately began his preparations for a decisive battle. In three days and nights of frantic labor, the panzers were reconditioned for a lightning drive into Egypt. It was an endurance race carried out in blistering heat. The Germans hoped to reach the Nile Delta before its defenses could be organized. Axis soldiers were promised leisure in Egyptian cities and urged to the limit of their physical strength. Mussolini came to North Africa with a large escort to make a triumphal entry into Alexandria and Cairo. The former Italian ambassador to Egypt prepared to take over the "protection" of Egypt in the name of the Axis powers. The fifth column was busy inside Egypt. The Germans printed invasion money.

General Auchinleck did not attempt a major stand in western Egypt. An earlier plan to hold Mersa Matruh was abandoned, too late, however, to prevent the capture of 6,000 more men when Axis forces entered the settlement on June 27. Reinforcements were on the way from Palestine, and 18 ships loaded with men and supplies sailed through the Red Sea. Small Eighth Army groups with considerable firepower, spread widely over the area of Rommel's advance, acted as rear guards. The RAF, established at bases deep inside Egypt, attacked the Axis columns.

The planned British defense line ran from El Alamein, 55 miles west of Alexandria on the Mediterranean, straight south to the eastern end of the Qattara Depression, an impassable stretch of land. Its flanks were safe and its length of 40 miles could be held by relatively small forces. To reach El Alamein, Rommel had to pass through a narrowing strip of land shaped like a bottleneck, with the sea to the north and the Qattara Depression to the south. In case the El Alamein line could not be held, the British planned rear guard actions all through Alexandria, where French warships were interned. An unsuccessful effort had been made to obtain the Vichy government's consent to remove these vessels. If Alexandria should fall, a newly organized "Delta force" was to defend the Nile Valley. General Headquarters was prepared to move from Cairo to Gaza, Palestine.

On July 1, Rommel's army faced the El Alamein line, manned by the remnants of the British Eighth Army—its losses amounted to 80,000 men—plus New Zealanders from Palestine and the gradually arriving 9th Australian Division. The German commander, promoted to the rank of field marshal general, could not wait to reorganize his exhausted men, nor could he wage a prolonged battle with soldiers on the verge of collapse. He had to win a quick victory, or else another plan would have to be worked out to reach the coveted goal.

Without much armored support (many German tanks had broken down on the strenuous trip) and with even less assistance from the air, as Luftwaffe bases were not yet established in forward areas, Rommel began an attack on the British front which lasted from July 1 to July 5 without breaking through. German attacks had to be discontinued after July 5. Alexandria and the Nile Delta were saved. A local British drive created a five mile-long salient along the coast, including a ridge and railroad station. Attempts to dislodge Rommel in other sectors failed.

General Auchinleck was relieved of his com-

mand. His appointed successor, General Gott, was killed in his plane on the way to Cairo. Lt. Gen. Sir Bernard Law Montgomery took charge of the reorganized Eighth Army. Gen. Sir Harold Alexander assisted in the revision of British desert strategy. Prime Minister Winston Churchill came to Egypt twice. The British armor was also reinforced by new, all-welded United States General Sherman and British Churchill tanks, United States fighter squadrons, and improved British antitank guns. British, Australian, South African, New Zealand, Indian, and Polish units built up the Eighth Army's strength beyond that of Rommel's forces.

The easy repulse of several German thrusts in September showed the Axis commander that the scales had tipped against him, but Rommel decided to hold his strategically unfavorable position. In a press conference in Berlin he boasted: "It may be relied upon: what we have, we keep!" Keeping what the Axis held in Egypt meant keeping the army at the top of a bottleneck which was likely to become a death trap in case of an enemy breakthrough. A retreat to Mersa Matruh would have improved Rommel's position, although it would have meant the abandonment of a part of the Axis conquests.

Occupation of Madagascar. — Although aware of the potential menace of the 241,096-square mile island of Madagascar (populated by 3,979,936 people, of whom 25,255 were French) under control of the Vichy government, the Allies were not fully convinced that action was necessary until April 1942. Gov. Gen. Armand Annet was having Allied sympathizers rounded up while Axis agents infiltrated the island. The Union of South Africa thereupon severed relations with Vichy France. British expeditionary forces gathered in South Africa. Early in May, it was reported that two ranking Japanese naval officers, members of their country's delegations to Berlin and Rome respectively, were negotiating with Vichy Premier Pierre Laval about Madagascar.

The British moved at once. During the night of May 4, naval forces, including one carrier and several cruisers, covered the landings of South and East African troops near the naval base of Diego Suarez in northern Madagascar. The United States government informed Vichy that the British move had its full support. The French resisted but were speedily defeated, and the base was occupied on May 7. One German freighter and two scuttled Italian merchant vessels were in port. The proximity of Japanese submarines was proved when, on May 30, Japanese undersea craft attacked the British Fleet off Diego Suarez without inflicting major damage.

Prolonged efforts to induce Governor General Annet to agree to a peaceful establishment of British control failed. During the negotiations, operations were confined to the occupation of the Comores Islands off Madagascar on July 9, 1942. On Sept. 10, the British drove on Tananarive, capital of Madagascar. Almost 75 per cent of the Vichy French troops, when captured, asked to be admitted to General deGaulle's Free French forces. Despite natural obstacles, the invasion army reached the capital in two weeks. On November 5, an armistice confirmed British control. Five days later, General deGaulle's committee appointed Gen. Paul Le Gentilhomme as high commissioner of Madagascar. The British turned over the administration to General Le Gentilhomme on December 14.

The Air War over Western Europe.—In 1942 there came a change in the strategic aspects of the air war over Western Europe. In the spring of that year, Prime Minister Churchill estimated that at least 600,000 to 700,000 men and six or seven armored divisions, with many thousands of vehicles, were needed to carry out an invasion of the British Isles. With the Wehrmacht heavily engaged in Russia, such numbers were not available, and under no conditions could Germany muster the shipping space needed to transport so huge a force. German bombing of Britain was therefore no longer intended to pave the way for an invasion. Its main purpose was to prevent men and matériel from reaching Britain, to hamper British production, and to interfere with the organization of invasion armies in Britain.

The British directed their air offensive against German production, German transportation, anti-invasion fortifications under construction, submarine bases, and plants engaged in the production of submarines and their accessories.

In 1942, the scale of the British raids surpassed that of the earlier Luftwaffe attacks on Britain. American support had not yet reached major proportions. In March, the RAF raided Essen, Cologne, Düsseldorf and other Ruhr cities. On April 17, the British bombed diesel engine plants working for the German Navy at Augsburg. This raid was followed by attacks on U-boat assembly plants in several cities. Mines were laid in German and German-controlled coastal waters. The Luftwaffe also laid mines to impede British shipping. U-boat bases at Lorient, St. Nazaire, Brest, La Pallice, and Bordeaux were bombed as often as weather conditions permitted.

In April, no more than 300 RAF planes were sent on a single mission. On May 30, Cologne was hit by 1,100 planes. Approximately 3,000 tons of bombs devastated one twelfth of the city's built-up area. On June 1, 1,036 planes hit Essen, site of the Krupp armament plant, and on June 25, 1,000 were over Bremen. On July 8, major raids hit U-boat yards at Danzig, previously considered beyond bombing range, and on July 9, Wilhelmshaven was bombed. Retaliatory German raids damaged a number of historic British buildings.

On July 4, United States Army Headquarters in Britain issued its first communiqué on an American air raid when United States crews, manning British planes, carried out a small attack on German airdromes in Holland. On July 7, 1942, Maj. Gen. Carl A. Spaatz was appointed commander of the United States Air Force in Europe under the direction of Lt. Gen. Dwight D. Eisenhower. The first American air raid on French territory took place on July 26.

ALLIED OFFENSIVE IN THE PACIFIC

The Japanese drive in the Pacific lost its lightning speed in the spring of 1942 but did not stop. Japanese invaders of Pacific islands established secure encampments close to the shore and worked on the construction of naval and air bases which were gradually put into operation. Supply bases were built up, and substantial land forces concentrated near zones of planned expansion. In April 1942, Japanese ships, planes, and men were massed in the East Indies and the Marshall

Islands. Harbors on the islands of Buka and Bougainville in the northern Solomons were occupied without opposition. On May 1, the conquerors moved to Tulagi and Guadalcanal, increasing the threat against Allied supply lines to Australia.

Battles of Coral Sea and Midway.—Two United States carrier task forces (Rear Admiral Frank Fletcher with the *Yorktown* and Rear Admiral Aubrey Fitch with the *Lexington*) were operating in the critical, South Pacific area. Only aggressive warfare could prevent the Japanese from severing vital shipping lanes.

On May 4, the *Yorktown* carrier group sank 12 Japanese supply ships south of Guadalcanal after they were unloaded. Three days later, Japanese forces headed toward New Caledonia and eastern New Guinea. Two Japanese carriers, escorted by battleships, cruisers, and destroyers, were ahead of the transports going to New Caledonia. In a surprise attack on the morning of May 7, planes from Admiral Fletcher's task force caught the carrier *Ryukaku* with its planes on deck and sank the vessel and one escorting heavy cruiser. Japanese planes detected and sank the 18,250 ton United States tanker *Neosho* and its escorting destroyer *Sims* but failed to locate the carriers (the *Lexington* had joined in *Yorktown*) until late in the day. That night, another Japanese force of two carriers and two battleships, plus several cruisers and destroyers, was reported on the move from the Marshalls toward the east side of the Solomons. On May 8, at 8 A.M., United States reconnaissance planes established contact with this fleet 200 miles away from the American vessels. During the previous night, both forces came within 30 miles of each other, still beyond gun range. The engagement fought in the Coral Sea actually took place without the ships exchanging a single shot. United States planes left the carrier *Syokaku* in sinking condition and damaged another of the Ryukaku class. The United States carriers came under attack by 105 Japanese dive bombers and torpedo planes. The *Lexington* was hit by two torpedoes and five heavy bombs (the official account reported five torpedo hits), and the *Yorktown* by one 1,000-pound bomb. Fires on the *Lexington* were under control, but the ignition of gasoline fumes in burning compartments subsequently led to the loss of the ship. In addition to the carrier, a tanker, and a destroyer, the United States lost 20 aircraft and almost 500 men. Japanese losses amounted to two aircraft carriers, one heavy cruiser, two destroyers, and several transports and lesser craft sunk, one carrier heavily damaged, about 100 planes lost, and 3,000 to 4,000 men killed. The engagement was a victory for the United States, and the hostile fleet returned to its bases without attempting any landings.

Japanese preparations in the Marshall, Caroline, Mariana, and Bonin islands indicated an impending move eastward, while the main United States strength was concentrated in the south. A new United States island base was established on Suva, where there was a good airfield with two squadrons of fighters. Another airbase on Canton Island, within bombing range of Japanese establishments in the Gilberts, was completed late in May.

The Japanese planned to attack Midway Island, which they had failed to take in December 1941, and, after the conquest of the island, to make another assault on Hawaii. On June 3, 1942, a Japanese fleet train was sighted 700 miles west of Midway and attacked by Flying Fortresses and torpedo-carrying naval Catalinas. The pilots reported ten big transports, with probably 30,000 to 40,000 men on board, four heavy cruisers, and four destroyers.

The U. S. carriers *Hornet, Enterprise,* and *Yorktown* assembled under the command of Admiral Fletcher, who had his flag on the *Yorktown.* Rear Admiral Spruance was aboard the *Enterprise* and Rear Admiral Mitscher on the *Hornet.* On June 4, at 5:45 A.M., a Catalina pilot reported additional Japanese forces north of Midway, divided into two groups: the first, 200 miles north of the island, was composed of three carriers (the *Kaga,* the *Akagi,* and the *Soryu*), four heavy cruisers, and ten destroyers; the second, 50 miles astern, was composed of one carrier (the *Hiryu*), two battleships, four heavy cruisers, and ten destroyers. The previously located Japanese train continued toward Midway. Fleet oilers and loaded supply vessels, escorted by two more destroyers, followed the fleet.

Admiral Fletcher intended to penetrate the gap between the Japanese units. From the base at Midway 36 fighter planes were ordered to stand by for the defense of the island, while 53 bombers and torpedo planes took off from Midway to attack the hostile fleet. They hit the *Soryu* and one heavy cruiser at considerable loss to themselves.

Each of the United States carriers had 75 planes. At 7:00 A.M., June 4, the *Hornet* and the *Enterprise* launched their aircraft against a Japanese force of 5 carriers, 4 battleships, 9 cruisers, and 34 destroyers. All Japanese vessels converged on Midway. At 10:15 A.M., American dive bombers and torpedo planes (*Yorktown*-based craft held in reserve) hit the Japanese fleet. Within a few minutes, the *Akagi,* the *Kaga,* and the *Soryu* were crippled, and two battleships were damaged.

While Japanese Zero fighters (armed with machine guns and 20-mm. cannon) fought the United States bombers, Japanese Baukegi 97 dive bombers scored hits on the *Yorktown.* Fires broke out, and the signal system was damaged. Admiral Fletcher transferred his flag to the cruiser *Astoria.*

In the late afternoon of June 4, the *Hiryu* was sunk. The opposing fleets were never less than 100 miles apart. Controversial reports of remaining Japanese forces accounted for some confusion in the United States command during the night of June 4 and the morning hours of June 5. Later that day, the Japanese were in full retreat, but the United States command underestimated the losses suffered by the enemy. Two Japanese heavy cruisers, the *Mikuma* and *Mogami,* collided at night. The *Mikuma* was sunk by United States carrier-based planes on June 5, and more Japanese ships were reported damaged. The *Yorktown,* after another attack by torpedo bombers, had to be abandoned by its crew on June 4. Efforts to save the carrier continued until June 7. Torpedo hits by a Japanese submarine finally sank the *Yorktown* and also a destroyer doing salvage work.

By nightfall of June 6, contact with the Japanese surface fleet was lost. Fuel was running low on the United States carriers. If Admiral Fletcher had had two or three battleships, he might have annihilated what was left of the Japanese fleet, but the Japanese transports escaped.

The Battle of Midway, in which ships did not come within sight of each other, was the turning point of the Pacific naval war, a fact that was not realized until much later. The Japanese lost 4 aircraft carriers, one cruiser and 3 destroyers, against one United States carrier and one destroyer. Plane losses were 275 Japanese and 100 American. Midway put an end to Japanese carrier supremacy and paved the way for United States superiority. After Midway, the outcome of the war at sea depended on shipbuilding capacity. As Japanese naval power decreased, their hold on the islands was bound to shrink. The number of land forces operating in island campaigns depended upon the capacity to supply them. After June 6, 1942, Japanese production began to fall far short of requirements. Japanese progress in the vicinity of Australia neared its end. Relieved of the most dangerous threat in the Far East, the Allies were able to gather strength in the Atlantic and to send more assistance to North Africa and Europe.

Aleutian Campaign.—While decisive battles were taking place in the South Pacific, the Japanese attacked northwestern American possessions. The seizure of the remote Aleutian Islands would probably not provide a springboard for an invasion of Alaska, Canada, or the United States west coast, and it would be difficult to establish air bases capable of carrying out a blitz on America. But the psychological effect of Japanese conquests in the Aleutians would be considerable. The Japanese also hoped that substantial American forces would be directed to the north.

Late in May 1942, the Aleutians and Alaska were alerted. At Dutch Harbor, in the Aleutians, and Kodiak, the aircraft strength was 23 PBY's. There was no garrison in Kiska to protect the local weather station. Umnak and Cold Bay, the only military installations in the 1,000-mile island chain, each had an airstrip and some P-40 fighter planes. The garrisons were disguised as fishing canneries.

On June 3 and 4, 1942, Dutch Harbor was raided by 28 Japanese planes from two small carriers, and 43 persons were killed and 50 wounded. Fighters from Umnak accounted for a few Japanese aircraft. On June 7, Japanese forces occupied Kiska and Attu, western outposts of the Aleutians.

Lt. Gen. Simon Bolivar Buckner was in charge of United States Army defenses in the Aleutian-Alaska sector. Rear Admiral John W. Reeves commanded navy installations. By Sept. 14, 1942, a new United States Army air base had been established at Adak, 250 and 400 miles east of Kiska and Attu respectively. The construction of another on Amchitka was begun on Jan. 12, 1943. The Japanese built an airstrip on Kiska. Amchitka-based United States planes and Kiska-based Japanese planes raided each other on a minor scale.

After the conclusion of the Solomons campaign, the United States Navy dispatched some available units to patrol waters between the Japanese-owned Kuril Islands and the Aleutians to prevent Japanese reinforcements from reaching Attu or Kiska. On March 27, 1943, Rear Admiral McMorris, commanding a small United States naval task force of one heavy cruiser, one old light cruiser, and four destroyers, met a Japanese fleet of medium-sized troop-transport vessels, two heavy cruisers, two light cruisers, and six destroyers 180 miles west of Attu and 70 miles south of the Russian Komandorskie Islands. In a four-hour, running battle, both sides suffered damage, but no ships were sunk. Before the United States Army planes belatedly arrived, the Japanese ships had turned away.

With the beginning of the spring season, United States bombing of Kiska and Attu was stepped up. A substantial invasion fleet, including one small carrier, battleships, cruisers, and destroyers, assembled in Cold Bay. Maj. Gen. A. E. Brown, commanding a force of 12,000 men, was in charge of invading Attu, 60 miles long and up to 20 miles wide. The main Japanese camp at Attu was situated at Holtz Bay. There were smaller installations at Massacre Bay, Chichagof Harbor, and Sarana Bay. On May 11, American landings were effected at Holtz and at Massacre Bay. On May 17, United States troops controlled Holtz Bay. At Massacre Bay the Japanese, well entrenched on stiff slopes, put up furious resistance. The United States 11th Army Air Force (commanded by Maj.Gen. William O. Butler) supported the invaders. On May 28 and 29, the Japanese counterattacked, the collapse of which ended organized resistance. On May 30, 1943, Attu was held by United States forces. Japanese losses were 2,350 killed, and 24 prisoners. United States losses amounted to 552 killed, 1,140 wounded.

The recapture of Kiska, garrisoned by about 7,800 men, was expected to be a difficult operation. On July 6, 1943, a fleet of three heavy cruisers, one light cruiser, and four destroyers shelled Kiska, and bombing and shelling continued thereafter to soften up the island's defenses. On August 12, an invasion fleet of 94 vessels, including capital ships and modern assault craft, assembled in Adak harbor; 29,000 Americans and 5,000 Canadians formed the invasion forces. On Aug. 15, 1943, after a violent air and naval bombardment, Allied troops went ashore. They found no enemy. Undetected by the Allies, the Japanese had evacuated the garrison by surface ships and submarines.

United States-British Agreements on War Strategy.—In July 1942, British and United States representatives conferred in London. The agreement which followed, according to the official communiqué, covered the entire field of the war in every part of the world and also dealt with necessary productive and administrative measures required to implement strategic decisions. Special operations under this decision were submitted to the Combined Chiefs of Staff Committee in Washington, D.C. It was decided to open a major offensive in the western theater of war first. In the Pacific, land operations were to be carried out on a smaller scale.

Safe bases for the massing of large forces existed in the British Isles. Such bases would have to be built in the Pacific before an all-out drive could be started. It would also be necessary to wait for the completion of additional ships in order to eliminate the Japanese Fleet. The Joint Chiefs of Staff Committee approved a plan to block Japanese designs for future offensives in the critical Pacific areas and to ease the pressure on Australia by attacks on the Solomon Islands and New Guinea.

Russia did not take part in the conference, but urgent Soviet requests for the early opening of a second front influenced the decisions. It was necessary to keep the Soviet Union in the war. Lend-lease aid to Russia was speeded up. One

third of the total goods and services delivered under the act went to Russia in 1942 (about as much as to Great Britain), despite grave transportation difficulties.

The Solomon Island Campaign.—Vice Admiral Robert L. Ghormley of the United States Navy, with headquarters in New Zealand, was in command of the southwestern Pacific areas east of longitude 160°, including the Solomons, when operations against the islands were planned. General MacArthur's zone lay west of the meridian. Later, in the spring of 1943, MacArthur was given strategic command of all South and Southwest Pacific areas. Expeditionary forces, assembled to invade the Solomons under the command of Maj. Gen. Alexander A. Vandegrift, United States Marine Corps, included one division of marines and the 1st Raider Battalion. Their transport train was protected by a naval force under Rear Admiral Kelly Turner. Vice Admiral Fletcher's task force stood by to repulse long-range Japanese interception.

Main Japanese installations in the Solomons were known to exist on the small islands of Tulagi, Gavutu, and Tanambogo, and on the big island of Guadalcanal (80 miles long and up to 30 miles wide, with mountains ranging up to 8,000 feet). On Tulagi, a naval and seaplane base was under construction. An air strip on Guadalcanal's north coastal plain was nearing completion. The strength of the Japanese garrison was estimated at 10,000 men, most of whom were on Guadalcanal. Constant naval and air cover was essential to keep invading land forces reinforced and supplied. This limited the number of ground troops engaged and led to high naval losses.

Between Aug. 7, 1942 and Feb. 10, 1943, Japanese naval losses were as follows:

	Sunk	Damaged
Battleships	2	7
Carriers	1	4
Cruisers	11	31
Destroyers	22	51
Transports	24	13
Total	60	106

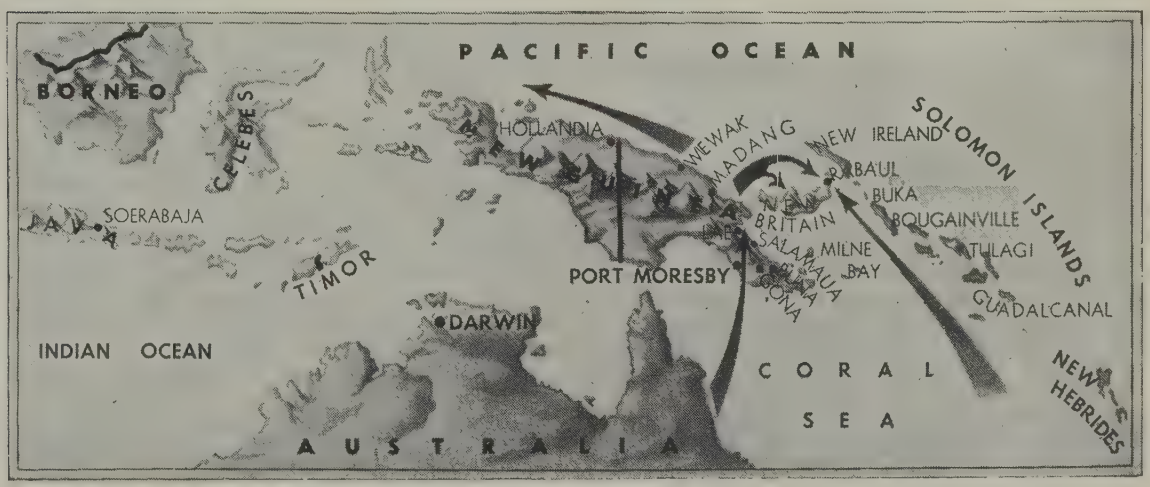
The Japanese also lost many lesser craft and 797 planes (mostly naval). In the same period, the United States lost 2 carriers, 6 heavy cruisers, 2 light cruisers, 15 destroyers, 4 transports, and some small vessels, but no battleships.

The campaign for the control of the Solomons developed into one of the greatest battles of attrition fought at sea and in the air.

On Aug. 5, 1942, through the Coral Sea sailed a United States fleet of 69 ships, including the carriers *Saratoga, Enterprise,* and *Wasp,* the new 35,000 ton battleship *North Carolina,* twelve United States cruisers, and three Australian cruisers, in addition to transport and supply vessels. In the early morning of August 7, the fleet was divided into two parts, the larger part heading for Guadalcanal and the smaller for Tulagi, Gavutu, and Tanambogo.

After one and one half hours of violent naval barrage, United States marines went ashore on Tulagi and Guadalcanal without encountering strong opposition, but stiff resistance was met at Gavutu and Tanambogo. This opposition was soon overcome. The marines were supported by the navy's heaviest guns, whereas the Japanese had no artillery. At nightfall of August 8, Tulagi, Gavutu, Tanambogo, and Makambo Island east of Tulagi were captured. Eighteen hundred Japanese were killed, most of them on Tulagi and Gavutu. None surrendered. A force of 20 to 30 Rabaul-based bombers raided the invasion fleet during the second day of the battle, sinking one 10,000 ton transport. On Guadalcanal, the marines landed near the airstrip, and the Japanese fell back seven miles to the west. The Americans completed capture of the airstrip on August 19. Fighting was restricted to skirmishes for the first eight days of the invasion.

On August 8, two Japanese task forces were sighted, one heading for Rabaul, the other for Guadalcanal. The latter force was expected to reach the vicinity of Savo Island around 2 A.M., August 9. To cover both sides of Savo, three Australian cruisers, and one United States cruiser, escorted by three destroyers, went to the south; three United States heavy cruisers and three destroyers moved to the north of the island. The crews were too fatigued to be properly alert. Although the Japanese vessels arrived almost exactly when and where they were expected, the Allies were caught off guard. To the north of Savo, all three United States heavy cruisers (*Astoria, Quincy,* and *Vincennes*) were lost to gunfire and torpedoes. To the south, the Australian cruiser (*Canberra*) was sunk, and one United States cruiser and two destroyers were damaged. Under the impact of the disaster, Admiral Fletcher ordered his carriers out of the area.



Partly unloaded transports also left. The Japanese force came to within 15 miles of United States transports but did not attack.

On August 20, Henderson Field (the airstrip on Guadalcanal) got its first United States planes: 12 dive bombers and 19 fighters. The marines held a beachhead three miles wide and one to two miles deep. It was attacked daily by bombers from Rabaul and shelled nightly by destroyers and submarines. During the night of August 21, 900 Japanese soldiers who landed from destroyers at the mouth of the Tenaru River east of the beachhead were annihilated. But Japanese equipment had been improved, and the odds were no longer in favor of the marines.

A major Japanese force was on the move from the Marshalls and the Carolines. Three carriers, two battleships, twenty cruisers and destroyers escorted transport and supply vessels; the armada spread out in a great arc north of Guadalcanal. Admiral Fletcher had two carriers, the *Saratoga* and *Enterprise,* ready for action, in addition to other ships. At 12:45 P.M., August 24, planes took off from the *Enterprise* and sank a light Japanese carrier of the *Ryuzyo* class. Guadalcanal-based United States planes joined in this action, and one Japanese cruiser and five transports were sunk. Eighty Japanese planes attacked the *Enterprise* and the *North Carolina,* 71 of which were downed. A hit set the *Enterprise* ablaze, but the fire was brought under control.

The great Japanese counter-invasion attempt failed, but small Japanese transports continued to land troops and supplies on Guadalcanal while Japanese submarines lurking offshore make it hard to reinforce the marines. On September 15, the 14,700 ton United States carrier *Wasp* fell victim to a Japanese submarine attack.

On September 13 and 14, the marines repulsed strong Japanese attacks at "Bloody Ridge," but the pressure increased and the marines had to retreat yard by yard. On September 16, the Japanese came within rifle shot of Henderson Field. American reinforcements of men and artillery, landed two days later, prevented the loss of the airfield.

A naval engagement was fought on the night of October 11 between a United States task force of two heavy cruisers, two light cruisers, and four destroyers, and a Japanese force of three heavy cruisers and six destroyers, escorting four transport vessels off Guadalcanal. It led to the almost complete annihilation of the Japanese squadron. The United States lost one destroyer, and the light cruiser *Boise* was seriously damaged. The next night, Japanese warships, including two battleships, shelled Henderson Field, inflicting heavy damage upon its already depleted airforce. Two and one half Japanese regiments landed east of the marines' position. The first American army unit, the 164th Infantry, reached Guadalcanal on October 13. General Vandegrift asked urgently for naval and air support and for one division of troops to regain the lost initiative. The situation on the beachhead remained extremely critical, although the American lines held firm during heavy fighting from October 23 to 27. The Japanese gathered considerable artillery strength and armor, offsetting the only American advantage.

The arrival of reinforcements permitted General Vandegrift to open two drives on November 3. A mixed force of marines and army troops under Brig. Gen. E. B. Seebree, attacking from the west, killed between 3,000 and 4,000 Japanese troops in one week. A push across the Matanikan drove the Japanese farther from Henderson Field. Reports that Japanese transports had been sighted on their way to Guadalcanal caused General Vandegrift to halt his offensive to await the outcome of naval actions.

Succeeding Ghormley, Admiral William F. Halsey took charge of operations early in November. The carrier *Enterprise* and cruiser *Boise* had joined the fleet. The carrier *Hornet* and the battleship *South Dakota* were also in action. The Japanese fleet had been strengthened, but again ships did not come within gun range. The U.S.S. *Hornet* (which had carried the Doolittle raiders to Tokyo) and one destroyer were lost in furious air attacks, and the *Enterprise* and *South Dakota* were damaged. The Japanese lost one carrier and one battleship, and three heavy cruisers were badly damaged.

Air attacks on November 11 and 12 heralded a renewed Japanese drive. An American convoy succeeded in unloading men and matériel on Guadalcanal. Escorting vessels were engaged by two columns of Japanese ships, including two of the *Kongo* class. The Americans lost two light cruisers and four destroyers, and one heavy cruiser suffered hits. On November 13, planes from Henderson Field, assisting the ships, destroyed one of the Japanese battle cruisers. United States warships accounted for one light Japanese cruiser. Another Japanese light cruiser was subsequently attacked and sunk by Tulagi-based PT boats. Still more Japanese were under way. One force, including one carrier, two battleships, one heavy cruiser, and ten destroyers, was off New Georgia. A Japanese transport train of 12 ships, supposed to be carrying about 35,000 men, moved toward Guadalcanal, 200 miles away.

The Japanese suffered heavily in three days of air and sea engagements with a United States task force. The United States force included two battleships, four destroyers, and all available planes. Eight of the Japanese transports were sunk, and only 2,500 Japanese reached shore. Hits were also scored on three Japanese battleships, eight heavy cruisers, six light cruisers, and twelve destroyers, most of which were sunk. A last Japanese attempt to reinforce the Guadalcanal garrison was made on November 30. The convoy was intercepted and severely mauled, with the loss of one United States cruiser. No Japanese soldiers were landed.

On December 7, the marines on Guadalcanal were replaced by army units under the command of Maj. Gen. Alexander Patch. The marines had fought continuously for four months, suffering heavy casualties, but holding their own even under very adverse conditions. No Japanese heavy naval units remained in the vicinity of Guadalcanal, but air attacks on the Americans continued from outside airdromes, one of which, established at Munda in late December 1942, was raided by United States naval vessels on Jan. 5, 1943.

On Jan. 30, 1943, the United States heavy cruiser *Chicago* was sunk by Japanese dive bombers off Guadalcanal, and a United States destroyer went down in the same waters on February 1. These were the last United States naval losses in the Solomons campaign.

The Japanese forces on land were isolated, and their supplies ran low. Late in January, the Americans began to force the Japanese to retreat. Another United States landing was carried out south of Cape Esperance to catch the exhausted defenders between two arms of a pincer.

An attempt by 20 destroyers to rescue what remained of the Japanese forces was unsuccessful. Organized resistance came to an end on February 10, the pincers closed, and the Guadalcanal campaign ended in a complete American victory. The Japanese gave their losses as 16,743, not including naval and air personnel and troops aboard destroyed transports. Total Japanese casualties were at least four times that number.

The Battle of the Solomon Islands gave a foretaste of things to come. Transportation decided the outcome of the war in the Pacific. After the collapse of their long-range transportation, Japanese garrisons on occupied islands, if not dislodged by seaborne attack, were doomed to starvation.

The Battle of New Guinea (Papuan Campaign).—The Japanese landings at Lae and Salamaua on March 8, 1942, and at Finschhafen, 65 miles from Salamaua, on March 10, were not contested by Australian land forces based in the Dutch East Indies and Australian-mandated New Guinea, inhabited by 1,000,000 rather primitive people. The Australians concentrated for the defense of Port Moresby and subjected the invaders to bombing raids, one of which sank one cruiser and six transports. During 1942, the Allies were never able to send more than 31 land-based planes on a single mission over New Guinea.

Established on the northern shore of New Guinea, the Japanese threatened Allied shipping in the Coral Sea and secured their right flank for a drive to the southeast of Australia. Control of Port Moresby, on the southern coast of the islands, would have provided a springboard for the invasion of Australia. In order to open the sea route to Moresby, the Japanese had to establish themselves at Milne Bay, easternmost point of New Guinea. To reach Port Moresby by land, they had to drive across the 13,000-foot Owen Stanley mountain range, site of the world's wildest jungle regions.

Japanese warships sailed from Lae and Salamaua toward Milne Bay to scout Allied positions. Resistance was confined to air opposition. During the spring and early summer of 1942, Japanese air raids hit Port Moresby but failed to destroy its airfields. A land drive from Lae and Salamaua to Port Moresby started on March 19. Even superlatively trained Japanese jungle fighters could not penetrate the wilderness and its crocodile-infested waters. Late in May, the Japanese understood that they would have to use the Kokoda Trail leading from Buna and Gona across the Owen Stanley Mountains to Port Moresby. In July, Japanese troops went ashore in Buna and Gona. New Guinea was within the zone of command of General MacArthur.

Early in August, scouts reported that a Japanese amphibious attack on Milne Bay was imminent. Two Australian fighter squadrons and one Australian brigade were dispatched to the area. On August 25, Japanese transports, under the protection of bad weather, arrived at Milne Bay. Due to Allied air opposition, only 1,500 Japanese reached the shore. The escorting cruiser and one destroyer were damaged, and one large transport and six barges were sunk. Japanese counterblows in the air extended as far as Port Darwin in Australia. The invasion was repulsed.

At Buna and Gona 2,500 Japanese carried out the initial landings, but there were reinforcements estimated at 50,000 men in Rabaul, New Britain. The Japanese were not able to throw more than 15,000 men into the battle for the mountain trail. The Japanese Navy was too busy in the Solomons to take an active part in the New Guinea campaign. This fact, as well as supply troubles on land, restricted Japanese striking power.

The Japanese jungle fighters' ration consisted of some rice and vitamin tablets, to be supplemented by food levies on native villages. Natives were forced to carry supplies for the Japanese. Snipers, with green-painted skull, face, and torso, were equipped with one-man flame throwers and miniature mortars, spearheading the advance. Again the Japanese masterfully employed infiltration and outflanking tactics. Manifold tricks were used to locate Australian positions and to catch them between crossfires. Carrying many times the weight of Japanese food supplies, Australian soldiers were constantly on the alert for Japanese sniping. A daily total average of 300,000 lbs. of supplies was dropped by parachute to the Australians in places marked with white tape stretched across treetops. Between 10 and 50 per cent of them were lost.

The Japanese overland drive from Gona and Buna had a successful start. The Australians were pressed back in a ferocious man-to-man struggle, losing Kokoda on July 21. On September 9, 1942, the Japanese, pouring through a pass 6,500 feet high across the ridge of the Owen Stanley Mountains, arrived in the region of the Myola Lakes, 75 miles from their starting point. Seven days later, the Australians lost Iorabaiwa Ridge, only 32 miles from Port Moresby. The Japanese, however, could no longer find native supplies, and their stores were gone. Not even minimum requirements reached the troops. Australian artillery, using 25-pounders, decimated Japanese ranks. Bombing and strafing, dysentery and malaria further depleted the ranks of the exhausted Japanese.

United States forces, trained in Australia, reached Port Moresby by transport plane at the rate of 300 to 400 a day. Gen. Edwin F. Harding was in charge of American field forces. Australian reinforcements also poured in, and 13-ton tanks arrived. After one week of violent fighting, the Australians recaptured Iorabaiwa Ridge on September 25. The fleeing Japanese were unable to make a stand until eight miles from Kokoda.

The Allied plan, drafted by Generals MacArthur and Blamey, laid emphasis on organization of supplies. Jeeps, native carriers, and planes contributed to rapid transportation. Japanese infiltration and outflanking tactics were studied and improved upon by the Allies. The Japanese were forced to abandon Kokoda on Nov. 3, 1942.

A last ditch stand was attempted in a beachhead from three miles below Buna to a point 17 miles beyond Gona. Its maximum depth was two miles, and in some sectors Japanese lines ran along the shore. The main body of the Allied troops laid siege to Buna. Smaller Australian forces captured Gona on November 24, and moved on seven miles west of Buna. At that time, the attackers of Buna were 1,300 yards from their goal. Japanese marines, taller and stronger than average Japanese soldiers, reinforced the garrison. The defenders had artillery, mortars, and machine guns, and fought with savage determination.

On December 3, Buna's defenses were infiltrated, and the Japanese beachhead split. The remnants of the defenders of Gona were wiped

out, and the Japanese at Buna were hemmed into a tiny fringe of coastal jungle. On December 14, Buna was in Allied hands. Some Japanese continued to fight, and an attempt was made by Japanese cruisers and three destroyers to supply the men. Mopping up operations continued through Jan. 22, 1943, when 725 Japanese were killed and 117 captured at Sanananda (the only prisoners captured in what was referred to as the Papuan Campaign). The Japanese suffered more than 15,000 casualties. Allied losses were about half as large. The threat to Australia was materially reduced, although the Japanese remained entrenched at Lae and Salamaua.

DESERT VICTORY

When General Bernard Montgomery was appointed commander of the British Eighth Army, its strength had about reached its peak. The army then consisted of eight infantry divisions (the British 44th and 50th, the 51st Highlanders, two South African, one Indian, one New Zealand, and one Australian divisions), plus the 1st, 7th, and 10th Armored Divisions. Stronger forces could hardly be deployed between the Mediterranean and the Qattara Depression.

Field Marshal Gen. Erwin Rommel's army received numbers of Mark III and IV tanks and 88-mm. guns but few German infantry reinforcements. The Wehrmacht's High Command needed most of its divisions in eastern Europe, and growing Allied strength in Great Britain had led to the creation of a German mobile reserve army, concentrated close to main traffic centers, to be dispatched to regions threatened by Allied invasion. The German commander considered Italian infantry a poor substitute for German foot soldiers.

Rommel did not expect an early British attack. German Intelligence failed to observe the concentration of British striking forces, and Luftwaffe reconnaissance was equally negligent. Cardboard dummies of tanks and trucks were mistaken for actual columns, and the real vehicles, well camouflaged, were overlooked. Rommel spent most of the early fall of 1942 in Germany, leaving General von Stumme in charge of operations in Africa. German positions were arranged in a pattern which Rommel termed "a devil's garden." In front of the main line ran another, less fortified position, connected with the stronger one by slightly irregular trenches. These trenches were supposed to draw attackers into a trap of cross fire and minefields. Von Stumme deployed his infantry evenly, and Italian battalions were partly sandwiched between German units, called "bodice clasps." Armor was held in reserve positions.

In the early evening hours of Oct. 23, 1942, Montgomery told war correspondents: "The campaign starts tonight. My objective is to move the Germans from North Africa. It may take some time, but this is what we are going to do. I think the battle may well be the turning point of the war."

To sever the Axis artery of retreat, the strongest British forces were concentrated in the highway and railroad sector. Montgomery's sappers and engineers were to open the drive by cutting gaps in the Axis minefields. After the breakthrough was achieved by infantry forces, armor would pour through the breaches to inflict the final blow. When Montgomery addressed the war correspondents, the RAF was already in action, destroying German dive bomber bases at Daba and Fuka and hammering at enemy positions.

On October 23 at 10:00 P.M., a furious 20-minute barrage by 800 guns paved the way for a British push. The British dented the Axis line in the coastal sector. Their advance was slow, however, and General Stumme dispatched the 15th Panzer Division and Italian infantry to counterattack, holding back substantial forces to ward off possible threats in other sectors and to frustrate landings in the rear of the Axis left wing (there were British naval feints near El Baba). Axis counterattacks collapsed, and the British continued to gain ground in night assaults. Their armor was not heavily deployed.

Rommel was back in Africa on October 27. Before his return, General Stumme was killed by a stray bullet and temporarily replaced by Lt. Gen. Wilhelm von Thoma. Rommel hurriedly redeployed the bulk of the Italian and German divisions against the British wedge which was forming along the coast, shaped like a finger, pointing westward. The German commander hoped to squeeze the British finger and then to open a counter-drive along the coast. He rallied his armor, recalling the 21st Panzers from the south, in the vain hope that British armor would attack prematurely and be caught between German pincers. The Axis center and southern wing were almost bared. Owing to faulty reconnaissance, British forces in these sectors were much stronger than the field marshal general had presumed.

Heavy Axis counterattacks failed to dislodge the British wedge. General Montgomery seized the opportunity to attack south of the main coastal highway, and British infantry breached the scantily manned defenses, rushed through the gap, enveloping the panzers to the north. When an Indian division assaulted the Trento and Trieste divisions, the Italians broke. The British 7th Armored Division poured through their scattered lines and, in a wide enveloping move, wheeled northward toward the coastal road and the main Axis supply dumps near Daba. Rommel ordered von Thoma to rally whatever troops he could organize for a defense of his vital line of retreat, but the covering troops, including General von Thoma, were captured.

On November 3, the Axis defeat became a fact, and Rommel could hope to salvage only enough troops to make a stand farther to the west. German troops seized whatever Italian transportation and armor remained intact, abandoning their allies. The Afrika Korps thereby succeeded in escaping complete annihilation. The Italians surrendered by the thousands. Total Axis losses at El Alamein, much higher than British casualties, amounted to 75,000 men, 1,000 guns, and 500 tanks. The RAF hammered at the retreating Germans, and British advanced columns raced on as swiftly as supplies and demolitions permitted. The railroad track was blown up in 40 places by the retreating Germans between El Alamein and Daba, and 67 times more between Daba and Mersa Matruh. On November 23, just one month after the battle began, the British occupied Bengasi.

Montgomery decided to attack El Agheila, but violent storms hampered British deployment. The German 90th Light Infantry Division and the remnants of the 15th and 21st Panzer Divisions, reinforced by a few battalions of panzer grenadiers, were in positions close to El Agheila. On December 12 and 13, the German commander split his infantry into small groups, attaching tanks

to each group, and succeeded in leading his forces through the screen of the advancing New Zealanders before Montgomery's frontal attack got under way. The Eighth Army was again in pursuit, without having annihilated the Afrika Korps. After an advance of 1,000 miles, communication lines were badly stretched, and the RAF had to prepare advanced bases before continuing its support of the ground troops.

British delay raised Italian hopes that the defense of Tripoli, a city of 150,000 and the pride of their vanishing colonial empire, might be successful. The Italian chief of staff, Gen. Ugo Cavallero, after inspecting the district reported in Rome that the situation was virtually hopeless. Rommel was not inclined to risk his forces for Tripoli. He preferred to join other German troops in Tunisia. On Jan. 23, 1943, British armor entered Tripoli. Ten days later, Prime Minister Churchill, Field Marshal Alexander, and General Montgomery reviewed the victorious Eighth Army. Advancing 1,600 miles, it had conquered all that remained of the Italian colonies in Africa, but more battles were ahead to reach the goal proclaimed by General Montgomery on the eve of El Alamein. A continued British drive faced the strong Mareth Line, a system of fortifications built along the frontier between Tunisia and Tripoli to protect French territory against Italian attack.

In early February 1943, extensive changes took place in the Allied command. Maj. Gen. Dwight D. Eisenhower became commander in chief of all Allied forces in Africa, with Field Marshal Alexander as his deputy. Sir Henry Maitland Wilson took over as commander in the British Middle East, and Air Marshal Arthur Tedder became head of Allied Air Forces in the Mediterranean.

Allied Landings in Africa. — When the United States entered the war, it was planned to move United States troops into the United Kingdom. The arrival of American forces in Britain was delayed by lack of men and shipping space and by the urgent necessity of sending 25,000 men to the South Pacific to stem the rising Japanese tide. Late in January 1942, the first convoy of United States troops reached North Ireland. It was not until early that summer that the United States forces in Great Britain exceeded one division in strength. During the month of June, United States Headquarters and an organization for the European Theater of Operations (including North Africa) were set up, with Eisenhower in command.

Early in 1942, a major drive in the southern Mediterranean was planned to coincide with a British offensive from Egypt and Libya. Control of the Mediterranean was necessary before an invasion of southern Europe could be attempted. It was also important to keep Axis submarines out of Vichy-dominated Morocco and Dakar.

In July 1942, an Allied invasion of French western North Africa was definitely decided upon. The operation was called "Torch." Meanwhile, in April 1942, Admiral William Leahy, United States ambassador to Marshal Pétain's government in Vichy, reported to Washington that he did not encourage any hope of a change in Vichy policy. He felt it was inadvisable to give any hint of the prospective invasion to Vichy. Gen. Charles deGaulle's loyalty to the Allies was beyond question, but previous experiences showed that he did not enjoy the confidence of French officers loyal to Vichy.

General Eisenhower, who distinguished himself as a diplomat as well as an organizer and strategist, was faced with the problem of finding Frenchmen willing to cooperate. Under Eisenhower's orders, American Gen. Mark Clark went to North Africa by submarine and gathered the important information that General Alphonse Juin, commanding the Algiers Garrison and Army Corps, was ready to work with French Gen. Henri Giraud, recently escaped from a German prison camp, who was anxious to join the Allies. So great was the need for secrecy that the Frenchmen supporting the Allies were not told of the invasion until four days prior to the date set for it. A British submarine, flying the American flag, cruised along the French Riviera and took General Giraud on board two days before "D-day." The general was transferred from the submarine to a seaplane and arrived at Gibraltar the next afternoon.

Three Allied task forces were formed. One of them, entirely American, sailed from the United States east coast and was to make landings at and near Casablanca on the west coast of Morocco. The second, also American, sailed from Great Britain escorted by British warships. It was to land in the vicinity of Oran in western Algeria. The third, American and British, sailed from Britain to the port and city of Algiers. The combined strength of all the task forces amounted to 107,000 men.

The American task force, formed in the United States under Maj. Gen. George S. Patton Jr., was composed of the 3rd Infantry Division, the major part of the 9th Infantry Division, and the 2nd Armored Division. Its transport train assembled at sea on Oct. 24, 1942. Rear Admiral Henry K. Hewitt was in charge of the convoy. After a successful landing, Patton's task force was to join the second American force at Oran. The latter, under the command of Maj. Gen. Lloyd R. Fredenhall, consisted of the 1st United States Infantry Division and part of the 1st Armored Division. General Fredenhall's troops were to seize Oran and surrounding air bases, and to establish contact with the eastern task force under the command of British Lt. Gen. Kenneth A. N. Anderson. Gen. Mark Clark, as Eisenhower's lieutenant, went with the Anderson army, formed of British commandos, infantry units, and two United States regimental combat teams from the 9th and 34th Infantry Divisions. This force was to carry out a lightning thrust into Tunisia. The second and third task forces left Great Britain on October 25. Their convoys, 850 transports and warships, concentrated at Gibraltar. Axis agents at Spanish La Linea and Tangier watched the ships. In less than a quarter of an hour, Berlin learned every detail except the destination. Axis submarine flotillas were alerted.

November 8 was D-day. At 1 A.M., in a broadcast to the French people, President Roosevelt asserted that the Allies sought no territory and asked for cooperation. Pétain was informed of the Allied decision to liberate France. The marshal's government, headed by Pierre Laval, countered by breaking relations with the United States. The Spanish government was told that operations under way were not directed against the Spanish people, Spanish possessions, or the Spanish government. General Eisenhower announced that General Giraud would be responsible for civilian and military affairs in French North Africa. Giraud broadcast pleas for French cooperation in which General deGaulle joined, despite his personal disappointment and unfriendly relations with Giraud.

Algiers surrendered to the Allies on November 8. Oran followed two days later. At Casablanca, Patton's task force ran into determined French opposition. Heavy fighting close to Spanish Morocco could result in Spanish-American incidents which the Allies were most anxious to avoid. Attempts to negotiate with French commanders were futile, and General Patton announced that he would open the assault on November 11.

In Algiers, the Allies found Admiral François Darlan, who was not acceptable to Britain because he had been one of the leading anti-British personalities in Pétain's cabinet and was considered responsible for the refusal of the French Fleet to join the British in June 1940. Darlan asked to be appointed as the highest authority in French North Africa in return for his support. A provisional deal with the admiral, made by Clark with Eisenhower's consent, stunned the British Cabinet. It led, however, to the cessation

of resistance in Casablanca. After November 11, when the Germans moved into unoccupied France, Pétain was no longer a free agent, and Admiral Darlan became his legal successor in the eyes of many French officers in North Africa. This changed the British government's attitude, and Darlan's appointment as head of a provisional government for French North Africa was no longer opposed. General Giraud was compensated with an assignment as commander in chief of French ground and air forces in that region. Admiral Darlan was assassinated six weeks later.

On November 13, General Eisenhower and British Admiral Cunningham, the latter in charge of Mediterranean naval operations, arrived in Algiers for parleys with General Clark, Admiral Darlan, General Giraud, and other ranking French officers. The French informed Allied negotiators that they would accept Darlan's leadership only. Darlan was recognized as the supreme French authority in Northwest Africa. French West Africa, including the key base at Dakar, joined the Allies on November 24.

In Tunisia, the small French garrison failed to resist German infiltration, and French Resident General Esteva's attitude was controversial. The "Darlan deal" thus fell short of its objective of keeping the Axis completely out of French North Africa. President Roosevelt, in a press conference on November 17, said that "the present arrangement in North and West Africa is only a temporary expedient, justified solely by the stress of battle." An appeal issued by Darlan, urging the French fleet in Toulon to join the Allies, had no effect.

German Occupation of Continental France.—The Vichy government discharged Darlan and called upon its African forces to resist the Allies. Following an emergency meeting between Vichy Premier Laval and Adolf Hitler, a message from the German führer was broadcast to the French people on the morning of November 11 stating: "to prevent further British-American aggression against French territory, German troops have moved into unoccupied France." Pétain's protest was dismissed as a "legal formality." The German march into France was carried out almost without incident. Italian troops occupying Corsica, however, had considerable difficulty in subduing local patriots. According to the Laval-Hitler deal, the French Fleet and the naval base of Toulon were to be left under French control. On November 17, Pétain ceded most of his powers to Laval, who appealed unsuccessfully to his countrymen to create an African Falange and to assist Hitler in his drive to conquer French North Africa.

Admiral Jean de la Borde, commander of the French Fleet, did not refuse to join the Allies because of anti-British or pro-German feelings, but because his vessels were not ready to sail. Axis submarines kept Toulon under guard, and German long-range guns were aimed at the ships. On November 27, in a letter to Marshal Pétain, Hitler claimed that de la Borde had issued orders on November 12 not to fire at Allied forces if they attempted to land. Hitler also announced that von Rundstedt would occupy Toulon to prevent French naval vessels from leaving. Before the Wehrmacht could act, French sailors and soldiers, under the fire of the infuriated Germans, scuttled and blew up most of the ships. Only 25,000 tons out of 220,000 tons of warships fell into German hands.

The Tunisian Campaign.—There were no Axis troops in Tunisia when the Allies landed in North Africa, and Tunisia was a vital objective for both sides. If the Allies could occupy it first, the retreating Afrika Korps would be trapped, and the war in Africa would be practically over.

The Axis had several advantages in the race for Tunisia. The Germans and Italians, operating from Sicilian bases, controlled the air over Tunisia as long as there were no Allied bases in Algeria and the desert air force was still far away. Axis land forces in southern Italy and Sicily outnumbered the Allied invaders of North Africa and could be safely transported across narrow waters as long as they were protected by an air umbrella. But if the Allies were to occupy the key cities of Tunis and Bizerte, Axis landings would be bound to fail.

General Anderson's so-called British First Army amounted actually to slightly less than one division in strength. The skeleton British forces and a few United States units were reembarked from Algiers for Bougie. They landed there on November 11, and parachutists, ahead of the main column, occupied Bône on November 12. French troops from Algiers were called upon to cover the southern flank of the Allies advancing along the coast, and to take airfields in the region of Tebessa and Gafsa, the latter being inside southern Tunisia.

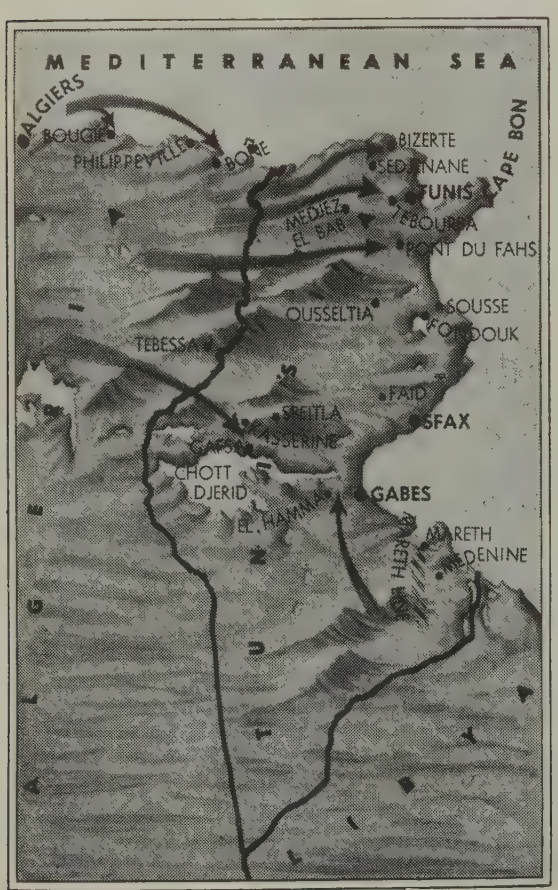
German General Nehring, arriving in Tunis by plane, organized an improvised German force. Ju-52 troop carriers brought in German panzer grenadiers by air. On November 18, Nehring asked that all French military and naval installations in Tunisia be handed over to him. Although Resident General Esteva refused the demand, no resistance was offered to the subsequent German seizure of military assets at Tunis and the big naval base of Bizerte, including the only French all-weather airfields in North Africa. Bombers, fighter planes, and troop carriers poured into these airfields. The Luftwaffe in Sicily concentrated its raids on Algerian harbors. German reinforcements also arrived by ship. The 10th Panzer Division, refitted after service in Russia, was sent into Tunisia. Colonel General von Arnim assumed command.

On November 25, the Allies pushed through the village of Tebourba in the direction of the hills of Djedeida, only 12 miles from the city of Tunis, where the advance was halted. Von Arnim counterattacked, making use of his 88-mm. cannon, heavy mortars, tanks, and the Luftwaffe's supremacy. In seven days of fighting, the Allies were pushed back toward Medjez-el-Bab, 20 miles west of their farthest point of penetration. Allied progress toward Bizerte was stopped by German infantry, tanks, and artillery at Jefna, 32 miles southwest of the naval base. To the south, where United States parachutists and French infantry were operating in the Gafsa-Sbeitla area, the Germans were able to prevent the Allies from reaching areas important to the regroupment of Rommel's army after it retreated to Tunisia. Early in December, the Allied attempt to overrun Tunisia had definitely failed. Arnim's army, three divisions strong and constantly reinforced, held a solid bridgehead covering Tunis and Bizerte. The bridgehead extended beyond Sousse, Sfax, Gabes, and the Mareth Line on the coast, and inland from Medjez-el-Bab to Ousseltia and the Tunisian border southwest of Kasserine toward

the salt lakes of Chott Djerid. The salt lakes lay between the onrushing British Eighth Army and Allied North African invasion forces. German short wave broadcasts beamed to the United States sarcastically bemoaned the fate of the poor inexperienced American boys whom the superior German soldiers were forced to kill.

While the British Eighth Army regrouped opposite the Mareth Line, Rommel's and Arnim's forces regrouped in Tunisia. The 15th and 21st Panzer Divisions were reformed, and their equipment now included the 56-ton Mark VI Tiger tank, protected by 4-inch armor and carrying an 88-mm. cannon and two heavy machine guns. The German 90th Light Infantry, augmented early in February by German parachutists, the Hermann Göring Division, Young Fascists, San Marco Marines, Bersaglieri, and the reorganized Ariete and Trieste divisions, increased the strength of Axis forces in Tunisia to 250,000 men. The German High Command, fully aware of the possible consequences of Allied victory in Africa, was anxious to prevent or at least to postpone it indefinitely.

Rommel, Arnim's senior in rank, chose to launch a blitz attack against Allied invasion armies while holding the Mareth Line with a screening force. Kasserine Pass was a critical spot in the Allied line. If the Germans could penetrate Kasserine Pass, the road to the vital communication hub of Tebessa would be open. With Tebessa lost, communications between the Allied forces in northern Tunisia and in southern and central Tunisia would be severed. Moreover, flanking drives from Tebessa toward Bône, Philippeville, and Bougie would threaten Algiers. Tebessa had to be won before Montgomery was ready to attack.



On February 14, Rommel threw his best troops into the drive at Kasserine Pass. At Sbeitla and Sidi bou Zid, American guns were overrun, United States armor fell back, and United States infantry, deprived of cover, had to give ground. Many prisoners were taken by the Germans. Faid, Gafsa, and Fériana, including two forward airfields, were taken, and the Germans poured through Kasserine Pass. On February 21, they were 21 miles beyond the gap and almost within sight of Tebessa. The British 6th Armored Division and the Guards were rushed into the breach. The Allies suffered substantial losses, most of which were borne by the United States 1st and 34th Divisions, but the Germans, too, were weakened. The Allied air force, growing in strength, bombed and strafed Rommel's legions, and ground resistance stiffened. Before reaching Tebessa, Rommel broke off his attack. To prevent the Allies from pressing the pursuit, Arnim launched heavy drives against the British in the Medjez-el-Bab sector. The drives gained ground in the direction of Beja but did not seriously endanger the Allied line.

While the British Eighth Army finished its preparations for attack, and Rommel withdrew to Fériana and Gafsa, the invasion forces and their French supporters regrouped. Three British divisions were deployed in the north, two French divisions in the center, and two American divisions in the south. Additional forces, mostly American, were moving toward the front.

On March 5, 1943, Rommel told his troops that, if they failed to capture British supply dumps at Medenine and to force the Eighth Army to withdraw, the days of the Axis in North Africa were numbered. In a surprise attack on March 6 against Montgomery's forces, the Germans pressed from Mareth toward Medenine. The offensive failed. German armor sustained heavy losses in British tank traps.

Montgomery's offensive opened on schedule. The General planned to breach the Mareth Line close to the coast, where it was strongest. The 50th (Northumbrian) Division, assigned to the task, was to penetrate Wadi Zigzau. A flanking drive by New Zealanders around the opposite end of the Mareth Line was aimed to hit the Germans from the rear.

During the night of March 16, a shattering barrage paved the way for the Northumbrians' attack. In three days of heavy fighting, the British advanced to the Wadi. On March 22, counterattacks, in which the 15th Panzer Division was engaged, stopped the 50th Division. On March 24, the British lost their foothold inside the Mareth Line, but the New Zealanders' advance, overcoming unexpectedly strong Italian resistance, reached El Hamma, beyond the salt lakes and 20 miles southwest of Gabes, after a 200-mile march. When Rommel switched his panzers to attack the New Zealanders, Montgomery threw in most of his tanks to counter the German blow while the 51st and the Indian divisions attacked the Matmata Hills, running parallel to the sea toward El Hamma. The hills were cleared with the aid of the desert air force, and the panzers suffered defeat at El Hamma. On March 27, the inland anchor of the Mareth Line was unhinged, and the German armor retreated to Gabes. Again Rommel used all the vehicles he could gather for

the transportation of the Germans and left the Italians behind.

Meanwhile United States forces moved toward Gafsa, El Guettar, and Maknassy. After the thrust at Maknassy was halted, the Americans concentrated on El Guettar, where General Patton's 1st Division was only 75 miles from the nearest Eighth Army forces. On March 23, the 10th Panzer Division counterattacked at El Guettar, but was repulsed with the loss of 40 per cent of its tanks. The U.S. 9th Division joined the American drive. On April 7, 1942, southeast of Gafsa and 20 miles inland, patrols of the 9th established contact with the Eighth Army. The Battle of North Africa entered its final stage.

In the north, the British First Army opened a drive toward Longstop Hill, main obstacle on the road to Tunis, on April 9. Progress was slow, but it prevented von Arnim from reinforcing the southern sector of his box-shaped front. After the fall of the Mareth Line, Rommel left North Africa, and Arnim took charge of all Axis forces. Field Marshal Alessandro Messe was the Italian field commander.

On April 8, the remaining bolt positions in front of the Eighth Army crumbled, and the British wheeled rapidly northward. The British 6th Armored Division, equipped with Sherman tanks, British Guards, and Hampshires joined the Americans and French in the sector of Fondouk in order to break through toward Kairouan and the coastal plain beyond. The Allies by now had many more tanks than the Germans, and this region was an ideal maneuvering ground for them.

According to Gen. George Marshall's report, the desert air force and the United States 9th Air Force under Gen. Lewis M. Brereton provided a classic example of the best strategic and tactical use of air power. The air forces not only supported the advancing Allied armies but also pounded enemy reinforcements still pouring into Tunisia. During a two-week period, 147 Axis transport planes and 31 Axis vessels of various sizes were destroyed or damaged by air attack.

Fondouk, Kairouan, and Sousse fell to the Allies. Thirty miles north of Sousse, the Axis made a stand in a rocky area where tanks were of little use. New Zealanders, Guards, and Indians attacked but made little progress against determined Italian resistance. After three days of preparatory thrusts, the Allies again attacked Longstop Hill. The slopes were heavily mined and fortified, but the hill was taken on April 27.

The United States 2d Corps (three divisions) advanced into the sector north of Medjez-el-Bab around Sedjenane, and the French, using British tanks and United States trucks and jeeps, drove into the Pont du Fahs gap. Three British, one Indian, and one armored divisions, mostly drawn from the Eighth Army, pushed through the Medjerda Valley. On May 3, the United States 1st Armored Division broke into Mateur, 20 air miles from Bizerte. Four days later, the Americans captured the naval base and, on the same day, the Medjerda drive reached Tunis. The trapped Axis forces surrendered on May 9.

Fanning out from Tunis, British forces raced through Cape Bon Peninsula, brushing aside remnants of Axis armor. The French 19th Corps, after taking Pont du Fahs, joined with the Eighth Army, reduced to three divisions in the process of regroupment, in another drive for Cape Bon. What was left of the Axis armies, threatened from flank and rear, made a disorganized retreat. German morale was low during the last days of the battle, but discipline remained firm. Entire units, under the command of their officers, marched in perfect order into prisoner-of-war cages. The last shot was fired on May 12, 1943. Colonel General von Arnim was among the 252,145 prisoners taken in the general surrender. The last Axis general to capitulate was Italian Field Marshal Messe. United States casualties in North Africa amounted to 18,558, of which 2,184 were killed.

The Casablanca Conference.—From Jan. 14 to 26, 1943, parleys were held in Casablanca among President Roosevelt, Prime Minister Churchill, and the Combined American-British Chiefs of Staff. Agreements reached in the military field covered the coming invasion of Sicily, air operations over Europe, ship tonnage allotments, convoy movements, and naval dispositions. Operations in the South and Southwest Pacific and the problem of sending war matériel to China were discussed.

Reverse lend-lease, an innovation adopted at Casablanca, was disclosed in the official report by General Marshall on Aug. 8, 1943. This agreement bound the other Allied nations to furnish supplies, services, facilities, and patent rights to the armed forces of the United States without cost. The most important single contribution of reverse lend-lease in the war effort was its saving in shipping requirements. Reverse lend-lease also reduced the demands on the United States for raw materials, productive facilities, and manpower. In the fiscal year of 1943, 1,500,000 tons of various goods were provided to United States forces stationed in the United Kingdom in addition to large quantities of construction materials. In Australia and New Zealand, American forces obtained almost all of their food requirements locally. In the Middle Eastern theater, the British provided United States forces in the area with all maintenance requirements. No other contributions by allied nations were listed in the report.

General Giraud and General de Gaulle met in Casablanca, but the meeting did not improve relations between the two. The most momentous decision taken at Casablanca was the acceptance of the formula that the war would be terminated only on the basis of unconditional surrender by the Axis. When adopted, this decision had not been made by the United Nations but by the two powers represented at the conference. Its scope was widened nine months later at the Moscow Conference when it was included in the Declaration of General Security issued by the representatives of the United States, Great Britain, the USSR, and China.

It was claimed by advocates of a negotiated peace with the Axis powers that the unconditional surrender formula prolonged the war. This claim, however, was not justified by events. The Casablanca decision did not keep Italy in the war in 1943. After a brief inquiry, it was accepted by the Japanese in 1945. The Germans sneered at the formula when it was made public. The Reich still believed in victory.

THE CONTINUED RUSSIAN OFFENSIVE 1942–1943

The Red Army deployed strong forces to the north of well fortified Voronezh. In the south, Rostov was built up as an anchor for the Red lines. Strong Russian forces were massed in and to the north of Rostov

Between the Rostov and Voronezh sectors, however, Red armies were disorganized by Marshal Timoshenko's unsuccessful drive. Thorough regrouping was needed to stem a German offensive. To gain a decisive victory, the Wehrmacht would have to pierce the Russian center before it was consolidated, and then eliminate both anchors.

Between June 15 and 20, 1942, strong German concentrations were observed in the triangle of Orel-Bryansk-Kursk and on the railroad system around Stalino. Field Marshal Gen. Fedor von Bock, temporarily suspended from command after his failure to take Moscow, was again in charge of the German drive in that sector. His group was made up of 40 German infantry divisions, 17 Rumanian, Hungarian, and Italian infantry divisions, 18 panzer divisions, and 8 motorized divisions. To the south, Field Marshal Gen. von Schwödler's army group prepared to attack after the arrival of some of Mannstein's divisions from the Crimea.

On June 22, Bock's attack from the Donets bridgehead at Izyum opened before the Russian center could regroup. The Wehrmacht's tactics were again based on the Luftwaffe-panzer-motorized infantry team. More than 2,500 German planes were in action, outnumbering the opposing Red Air Force. The Germans captured the railroad junction and supply base of Kupyansk. Three days later, another blow fell at Kursk. The German Second Tank Army and von Weich's army, overcoming Russian resistance, advanced toward the Don on July 1. On July 2, the center of the Russian southern armies was pushed back when von Bock's third thrust opened between Byelgorod and the Oskol River and gained ground rapidly.

On the left flank of the attacking Germans, the battle did not develop according to the Wehrmacht's plan. The German panzers, followed by motorized infantry, bridged the Don at Voronezh and penetrated into the western part of the city only after most stubborn fighting, which did not disorganize Russian lines. Between July 6 and 7, their slow advance was halted by Russian counterattacks, supported by new tanks and mobile guns. Ten days of violent struggle followed. The Germans were unable to resume their advance and were forced to yield some ground. Panzer losses were high, and von Weich's army suffered substantial infantry casualties. Von Bock called on satellite divisions to dislodge the Russians from Voronezh, but their attack was repulsed, and the original plan was changed. Narrowing the scope of his operations, he abandoned efforts to take Voronezh, concentrated on the southern sector where progress continued and the Russians abandoned Rostov.

The Red Army High Command made a momentous decision. The central southern armies could not be reorganized without giving up much valuable territory. Time was more important than space. The Red forces maneuvered out of Rostov were intact. Some of these troops were pulled back to the approaches of Stalingrad; others were dispatched to prepare the defense of the Caucasus along the Kuban River. Vital farming and coal mining areas were scorched, and oil resources came within range of the German drive.

Late in July and during most of August, von Bock's campaign was reminiscent of the earlier blitz. Only momentarily delayed by Russian rear guards, the German Fourth Tank Army and the German Sixth Army drove on Stalingrad. A lull continued at Voronezh. If the Germans should fail to take Stalingrad and to stage a flanking attack on the Russian Army in the Voronezh sector, they would be outflanked themselves by this substantial force. Von Bock took the risk because of his confidence that he would reach his goal. Besides, despite the speed of the advance, time was running short, and Bock dreaded another winter campaign.

The Siege of Stalingrad.—Russian forces concentrated at Stalingrad. Battered divisions of Timoshenko's central group and the undefeated troops from Rostov arrived. The city's strategic importance was due to its geographical position on the Volga. The river was a vital artery for supplies from the Caspian oil regions and lend-lease goods coming in from Iran and, equally important, for communications between Russian Caucasian and Transcaucasian forces and Red armies farther to the north. The loss of Stalingrad, situated on the west bank of the river, would have hampered but not completely cut off Volga traffic. Large islands used as stepping stones would permit emergency shipping on the Volga, even with the city in German hands. A railroad line, linking Astrakhan on the northern shore of the Caspian Sea with the interior of Russia, ran east of the Volga. Once they were established in Stalingrad, the Germans would have been able to bomb the railroad and the remaining shipping lanes incessantly.

In the summer of 1942, von Bock's intention to make Stalingrad a base for a continued drive to knock the Soviet Union out of the war, before the Western Allies could build up sufficient strength for an attack on the European continent, increased the importance of the city's fate. Most of the defending Russian forces, numerically almost equal to the onrushing German and satellite troops, were deployed in the western approaches of Stalingrad. Strong points were established on the edge of the city. The residential sectors in the west and the center were adapted for block-by-block defense. The eastern industrial section, along the river including steel and cement buildings, was to become the nucleus of the improvised fortress. Long-range artillery was established on the Volga islands and to the east of the river.

A delay in the German advance was needed to complete preparations. Substantial Red forces contested German crossings of the Don in the eastern section of its big bend. The impact of the onrushing Wehrmacht shattered the Russian lines. The Russians suffered heavy losses and had great difficulty in preventing a breakthrough and consolidating their lines in the outskirts of the city.

The Germans massed armored forces southwest of Stalingrad. Russian armor thrown into the battle beyond German-occupied Kotelnikovski was unable to stem their advance. German tank groups, ranging from 100 to 250 vehicles backed by two to three infantry divisions, hammered the Soviet lines. Von Bock's columns northwest of the city crossed the Don at Kalach and advanced to within 10 miles of Stalingrad.

Between September 9 and 12, the Germans methodically pressed through the western outskirts of Stalingrad toward the main railway station in the center of the city. Soviet mobile reserves stationed east of the Volga staged nightly counterattacks. German bombs reduced most residential sections to rubble, but heaps of rubble covering intact cellars proved to be ex-

cellent shelters for the defenders. Russian morale was high. The German soldiers, too, were confident, and their command was determined to take the city at almost any price. The strategic value of Stalingrad was overshadowed by the moral importance of its capture or successful defense. It was widely and wrongly assumed that the fall of the city might bring the Russian campaign to a close.

After September 15, the battle did not rage block by block but actually building by building and floor by floor. On September 22, the Germans reached the center of the city and on September 26 invested the factory district. A serious crisis developed the next day when the Iron Heights, commanding the river, were captured by Wehrmacht units. Russian Lt. Gen. Vassilii Chuikov, in charge of the staggering defenses, called on a guard division, stationed east of the Volga. After crossing the river, the guardsmen retook the Iron Heights on September 29.

German shock troops reached the Volga's right bank north of the Orlovka factory district, while small gains were hammered out inside the city in the region of the main railroad station, the tractor works, and the steel works.

October 4, 7, and 14 were considered by the defenders to have been their hardest days. In a broadcast, Hitler boasted that no power on earth could dislodge the Germans from Stalingrad. More soberly worded, a German official communiqué stated: "With the attainment of the strategic objective, i.e. the capture of the nucleus of the city and the breakthrough to the Volga, the rest of the city no longer has to be stormed. It will be systematically laid waste by heavy artillery and Stukas."

Actually, the original German strategic ambitions went far beyond the capture of Stalingrad, and not even the capture was fully achieved. Traffic on the Volga continued, and although most of the city was captured, it offered no base for another offensive. Once again the German drive lost momentum, while the shaken Russian lines remained unbroken. Another recoil was to be expected. The German lines in and around Stalingrad formed a precarious wedge, increasingly vulnerable to Russian flank attacks.

On October 14, immediately after repulsing the German assault, the Red armies were in no condition to block a planned German retreat beyond the Don bend. Such a retreat would have created a fair defensive position for a winter campaign. But the Wehrmacht could not voluntarily withdraw from a place where—according to the führer and supreme commander—"no power on earth could dislodge it." Colonel General von Paulus (later promoted to field marshal general) took charge of German and satellite forces in the Stalingrad sector.

In the extreme south, the necessity for abandoning Rostov called for changes in the Soviet defense plan. Farmlands and oil regions had to be sacrificed before the German drive could be stopped. The Caucasian Mountain range runs across an isthmus between the Black Sea to the west and the Caspian Sea to the east. Its foothills along the Black Sea coast were not insurmountable to a determined drive by substantial forces. A two-pronged drive, north and south of the Caucasian range, would not only threaten Russian oil supplies but also the northern approaches to the British Middle Eastern lifeline. A Soviet Transcaucasian Army was in readiness to defend the vital regions. Beyond the Russian border, tiny British forces were hardly capable of holding the Middle East if the Russians were overrun.

On July 27, troops of Field Marshal General Mannstein's army swept beyond the Don past evacuated Rostov, with General von Kleist's panzer army spearheading the advance. Other units of von Mannstein's army, including Rumanians, crossed the undefended Kerch Straits. The Wehrmacht occupied Voroshilovsk on August 4 and reached the Kuban River, between Nevinnomissk and Kropotkin, the next day. Russian troops at Krasnodar, threatened from the east, prepared to abandon the city. The Wehrmacht came in sight of the Maikop fields, source of a relatively small part of Caucasian oil production. On August 8, Soviet troops wrecked and evacuated the Maikop installations.

After many successes, on August 20 the Wehrmacht entered Krasnodar. It was a difficult problem to supply the numerous German panzers with fuel, as stores and refineries had been wrecked, and transportation was poor. Many German tanks ran dry, and on August 25, the German drive came to a complete halt for lack of fuel.

After reaching Novorossisk on September 10, the southern prong of the German drive bogged down in the face of stiff resistance by advanced units of the Red Transcaucasian Army. The northern prong seized the terminal of the Sukhumi military highway, and German Alpine Chasseurs planted the swastika at the top of Mount Elbrus (18,564 feet), the highest Caucasian peak.

In late September and early October, no more than two of von Kleist's divisions on the Terek River could continue the drive to the Grozny oilfields, because of lack of fuel. The season was too advanced for a continuation of the offensive, but in the Caucasus, as at Stalingrad, German considerations of prestige prevailed over those of safety. Instead of taking up defensible positions to the rear, the German armies attempted to drive across the Caucasian range late in October, far to the east of their deadlocked forces at Novorossisk. Nalchik was occupied by German motorized troops and Rumanian infantry, but further progress was halted by Russian resistance.

A German advance toward Ordzhonikidze, terminal of the Georgian road, ran headlong into Soviet forces preparing a counterblow. The Wehrmacht suffered a severe defeat at Ordzhonikidze. The Mannstein Twelfth Army, the Seventeenth Army, the First, and most of the Second Panzer Army reeled back in disorder, abandoning much matériel.

Official reports of losses were propaganda claims on both sides. The Russians put German casualties at 450,000 a month. The Germans reported the total of Russian prisoners since June 22, 1941, as 4,909,412, plus Soviet losses of 28,622 tanks, 24,750 planes, and 44,461 guns. Actually, casualties in the summer of 1942 seem to have been below those suffered and inflicted in the first summer campaign. They were, however, at least as hard to bear in view of the heavy strain on manpower and production.

By Nov. 7, 1942, Russian preparations for a winter offensive in the Stalingrad sector were complete, and the Wehrmacht was in full retreat in the Caucasus. Marshal Stalin, in a public address, again urged the establishment of a second front in Europe as "no less needed by our Allies than by us." He made it very clear that

Russia did not feel that Allied landings in French North Africa were adequate to the occasion. The situation of the German armies, according to Stalin, would be very bad if a second front could divert 60 German and 20 satellite divisions.

The Dieppe Raid.—Small units were selected from young British soldiers, including some men from the small Allied countries, trained in warfare to combine primitive ruses with modern weapons. These men were called commandos. Later, similar units, called rangers, were formed in the United States Army.

The commandos occasionally raided the coast of occupied France during the winter of 1941–42. A spectacular action took place on Feb. 27, 1942, when commandos, outwitting the SS (German Elite Guards) at Bruneval, France, destroyed a radio detecting station.

On March 28, a combined land and sea commando raid was successfully carried out at St. Nazaire. Submarine pens in St. Nazaire's harbor had not been demolished by RAF bombs. The old destroyer HMS *Campbeltown,* steaming into port past German vessels, rammed the lock gates. Five tons of high explosives with time fuses were under the deck. Commandos swarmed ashore and inflicted damage on installations and docks before the garrison recovered from its surprise. French civilians assisted the Britishers, some of whom escaped capture by making their way to Spain. The explosive charges blew up with devastating effect while a German commission was on board the *Campbeltown.*

Russian calls for the opening of a second front in Europe could not be met in the summer of 1942, but a costly effort was made to induce the Wehrmacht's command to rush men and supplies to the west which otherwise might have reached the German armies in the east.

On August 19, 1942, before dawn, a force of 5,000 Canadians and 2,000 British, plus a few United States Rangers and Free French soldiers, was shipped to the French coast in barges protected by British corvettes, Free French destroyers, and Polish destroyers. An air umbrella was provided by 1,000 planes, most of them from the RAF, but including some United States Army Air Force craft, and Polish, Czech, Norwegian, and Free French pilots. The goal was Dieppe on the Channel coast. A 3:30 A.M., a German tanker escorted by five trawlers sighted the approaching armada. The surprise element was eliminated, but the Allies continued on their way. Their equipment included light artillery and tanks; heavy naval guns were not available. The Germans were alarmed in time to man their defenses, including pillboxes, road blocks, and a heavily fortified sea wall. The Luftwaffe intervened in strength. Allied preparatory bombing failed to destroy German airbases and wrecked only a few of the coastal guns.

A withering fire met the attackers. Many of their tanks did not reach shore and those which did were destroyed before they could open fire. While the fight was under way, the British Broadcasting Corporation radioed a repeated warning to the French patriots: "This is not an invasion! Do not help them! It's only a raid! Do not betray yourselves to the Germans!" The fortified Casino in the lower town was occupied by the raiders, but because of unabated German fire and dive bombing, their position rapidly deteriorated. After nine hours, the raid collapsed. Canadian casualties amounted o 170 dead, 633 wounded and 2,457 missing. The other Allies suffered less, but a total of more than 50 per cent of the raiding force was lost. The survivors were evacuated to Britain, leaving most of their equipment behind. The Allies lost 98 planes against 92 for the Germans. The paramount lesson of the ill-fated raid was that an invasion could only be carried out with full control of the air and overwhelming firepower.

Russian Winter Campaign. — Saratov became one of the most important centers for Russian reserves preparing a counterdrive against the Germans in the Stalingrad area. The railroad between Astrakhan and Saratov carried supplies where German air interference was negligible. In the Stalingrad sector, von Paulus had four panzer, three motorized, and fourteen infantry divisions, with substantial artillery and technical troops. Six German divisions held bolt positions in the region of the great Don bend. The defense of Luftwaffe bases and their approaches on and beyond the right bank of the Don was entrusted to satellites—Rumanians, Hungarians, and the Italian Eighth Army under General Gariboldi. Satellite forces also covered the two railroads linking Stalingrad with the west. Most German panzer divisions were in the process of reconditioning. Many Luftwaffe squadrons were transferred to the Mediterranean theater in November 1942. Twelve German infantry divisions from Russia moved to the west to prevent an invasion of southern Europe if the Allies should win the race for Tunisia.

The Russian winter offensive was organized by Marshal Georgi K. Zhukov, in cooperation with Generals Konstantin Rokossovski, Andrei I. Yeremenko, and Filip I. Golikov, with Gen. Alexander M. Vassilevski acting as chief of staff. The plan was to cut through the flanks of the German Stalingrad wedge, to encircle von Paulus' army, and to open a breach through which the Red offensive could carry on in the west.

The offensive opened on Nov. 19, 1942. On November 21, Rokossovski's armor crossed the Don at Kalach and reached the railway, 45 miles west of Stalingrad to the rear of Field Marshal Gen. Friedrich von Paulus' forces, within 24 hours. Gen. Nikolai F. Vatutin's forces virtually annihilated the Rumanians on Paulus' left wing and on November 22, broadened the Russian front along the northern railroad.

South of Stalingrad, supplies had to move across the Volga River, which was not solidly frozen when the drive began. The Red Army pierced the Rumanian lines on November 20 and cut the southern Stalingrad railway in three places within two days. Until November 25, the Rumanian Army of 8 infantry and 7 cavalry divisions lost 65,000 prisoners. Yeremenko from the south and Rokossovski and Vatutin from the north pressed toward a junction west of Stalingrad.

There was still a chance for Paulus to pull out of the city and break through in the direction of Kotelnikovski until November 27, when the Russian pincers came close enough to a junction to trap retreating German forces. The Germans, still holding on, hastily improvised a covering force to the west.

On November 28, the Russian ring closed around Stalingrad. Twenty-one German and two Rumanian divisions, all of them understrength and some of them parts of the defeated armies north and south of the city, were trapped. Land

communications were severed, and German supplies ran low.

Field Marshal General von Mannstein was put in charge of a reserve force of 150,000, including three German panzer and two Rumanian cavalry divisions massed in the Kotelnikovski sector. Mannstein planned a drive against Russian vanguards 30 miles west of the Stalingrad ring, in the early days of December. Paulus was to attack in the opposite direction, but his push started prematurely. When Mannstein launched his drive on December 10, the attempt by Paulus to break out had already failed. Mannstein advanced toward Abganerovo, but he did not break through.

On December 16, the Russians regained the initiative. General Vatutin's right flank successfully attacked on the upper Chir River, and the Red Voronezh group opened a major offensive. On December 17, General Golikov's mobile forces crossed the Don, captured Kantemirovka, and routed the Italian Eighth Army. General Mannstein hurled reserves into the breach opened by the Italian defeat, but the Germans were unable to continue the offensive toward Stalingrad or to prevent another Italian disaster. Gariboldi's army disintegrated, losing 60,000 prisoners. Russian armor engaged Mannstein's panzers on December 24. After three days of fighting, Kotelnikovski fell to the Russians, and Mannstein lost 25,000 men killed and captured in addition to 500 tanks. Red forces, advancing toward Tsimlyanskaya through the lines formerly held by the Italian Eighth Army, took Chertkova and encircled Millerovo.

In six weeks of fighting in the Stalingrad and Don sectors, the Germans and their satellites lost approximately 300,000 men, 2,000 tanks, and 4,000 guns. The remnants of Paulus' army were doomed. Twenty-five divisions of German troops marching back from the Caucasus had to be reorganized before joining the battle on the main front.

The German High Command decided (this decision was taken by professional officers rather than by Hitler who remained silent for a long period) to shorten the front and to abandon areas the defense of which could lead to disaster. German bulges at Demyansk and in the Rzhev-Vyazma sector were gradually evacuated without Russian interference. Two new German forces of 40 divisions were formed: one to hold a line running along the Dnieper River from Kiev to Kremenchug if the Russian offensive should penetrate that far; the other to open a counter-drive when Soviet communications became strained.

The Russians entrusted the liquidation of the Germans in Stalingrad to Generals Rokossovski and Chuikov. Two representatives of the supreme command, Marshal N. N. Voronov and General Vassilevski, acted as their advisers. On January 8, Paulus rejected a demand to surrender his exhausted garrison of 80,000 fighting men and an almost equal number of auxiliaries. A Russian assault, opening from the south on January 10, tightened the strangling vise; on January 20, the Russians inside the city joined the drive from the east. Five days later, Paulus' fighting forces were reduced to 20,000. On February 2, at 4 P.M., the remaining defenders surrendered, including their commander and 23 German and Rumanian generals.

The victorious Soviet armies from Stalingrad were unable to join the battle for the Donets in time to win an even more spectacular victory. During January, inadequacy of transportation still impeded the advance of Gen. Ivan I. Maslennikov from the Caucasus. The Russian Caucasian Army lost contact with the enemy. General Yeremenko tried to seize Rostov before German Caucasian forces could pivot through the city. Mannstein, organizing defenses east of Rostov, succeeded in halting Yeremenko's army at Salsk. On January 22, Gen. Rodion J. Malinovski's forces pressed against Rostov from the east in cooperation with Vatutin's army, which crossed the Donets River at Kamensk. In the extreme south, a Russian column recaptured Maikop on January 30 and pushed on toward Krasnodar.

With the fall of Krasnodar, however, the Wehrmacht's hold on the Caucasus shrank to a relatively narrow region of little offensive value, opposite the Kerch Straits and extending southward to the city of Novorossisk. The Russian High Command decided to postpone an attack on this remaining bridgehead until operations in the north had reached their objectives: Rostov, Kharkov, and Smolensk.

Vatutin crossed the frozen Donets near Izyum on February 5. On February 10, Russian armor penetrated Lisitchansk, and Vatutin's forces were established in Chuguyev. Krasnoarmeisk fell to Soviet troops on February 13. On February 14, portions of the armies of Generals Malinovski and Yeremenko entered Rostov, but the bulk of the German Caucasian armies had already passed safely to the west.

Generals Golikov and Vatutin won spectacular successes. On January 16, the hedgehog of Rossosh was captured with 17,000 prisoners, many of them Italians and Hungarians. Three days later, the railway town of Valuiki fell to Vatutin's troops, and remnants of three Italian divisions surrendered. On January 23, Golikov's men routed the German and Hungarian forces between the Voronezh and the Don rivers. Three days later, seven German and Hungarian divisions were almost annihilated at Kastornoya. Surrender of two more Italian divisions foiled an Axis attempt to rally along the Oskol River.

Vatutin reached Kupyansk on February 3 and continued toward Kharkov to attack the city frontally. Golikov captured Kursk on February 7 and opened a flanking drive from the northwest. The Germans threw mobile SS (Elite Guard) shock troops into the defense of the city, but they were in hasty retreat toward Poltava, on February 16, leaving Kharkov in Russian hands.

On January 12, in the Leningrad sector, Soviet armies under Generals Leonid A. Govorov and Kyril A. Meretskov assaulted the German vise. Schlusselburg and a strip of land 10 miles wide, south of Lake Ladoga and the Neva River, were recovered. A specially organized offensive group under Marshal Timoshenko pushed toward Demyansk and the Rzhev-Gzhatsk-Vyazma salient on February 15. Rzhev was occupied March 3, Gzhatsk March 6, and Vyazma, March 11.

In the subsequent advance on Smolensk, defended by German Field Marshal General von Kluge, the Soviet forces crossed the upper Dnieper at Kholm-Zhirkovski on March 14. Counterattacks by panzers and infantry were repulsed, but the Russian drive lost momentum and broke down east of Smolensk's outer defenses. In the last days of March, thaws set in and the offensive could not be resumed.

Weather conditions of the winter of 1942–1943 did not favor the Russians. During February, unseasonable thaws and heavy rains hampered their operations from Voronezh to the Caucasus.

Soviet lines were thinned out by the advance. Infantry fell dangerously far behind armor, and Gen. Markian M. Popov's tanks were immobilized in seas of mud. Other Russian columns at Poltava and Krasnograd were no better off. Parts of Yeremenko's forces were immobilized in the Caucasus, and by the middle of February, General Maslennikov was still inching ahead in the Kuban River valley.

Rokossovski's army could not be expected in line before spring. There were no Russian heavy caliber guns in advanced areas. Northwest of Rostov, Russian spearheads ran into formidable German defenses centered at Stalino. Beyond Kharkov and Kursk, a screen of Russian armor spread over a sector of almost 200 miles, but the infantry and artillery were unable to keep up, and fuel supplies were running short.

Mannstein's forces in the Stalino sector united with a newly created German offensive group, increasing their armored strength to nine panzer divisions. On February 26, all of the armor and 12 of the infantry divisions were hurled against Red vanguards at Stalino and on the Dnieper River in an attempt to break through between the Donets and Kharkov. The Russians fell back to the eastern bank of the Donets, but their lines were not pierced. In March, Mannstein opened another drive supported by Kluge's panzers and SS troops from Poltava. Sudden frost hardened the ground, aiding armored operations, and three prongs closed in on Kharkov from the west, north, and northwest. The Red Army evacuated the prize city on March 15. Mannstein was not able to continue his offensive because of the changing weather and the strength of the still intact Red forces, and by April 1943, the eastern front was generally quiet.

Casualties suffered by German and satellite troops during the second eastern winter campaign, in which the Wehrmacht lost about as much space as it had conquered in the previous summer drive, were estimated at 1,200,000 men. Russian losses were probably slightly less. Soviet sources reported that the Germans lost 5,000 aircraft, 9,000 tanks, and 20,000 guns. These figures seem high, but Wehrmacht losses greatly exceeded those suffered by the Russians.

Prime Minister Churchill estimated German strength in Russia after the winter campaign at 190 divisions (plus 50 or 60 divisions in occupied countries). These divisions were under full strength and no longer first-rate fighting forces. Second-rate German troops, including militia units, filled the gaps. Satellite forces were even more depleted. The Wehrmacht, in the summer of 1943, had no more than 50 per cent of its 1941 strength and about one third those who set out to conquer Russia.

Russo-Polish Crisis.—On Feb. 21, 1943, Gen. Wladyslaw Sikorski, premier of the exile Polish government in London, disclosed that his government had protested to Moscow against intervention in the internal affairs of the Polish state, such as the dropping of parachutists in central and eastern Poland to organize communist cells. Another Russo-Polish controversy arose at about the same time. After marching into eastern Poland in September 1939, the Russians had removed approximately 1,300,000 people from occupied areas to the interior of Russia, mostly to Siberia. Insisting that these persons were Polish citizens, the Polish government asked to arrange relief for them under its control and offered to provide the necessary funds. Prime Minister Sikorski pointed out that Poland had a right to its frontiers of Sept. 1, 1939. On March 2, 1943, the Moscow radio replied by broadcasting a statement from the official Tass news agency, charging the Polish government with imperialistic tendencies. According to Moscow, the persons removed were Soviet citizens. On March 8, a pro-Soviet group of Poles in Moscow proclaimed that Poland should give up its claims to territory annexed by Russia. Another argument arose over the execution by the Russians of two Polish-Jewish trade unionists, Henryk Ehrlich and Victor Alter. Soviet authorities declared that the execution was justified, while the Poles insisted it was arbitrary.

On March 30, 1943, Premier Sikorski, emphasizing his government's desire for a rapprochement with Russia, called upon the great powers to stand by their pledges and protested against plans to reduce Polish sovereignty and territory. The German government aggravated the crisis by suddenly announcing the discovery of mass graves in the Katyn forest near Smolensk, containing the bodies of 10,000 Polish officers allegedly slaughtered by the Russians. The Russians charged the Germans with the massacre. On April 18, the Polish Cabinet requested its representative in Switzerland to ask for an investigation of the Katyn murders by the International Red Cross. Moscow denounced this step as helpful to the Germans and severed relations with the Polish government in London on April 26, 1943.

The pro-Russian Poles in Moscow who had been responsible for the proclamation of March 8 were organized into a Union of Polish Patriots under the sponsorship of the Soviet government. This step was disclosed on May 12, 1943. It led ultimately to the creation of another Polish government, adhering to Soviet political and economic principles and opposed to the London government in exile. American and British attempts to restore relations between Russia and the Sikorski government produced no results. On June 16, Premier Stalin declared that the USSR would assist in the creation of a strong and independent Poland in every way. But Russia showed a firm determination to deal exclusively with the Union of Polish Patriots in matters concerning Poland.

Premier Sikorski was killed in a plane accident on July 4, 1943. His successor was Stanislaw Mikolajczyk, leader of the numerically strong Polish Peasant Party. Three members of that party, three Socialists, two Christian Democrats, two Nationalists, and three Non-partisans were included in his Cabinet, to represent political trends in Poland prior to the invasion. The Soviet government refused to deal with this Cabinet.

Growing Partisan Strife in Yugoslavia.—Gen. Draža Mihajlovic's Chetniks, men under his command, joined by popular elements, were loyal to King Peter and his government in exile, in which their leader was minister of war. A rival group of Partisans led by Marshal Tito (Josip Broz) looked to Moscow rather than to the government in exile for guidance. Moscow's aid to the Yugoslav resistance movement went exclusively to Tito.

General Mihajlovic's strategy was based

upon the assumption that the Allies would land at Salonika for a drive toward the Danubian basin. He husbanded his men and scanty equipment to support this drive, and confined his activities to surprise attacks upon Axis communications and attempts to gain control of areas from where the Chetniks could open the way through the vital Vardar and Morava river valleys as soon as the Allied armies were on the move. The Partisans, by contrast, engaged in continuous action to keep pressure upon the occupation powers and to gain control of large areas, regardless of their strategic location, preparatory to the establishment of postwar control of the country. The Russian-based Partisan radio claimed local successes, while General Mihajlovic insisted that his men deserved credit for some of these actions. Complete verification of claims and counter-claims was impossible. Hostility between the rival factions led to serious clashes between Chetniks and Partisans. In November 1942, Tito's men met in Bihac, a town in Bosnia, where an "Anti Fascist Assembly for the People's Liberation" and a Communist-dominated executive committee was set up. The Partisans subsequently called themselves the People's Army of Liberation.

Until May, 1943, British support went exclusively to the Chetniks, which caused friction between Great Britain and Russia. U.S. mediation led to the dispatch of a British military mission to Tito's headquarters, then at Jajce, while the Russians continued to recognize Tito only. The British then urged the Yugoslav government in exile to make changes in the cabinet to pave the way for a reconciliation between the rival factions. Subsequent changes had no such effect.

In the fall of 1943, King Peter urged General Mihajlovic to wage a more active campaign. The general reported that the Chetniks had wrested substantial areas from the German during the month of October. This was denied by his rivals. Mihlajlovic, stunned by Allied reluctance to invade the Balkans after the surrender of Italy, saw his pattern of strategy destroyed.

Coinciding with the Teheran Conference, Tito formed a government of his own on Nov. 29, 1943. He became prime minister, minister of war, and chief of the armed forces with the rank of a marshal. In a statement of policy, Tito reserved the right to review all treaties and commitments made by the government in exile, adding that he would not recognize any further obligations undertaken by King Peter's government. The Partisan leader asked for recognition of his Cabinet as the legal government of Yugoslavia.

On December 15, General Mihajlovic charged his rival with aiming to establish a minority dictatorship. The Communists had previously had no substantial following in Yugoslavia, and Tito assumed much greater power than the king enjoyed constitutionally. On December 22, Tito's government declared the government in exile deprived of its rights and forbade the king to return to his country. It also demanded that General Mihajlovic be tried for conspiring with the enemy to destroy the Partisan forces. On Dec. 8, 1943, a British government spokesman said that more British aid was going to Tito than to Mihajlovic because the Partisans were fighting much more actively. The next day, Secretary of State Cordell Hull stated that the U.S. government would help both the Partisans and Mihajlovic and leave the choice of a future government to the Yugoslav people. The Russian government announced that a military mission would be dispatched to Tito's headquarters.

In December 1943, the Allies controlled the Adriatic Sea and seaborn supplies were reaching Yugoslavia in far greater volume than before. The balance of power switched in Tito's favor. This gave Tito the opportunity to increase his power to the point where the Yugoslav people no longer had a free choice of government.

Although communism was and remained unpopular, growing numbers of men joined Tito's forces in order to expedite the liberation of the country. The Chetniks supplies approached exhaustion. Lack of food and ammunition led to the discharge of many who wanted to remain with Mihajlovic, who continued to aid the western Allies. But district Chetnik leaders got out of control. The organization split and gradually dissolved. A number of regional commanders eagerly fought Tito, whom they considered a greater enemy than the invaders. Their actions frequently coincided with German operations against the Partisans. This created the impression of outright collaboration and later occasionally led to it. Such acts, however, were not in accordance with Mihajlovic policy. Late in 1943 and early in 1944, according to a statement by Capt. George S. Musulin of Pittsburgh, Pa., nearly 500 Allied airmen who had parachuted into Yugoslavia (mostly American), were saved by Chetniks. The same officer quoted General Mihajlovic as having told him: "Only a fool could believe such an accusation" (of having conspired with the enemy) "in view of the 100,000 Serbs under my leadership who died fighting the Nazis."

Strife in Greece.—In Greece, two factions of anti-Axis underground forces were engaged in a feud: the *ELAS* (Greek People's Army of Liberation) and the *EDES* (National Democratic Greek Army). The *ELAS*—its most prominent leader was Colonel Seraphis—was organized by the *EAM* (National Liberation Front), a small but extremely active and courageous group which included communists. It had a remarkable record of sabotaging the main Greek railroad lines. The *EAM-ELAS* asked for representation in the Greek government and did not want the king to return to the country before a plebiscite was held to determine the fate of the monarchy.

The *EDES,* under the command of Col. Napoleon Zervas, was a well armed group led by professional officers. It operated chiefly in southern Epirus. The *EDES* was loyal to the king and regarded the *ELAS* as composed of Russian-sponsored rebels. The *ELAS* countered by charging Zervas with dealing with the Germans. The British dispatched military missions to both groups and endeavored to reconcile them. Acting upon a British suggestion, a deputation from the *EAM-ELAS* went to Cairo to present their demands to King George, who evaded the issue while *EAM* and *EDES* battled among themselves. The political tendencies of the *EDES* moved gradually toward right wing extremism.

Czechoslovak-Soviet Rapprochement.—Since 1940, parleys had been held between the government in exile of Czechoslovakia and Poland concerning a future of Czechoslovak-Polish coalition to which other neighboring countries might be admitted upon request. After the severance of relations between the London Polish government and the Soviet Union, the Czechoslovaks discontinued these negotiations. President

Beneš insisted that no federation program was feasible among the small Central European states except with the prior approval of both Great Britain and the USSR. No objections was raised by Britain. He therefore made the point that the restoration of friendly relations between the London Poles and the Russian government must precede resumption of the talks. In a broadcast to his countrymen on June 24, 1943, Beneš, in an effort to dispel fears that close ties with Russia might jeopardize Czechslovakia's relations with the United States, asserted that friendly collaboration between the United States and the Soviet Union during and after the war was absolutely certain. On October 12, the Czechoslovak government announced its desire to conclude with a mutual pact of assistance with the USSR. The matter was discussed at the subsequent Moscow conference between Motolov, Eden, and Hull. Motolov insisted upon concluding the pact with the Czechoslovak government immediately, while the United States and British representatives called it calculating to discourage progress toward a new world order. Beneš went to Moscow and a 20-year Czechoslovak-Russian mutual assistance pact was signed there on Dec. 12, 1943. It led to the extension of communist influence in the Czechoslovak government. Despite previous recognition of Czechoslovakia's pre-Munich frontiers, Russia obtained the cession of the Carpatho-Ukrainian province in eastern Czechoslovakia after the end of World War II.

The French Regime.—From Aug. 11 to Aug. 24, 1943, President Roosevelt and Prime Minister Churchill conferred in Quebec. Canadian Prime Minister Mackenzie King acted as host to the conferees, who included Secretary of State Cordell Hull, Foreign Secretary Anthony Eden, and American and British military and political advisers. Dr. T. V. Soong was present as a representative of Generalissimo Chiang Kai-shek.

France was one of the main topics on the Quebec agenda. On March 18, 1943, a pro-Allied committee in French Guiana ousted the pro-Vichy administration. A dispute arose between Generals Giraud and deGaulle as to whose appointee was to govern the colony. United States influence was favorable to Giraud. On June 3, a merger of the opposing factions was formally achieved in Algiers in the Committee of National Liberation. Rivalries persisted within the committee, with deGaulle's influence growing. The committee obtained very limited recognition in Quebec. President Roosevelt recognized it as "administering those French overseas territories which acknowledge its authority." A British statement, couched in more diplomatic terms, followed the United States pattern. The USSR called the Committee "the Representative of the State interests in the French Republic and leader of all French patriots fighting against Hitlerite tyranny." Roosevelt made it plain that the United States did not recognize the committee as the government of France on Aug. 26, 1943, when he declared that the French people were to select their own government and their own officials to administer it.

Unlike most other conquered nations, France had no legal government, since that of Marshal Pétain and Pierre Laval could not be considered as such. This had an adverse effect upon the country's political stability after its liberation by the western Allies.

The Moscow Decisions.—Between Oct. 19 and 30, 1943 parleys were held in Moscow among Cordell Hull, Anthony Eden, and Vyacheslav Molotov and their staffs. China was not represented at the conference but was invited to adhere to the Declaration of General Security made at Moscow.

The declaration emphasized the determination of its adherents to continue hostilities against the Axis powers with which the signatories were at war until such powers surrendered unconditionally. The signatories pledged themselves to secure the liberation of Allied peoples, to ensure a rapid and orderly transition from war to peace, and to maintain peace and security with the least possible diversion of the world's resources for armaments. They further reiterated their intention to continue united action for the organization and maintenance of peace, to cooperate in all matters relating to the surrender and disarmament of the enemy, and to take precautions against violations of terms by the enemy. The participating powers recognized the necessity of establishing, at the earliest practicable date, a general international organization based on principles of the sovereign equality of all peace-loving states and open to membership by all such states, large or small, for the maintenance of international peace and security. Pending the establishment of a system of general security, they agreed to consult with each other and, as occasion requires, with other members of the United Nations, with a view to joint action on behalf of the community of nations." They also agreed that, "after the termination of hostilities, they will not employ their military forces within the territory of other states except for the purposes envisaged in this declaration and after joint consultation."

Another part of the declaration concerned the status of Italy following the country's surrender. After the destruction of fascism, the Italian people were to be given the opportunity to establish democratic institutions. Anti-fascism elements were to liberalize the Italian government, and freedom of speech, of political belief, of the press, and of public meetings should be restored. Institutions and organizations of the Fascist regime were to be suppressed and Fascist elements removed from office. Political prisoners were to be released and Fascist chiefs and other war criminals placed under arrest. The right of the Italian people to choose their own form of government was confirmed.

A third part of the Moscow declaration dealt with Austria. The annexation of that first victim of German aggression was declared null and void, and the signatory powers promised that, after its liberation, Austria would be established as a free and independent state.

A fourth document—subsequently signed by Roosevelt, Churchill, and Stalin—warned that German officers, men, and Nazi Party members responsible for atrocities in occupied territories would be sent back, after the end of the war, to the countries where they had committed their crimes to be judged and punished according to the laws of the liberated countries. Those whose offenses had no particular geographical localization would be punished by joint decision of the Allied governments.

An Advisory Council for matters relative to Italy was created, composed of representatives of the United States, Great Britain, the USSR., and the French Committee of National Libera-

tion. It was also decided to establish a European Advisory Committee in London to study European questions.

The First Cairo Conference.—President Roosevelt and Prime Minister Churchill met Generalissimo Chiang Kai-shek and Madame Chiang Kai-shek in Cairo between Nov. 22 and 25, 1943. The results of these discussions was summed up in the statement that Japan should be stripped of all the islands in the Pacific it had occupied since 1914, and that all territories stolen from the Chinese, such as Manchuria, Formosa, and the Pescadores, should be restored to the Republic of China. Japan was also to be expelled from "all other territories which she had taken by violence and greed," and Korea was to become free and independent. Russia assumed no obligation under the declaration, but the term "all other territories" could be interpreted as including what Japan had taken from Russia since 1905.

The Teheran Conference.—From Cairo, the president of the United States and the British prime minister proceeded to Teheran (called the "capital of our Ally, Iran" in the announcement) to meet Marshal Stalin. President Roosevelt, at Stalin's invitation, resided in the Russian Embassy during the conferences, which lasted from Nov. 28 to Dec. 1. The official communiqué summing up the results on the conference emphasized the determination of the participants to cooperate in war and in the peace to follow. Complete agreement was reported to have been reached regarding the conduct of the war. "No power on earth," the communiqué stated, "can prevent our destroying the German armies by land, their U-boats by sea, and their war plants from the air."

The invasion of France in 1944 was finally pledged by the Western Allies in Teheran. Russia had repeatedly insisted that Allied landings in Italy did not satisfy the Soviet desire for the establishment of a second front. The USSR was anxious to have the United States and Britain concentrate in the western part of the European continent. The Teheran Conference resulted in a long step toward the division of Europe into spheres of influence. Russian predominance in Poland, Rumania, Bulgaria, and Yugoslovia was clearly established.

The Second Cairo Conference.—Returning from Teheran, Mr. Churchill and Mr. Roosevelt stopped in Cairo again from Dec. 4 to 6, to meet President Ismet Inonu and Foreign Minister Menemenicoglu of Turkey. The Turkish government was disturbed about the prospect of concessions to Russia at Turkey's expense. Soviet nationalism was expected to press czarist claims for Russian domination of the Dardanelles. The official report on the meeting failed to mention that topic. It emphasized the "strength of the British-Turkish alliance and the firm friendship between the Turkish people, the United States, and the USSR."

AN ATTACK UPON FORTRESS EUROPE

During the two years preceding July 1, 1943, enlisted strength in the United States Army increased by five million men. The officers corps grew from 95,000 to 521,000. The air force in 1943 numbered 182,000 officers and 1,960,000 enlisted men. After more than two years of undisputed control of western and central Europe by the Axis, Allied invasion plans were ready.

German propaganda reassured their people that an impregnable wall had been built to protect every potential landing area. But the transformation of Europe into a fortress could not possibly be completed within the lifetime of a single generation. The German boast that they had garrisons and equipment for the entire perimeter of Europe was not true. Certain coastal regions, such as those along the English channel, were heavily fortified, but other areas were not, especially in southern Europe.

Stepping Stones.—Both for military and political reasons, the opening assault on Europe was directed against islands covering the approaches to Italy. Pantelleria ("Mussolini's unsinkable aircraft carrier"), Lampedusa, and Linosa were to be eliminated as obstacles to an Allied invasion of Sicily and Italy. Pantelleria had an area of only 45 square miles. Its steep rocks were honeycombed with gun emplacements; torpedo launching tubes were installed on its coast; and an airfield was built in its center. Lack of water limited the island's garrison to 12,000 men, and mountainous terrain restricted the size of the air base. Pantelleria's antiaircraft defenses were not up to date.

On May 20, Allied air attacks began against the island. Malta's strengthened air force joined the 4,000 Allied planes assembled in North Africa. The bombardment continued until June 11; 1,500 tons of explosive hit the target that day. Allied naval forces approaching Pantelleria were not fired upon by the island's vaunted 16-inch rifles. The demoralized garrison surrendered without a fight. Southeast of fallen Pantelleria, Lampedusa capitulated on June 12 and Linosa on the following day, yielding a total of 600 prisoners.

The Sicilian Campaign.—In Sicily, with an area of 9,860 square miles and a population of over four million, the Germans maintained three infantry and one panzer divisions and 24,000 Luftwaffe men on 18 airfields. The Italian Sixth Army, also in Sicily, included five first-line divisions and a large number of second-rate and auxiliary formations of poor quality. The total strength of the defending forces was estimated at 345,000, but it was actually about 200,000. Nearly 1,200 Axis aircraft were based in Sicily.

The Allied assault was a three-dimensional operation: air bombardment softened up defenses and disrupted supply and communication lines; naval action covered the landings; and Allied naval and air forces assisted the ground forces after the invasion.

After June 13, the Northwest African Coastal, Tactical, and Strategic Air Forces, the Gibraltar, Malta, and Middle East Commands, and the Naval Cooperation Groups joined in smashing airbases and defense installations, disrupting railroad traffic, and wrecking harbors and ferries in Sicily and Southern Italy.

Saboteurs were dropped by parachute to add to the destruction in Sicily.

Invasion convoys assembled on July 6. The initial forces included 160,000 men, 600 tanks, 1,800 guns, and 14,000 vehicles of various types. Troops landed subsequently brought the total number to 250,000. The invasion army embarked from Gibraltar, Oran, Algiers, Bizerte, Tunis, Tripoli, the United Kingdom, and the United States. Naval craft numbering 3,200 were involved in the operation, the code name for which was "Husky."

On July 9, German broadcasts reported the

presence of thousands of Allied ships in the Mediterranean. The German presumed that Sicily was to be attacked, but simultaneous landings in Sardinia, Corsica, and the Italian mainland were not discounted. Neither the Italian surface fleet nor twelve Axis submarines in North African coastal waters interfered with Allied shipping. Improved Allied landing craft—the LCI (landing craft infantry) and the LST (landing ship tank)—came as a surprise to the Axis. Men were transferred from transports to landing craft at a safe distance from the shore.

The combined Allied air forces under the command of British Air Marshal Sir Arthur Tedder (The United States portion was the Northwest African Air Force under Lt. Gen. Carl Spaatz) provided an air umbrella. The naval commander in chief was again Admiral Cunningham. The British task force included the ships *Nelson, Rodney, Formidable, Warspite, Valiant, Indomitable, Howe,* and *King George V.* Its assignment was to guard the invasion armada against possible attack by the Italian Navy and to confuse the enemy by widespread operations in the Tyrrhenian and Ionian Sea, thus implying preparations for an imminent invasion of the Balkans, Sardinia, and central Italy as well as Sicily. At the same time, two United States battleships, the *South Dakota* and the *Alabama,* reinforced the British Home Fleet at Scapa Flow. The British Navy escorted General Montgomery's Eighth Army to its landing places.

The United States portion of the Allied fleets, the Western Task Force, was under the command of Vice Admiral Henry K. Hewitt. The escorting cruiser division including the *Philadelphia, Boise, Savannah,* and seven destroyers, was assisted by British MTB (motor torpedo boat) and MGB (motor gunboat) flotillas. The United States task force split into three main attack forces for landings, code-named "Joss," "Dime," and "Cent."

General Eisenhower's deputy commander, Sir Harold Alexander, was in command of the attacking land force (the Fifteenth Army Group). The army group consisted of the United States Seventh Army (Lt. Gen. George S. Patton, Jr.), and the British Eighth Army (Lt. Gen. Sir Bernard Montgomery). The United States Seventh Army included the 22d Corps (Lt. Gen. Omar N. Bradley, 1st and 45th Divisions and paratroopers) and a separate task force (3d Division and parts of the 2d Armored Division) under Maj. Gen. Lucian K. Truscott. The British Eighth Army included the 5th, 50th, and 51st British and the 1st Canadian Divisions, with the 78th Division held temporarily in reserve.

According to the Allied plan of campaign, the landings were to take place on the southern coast of Sicily. The objective of attack force Joss (main force 3d Division) was the port and airfield of Licata. Attack force Dime (1st Division) was to capture Gela and the nearby air base of Ponte Olivo. Attack force Cent (45th Division) was to invade Scoglitti, take the airfields of Comiso and Biscari, and establish con-

tact with the British Eighth Army, which was to land in full force on Pachino Peninsula (southeastern Sicily) for an opening drive on Augusta and Syracuse. After reaching these objectives the British Eighth Army was to advance along Sicily's east coast toward Catania and Messina. Inland, it was to by-pass Mount Etna from the west. The United States Seventh Army was to seize Porto Empedocle in the south and drive across the island to Palermo. From there, the push was to continue east to join the British at Messina.

The Germans hurriedly fortified the approaches to Catania. The lava-encrusted western slope of the 10,875-foot volcano Mt. Etna made natural fortresses of the towns of Adrano, Bronte, and Randazzo. The rugged terrain of Sicily offered a formidable obstacle even to superior attacking forces.

D-day was July 10. A sharp breeze sprang up in the early morning hours, interfering with the transfer of troops to the landing craft, but the landings were carried out on schedule. Low flying Axis aircraft in small groups bombed the fleet off shore and accounted for the loss of one destroyer. The United States 82d Airborne Division descended in the rear of the beaches three hours ahead of the seaborne forces. Heavy winds scattered the paratroopers over wider areas than expected, and the divisions suffered substantial losses from enemy action.

The Allied air forces flew an average of 1,200 sorties during the first days of the operation. The landings of the British Eighth Army and of operations Joss and Cent proceeded smoothly. Operation Dime met with a temporary crisis. The German Hermann Göring Division attacked before American tanks, antitank guns, and heavy artillery were ashore to reinforce the Gela beachhead. Thirty German tanks drove to the beach, but Allied naval artillery turned the tide. Gela was secure by the early afternoon of D-day.

In the plans, the Allied High Command had allowed for 20,000 casualties during the initial attacks, but less than 1,000 men were killed or wounded on July 10, 1943. The Italians frequently surrendered en masse. Two hours after the first Allied troops went ashore, Italian prisoners of war were helping to unload men and supplies. During the first 48 hours, more than 80,000 men, 7,000 vehicles, and 300 tanks were ready for action, with additional forces pouring in.

The United States Seventh Army split into three columns, one pushing along the south coast toward Porto Empedocle, the others racing inland toward Palermo. The 3d Infantry Division met unexpectedly heavy Italian resistance at Empedocle and Agrigento. On July 17, British and United States cruisers shelled those cities until they surrendered. The British drive on Augusta and Syracuse reached its objectives two days after the landings. On July 15, all the ground captured by the Eighth Army was securely held with the assistance of British commando and naval units. On July 16, one quarter of Sicily was in Allied hands.

The British 5th and 50th Divisions from Augusta moved north along the coastal highway toward Catania to take the town, its harbor, and its airfields. The Canadian Division swung inland for a thrust around Mt. Etna. The 5th and 50th Divisions ran into strong German positions barring the way to Catania. Following the first unsuccessful attempt to breach the German line, there was a stalemate until August 5, when the defenders were forced out. The Canadians attacked Adrano, on the western slopes of Mt. Etna, a mountain village built of stone, where every house was a pillbox. They were finally able to overcome German resistance with the help of the British 78th Division and strong artillery support. Adrano was taken on August 7.

From Palermo, taken July 22, the American Seventh Army continued toward Messina, splitting into two columns, one of which progressed along the coast, and the other parallel to the first drive, pushed eastward inland. The inland drive aimed at Randazzo to join the Canadians, the French, and other Seventh Army forces.

Although the fall of Adrano and Catania made the further defense of Sicily meaningless, the Wehrmacht continued to fight with strong rearguards, while the main forces withdrew toward Messina and the ferry to the Italian mainland.

During the last part of the campaign, the United States Seventh Army fought very hard. Neither Allied superiority on the ground nor the violent air bombardment of the Messina ferry broke up the orderly German withdrawal across the straits, only 2 miles wide at their narrowest point. According to Gen. George C. Marshall's report, the Germans, by using heavy concentrations of antiaircraft guns, managed to evacuate thousands of their first-line panzer and airborne troops, as well as a considerable amount of light equipment.

Patrols of the United States 3d Division entered Messina from the west at the same time that British units entered from the southeast. On August 17, organized resistance came to an end. Axis casualties totalled 167,000, of which 37,000 were German. Allied losses amounted to 31,158 killed, wounded, and missing, of which 19,235 were British and Canadian. On August 17, the Italian islands of Lipari and Stromboli, north of Sicily, surrendered to a U.S. task force.

The Air Attack of Rome.—After the landings in Sicily, most of the Allied Mediterranean air power turned against the Italian mainland. The Ports of Genoa, Trieste, Leghorn, Naples, Taranto, Bari, and Brindisi suffered heavily, as did the industrial centers of Milan and Turin.

On July 19, 500 United States planes raided Rome, concentrating on its railroad yards. The possibility of damaging Vatican City and the desire to protect venerable monuments accounted for previous Allied reluctance to bomb the capital. But Rome was an important transportation hub, and the Wehrmacht made use of its presumed inviolability to direct much transportation through the city. Moreover, the political crisis in Italy, rapidly moving to its climax, called for drastic warfare to hasten the Italian surrender.

Mussolini's Downfall.—The emotional, popular enthusiasm which followed Italy's entry into the war subsided when the Italians realized that the war would not end quickly, and it was replaced by inertia when setbacks accumulated. The loss of the African Empire wiped out the belligerent spirit in Italy. Italian antipathy to the Germans had not been entirely eliminated even in the heydey of the Axis pact. It rose to deep hatred when the Germans tightened their grip on Italy. Discontented officers blamed the Fascist Party for inadequate preparations, favoritism in assignments, and the subordination of

Italian needs to German demands. Pro-Allied elements in the armed forces were increasingly active. Some Fascists, worried about the future, blamed Mussolini.

On Feb. 5, 1943, Mussolini dismissed 12 members of his government, including his son-in-law, Count Galeazzo Ciano, and assumed complete command of political and military operations. Mussolini urgently requested German antiaircraft weapons, planes, and raw materials. In payment, he offered to dispatch even more Italian labor to the Reich. The chief of the Italian government expected the Allied invasion in February 1943.

On April 15, Mussolini met Hitler. Il Duce, in the humilating role of a petitioner, explained that 30 additional German divisions and strong Luftwaffe forces were needed to hold the country against Allied attack. Hitler replied that the defense of the whole of Italy would put a heavy strain on German strength and that if the Italians were unable to defend themselves, parts of the Apennine Peninsula would have to be abandoned. Il Duce, returning from this conference on April 17, wrongly told his inner circle that the German führer was preparing to give all necessary assistance and made an attempt to tighten his control of the Army. Party purges and changes in civil service appointments followed, but signs of revolt increased. Italian casualties, totalling 633,251 after the fall of Tunisia, alarmed the public.

On July 19, Mussolini met Hitler again in Verona, Italy. The German leader refused the plea of his Axis partner for more help and flatly declared that Italy should be evacuated south of a line running along the southern border of Tuscany.

Mussolini was forced to inform the Fascist Great Council of the true German attitude. On July 24, led by Count Dino Grandi, former Italian ambassador to London, the council expressed lack of confidence in Mussolini by a vote of 19 to 5. The next morning, Mussolini yielded to a demand of his ministers and submitted the German plan to the king of Italy who flatly rejected it. At 11:00 P.M., July 25, 1943, the Rome radio announced that King Victor Emanuel had accepted the resignation of Mussolini and appointed Marshal Pietro Badoglio as his successor. As he was leaving the royal palace, Mussolini was taken into custody and, after various transfers, was interned. His guard had orders to shoot the former dictator rather than let him escape. Neglect of duty accounted for Mussolini's rescue by a special detachment of German parachutists. He was first taken to Germany and subsequently to northern Italy. Hitler decided that the maintenance of German control over most of Italy was vital to the German war effort. Additional German divisions poured into Italy, and Mussolini was used as a puppet to force Italians to aid the Wehrmacht.

On September 23, German broadcasts announced the formation of a new Fascist cabinet of 12 members in German-controlled Italy. Five days later Mussolini proclaimed himself chief of a new Republican Fascist State. On October 31, Mussolini's government demanded the death penalty for the king of Italy, Marshall Badoglio, and the members of the Fascist Great Council who had voted against Mussolini. Il Duce's mobilization orders failed to raise substantial Italian forces, but Republican Fascists, assisting the gestapo, established a reign of terror in central and northern Italy.

The Surrender of Italy.—On July 26, King Victor Emanuel proclaimed: "I assume, as of today, the command of all armed forces. Italians! I am today more than ever indissolubly united with you by unshakable faith in the immortality of the fatherland." Another proclamation by Badoglio was disappointing. After announcing that he had taken over the military government of Italy with full powers, by order of the king, he merely stated: "The war goes on."

Speaking in the House of Commons on July 27, Prime Minister Churchill hailed the downfall of Mussolini but warned that the Allies would have to resort to extreme measures to force the Italians to help the Allies against Germany. On July 28, President Roosevelt reiterated in a broadcast that the terms to Italy were the same as to Germany and Japan: unconditional surrender. General Eisenhower also broadcast to Italy: "We commend the Italian people and the House of Savoy for ridding themselves of Mussolini." He added that the only remaining obstacle to an honorable peace was the fact that the German aggressor was still on Italian soil. The Allies were coming as liberators, and the Italian people should immediately cease any aid to German military forces.

An immediate Italian surrender was vital to the Allies before German countermoves became effective. On August 2, the Allies warned the Italian people that their breathing spell was over and that an Allied invasion of their mainland was imminent. On August 14, Marshal Badoglio declared Rome an open city. On August 15, an Italian envoy, General Castellano, armed with credentials issued by Badoglio, visited the British ambassador to Spain, Sir Samuel Hoare. He proposed that Italy should join the Allies as soon as they landed. The British ambassador, after obtaining instructions, suggested that the envoy proceed to Lisbon to meet American and British staff officers. The envoy learned in Lisbon that unconditional surrender would be asked and directions for actions following surrender were already prepared. Before leaving, he was further informed that civil and administrative terms would be presented later. The envoy left for consultation with Badoglio and returned to Lisbon on August 31, accompanied by the highest ranking Allied prisoner of war, British Gen. Adrian Carton de Wiart, as a token of Italian goodwill. The Badoglio government was prepared to accept Allied terms and instructions but failed to see how they could be carried out with German forces gathering around Rome and other key places in Italy. It was agreed that the armistice should be announced at the moment when conditions were most favorable for the Italians to extricate themselves from the German grip.

On Sept. 3, 1943, armistice terms were signed in Syracuse, Sicily. The Soviet government, fully informed about the negotiations, authorized Gen. Eisenhower to sign on its behalf. Part of the terms were made public on September 12. Publicized terms stipulated: immediate cessation of hostilities; Italian denial to the Germans of facilities that might be used against the United Nations; immediate delivery of all Allied prisoners of war (about 70,000 British and 25,000 Greeks and Yugoslavs) and internees to the Allies; transfer of the Italian Fleet and aircraft to points designated by the Allied commander; requisition-

ing of all Italian merchant shipping; surrender of Corsica and all Italian territory; Allied use of all airfields and ports, with Italian armed forces guaranteeing their protection until the Allies took over; withdrawal of Italian armed forces from participation in the war; employment by the Italian government of its available armed forces to insure compliance with the armistice provisions; Italian acquiescence in an Allied Military Government to control such parts of Italian territory as the Allied commander might consider necessary; Italian acceptance of all measures of disarmament, demobilization, and demilitarization imposed by the Allied commander; compliance with other conditions of a political, economic, and financial nature to be transmitted later; and nonpublication of the armistice conditions without prior approval by the Allied commander. Among the unpublicized conditions was Italy's renunciation of its colonies. The question of its metropolitan borders was left open.

On September 8, the king of Italy, Crown Prince Umberto, Marshal Badoglio, and the members of his government fled from Rome to southern Italy. Two days later, the Germans formally took possession of the capital.

In a message to Hitler, on September 9, Marshal Badoglio stated: "Our defence has crumbled . . Italy has no power of resistance left . . The Italian government can no longer assume responsibility for continuing the war."

In a radio address, the German führer replied by denouncing Italian "treachery." The day the armistice was signed, according to Hitler, Badoglio assured the German chargé d' affaires in Rome that he would never betray Germany and that Italy had no thought of surrender. The king, Hitler asserted, had made similar commitments. Hitler added that measures for the protection of German interests, in view of events in Italy, were already taking their course according to plan, and that the decision of the Italian government to break the alliance would make Italy a real theater of war.

On September 10, Roosevelt and Churchill told Badoglio and the Italian people: "It has fallen to you to win back for Italy an honorable place in the civilization of Europe. Now is the time for every Italian to strike his blow. . . Strike hard and strike home." The following day, from behind Allied lines, the king and Badoglio appealed to the Italian people to defend themselves against German aggression.

On Oct. 13, 1943, Marshal Badoglio, in the name of King Victor Emanuel, declared war on the Reich. A joint statement issued by President Roosevelt, Prime Minister Churchill, and Marshal Stalin accepted the active cooperation of the Italian nation and armed forces as cobelligerents against the Reich. Cobelligerency did not substantially change the status of Italy or affect the military situation. The war-weary, poorly equipped Italians could not rise to a major military effort. Small Italian forces, however, joined the Allies and fought better against the Germans than they had previously fought at their side.

Soon after the armistice was proclaimed, the Germans built up their strength in Italy to 24 divisions (more than the Allies could muster in that theater) although only 10 of them were in southern Italy. Most of the Italian Air Force failed to land at fields designated by the Allies. The Italian fleet sailed to harbors named by Admiral Sir Andrew Cunningham and surrendered. Five battleships, 8 cruisers, 27 destroyers, and 19 submarines arrived safely. A German bomb attack sank the 35,000 ton battleship *Roma*. (The bomb used was a test missile, carried to the vicinity of the target by a dive bomber and then released to continue under radio control. One type of the later Japanese Kamikaze closely resembled the test bomb.) Most of the Italian merchant fleet in home waters was seized by the Germans. Only 80,000 tons of a total of 300,000 were added to Allied shipping.

On the mainland, Italian garrisons surrendered to small German forces, and vital ports and air fields fell into German hands. Italian air bases were of particular importance to the Allies. South German and German-controlled war plants in Czechoslovakia and Austria which previously had been safe from large scale bombing were within easy range from Italy. German installations in the Balkans, including the oil fields of Ploesti, could be raided from Italy without excessive losses, and air assistance could be given to the Russians. The Allies had to fight hard for Foggia, the only major base they gained in 1943.

Sardinia, not garrisoned by the Germans, came under complete Allied control on Sept. 20, 1943. French and American forces landed in Corsica on September 9. The island was garrisoned by 70,000 Italians and 10,000 Germans. After three weeks of fighting in which the Italians did not participate, but aided by a popular uprising, Corsica was in Allied hands.

On September 8, Field Marshal Sir Henry Maitland Wilson appealed to the Italian forces in the Balkans and the Aegean islands to resist German attempts at disarmament and to seize German positions. Twenty-five Italian divisions faced 22 German divisions, many of which were *Landwehr* (militia). Cooperation between Italians and guerillas appeared to guarantee control of strategically vital areas by anti-German forces until the Allies could take over.

There were substantial Allied forces available in the Middle East which were not involved in the opening stages of the Italian campaign. These included most of the British Ninth and Tenth armies, a strong Polish corps (which went to Italy later), and Greek and French troops. All Field Marshal Wilson needed to carry on amphibious operations was adequate shipping space which was not allotted. The Germans were thus enabled to seize control of the Aegean and the Balkans.

The Germans, outnumbering the Italians in Crete, disarmed their Axis partners after a flurry of shooting on July 31. The Aegean islands, on the way to Greece, were manned by Italians, except for Rhodes, an important strategic base and site of good airfields. Thirty thousand Italians faced 7,000 Germans there. On September 9, a "good-will mission" of three British officers wanted to land at Rhodes "to rally the Italians to our cause," but were turned away. The Italian garrison surrendered to the Germans.

A small British seaborne force occupied the island of Samos on September 9, Six days later, British parachutists seized Cos, and Leros was occupied on September 16. With Crete and Rhodes in German hands, and substantial Luftwaffe based on their air fields, Samos, Cos, and Leros had little, if any, stategic value. It was hard to supply them, and a defense against counterattacks was almost impossible. The Allies made no attempt to carry on against Rhodes and Crete.

Cos fell to a German airborne attack October 6. Six hundred British and 2,500 Italian soldiers were captured. Leros was lost November 12, with 3,000 prisoners, and Samos was evacuated without a fight on Nov. 23, 1943. The Germans shot captured Italian officers. In the Balkans, the Wehrmacht disarmed the bewildered Italians except for a few units who joined Mussolini's army.

German prestige in southeastern Europe, at a low ebb in the summer of 1943, rose again. Potential elements of resistance in Bulgaria were discouraged, and an increasing number of people in the Balkans, regardless of their political view, began to look upon Russia instead of the Western Allies as their future liberator.

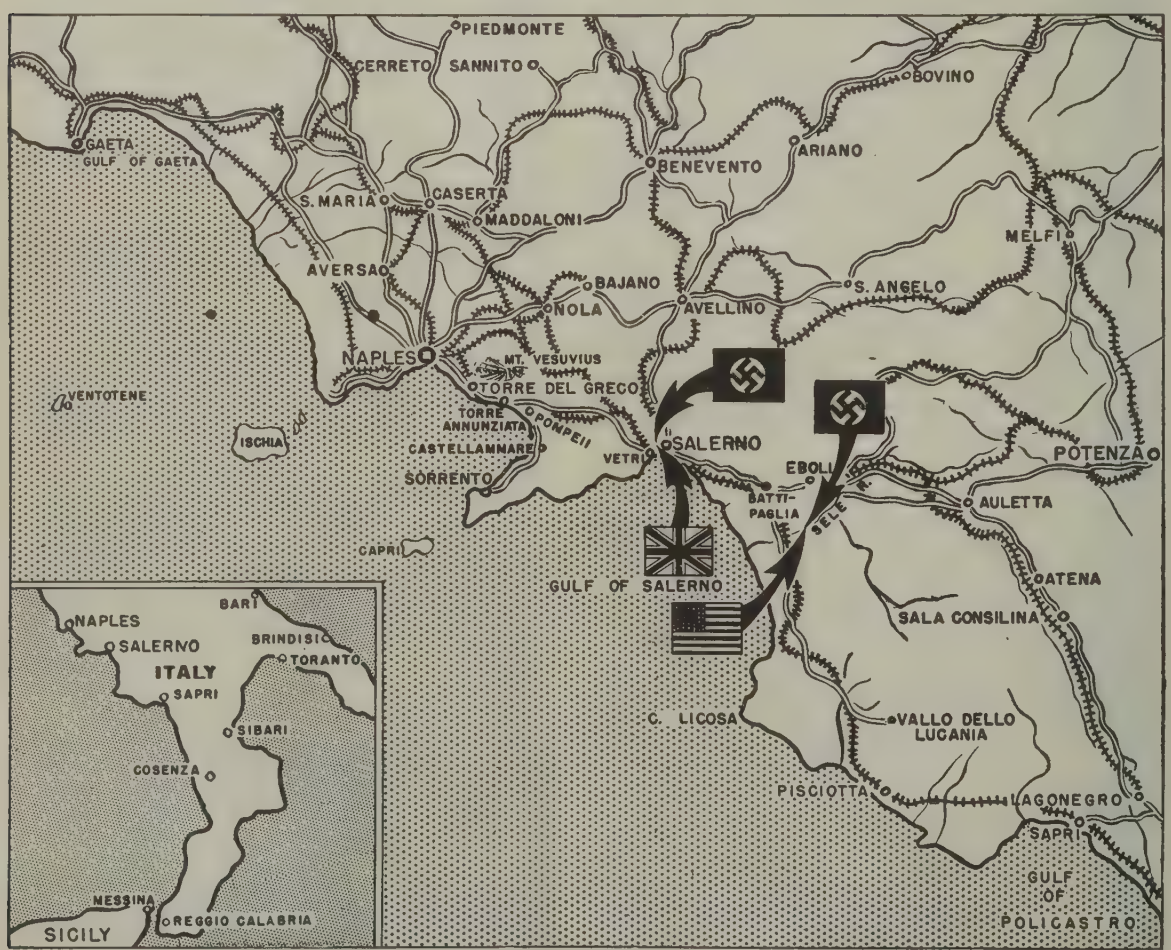
The Invasion of the Italian Mainland.—The Allied landings in Italy were designated as "Operation Avalanche." The British Eighth Army (Lt. Gen. Sir Bernard Montgomery) and the American Fifth Army (Lt. Gen. Mark Clark) formed the 15th Army Group, commanded by Field Marshall Sir Harold Alexander. The Fifth Army embarked from Bizerte on September 6. It included the United States 6th Corps (36th and 45th United States Divisions, American Rangers, and British Commando units) and the British 10th Corps (only one division strong). The 82d Airborne Division was held in reserve.

Four landings were scheduled for the week beginning Sept. 3, 1943. Strong forces from the British Eighth Army were to cross the Straits of Messina near Reggio di Calabria, while other parts of that army landed near Pizzo on the Gulf of San Eufemia, 50 miles from Reggio. The rest, supported by the 1st British Airborne Division, invaded the naval base of Taranto. The United States Fifth Army was to land at Salerno, south of Naples.

The United States Seventh Army's troops from Sicily were transferred to Britain to prepare for participation in the invasion of France. Its headquarters remained in the Mediterranean to mislead the Germans.

Sir Andrew Cunningham again commanded the naval phase of the three-dimensional operation. A task force including four battleships, under Vice Admiral Sir Algernon U. Willis, guarded the Tyrrhenian Sea. An amphibious air support group, including five aircraft carriers (Rear Admiral Sir Philip Vian), provided fighter cover for the United States Fifth Army. Land-based bombers also supported the drive.

The naval force covering the landing of the Fifth Army included more than 500 vessels of various types. This force, under the command of Vice Admiral Henry K. Hewitt, was split into a northern and southern attack force, under Rear Admiral Richard L. Connolly, and Rear Admiral John L. Hall, Jr., respectively. The northern attack force was to land the British 10th Corps on a ten-mile beach extending from the Sele River to within three miles southeast of Salerno, while the southern attack forces landed the United States 6th Corps on an eight-mile beach from the Sele southward to Agropoli. Fifth Army landings were scheduled for September 9.



Courtesy the New York *Times*

It was assumed that the Tenth Army under Field Marshal Gen. Kesselring had the Hermann Göring Division and 15th Motorized Division in the Naples area and the 16th and 26th Panzers, 29th Motorized, and 1st Paratroop Divisions south of that port. Actually, Kesselring not only had these troops but also the 65th and 305th Infantry Divisions and the 3d Panzer Grenadiers available for immediate action. Two German Alpine Chasseurs Divisions were also on the way to southern Italy. Italian opposition, even before the publication of the armistice, was rightly discounted.

On September 3, before dawn, the British crossed the Straits of Messina without encountering noteworthy opposition. By nightfall, strong forces were established at Reggio. The major part of these forces moved northward in the direction of Salerno; the rest proceeded along the coast of the Ionian Sea toward Taranto. Supported by sea and air operations, the landings at Pizzo and Taranto proceeded smoothly. Only German demolitions hampered the initial moves of the Eighth Army.

By September 9, the toe, foot, and heel of the Italian boot, including Taranto, had been secured and the advance was continuing. The right wing of the Eighth Army drove through Brindisi and Bari to capture Foggia on September 27. It ran into a heavy German counterattack designed to recover the Foggia air fields. The British had to use all their available strength to deal with the German drive until October 3, when a successful landing operation at Termoli in the German rear broke up the Wehrmacht's attack. The Germans, however, reinforced by one panzer division, prevented the British drive from gaining momentum.

On the morning of September 9, General Clark's Fifth Army landed on the assigned beaches, with the advantage of naval support and air superiority. The Luftwaffe flew an average of 100 sorties a day, against 750 for the Allies during the critical period of the fight. The Wehrmacht was superior in armor. The United States 2d Armored Division from Sicily had embarked for Britain, and curtailed shipping allotments deprived General Clark of heavy armor on the spot immediately after the infantry went ashore. Only on September 14, did the British 7th Armored Division unload on the beaches to assist the assault infantry.

German artillery on high ground beyond the beaches held the invaders under fire and could not be silenced by Allied naval shelling. Within four hours, the Americans reached Paestum and progressed toward Mt. Soprano. Wehrmacht batteries inflicted heavy casualties upon the attackers, and German panzers, split into small groups in order not to offer big targets to navy rifles, succeeded in crashing through American lines, breaking into the beachhead area, and raising havoc among the unloading parties. The British took Battipaglia but were unable to hold it. Rangers and commandos reached the passes leading into the Naples plain but could not keep contact with the main forces.

On September 10, the Allies entered Salerno. On September 12, the beachhead, 2 to 7 miles in depth, extended 25 miles from Salerno to Agropoli. After the loss of Salerno, the Germans used glider bombs against Allied positions and shipping, inflicting serious damage and casualties. The Germans gathered strength more rapidly than the Allies. Kesselring's forces rose to five divisions, including powerful armor.

On September 13, the Germans launched a heavy counter blow between the Sele and Calore rivers. The Allies were pressed back. By nightfall, it was doubtful if the beaches could be held. But the Wehrmacht discontinued its drive during the night, giving the hardpressed Fifth Army a breathing spell and an opportunity to gather additional reinforcements, including the United States 82d Airborne Division. Every available Allied airplane was thrown into action. In 4 days, 2,150 tons of bombs were dropped in support of the ground forces, while the navy shelled the Germans without respite.

The crisis was surmounted on September 15, when the Eighth Army's left wing reached the southern end of the beachhead. Kesselring's forces began to fall back, and the Allied advance was resumed on September 16. Patrols of the Fifth and Eighth Armies met 40 miles southeast of Salerno. An advance of 9 miles carried the Fifth Army inland from Agropoli, and an airfield, 12 miles from Salerno, was captured. Glider bombs ceased to fall and unloadings were speeded up. Eboli, in the center of the front, fell to the Allies on September 20. German rearguards held out against the Allied advance for five more days. During the first 18 days of the Salerno operation, navy crews and army services landed a total of 108,000 tons of supplies, 30,000 motor vehicles, and 189,000 troops.

Twenty-one days after landing at Salerno, the Allies entered Naples. The Germans had wrecked the port and its installations. Residential sectors, cultural monuments, and public utilities were ruined in an orgy of destruction by the Germans. Thousands of murders were added to acts of vandalism and arson. Allied salvage teams restored Naples harbor to normal capacity within four months.

Allied shipping space amounting to 300,000 tons was used exclusively to build up air power in southern Italy. The movement of bombers and fighters into Foggia was an enormous undertaking. Two heavy bombardment groups, two medium groups, and two fighter groups were established on 10 fields. The strengthening of the Fifteenth Strategic Air Force in Italy under General Doolittle considerably delayed the building up of the ground forces. By the end of 1943, 35,000 combat airmen were established with their supporting troops. Pipelines and pump stations were transferred from Africa to Italy. For a substantial period, on the ground the Wehrmacht remained stronger than the Allies. Only Kesselring's insistence on guarding the coast against the imaginary threat of Patton's army accounted for the fact that the Germans did not gain superiority in the front line.

The Fifth Army, after a 20-mile advance beyond Naples, reached the southern bank of the Volturno River in contact with the left wing of the Eighth Army. The center and right wing of the Eighth, operating on flatter ground than other Allied forces, had formidable barriers ahead in the Trigno, Sangro, and Moro rivers, swollen by constant heavy rains. On October 13, the battle for the crossings of the Volturno began. After 9 days of stubborn fighting, the Allies succeeded in securing high ground beyond Capua, north of the river.

The Germans prepared a "winter" line across the peninsula, following generally the courses of

the Liri and Sangro rivers. It was 75 miles from Rome at one point. Neither the "winter line" nor the Barbara, Bernhardt, Hitler, Gustaf, or Gothic lines was composed of continuous artificial fortifications. German propogandists used the term "line" freely to imply the existence of several "impregnable walls" across the Apennine Peninsula. Actually the German Tenth Army availed itself of numerous natural obstacles and skillfully improvised strongholds, protected by mine fields, wire entanglements, and log and earth emplacements, on key terrain features. Mortar and machine gun emplacements were frequently dug four or five feet deep into solid rock. Howitzers (240 mm) and 8-inch guns had to be rushed to Italy from the United States to deal with the German strongpoints. Up to November 23 and 25, respectively, British casualties on the Italian mainland totaled 16,074 and American 10,649.

On November 28, General Montgomery attempted a breakthrough along the Adriatic coast. The attackers could only inch forward despite heavy artillery and air support. The initial objective, Lanciano Ridge, was seized on December 1. It took 13 more days to cross the Moro River. Ortona, defended by German tanks, flame throwers, and infantry, was captured on December 29, in 7 days of costly house-to-house fighting. The attack bogged down five miles beyond Ortona.

Also in December, the Fifth Army arrived at the entrance of the "Cassino Corridor" south of Rome, where it was stopped by extremely strong German positions. The 2d Moroccan Infantry Division came to Italy in December, as the forerunner of the French Expeditionary Corps under Gen. Alphonse Juin, after the United States agreed to equip eight French infantry and armored divisions. Moroccan *Goumiers,* Indian Ghurka's, and New Zealand Maoris distinguished themselves in mountainous terrain.

On December 5, the Combined Chiefs of Staff delegated responsibility for all operations in the Mediterranean except for strategic bombing to Gen. Dwight D. Eisenhower. On December 24, Eisenhower was appointed supreme allied commander of the invasion forces from the west (meaning from the British Isles) and was ordered to England to take charge of final preparations for the invasion of France. General Montgomery, Air Chief Marshal Tedder, and General Bradley joined him there. Sir Henry Maitland Wilson was named supreme commander of Allied forces in the Mediterranean, with Lt. Gen. Jacob L. Devers as his deputy. Lt. Gen. Sir Oliver W. H. Leese assumed command of the Eighth Army. Lt. Gen. Carl Spaatz took charge of the United States Strategic Air Forces in Europe, General Doolittle of the 8th Air Force, and Lt. Gen. Ira C. Eaker of the Mediterranean Allied Air Force. Maj. Gen. Nathan T. Twining was given command of the Fifteenth Strategic Air Force.

Early in January 1944, preparations were under way to break the stalemate in Italy by another amphibious operation.

AIR AND SEA BATTLE FOR EUROPE

In 1943, Allied air power became as important a factor in the war as ground and naval forces. In contrast with German manpower allotments which gave the ground forces priority over the Luftwaffe, a substantial proportion of draftees in the United States and Great Britain were assigned directly to the air forces. Increasing production and improvements in aircraft design, in which the United States took the lead, permitted the Allies to develop an independent air strategy while simultaneously strengthening team work among all the services.

The Air War Over Europe.—The Germans were the first advocate of total war. Allied air strategy brought it closer to realization than ever before. What happened between 1943 and 1945 gave a relatively minor foretaste of what might happen in the event of future armed conflict between highly industrialized and scientifically progressive nations.

Allied air power aimed to disrupt Axis industries and communications and to undermine enemy manpower at its source, not only by inflicting civilian casualties but also by striking at morale through the destruction of housing and the nerve-wrecking strain of incessant night raids.

In reality, industrial bombing did not seriously affect the Reich's output of war materials. It did, however, force German planners to keep millions of men in war jobs who otherwise might have joined the depleted ranks of the Wehrmacht, and it impeded a further increase in German war production by diverting manpower to essential reconstruction. The disorganization of transportation offset the Reich's initial advantage of short lines of communication. Civilian casualties rose, and the German working potential was gradually reduced.

Both the Allied air forces and the Luftwaffe suffered substantial losses. Replacement capacity of airplanes and crews was far higher on the Allied side, because of United States production which rose to 9,000 planes in December 1943, and to manpower allotments. The Luftwaffe could no longer afford to husband its forces and rely upon ground defenses. German planes gave battle when Allied raiders approached in force. In 1943, long distance bombers had no fighter cover for the latter part of their trip, and the Germans were willing to sacrifice several fighter planes to shoot down a heavy bomber. Most Luftwaffe losses in 1943 were fighters. As the range of Allied fighters increased, the Germans were deprived of this advantage.

In 1943, the Allies dropped 152,448 tons of bombs on the Reich (72,467 during the last three months of the year) against 41,440 in 1942. The United States share in the bombings increased during the year, but even during the last three months it did not match that of the RAF (28,227 tons of bombs compared with 44,240 tons, and 36 day raids compared with 41 day and 56 night raids). Cooperation between the Allied air forces assigned the RAF chiefly to night saturation bombing and the United States Air Force to daylight precision bombing. By mid-1943, Gen. Ira Eaker's 8th Air Force numbered 2,000 planes, half of which were heavy bombers. In 1943, British plane losses over Germany were 672, United States losses 489.

Berlin, seat of the highly centralized German government, site of great war plants, and a vital communication hub, was hit by 3,000 tons of bombs on Aug. 23 and 31 at a loss of 105 planes. Between November 22 and 27, the city felt the impact of 5,000 tons of bombs, a number of which were blockbusters. In December 1943 and January 1944, raiders came over the capital almost nightly. On Feb. 9, 1944, 1,000 planes drop-

ped 2,300 tons of explosives and incendiaries on the capital.

The Ruhr suffered considerably. Essen, Düsseldorf, Mühlheim, Bochum, Wuppertal, Krefeld, and Duisburg—the latter a great inland port—were heavily hit. A specially trained RAF force smashed dams on rivers, releasing waters which inundated Dortmund and Wuppertal, and ranged as far as Kassel.

German research laboratories on the Baltic at Peenemünde were destroyed in an RAF attack in August 1943, which killed many scientists and impeded the development of new weapons.

On August 17, the United States Air Force raided German ball-bearing plants at Schweinfurt with 424 tons of explosives, and airplane industries at Regensburg, Bavaria, with 298 tons. The Luftwaffe put up a strong defense, destroying 60 out of 350 United States Flying Fortresses.

During six days, beginning June 24, Hamburg was hit by 8,000 tons of explosives and incendiaries which devastated about three fourths of the built-up area. Cologne, industrial city and Rhine port, suffered additional damage on June 29, July 4, and July 9.

On Aug. 1, 1943, a United States force of 178 B-24 heavy bombers from North Africa raided Ploesti in Rumania, site of fields from which the Axis obtained three million tons of oil a year, with a loss of 54 bombers. Great fires were started, and the Wehrmacht lost urgently needed fuel for its mechanized forces and the Luftwaffe.

A shuttle service was introduced in 1943, and planes from Britain, after bombing targets in southern Germany and northern Italy, continued to North Africa or to Foggia, to refuel, take on new bomb loads, and carry out another mission on the return trip to Britain. Another shuttle service between Britain and the USSR did not reach noteworthy dimensions. By July 1, 1943, two thirds of the Luftwaffe was engaged against the Western Allies.

The U.S. Air Force.—In May, 1943, United States Air Force mobilization was fixed at 273 combat groups as follows: 5 very heavy bombardment (B-29 Superfortresses), 96 heavy bombardment (Flying Fortresses and Liberators), 26 medium bombardment, 8 light bombardment, 87 fighter, 27 troop carrier, and 24 reconnaissance groups.

According to General Marshall's report, experience taught that casualties suffered in air missions had to be replaced the same day, as vacant chairs at the mess hall had a depressing effect on the survivors of heavy fighting. It was also found necessary to provide three combat crews per operating plane and to return the men to the United States after 25 missions in areas of strong opposition and after 50 missions in less strenuous theaters. Most of the best qualified inductees were allotted to the air force, and a top strength of 2,380,000 was authorized.

The U.S. Ground Forces.—Early in 1942, the United States Army established a troop basis of 3,600,000 men to permit the organization of 59 infantry (including 18 National Guard), 10 armored, and 2 cavalry divisions. No larger force could be envisaged at that time. Yet, by the end of that year, the total strength of the United States Army had increased to 5,397,674 men, thanks to greater numbers of trained officers and noncommissioned officers and more equipment available. Even this figure was considered insufficient when plans for future invasions of Europe were drafted. For 1943, a peak army mobilization of 8,248,000 officers and men was planned. The turning of the tide in the eastern theater of war in early 1943 led to a slight reduction of the estimate to 7,700,000 in an army of 90 divisions, including 3 "light" divisions for jungle and mountain warfare. This figure included the air force. The number of combat troops was further reduced by necessary allotments to service forces. Tremendous distances between the American homeland and the theaters of war required 2,174,000 men to secure communication lines and to build and man service installations.

The ceiling on American men physically fit for active service was between 15 and 16 million, of which 14 million were actually mobilized; in this respect the United States ranked third behind the USSR and Germany. The United States ranked only fifth among the belligerents in the number of combat divisions organized, after the USSR, Germany, Japan, and China (Chinese divisions were under normal strength by international standards). The United States Women's Army Corps (WAC), numbering approximately 100,000 at the end of the war, including 6,000 officers, helped to release men for combat duty and contributed substantially to relieve the shortage of hospital personnel. Approximately 17,000 WAC's were on duty in active theaters when the war ended.

Original calculations based upon North African experiences overestimated future losses in the armored services and underestimated infantry losses. This led temporarily to a rather critical shortage of adequately trained infantrymen in 1944, which was overcome in time to secure victory in both main theaters of war.

Conditions in Britain were analogous to those in the United States. Great Britain and the Dominions had to allot a considerable proportion of available manpower to the navy and the air force. Despite the mobilization of 12,000,000 men (fourth, after the United States), Britain ranked seventh in the number of divisions (after Italy as well as the other nations mentioned).

War in the Atlantic—1943.—Early in 1943, the German High Command began to consider the possibility of an Allied invasion of Europe. To prevent such an invasion, it was estimated that the German Navy, assisted by the Luftwaffe, must sink at least an average of one million tons of Allied shipping a month. This estimate discounted American ability to build 16 million tons of shipping space a year as planned and placed the figure at 11 million tons instead. (In reality, United States ship construction reached 19 million tons a year.) Grand Admiral Erich Raeder, commander of the German Navy since 1928, declined to guarantee such a volume of sinkings. However, Admiral Karl Doenitz—in charge of submarine operations—insisted that it could be done. On Feb. 1, 1943, Raeder was discharged and Doenitz, promoted to the rank of Grand Admiral, was put in command of the German Navy (*Wehrmacht Marine*).

In March, Doenitz called the U-boats out in strength. The wolf pack system was continued. The Germans claimed Allied shipping losses of 851,000 tons during the first month of the offensive. The Allies made no counter claims, but the Germans had to admit the sinkings had declined to 107,000 tons by June. Allied sources stated that the tonnage of new ships built in the first

half of 1943 (before United States ship construction had reached its peak) exceeded losses by three million tons, and that the Germans, in a three-month offensive, had lost an average of one U-boat a day.

A new type of escort carrier had been added to the protection of convoys, providing constant air cover. Air attacks on submarines increased. Sloops and destroyers, freed from escort duty by the new small carriers, were organized in "killer groups" and hunted down the wolf packs with the aid of aircraft. German U-boat pens in the Bay of Biscay were watched, and submarines leaving or returning to port were intercepted. Radar facilitated the detection of lurking raiders.

After the failure of his first campaign, Doenitz withdrew most of his submarines to be equipped with new devices. Improved torpedoes of a magnetic type were introduced. So was an ingenious invention designed to fool the Allies. The appearance of air bubbles, oil slicks, and debris on the surface was considered evidence of the sinking of a submarine. The Germans equipped their U-boats with an apparatus to discharge such "evidence" through torpedo tubes. When Allied ships —believing the raider sunk—continued their course, they were attacked by magnetic torpedoes. German submarines were also equipped with heavier caliber guns and AA cannon and their armor was reinforced. Wolf pack tactics were not abandoned, but were supplemented by attacks by single raiders.

The submarine offensive was resumed late in September 1943. For three weeks ending September 19, not a single Allied ship had been lost in the Atlantic. Then sinkings began to rise. A convoy from the United Kingdom to the United States lost 5 merchantmen and 3 escort vessels to 15 attacking U-boats. Another new German weapon turned up, resembling a type used on the beaches of Salerno. Long-range German planes carried glider bombs. These winged missiles, speeded up by rockets, were guided to Allied ships by radio waves. Tight air umbrellas dealt with that weapon.

On October 12, it was simultaneously announced in London and Lisbon that Portugal had granted Great Britain the use of facilities in the Azores in exchange for material and supplies for Portugal's armed forces and for the maintenance of Portugal's national economy. Use of these facilities did not prejudice Portuguese sovereignty, and all British forces were to withdraw at the end of hostilities. The Azores were ideally located for the protection of shipping lanes from the United States to the Mediterranean and West Africa. They were 1,285 miles from Gibraltar, 1,470 from St. John's, Newfoundland, and 1,785 from Dakar.

Two weeks after the announcement, British anti-submarine patrol planes went into action from the newly acquired bases. The German reaction was confined to angry protests against Portugal's breach of neutrality. The Reich continued to maintain a spy organization in Portugal and to import tungsten from there.

In November 1943, Allied shipping losses in the Atlantic had dropped again. Hitler, in his New Year message of 1944, admitted a "slackening in the U-boat war," which he attributed to an Allied device that German technique would soon neutralize. This device, which German technique never neutralized, was a magnetic airborne detector, mounted on planes and dirigibles, which located submarines beyond the range of radar.

Other elements of success in the anti-submarine war were the strengthening of Russian air defenses at Murmansk and increasing protection given to Allied convoys by Murmask-based Russian fighters. Grand Admiral Doenitz called upon German capital ships in Norway to raid the Murmansk route—protected by the British and Canadian navies—in the early fall of 1943.

The battleship *Tirpitz* prepared to sail from its berth in the Altenfjord, 200 miles inside the Arctic Circle. The narrow and heavily defended channels which led to the vessel's mooring seemed to make any approach by hostile craft impossible. But on Sept. 22, before the *Tirpitz* could get out, British midget submarines, traveling 1,000 miles, penetrated the channels and scored torpedo hits. None of the submarines returned to its base, but air reconnaissance showed the *Tirpitz* surrounded by a thick oil slick extending two miles from its berth. No docks capable of accommodating a vessel of its size were available close to the Altenfjord, and the damage prevented long distance towing. The last big German battleship was out of action.

Another powerful surface raider, the 26,000 ton battle cruiser *Scharnhorst,* mounting nine 11-inch (280 mm.) rifles, attacked a Murmansk-bound convoy protected by 3 British light cruisers on December 26. A British battleship, the *Duke of York,* escorted by four destroyers, was nearby, but the *Scharnhorst* turned away to the southwest before it came within range. After a sharp chase, the *Duke of York* caught and sank the battle cruiser 60 miles from the North Cape. The German ship's gunners fired 1,000 rounds of heavy shells, but scored only two hits.

Blockade runners augmented the Reich's short supplies of vital raw materials. A number of them were intercepted between Iceland and the Bay of Biscay. Four large cargo vessels and one tanker were caught in the second half of 1943. Their cargoes included 30,000 tons of rubber, 5,000 tons of tin, 25,000 tons of edible oils, and smaller quantities of tungsten and quinine from Japanese-controlled territory.

CHINA'S WAR

Allied reverses in Burma, resulting in the severance of the Burma Road, placed China in a desperate situation. No early counter-offensive was feasible. Chiang Kai-shek's appeals to the British government to grant genuine self-government to India and his conferences with Pundit Nehru and Mohandas Gandhi failed to increase India's war effort appreciably. Although the European war had top priority in Allied land operations, the United States and British High Commands realized the vital importance of keeping the Chinese in the war. The possibility could not be discounted that if the Japanese should gain control of the vast spaces and natural resources of China, they might continue the war on the Asiatic mainland long after their home islands were invaded.

On July 15, 1942, the Chungking government reported that 6,000,000 more men had been drafted, bringing the total to 26,000,000. On October 23, Gen. Ho Ying Ching announced that, since the opening of hostilities in 1937, 11,129,572 men had been conscripted for military service. Even the latter claim possibly was far in excess of the actual figure.

China desperately needed supplies. The only

remaining supply line in 1942 was the air route over the 500 miles of the Himalayan Hump between Assam Province in India and Yunnan Province in China. Hump flyers could not carry such heavy equipment as trucks, rolling stock, tanks, and artillery of which the Chinese were particularly short. They did deliver gasoline, bombs, and ammunition to General Chennault's Fourteenth Air Force, assisting Chinese ground forces. The load carried over the Hump rose from small beginnings to 46,000 tons a month in 1945.

In 1942, American engineers, using Chinese labor, undertook to build a new road from India to China, leading from Ledo in India to the old Burma Road at Mongyu. It was finished in the spring of 1944. A pipeline from the Indian port of Calcutta to Ledo and parallel to the road from Ledo was also under construction. The goal of the combined air and land routes and the pipeline, as established at the first Quebec Conference, was 85,000 tons of general stores and 54,000 tons of petroleum products.

On May 5, 1942, the Japanese, advancing along the captured western section of the Burma Road, penetrated into Yunnan Province, but soon came to a halt 20 miles east of Wanting. The Japanese High Command believed that Doolittle's raiders had taken off in China and decided to eliminate General Chennault's air bases. On May 19, four Japanese columns from Hangchow advanced on Chuhsien air field, which was captured on June 7. Three days later, the city of Chuhsien and its railroad station fell to the Japanese. This continued advance ran into stiffening Chinese resistance and was halted on July 10. Supported by United States air power from remaining bases, the Chinese regained Chuhsien on August 29. This setback was especially annoying to the Japanese because, with Chuhsien in their hands, they could hope to gain control of the Chekiang-Kiangsi railroad, the missing link in land communications between Korea and Singapore. The growth of United States sea power and heavy shipping losses forced the Japanese to rely more and more on land transportation. The bombardment of Hangkow, Canton, and Hongkong by the United States Fourteenth Air Force added to their transportation troubles. In March 1943, the Japanese lost their hold in Yunnan Province.

The Japanese next attempted to conquer China by starvation. A considerable proportion of Chinese rice supplies came from Hunan and Hupeh provinces, where the "rice bowl" around Lake Tungting produced an average annual surplus of 650,000 tons of this basic food. In February 1943, a Japanese force of 100,000 moved south of the Yangtze River in the direction of Lake Tungting. Infiltrating the fertile region, they burned granaries and destroyed crops. Not before May 23, when the damage was already serious, were the Chinese, aided by United States air support, able to prevent further Japanese advances. The invaders were defeated in a battle lasting one week, in which the Japanese lost 31 planes to American action. Before the autumn crop was secure, another Japanese raid, carried out by 80,000 men, hit the "rice bowl." Chinese counter-action culminated in the battle for Changteh, Dec. 3-9, 1943. The city was finally won by the Chinese. Only 30 of its 10,000 buildings remained standing. Additional quantities of rice were destroyed. Although the Chinese did not literally starve, few people in the world could have endured the privations they suffered.

In May 1943, the "Trident Conference" in Washington, D. C., decided that a campaign should be launched to recover Burma in the fall of that year, after the end of the monsoon season. In August, the Allied "Quadrant Conference" created the Southeast Asia Command under Admiral Lord Louis Mountbatten. Lt. Gen. Joseph Stilwell became Mountbatten's deputy. The RAF and the United States Tenth Air Force on the Burma front were formed into the Eastern Air Command under Maj. Gen. George E. Stratemeyer. Allied operations faced considerable difficulties. The railroad from Calcutta to Assam, main supply route of the attacking forces, changed from broad to narrow gauge en route and crossed the Brahmaputra River by ferry. The jungles along the Burma-India frontier were hotbeds of disease. An amphibious attack on southern Burma might have facilitated the Allied offensive, but no shipping space was available for that purpose.

During the Cairo conferences of 1943, it was emphasized that there should be an Allied attack across the India-Burma frontier to reopen the Burma Road. To assist the impending drive from the east, the Chinese 22d and 38th Divisions moved into the Hukawng Valley. In February 1944, they were joined by a specially trained United States infantry combat team, the *Galahad* force under Brig. Gen. Frank D. Merrill.

The Japanese, aware of Allied preparations, opened an offensive during the fall and winter of 1943–1944 to capture Assam Province and to sever the Ledo Road, the Hump air line, and the Assam-Bengal railroad. Japanese forces in Burma, attacking across the Salween River in the Lung Ling area, were repulsed by the Chinese before they could reach the Ledo Road. Another Japanese drive, however, aimed at the supply base at Imphal, India, and the Assam-Bengal railroad, caught the British Fourteenth Army in the process of final organization for its drive, lagging behind the "Trident" schedule and with its advanced lines incompletely manned. In April 1944, Imphal was isolated (the Japanese wrongly claimed the capture of the city) and the railroad was threatened at Dimapur. Airborne British and Indian reinforcements repulsed the Japanese at Dimapur and reestablished contact with Indian troops at Imphal, while another British drive along the Bay of Bengal pressed the Japanese back in Arakan. Another sharp reverse at Kohima added to Japanese losses in the short-lived invasion of India.

Chinese and American forces, advancing through the Hukawng Valley in May 1944, invested Myitkyina in northern Burma. The Japanese tried in vain to reinforce their troops in this sector after the 18th Division of Singapore fame was annihilated. British and Indian long range penetration groups, commanded by Maj. Gen. Orde C. Wingate, blocked the Irrawaddy River Valley, through which Japanese reserves had to pass. Part of these jungle troops marched from India; others were carried to the theater of operations in gliders.

STRATEGY IN THE PACIFIC

Japanese offensive strategy in the Pacific was designed to gain permanent control of that ocean by establishing bases on its key islands. The Japanese even seized many secondary islands but

were never able to achieve their major objective of closing most of the Pacific to the United States Fleet. The Japanese conquests could only be held and extended by maintaining naval and air superiority. In 1943, this superiority passed completely to the Allies because of United States ship and aircraft construction which was little short of miraculous by prewar standards. Thus the foundations of Japanese offensive strategy collapsed.

A Japanese switch to an effective defensive strategy required large scale redeployments, absorbing a huge amount of shipping space. As Japanese shipping was cut down and vital lanes came under Allied attack, garrisons in outlying bases were isolated, and their planes were grounded by lack of fuel. Meanwhile, new positions closer to the home islands needed men and equipment.

According to Undersecretary of the Navy James Forrestal, 1,600,000 tons of naval vessels were built in the United States in 1943. This doubled the size of the fleet, which by the end of 1942 already far exceeded its own pre-Pearl Harbor strength plus that of the other great powers. New ships included six 27,000 ton *Essex* class and six converted 10,000 ton cruiser aircraft carriers, in addition to 50 smaller carriers. The United States Navy also received 13,617 new combat planes in 1943. By the end of the year, naval personnel numbered 2,294,000, in addition to 399,700 marines, and 171,500 in the coast guard. United States overseas transportation increased rapidly. From June 1942 to June 1943, 16,000,000 tons of cargo and 780,000 men were sent to the Pacific theater of war, plus 24,000,000 tons of cargo and 1,820,000 men to the European theater.

The Japanese Navy in 1943 was reduced to 79 per cent of its 1941 tonnage, and shipbuilding could not keep pace with losses. The Japanese merchant marine (6,369,000 tons in 1941) had already lost 2,500,000 tons, mostly to United States submarines.

Eighty per cent of American naval strength was deployed in the Pacific, but Admiral King's hopes that the United States fleet would meet and decisively defeat the Japanese Navy did not materialize in 1943. The Imperial Navy shunned major engagements. The Japanese still expected the Allies to attack every Japanese-held island and to fight until the defenders were annihilated, suffering tremendous casualties in slow "island hopping." This would have been a characteristic textbook strategy before the weapons of World War II were developed. But Allied planners realized that island garrisons without naval and air support were no threat to amphibious advances beyond their striking distance. They decided, therefore, to concentrate on carefully selected breakthrough areas, aimed toward the Japanese home islands, the Philippines, and China, and to by-pass islands that could not interfere with their progress.

At the Quadrant Conference, General Arnold called for the establishment of bases in China, in the Marianas, and in other Pacific islands, to enable B-29 Superfortresses to carry total war to Japan. His plan which was disappointingly hard to execute in China succeeded brilliantly in the Pacific. It reduced Japan's war potential and tied a large proportion of available Japanese fighter planes to their home bases.

Three lines of advance were decided upon by the Joint Chiefs of Staff at the turn of the year 1943. Two of them were aimed at the Philippines and the Asiatic mainland beyond; the third pointed across the Central Pacific toward Japan proper. The Philippine drives, under the strategic command of MacArthur, led along the coast of New Guinea and through the Solomons. They were scheduled to reach their goal in the fall of 1944. Lt. Gen. Walter Krueger was the field commander in New Guinea, while Admiral William F. Halsey took charge of the Solomons operations. The Seventh Fleet was under General MacArthur's command. On July 1, 1943, MacArthur had at his disposal four American and six Australian and New Zealand divisions, plus small forces of United States Marines. Admiral Chester Nimitz, in charge of the Central Pacific offensive, commanded nine United States Army and Marine divisions. Reinforcements kept arriving. The air force included 150 heavy bombers and numerous naval aircraft.

The success of the revolutionary strategy was described in a report made by General MacArthur late in 1944: "The enemy garrisons which have been by-passed in the Solomons and in New Guinea represent no menace to current and future operations. . . . Their capacity for organized offensive effort has disappeared. The various processes of attrition will eventually account for their final disposition . . ."

The Continued Fight for the Solomons.—Between March and May 1943, heavy air raids against Rabaul, Wewak, and Munda gave evidence of growing Allied might. Japanese reserves massed at Truk in the Carolines (about 200,000 men and a large number of aircraft) were unable to help their compatriots in the southern islands. Their mobility was sharply restricted by Japanese naval deficiencies.

The Japanese-held island of New Georgia in the Solomons, 40 miles long and up to 20 miles wide, could not be by-passed. Its Munda airfield became a main target for Allied air attacks prior to invasion. Admiral Halsey's naval forces were engaged in protecting Maj. Gen. Oscar W. Griswold's 14th Corps, New Zealanders, and United States Marines assigned to land in New Georgia.

A group of United States Marines landed near Viru Harbor, 35 miles from Munda, on June 23, 1943. By July 5, the marines had seized the anchorage. On June 30, United States Army forces effected a surprise landing on Rendova Island, less than six miles from Munda. The small Japanese garrison offered only minor resistance for 48 hours. United States 155-mm. guns shelled Munda airfield from Rendova. On July 5, elements of the United States 37th and 43d divisions landed 12 miles north and 6 miles south of Munda, opening a twin drive toward the base. There were 10,000 Japanese on New Georgia, mostly concentrated near Munda. Almost 200 Japanese planes battled the invaders. On the first day, the Japanese lost 123 aircraft to the Americans 14.

The Japanese Navy, a mere shadow of what it had been in the battle for Guadalcanal, made attempts to duplicate its previous Solomons strategy by landing reinforcements and supplies on the invaded island. Strong United States naval forces, with effective air support, intercepted enemy cruisers and destroyers in Kula Gulf between New Georgia and the adjoining island of Kolombangara. Five Japanese vessels were blown

up by the first blast of American heavy guns. During the subsequent pursuit, the Japanese lost four more ships in as many hours. The United States task force lost the light cruiser *Helena* in the engagement of July 6, 1943. Light Japanese forces returned one week later, and four more Japanese ships were sunk. No reinforcements or supplies reached the defenders. The last naval action near Munda took place on August 3 and resulted in the loss of three more Japanese craft.

On land, the defenders offered stubborn resistance. The approaches to the airfield were honeycombed with small pillboxes, offering indistinct targets to aerial bombs and artillery shells. On July 12, the invaders were halted two miles from the airfield. Tanks failed to clear the way. Flame throwers were more effective, but it was extremely difficult to bring them into range against Japanese fire. During the following week, air attacks destroyed the remaining Japanese planes and saturated the defenders' positions with bombs. The land attack was resumed on July 25, after 200 bombers raided Munda with 186 tons of bombs and troops of the United States 25th Division joined the invaders. On August 5, Japanese resistance ceased. The defenders of Munda were wiped out.

Bairoko Harbor was occupied on August 25. Part of the Japanese garrison escaped to Kolombangara. Vila airfield on Kolombangara came within United States artillery range on August 27, when American forces invaded Arundel Island, and was abandoned by the Japanese six weeks later. By-passing Kolombangara, General Griswold's forces occupied Vella Lavella Island, northwest of Kolombangara, on October 9. Five weeks earlier (September 5), the Japanese had given up their seaplane base at Rekata Bay on Santa Isabel Island. A Japanese attempt to mass relief air forces on Wewak was wrecked by American raids on August 17 and 18, which destroyed all but 10 of the 225 planes assembled there.

Rabaul, on New Britain, was still a major Japanese air and naval base. A raid on October 12 knocked out 177 Japanese planes, most of them on the ground. Three destroyers, three large merchant ships, and 43 smaller merchant ships were destroyed in the harbor. Between Rabaul and Bougainville, two Japanese destroyers and eight cargo ships were sunk by American aircraft on November 2. On the same day one heavy cruiser and nine smaller naval vessels were added to Japanese losses near Rabaul. On November 12, one Japanese cruiser and two destroyers went down, and twelve vessels of various types suffered damage. Four Japanese destroyers, heading for Rabaul, were sunk on Nov. 25, 1943.

New Zealanders landed in the Treasury Islands on Oct. 26, 1943. Two days later, New Zealand parachutists invaded Choiseul.

A major operation began on Nov. 1, 1943, directed against Bougainville, an outer island of 3,880 square miles in the Solomons. The Japanese garrison numbered 25,000. Initial landings at Empress Augusta Bay, on the island's west coast, were carried out by the 3d Marine Division of Lt. Gen. Vandegrift's First Marine Amphibious Corps. It was decided not to wage a battle of annihilation against the garrison, but to drive it back into the interior and leave it to perish by starvation and disease.

After heavy air and naval preparation, the marines met little opposition on the beaches. Advancing beyond the landing grounds, however, they encountered violent counterattacks. Light Japanese naval forces attempted to intercept the mighty American task force and to land reinforcements. The few seaborne Japanese who reached shore were quickly wiped out by the marines. The Imperial Navy lost one cruiser and four destroyers. The bridgehead was extended on November 11, when United States Army forces of the 37th Division, equipped with armor, joined the marines. In almost four weeks of intensive fighting, a firm hold on an area seven miles wide and five miles deep was established. On December 15, General Griswold took charge of operations. A fighter strip was completed on that day, and a bomber field was placed in operation ten days later. The disorganized defenders confined their activity to patrol raids. A naval base and three airfields were rapidly established within fighter range of Rabaul, 235 miles away. From Bougainville, Maj. Gen. Nathan F. Twining's 13th United States Air Force neutralized what remained of Japanese installations in the Solomons.

On March 10, 1944, the Japanese launched a desperate drive to dislodge the United States forces. It continued until April 1. When the unsuccessful assault subsided, 7,000 Japanese dead were counted. Patrols kept stabbing at the American lines during April, but there was no organized resistance on Bougainville thereafter.

Naval Forces in the Pacific.—The South Pacific command had to be reorganized because of the growth of United States forces and the needs of their deployment. The Seventh Fleet remained at MacArthur's disposal. Admiral Halsey took command of the United States Third Fleet in the Central Pacific, and the Fifth Fleet was assigned to Admiral Spruance. Both Halsey and Spruance were subordinate to Admiral Nimitz. A special unit originally attached to Spruance's fleet, Task Force 58, was created at the end of 1943 under Admiral Marc Mitscher.

The Attack on New Britain.—The Japanese hold on New Britain and New Ireland impeded the successful completion of MacArthur's campaign in New Guinea. MacArthur's air forces raided secondary air bases at Arawe, Gasmata, and Cape Gloucester (New Britain) late in November and early in December 1943. On Dec. 15, 1943, after air and naval preparation, a reinforced United States cavalry regiment landed close to the village of Arawe, on the western end of New Britain, where it could partly control Vitiaz and Dampier straits. The beaches were secure after two days of fighting. On December 26, another invasion hit New Britain, west of Cape Gloucester and east of that cape at Borgen Bay. Two weeks of aerial bombing and one week of naval shelling preceded these landings by the First Marine Division. Cape Gloucester airfield was captured after four days of frustrated Japanese counter attacks. The third invasion of New Britain was carried out at Talasea, 170 miles from Rabaul. Once formidable, Rabaul had become useless to the Japanese, who vainly attempted to divert shipping and air movements to nearby New Ireland. Crushing air and sea superiority enabled the Americans to turn at will against the new target. Kavieng on New Ireland suffered relentless bombardment, and naval shelling completed its destruction on Feb. 18, 1944.

On March 20, Emirau Island, 75 miles northwest of Kavieng, was seized by United States forces, and this island held the key to control of the Bismarck Archipelago. Almost 100,000 Japanese troops on New Britain and New Ireland were finally isolated and bypassed.

The Reconquest of New Guinea.—After the success of the Allied Buna campaign, the Japanese still held the long northern coast of New Guinea, thereby blocking one avenue of Allied approach to the Philippines.

Early in 1943, the Japanese made attempts to land reinforcements, the most determined of which led to the Battle of the Bismarck Sea. On March 1, 1943, Allied planes observed a Japanese convoy north of New Ireland, proceeding in the direction of Lae in New Guinea. It was joined the next day by additional vessels, bringing the total to 12 merchant ships escorted by 10 cruisers and destroyers. From March 2 to 4, Allied air forces kept the convoy under constant attack. Japanese land-based planes, attempting to intercept Allied squadrons, lost 63 craft (to 4 of the Allies) without preventing the convoy's systematic destruction. The last Japanese vessel went down on March 4. Ninety thousand tons of Japanese shipping were lost, and approximately 15,000 soldiers on board were drowned.

The unopposed invasion of Woodlark and Kiriwina islands off the eastern tip of New Guinea, on June 22 and 23, respectively, prepared the New Guinea offensive. Regimental combat teams quickly seized both islands and established air strips.

The attack on Salamaua began on June 30. After ten days of bitter fighting, two attacking groups joined and outflanked Mubo, which fell on July 15. It took the Americans and Australians the rest of the month to reach Salamaua's air strip, five miles from the settlement. A counterattack led to some loss of ground, but an Allied invasion near Lae forced the Japanese at Salamaua to discontinue the attack and to abandon the place on September 11.

The Japanese garrison at Lae was reinforced by the defenders of Salamaua. After heavy naval and aerial preparation, an Australian force had invaded the shore a few miles above Lae on September 4. Squeezed between sea and airborne Allied forces, Lae fell on September 16, and the Allies moved on to seize Huon Peninsula and Finschafen.

On September 18, Allied forces (mostly Australian) landed 60 miles northwest of Lae. Four days later, other Australian forces went ashore six miles from Finschafen, which was occupied on October 2. The defenders fell back to high ground at Sattelberg. A Japanese thrust from Sattelberg through the Sang River Valley temporarily opened a corridor to the coast, through which reinforcements were expected, but no reinforcements arrived. Allied control of the coastal waters was too tight. By the end of October, the Australians closed the corridor and isolated Sattelberg. On November 17, after air preparations, the assault on Sattelberg began. After nine days of severe fighting, the Australians advanced beyond the take-off positions, while a drive from Finschafen took Wareo, 12 miles away. The conquest of Huon Peninsula was not completed until early February 1944. The air force had a considerable share in the final success, which gave the Allies full control of Dampier and Vitiaz straits.

On Jan. 2, 1944, a regimental combat team of the United States 32d Division by-passed Huon Peninsula and landed 10 miles beyond crumbling Japanese positions near Saidor, where an air strip was put into operation on January 7. From Saidor, the Americans drove toward a junction with the Australians fighting their way through and beyond Huon Peninsula. The Japanese defenders of Huon, still about 14,000 strong, were caught between the Americans and the Australians. On February 10, they were attacked from both sides and virtually annihilated.

The Japanese hold on the Admiralty Islands west of the Bismarck Archipelago impeded further Allied advances along the New Guinea coast. Air fields and harbors in the archipelago were needed for General MacArthur's offensive. The invasion was originally scheduled for April 1944, but as progress in New Guinea exceeded expectations and shipping space allotments were satisfactory, operations started on February 29. Advanced elements of the United States 1st Cavalry Division, supported by units of the Seventh Fleet (tactical commander Vice Admiral Thomas C. Kinkaid), landed at Los Negros Island and captured Momote airdrome. Fanatical counterattacks were broken up. The fight for the Admiralty Islands, in which the entire 1st Cavalry Division became engaged, continued for six weeks. By that time, Los Negros, Manus, and smaller adjacent islands were under American control.

Australian airborne forces from Markham Valley worked their way painfully across the Finisterre range toward Madang. They were supported by an American landing 50 miles from Saidor on March 7. The combined Allied forces took Madang on April 25. Even where Japanese resistance was relatively weak, the terrain and climate imposed great hardships upon the attackers.

On April 22, a major amphibious operation struck Hollandia and Aitape, 400 miles west of Madang. Powerful units of the United States Third Fleet (Admiral Halsey) and carrier-based naval aircraft assisted the landings. Troops from the United States 24th, 32d, and 41st divisions went ashore on three beaches, two of them near Hollandia and one near Aitape. They formed part of the 1st Corps (Lt. Gen. Robert L. Eichelberger). Fifteen thousand Japanese were thought to be in that sector, but no more than 5,000 were actually found. After offering weak resistance, they retreated along the coast toward Wewak. The Japanese lost 1,054 men compared to 125 American casualties. The Americans were operating three Japanese air fields at Hollandia and the naval base of Humboldt Bay by April 27. Landings at Aitape were even less firmly opposed, and American fighter planes were soon using its air strip.

At Wewak, half way between Hollandia and Madang, Japaneses troops were caught between Allied forces moving toward a junction and were subjected to heavy air attacks. On July 11, the trapped forces attacked American spearheads in an effort to break out. After small penetrations, the drive was repulsed and the remnants of the Japanese were isolated.

Elements of the United States 41st Division landed unopposed at Arara, 110 miles west of Hollandia, on May 17, 1944. The drive continued in two prongs. One of them—amphibious—took Wadke Island on May 18; the other, moving

along the coast, captured Maffin air strip on May 24. Sharp fighting took place on May 27, when the bulk of the 41st Division invaded Biak Island, off Geelvink Bay, 330 miles farther to the west. When the Americans moved beyond the beaches, 8,000 excellently equipped Japanese struck a furious counter-blow and overran advanced American units. Seaborne reinforcements halted the attack. Organized Japanese resistance subsided on June 22, when the island's three airfields were put into operation by the Americans. Occasional stabs by small Japanese units were discontinued late in July.

In an operation winding up the New Guinea campaign, elements of the United States 6th Division landed at Sansopor on Vogelkop Peninsula, at the western end of New Guinea. The 18,000 Japanese troops on the peninsula were caught off balance, and resistance was negligible. Further air and naval bases were secured. The few remaining Japanese footholds in New Guinea, such as Manokwari and Sarong, were isolated and doomed.

On July 6, General Krueger's Sixth Army Headquarters moved to Hollandia and General MacArthur's Headquarters—previously located at Brisbane, Australia—was established there on Sept. 8, 1944. General Eichelberger, appointed commander of the newly activated United States Eighth Army, took charge of these forces on September 8 also.

According to General Marshall's report, the Allied drive in the Southwest Pacific had pushed 1,300 miles closer to the heart of the Japanese Empire in a little over 12 months, cutting off more than 135,000 enemy troops beyond hope of rescue.

The Gilbert Islands.—The personnel used in the Central Pacific area was given special training, under the supervision of Gen. Robert C. Richardson, Jr., of the Army Command, at amphibious and jungle training centers in the Hawaiian Islands. American aerial and naval superiority was fully exploited in the vast spaces of Pacific operations. The Gilbert, Marshall, and Caroline Islands—in this sequence—were the most formidable obstacles in the Central Pacific path of advance. After United States carrier task forces had raided the archipelagoes, Baker, Nukufetau, and Nanumea islands, close to the British Gilbert group, they were occupied in minor operations on Sept. 1, 1943.

Allied air activity left the Japanese uncertain as to where the next blow would fall. Long range bombers, based in the Ellice Islands, hammered away at the Gilbert atolls, while heavy diversionary raids hit the Marshalls. On October 24, light United States naval forces attacked Tarawa atoll in the Gilberts, sinking one Japanese patrol boat and damaging one destroyer.

The invasion of the Gilbert Islands, designated "Operation Galvanic," began on November 21, 1943, after a naval and air bombardment in which Maj. Gen. Willis H. Hale's 7th Air Force had a major share. Betio Island in Tarawa, less than one square mile in size, was the key to Japanese defenses, where 4,500 picked troops manned 500 pillboxes. Twelve hundred Japanese held Makin Island. Abemama, another target of this exclusively American operation, was taken without opposition.

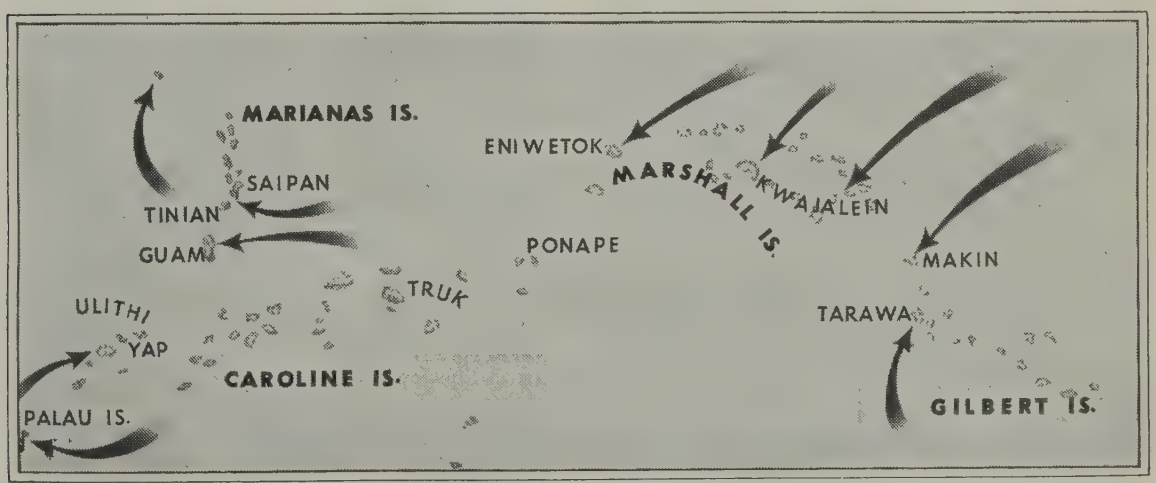
The 2d Marine Division was assigned to capture Betio Island. Despite shattering naval and air preparations, landing barges ran into severe cross-fire. Hundreds of casualties were suffered off shore. Mines and beach obstacles added to the difficulties of the invasion. Amphibious tractors, floated beyond the range of shore batteries and deployed in landing boat formation, proved very effective. Three battalions went ashore in the first assault wave. During the following night, some artillery and a few tanks were brought in.

On November 22, the strength of the invaders rose to two regiments. They battled their way from pillbox to pillbox. Further reinforcements landed the following day in the southwest corner of the island. Armored half tracks, mounting 75-mm. guns, were effective in the closing stages of the operations. The island was entirely in American hands on November 24.

A combat team of the United States 27th Division captured Makin Island. The fight for Makin, although on a smaller scale than Tarawa, was hardly less severe. The most substantial United States naval loss occurred off Makin, where the small carrier *Liscombe* went down with 700 casualties.

Total United States casualties in the campaign amounted to 3,772, of which 3,031 were suffered by the marines.

The Marshall Islands. — The Marshall Islands, made up of 33 atolls and islands, had been under German control from 1885 until 1914, when Japan seized them. In 1919, Japan was given a mandate over the Marshalls and pro-



ceeded to build strong fortifications in this strategically important area.

After the seizure of the Gilberts, Admiral Nimitz prepared to carry the drive to the Marshalls in an operation code-named "Flintlock." Heeding the lessons of Tarawa, preliminary bombing and shelling was intensified, to soften Japanese defenses. More landing craft, including amphibious tractors, were used to put stronger forces ashore in the initial steps of the invasion. Care was taken to smash opposing air forces by devastating landing strips, even though this would delay their future use by the invaders.

From mid-November 1943, constant American air raids hit Wotje, Jaluit, and Kwajalein in the Marshalls. The bombardment reached its peak in late January 1944. The Japanese believed that a simultaneous invasion would be directed against all three targets. However, in a classic example of by-passing strategy, the Americans cut behind Wotje and Jaluit to concentrate on Kwajalein, the world's greatest atoll: 30 islets 66 miles long and 18 miles wide.

Naval forces covering the invasion included modern battleships and carriers. On January 29, the armada lined up offshore to give Kwajalein an unprecedented shelling, while carrier-based aircraft showered heavy loads of bombs on the dazed defenders. On Jan. 31, 1944, the United States 7th Division landed in the southern section of the atoll. Its northern islands, Namu and Roi, were invaded by the 4th Marine Division. Both divisions formed part of Maj. Gen. Holland M. Smith's 5th Marine Corps.

In Roi and Namu, the marines broke Japanese resistance in 27 hours, losing 229 killed and 797 wounded against 3,800 Japanese dead. The naval base on southern Kwajalein resisted until February 4, but mopping up operations continued for four days more. Army casualties were 117 killed and 1,037 wounded. Japanese losses in both sectors amounted to 8,122 killed and 264 captured. General Richardson, reporting to General Marshall, stated: "As a result of the air, naval, and artillery bombardment, the scene of Kwajalein was one of great devastation. The destruction was . . . even greater than that of Betio on Tarawa. With the exception of rubble left by concrete structures, there were no buildings standing." Majuro, an anchorage close to Kwajalein, was also invaded and occupied on January 31.

The next operation was directed against Eniwetok atoll in a further by-passing move. From Feb. 10 to 12, 1944, a powerful naval task force, including aircraft carriers, pounded the atoll at the northwestern end of the Marshalls. On Feb. 19, a marine combat team (22d Regiment) and a combat team of the 27th Division (106th Infantry Regiment) landed at Eniwetok, Engebi, and Parry islands. Engebi was seized in 6 hours. The fight for the other islets lasted until February 22. The marines lost 196 killed and 550 wounded, and the Infantry had 70 killed and 228 wounded.

The Japanese Base at Truk.—One of the most important moves toward strengthening Japan's position in the Pacific had been the placing of the Caroline Islands under the Japanese mandate in 1919, after they had formed part of the German Colonial Empire since 1899. The Carolines comprised 770 islands of varying size, including Palau. Ulithi, Ponape, and Truk. The Truk lagoon, 40 miles long, could accommodate almost unlimited naval forces. The Japanese built Truk into a base matching Pearl Harbor. Its potential importance was greater in offensive than in defensive warfare. When Japanese naval power dwindled, Truk was too remote from the home islands to keep the main fleet there.

An assault on Truk would have resulted in severe casualties as long as its land, air, and naval defenses were fully manned. With the shrinkage of Japanese sea and airpower, however, constant bombing could reduce the base without invasion. Early in February 1944, air reconnaissance disclosed that two of the few remaining Japanese carriers and twenty-three other naval vessels were still anchored in the lagoon, although the bulk of the Imperial Fleet had left.

United States carrier-based planes raided Truk on Feb. 16 and 17, 1944. The Japanese carriers had left the port prior to the attack. Two Japanese cruisers, three destroyers, and eighteen merchant ships were sunk and 201 Japanese aircraft destroyed, against a loss of 17 United States planes. After the seizure of the Marshalls, Truk came under air attack from there also.

In late February, United States bomber crews reported negligible air opposition from Truk, very little shipping in its harbor, and considerable reduction in the number of land forces. By spring of 1944, Truk was no longer of value to the Japanese.

THE RUSSIAN CAMPAIGN, 1943–1944

In the great war against the Russians, the Wehrmacht was getting its replacements from men who had no prewar military training. The balance of quality changed in favor of Russia, where almost no able-bodied men of draft age had escaped such training. Axis satellite forces were reduced to 28 divisions, 14 of which were Finnish, deployed exclusively in the isolated sector from Lake Ladoga to the Arctic Ocean. The remaining 14 divisions, made up of Rumanians Hungarians, and Slovaks, were badly mauled and dispirited. The Luftwaffe no longer could outfight the Red Air Force which was well equipped with American planes. The Germans retained an advantage only in tanks and self-propelled guns, due to the superior quality of their Tigers and Panthers and the self-propelled Ferdinand guns. The USSR organized new armies with considerable striking power to continue the offensive during the summer.

The Summer Campaign of 1943.—The Pripet Marshes and thick woods of Polesie (in Poland) were 200 miles behind the German lines on the central front. If the Red forces could press the Wehrmacht back to that region, German communications between the northern and southern sectors of the front would be impaired, and the Red Army could operate against two, almost isolated sectors.

In June 1943, two adjoining bulges were crucial sectors. In a rough triangle, based north and south of Kursk, a Russian wedge pushed sharply into the German lines. Immediately to the north, Wehrmacht positions in a semicircle, with the hedgehog of Orel on its perimeter, pointed toward Tula. The bulges outflanked each other. The Russians had to eliminate Orel before breaking out of the Kursk bulge, while the Germans had to destroy the Kursk triangle before attempting an offensive on the central front.

The German High Command had conditional

offensive plans. It wanted to drive the Red armies back from Kursk, but the offensive was to continue eastward only if the defenders of Kursk were destroyed. If the Russians were forced to evacuate the wedge without suffering a major defeat, the Germans planned to adjust their lines for a successful defensive. If the attack should fail, the Wehrmacht had little if any chance to hold the initiative.

All that the Germans could muster for the offensive were 17 infantry, 17 armored, and 4 motorized divisions, supported by 1,500 planes. This army group was placed under the command of Field Marshal Gen. Gunther von Kluge. The northern perimeter of the Kursk wedge was held by Gen. Konstantin Rokossovski's army, the southern by Gen. Nikolai Vatutin's. Kluge attacked on July 5. Soviet antitank defenses took a terrific toll of the panzers. The Germans made very little progress in the south until July 8; in the north, however, they gained between 7 and 10 miles, at a cost of 40 per cent of their armor, and captured Maloarkhangelsk. Beyond that city the drive was halted by stiffening Russian resistance. On July 15, the army of Gen. Markian Popov, on General Rokossovski's northern flank, opened up against Orel. Rokossovski captured Maloarkhangelsk on July 18. On July 22, the rapid progress of the Russian attack on Orel forced Kluge to withdraw to his initial positions. Eight of his panzer divisions were crippled, and the motorized divisions were all but destroyed. His infantry had lost 100,000 men.

After July 22, 1943, the eastern European campaign became a succession of German retreats, interrupted by occasional local counterattacks and positional warfare. The Russian armies resembled a gigantic steam roller which moved at varying speeds and with many halts to the logical end of the campaign: the destruction of the Wehrmacht's remaining eastern forces in Berlin.

On July 21, Red vanguards were only 10 miles east of the town. Heavy rainfalls prevented a quick severance of communications between Orel and Bryansk, and immense mine fields at the approaches of the town held up the frontal advance. From July 28 to 31, Russian sappers removed the mines. On August 4, Rokossovski entered Orel. On the same day, Vatutin's army, joining the offensive, captured Belgorod.

The original Russian plan called for an attack on Bryansk prior to another drive on Kharkov by Gen. Ivan S. Konev's army. But when Vatutin penetrated the German lines between Belgorod and Rakitnoye in a two-day battle, clearing the way for Konev, the Soviet High Command gave priority to the Kharkov offensive.

On August 11, Konev's troops were beyond the Donets at Zmiyev, and Vatutin, having severed the Poltava-Kharkov railroad line, was threatening the rear of the Germans in Kharkov. Deploying all available armor, the Germans held Vatutin long enough to evacuate their troops from Kharkov in reasonable order. The Red Army entered the badly damaged city on August 23. The attack on Bryansk was resumed the week before Kharkov fell. In the Bryansk sector, where the Luftwaffe was strongest, it flew more than 1,000 sorties a day to make up for lack of armor.

On August 22, General Tolbukhin attacked in the southern sector with strong armored forces. Within one week the Russians flooded over the area between Stalino and Taganrog, capturing Taganrog on August 30 and achieving a strategic breakthrough. German militia troops gave a poor account of themselves. Between the Seim and the Desna rivers, farther to the north, Rokossovski captured Sevsk on August 27 in a two-pronged attack and took Glukhov on the highway into the Ukraine, 60 miles from Sevsk, on August 31. On September 2, his army approached the crossings of the Seim River between Sumy and Chernigov, while Vatutin's columns entered Sumy. Joining forces, the two armies broke through to Konotop.

In the Smolensk sector, another Russian army under Gen. Vassili Sokolovski took Dorogobuzh on September 2, piercing prepared German positions. Two more Red armies under Generals Yeremenko and Ivan Y. Petrov attacked in the sector of Velikie Luki and in the long-dormant lower Kuban district.

The Wehrmacht was compelled to carry out a general withdrawal. New German positions ran from Zaporozhe south to the Sea of Azov, covering the Perekop Isthmus, from Zaporozhe northwest to Kiev along the western bank of the Dnieper, and from Kiev along the Desna River, covering the approaches to the Pripet Marshes and the district of Polesie. Two more river lines extended the Desna defenses to the rear. The Germans fought costly rear-guard actions to cover the withdrawal of the main forces.

After entering Bakhmach on September 8, Vatutin pressed German rear guards toward Poltava. Malinovski took Stalino on September 7. On September 9, his vanguards were 50 miles from the Dnieper, and Tolbukhin captured Mariupol.

Two panzer divisions and six German and six Rumanian infantry divisions lost Novorossisk to General Petrov's army on September 15 and made a precarious withdrawal across the Kerch Straits into the Crimea 13 days later.

A Russian communiqué, datelined September 18, triumphantly announced the liberation of 1,200 towns and villages in a single day. Rokossovski's right flank went beyond the Desna, while Popov's columns fought for crossings of that river in the direction of Roslavl. Sokolovski took Yartsevo, and Yeremenko took Dukovshina, both on the approaches to Smolensk. Smolensk itself fell to the Red armies on September 25. The Germans lost Bryansk on September 20 and Chernigov on September 23. On September 28, Konev opened an attack on Kremenchug, while Malinovski's forces reached the left bank of the Dnieper opposite Dnepropetrovsk. Rokossovski was approaching Kiev.

German propagandists proclaimed that the Dnieper would be the Wehrmacht's 1943–1944 winter line. Its right bank, then under German control, was generally higher than the left. At Kiev, 600-foot cliffs on the western bank formed a forbidding obstacle. Rapids in the river, which was up to 1,000 yards wide, made crossings hazardous under fire.

From Zaporozhe to the south, the Germans held positions across the steppes to Melitopol and the Sea of Azov east of the Dneiper bend, manned by the best mobile formations the Wehrmacht could muster and commanded by von Mannstein. The Wehrmacht also stubbornly clung to its positions inside the Crimea, although their usefulness as a springboard for an attack on the Caucasus was gone.

From Zaporozhe to Kiev—200 miles—the Germans left only screening forces and observers on the river bank. The main forces were concentrated 30 to 40 miles to the rear, along the railroad. In case of a Russian attack, they were to be rushed to the crucial point. A German-built highway along the river bank was supposed to ensure swift deployment.

On October 5, Yeremenko took the railroad center of Nevel north of Vitebsk. The next day, before the German mobile defensive system could function, several Russian bridgeheads were established across the Dnieper, north and south of Kiev. Malinovski's army attacked Melitopol. Mannstein, relying on the city's strong fortifications, concentrated the bulk of his forces on the northern wing near Zaporozhe in an effort to outflank the Russians. The Germans were routed and lost Zaporozhe in a sea-saw battle that raged for four days. Konev's divisions erupted from their Kremenchug bridgehead. On October 17, the opposing German lines broke on a front 28 miles wide. Three Russian columns advanced in the directions of Krivoi Rog, Kirovograd, and Dnepropetrovsk. Before Konev's drive could be stopped, Malinovski's vanguards crossed the Dnieper, and a twin attack wrested Dnepropetrovsk from the Germans. The Melitopol line collapsed on October 27. The Russian advance bypassed the Perekop Isthmus. The Crimea was bottled up and left for later mopping-up operations.

A new German line was formed along the lower course of the Dnieper, covering Krivoi Rog, Apostolovo, Dolinskaya and Znamenka. The Russian advance halted in early November in front of this sector. The center of gravity of the Russian offensive again moved north. Although the edge of the marshy regions had been reached, the Wehrmacht was not as firmly pinned against the marshes as the Russians had planned.

A remarkable innovation in Russian tactics was the maintenance of bridgeheads in positional warfare along rivers. Their perimeter was exposed to heavy pressure, and it was hard to supply them. Experience showed that losses sustained in holding these outposts were offset by the more rapid development of later offenses and reduced casualties in such operations.

On Nov. 4, 1943, a special Russian communiqué gave German losses since July 5, 1943, as 2,700,000 and territory recovered since the counteroffensive near Stalingrad as 335,000 square miles. The casualty claim was fantastic, but more than half of their earlier conquests in the east had been wrested from the Germans. A Russian threat to German-occupied territory, satellite states, and the Reich itself began to take shape.

The Russian Offensive.—Reconquered Soviet territory revealed a picture of horror, second to none in any previous invasion of present European Russia (100 of them are recorded in history). Almost 10,000,000 people had been forced into slave labor in Germany. Systematic demolition by special German squads was added to the destruction wrought by military action and the scorched-earth policy.

Ever since the establishment of Soviet rule in Russia, official propaganda had been designed to convince the citizens that living conditions in the USSR were better than anywhere else, and that other nations and governments, envious of Russian achievements, should be viewed with suspicion. The barbarous behavior of the Germans in Russia strengthened the Russian belief in the propaganda, and their distrust of foreigners increased. There were relatively few cases of Russian collaboration with the enemy, most of them in the Crimea and the Kuban Valley. A flaming hatred and desire for revenge on the Germans became a dominant factor in Russian psychology.

In the south, General Petrov's group in the Taman Peninsula cooperated with Gen. Fedor I. Tolbukhin's southern group on what was termed the 4th Ukrainian front, running from the lower Dnieper to a point close to Zaporozhe. From there to the sector north of Krivoi Rog, the 3d Ukrainian front was held by General Malinovski's group. Konev's forces formed the 2d Ukrainian front toward Kirovograd and Znamenka. To Konev's right, on the 1st Ukrainian front, General Vatutin's army, reinforced by troops drawn from General Rokossovski's group, prepared for the assault on Kiev. The rest of Rokossovski's divisions concentrated on Gomel on the "White Russian front," north of the Pripet Marshes. On Rokossovski's northern wing, Popov's army aimed at Mogilev and Orsha; on Popov's right, General Sokolovski's objective was Vitebsk; and on Sokolovski's right flank, Yeremenko prepared to drive toward Polotsk.

The Germans called part of the sector north of the marshes the "Fatherland Line," for it covered the approaches to the Reich. The German High Command, discounting Russian ability to continue the offensive on a broad front before midwinter, expected only a local thrust in the direction of Krivoi Rog and its railway system linking the city with Nikolaev, Odessa, and Kiev. Field Marshal General von Mannstein, in charge of the Krivoi Rog sector, received most of the available reserves, and the Kiev front was bared by the withdrawal of almost two thirds of its defenders to assist Mannstein.

During the latter part of October 1943, the Russians strengthened their bridgehead across the Dnieper north of Kiev. On November 2, Vatutin's forces broke out of the bridgehead to take Dymer on November 3. Mechanized units south of Dymer captured Svyatoshin four miles from Kiev, cutting the railroad and highway leading to the west of the city. A three-quarter circle was formed around Kiev. On November 6, the Russians entered the city in pursuit of withdrawing German forces. The Soviet official communiqué reported 15,000 Germans killed and 6,000 captured in that operation.

The drive disrupted communications between the northern and southern German armies, and Mannstein made an attempt to halt Vatutin's army, fanning out in an arc almost 130 miles wide and capturing Zhitomir on November 11. Although the Russians temporarily lost Zhitomir, the loss was offset by the capture of Korosten. From Korosten the Russians, using paratroopers in great numbers, pushed on in the direction of the nearby Pripet Marshes.

On November 15, the left wing of Rokossovski's army, after two days of fighting, captured the railroad town of Rechitsa and on November 25 entered Gomel.

Mannstein, switching the center of gravity of his attack toward Korosten, recaptured the town on November 28. Reserves from as far as Norway and the Balkans were pulled in, but the German offensive was no lightning war with wedge and kettle. The Luftwaffe ceased to be a major partner in the Wehrmacht team. The panzers,

suffering appalling casualties, were unable to drive wedges into the Russian lines. Finally, unseasonable rain interfered with German maneuvers. Half of the Russian bulge—formed since the capture of Kiev—had been evacuated, but the rest of it was consolidated.

On December 15, Cherkassy, between Kiev and Dnepropetrovsk, was captured by the Russians. A powerful Soviet armored drive gained control of the railway system in the northern area inside the great Dnieper bend. In the north, Popov took Dovsk on December 3. The Red offensive expanded farther to the right and, on December 13, Gen. Ivan Bagramian's First Baltic Army, with cavalry and armor, attacked from the Nevel sector toward Vitebsk. This assault tore a gap in the Fatherland Line 50 miles wide and up to 18 miles deep, but German counterattacks met the advancing First Baltic Army. Bagramian abandoned frontal attacks on Vitebsk and opened flanking drives to sever its communications. Gorodok fell to the Russians on December 24, and one week later a vise encircled Vitebsk. But the Germans still held out, and the front became deadlocked.

Between December 10 and 20, Mannstein failed to gain ground. Russian forces—with equipment including the heaviest-caliber guns—poured across the Dnieper at Kiev to counter the attackers. On December 24, Vatutin's sudden assault broke through weary German lines on both sides of the Kiev-Zhitomir highway. On December 31, the Russians not only had recovered the ground they had lost to Mannstein but had driven beyond the limits of the former Kiev bulge.

Jan. 3, 1944 was a memorable date in the Soviet-German war. The Russians crossed their pre-1939 borders beyond Zhitomir, capturing Olevsk on former Polish soil. Vatutin's vanguards approached the Bug River on a 50-mile front.

With German north-south communications disrupted in Polesie, Soviet grand strategy aimed at establishing another communications block beyond the Pripet Marshes at the Carpathian range, deep inside German-conquered and satellite territory. The First Ukrainian Army had supply troubles, and the unusually mild winter transformed the earth into quagmires. New German positions faced Vatutin's forces between Vinnitsa and the railway junction of Kristinovka. From January 13 to 23, Red attacks failed to gain ground, and the Soviet High Command announced that poor weather had temporarily halted the offensive. The Germans threw eight infantry divisions and some armor into a counterdrive and gained ground in the region of Vinnitsa. The Wehrmacht's communiqué triumphantly announced the defeat of 10 Russian infantry divisions and one tank corps. This report was exaggerated to bolster the morale of the home front. On January 31, the German drive reached its climax, but Vatutin's lines recoiled. Five days later, the First Ukrainian Army took Równe (Rovno) and Luck, and Shepetovka fell on February 11. The German operational reserves—the Sixth and Eighth armies—always seemed to arrive too late with too little.

Early in 1944, Konev's group in the south, cooperating with Vatutin's southern wing, prepared an offensive toward Kirovograd and Krivoi Rog. On January 7, the Russian official communiqué reported that Konev had pierced the German lines on a sector 60 miles wide and had scored advances up to 25 miles. The Russian breakthrough was marked by a tactical innovation. Parallel spearheads, operating less than 10 miles apart, tore gaps in the enemy front. Squeezed between spearheads and lacking operational space, the Germans abandoned their base line, and the Russian twin breaches widened into a single solid wedge. On January 8, Kirovograd fell to Konev's troops. Five German divisions fell back, leaving 8,000 dead. To the north of Kirovograd, Vatutin pressed toward Uman. A narrow German bulge remained between Russian pincers based on Medvin and Smela.

On February 3, a successful breakthrough linked the First and Second Ukrainian armies near Shpola, cutting off 10 German divisions at Korsun. A corridor 20 miles wide was opened between these divisions and the bulk of the Wehrmacht. Mannstein deployed the remnants of 8 panzer divisions to break the Russian trap from the outside. From inside, the trapped forces hammered at the vise from the opposite direction. On February 17, the Russians announced the liquidation of the encircled troops, of which 58,000 were reported killed and 18,000 captured, while the relief forces were said to have suffered an additional 20,000 casualities. The German High Command countered by claiming that the ring of encirclement had been broken and the trapped forces rescued.

On February 5, Malinovski made a feint toward Krivoi Rog, immediately followed by a powerful drive along the railway from Dnepropetrovsk. A breakthrough on a front 94 miles wide, to a depth of 37 miles, resulted in the capture of Apostolovo and cut the supply lines of five German divisions at Nikopol on February 6. Tolbukhin's forces, on Malinovski's left, crossed the lower Dnieper and seized Nikopol two days later. Krivoi Rog fell to the Soviet forces on February 22.

Four Russian army groups were deployed north of the Dnieper: Bagramian's First Baltic Army, Popov's Second Baltic Army, Meretskov's Volkhov Army, and Govorov's Leningrad Army. On January 14, while Bagramian was stalled before Vitebsk, Popov severed the railroad running south from Leningrad, an important German supply route. Meretskov cut the railroad in another place north of Lake Ilmen, while Govorov assaulted the Wehrmacht on the hills and ridges of the southern approaches to Leningrad. German positions, built up to a depth of 20 miles, included underground chambers, concrete blockhouses, and other permanent fortifications, but these were demolished by Red firepower.

On Jan. 15, 1944, twin drives from Oranienbaum toward Ropsha, and from Pulkhovo in the direction of Krasnoye Selo, drove the Germans back to Krasnogvardeisk after five days of fighting. On the same day (Jan. 15, 1944) the Volkhov Army took Novgorod and, in cooperation with the Leningrad Army, crushed German positions across the railroad at Mga, opposite Schlusselburg. The Wehrmacht's hold on the eastern bank of the Volkhov River, near Chudovo, was eliminated on January 25. Communications between Leningrad and Moscow were permanently stabilized. The loss of Krasnogvardeisk on January 28 was even more serious for the Germans.

The next Russian goal was Luga, the pivotal communications hub west of Novgorod. The Wehrmacht made a fighting retreat, but Russian pressure did not permit the organization of effec-

tive defenses. Luga was captured on February 12, forcing the Wehrmacht back to the Estonian border along Lake Peipus and the Narva River. The retreat bared the rear of German divisions south of Lake Ilmen, forcing them to abandon Staraya Russa on February 18 and to fall back along the railway Staraya Russa-Dno-Pskov. This retreat exposed the German Lovat River positions south of Staraya Russa. A Russian attempt to cut off substantial German forces by a drive in the direction of Riga and Latvia fell short of its objective. Advancing on Pskov, the armies of Generals Govorov and Popov reached a point on the southern edge of Lake Peipus, five miles from the town, on March 3. A simultaneous Russian attempt to penetrate northern Estonia by forcing the passage of the Narva River was unsuccessful.

Early in March 1944, General Gogorov, promoted to the rank of marshal of the Soviet Union, was put in charge of the Karelian Army, deployed to launch a final drive against Finland. Malinovski held the front from the mouth of the Dnieper to the region southwest of Kirovograd. From there to Vinnetsa, Konev was in command. On his army's right flank, Marshal Zhukov replaced Vatutin who had died on April 14, 1944, of wounds received previously.

Total Russian strength approximated 300 divisions, outnumbering the Wehrmacht 2 to 1. The equipment of this huge force was made possible by vigorous efforts to increase domestic production and by lend-lease. Between October 1941 and March 1944, the United States shipped 8,800 planes, 5,200 tanks and tank destroyers, and 190,000 trucks and jeeps to the Soviet Union. During the same period, 6,700 planes and 5,000 tanks (many of them American-made) came to Russia from Great Britain.

The Russians concentrated on the Odessa-Lwów railroad line, the main link between German forces in Poland and in southern Russia. The reinforced German Sixth and Eighth armies and the First and Fourth panzer armies defended the vital railway.

On March 4, Zhukov attacked on a 112-mile front. After two days, his First Ukrainian Army severed the Odessa-Lwów railway. Widening a wedge in the German lines, the Russians invested Tarnopol in eastern Gallicia Province on March 9. Konev and Malinovski attacked two days after Zhukov's push got under way. Konev's armor defeated six panzer divisions near Uman. On March 10, the Soviet High Command announced the rout of 14 German divisions in a breakthrough on a 109-mile front in the direction of the Bug River. No substantial Wehrmacht reserves were available for the defense of the Bug line, which was reached on March 12.

On March 15, Konev was beyond the river, capturing Vapnyarka on the Odessa-Lwów railway. Malinovski shattered German positions covering Nikolaev, at the mouth of the Bug River, and Odessa harbor farther to the west. Tarnopol, Proskurov, Vinnitsa, and Zhmerinka, gateways to the Carpathian range, continued to resist. On March 20, however, Zhmerinka and Vinnitsa fell into Russian hands.

On March 19, Konev, crossing the Dniester into Bessarabia, brushed aside five second-rate Rumanian divisions to capture Mogilev. His gains threatened the flank of the Germans facing Zhukov's army. Malinovski captured Kherson on March 13. On March 24, the Russians were within sight of Nikolaev. Konev advanced through northern Bessarabia and reached the Prut River, Rumania's pre-World War I border, on March 28. On April 3, Foreign Commissar Molotov announced the crossing of the Prut but insisted that the Soviets had no designs on Rumanian territory nor any intention of interfering in Rumanian affairs. While Konev's drive continued toward Iasi, Malinovski liberated Nikolaev on March 28. On April 10, the Russians recaptured the port and city of Odessa. Four days later, German rearguards crossed the lower Dniester, beyond Ukrainian soil.

The liquidation of 110,000 Germans and Rumanians by-passed in the Crimea was begun on April 8. Tolbukhin attacked through the Perekop Isthmus and Yeremenko from the Taman Peninsula. Ten days later, the remnants of the Axis garrison, of 44,000 men (most of the rest were captured) fled to Sevastopol. Tolbukhin attacked the fortress on May 7, and captured it two days later.

Farther to the north, the Germans formed a line from Stanislaw to Brody to cover the gap between the western end of the Pripet Marshes and the Carpathian range. Zhukov countered by a vigorous attack east of Tarnopol. The First Ukrainian Army advanced 40 miles, while Konev penetrated into Bucovina Province. On March 29, the Russians took Kolomya, severing the Lwów-Iasi railroad. Cernauţi, provincial capital of Bucovina, fell on March 30, and Stanisławów on March 31.

On April 8, 1944, another historic date in the campaign, the Russians reached the Carpathian range at Tatar Pass on the Czechoslovak border. Tarnopol, encircled for 38 days, fell to the Red forces on April 15. By that time, the momentum of the Russian offensive was lost, and German counterattacks drove the tired captors of Stanisławów out of the city. Kishinev, provincial capital of Bessarabia, by-passed in Konev's earlier drive, continued to resist. The garrison of Iasi gained some ground in a local counterattack. The Russians took Tiraspol on the southern end of the front but failed to penetrate the Galati gap into the Danube Valley. The Russian lines, although thinned out by rapid advances and with supply channels in the process of organization, proved almost shock-proof. They rarely gave way and never broke.

Rumania: Among the Axis satellite governments, Rumania under Marshal Ion Antonescu was ready to go to the limit to prevent a German disaster, although he occasionally played with the idea of contacting elements in favor of a separate peace. Rumanian strength was nearly exhausted. First-line troops were decimated, and second- and third-rate troops, in the German High Command's opinion, were not worth their German-supplied equipment. But Rumania was still very important to the Germans. Despite damage from air attacks, the Ploesti oilfields supplied most of Germany's natural oil. After losing the Ukraine, the Reich also needed Rumanian wheat. Moreover, a Russian thrust beyond the Danube delta would have unhinged the southern anchor of the eastern front. Anti-German elements in Rumania, loyal to King Michael, did not put up an effective resistance, but rallied to contact Allied representatives late in 1943.

Bulgaria: Although Bulgaria had been at war with Great Britain and the United States since Dec. 13, 1941, its government resisted German

calls for participation in the war against the USSR. The Bulgarians never forgot that they owed their independence to Russian assistance, and their Slavic nationalism made no distinction between czarist and Soviet Russia. The deployment of the Bulgarian Army on the eastern front might have resulted in mass desertions and uprisings against the unpopular king and his German-dominated government.

On March 31, 1943, King Boris was summoned to Hitler's headquarters and told that the führer insisted upon having Bulgarian divisions dispatched to Russia. Commitments made by the king were not disclosed but, upon his return to Sofia, violent anti-German demonstrations forced Prime Minister Bogdan Philov to declare a state of siege. No Bulgarian troops went to the eastern front. Angry and impatient, Hitler again summoned the king. At a brief conference Boris was handed a five day ultimatum, calling for total military and economic mobilization in the interest of the German war effort, Gestapo control of the country, and the guarding of the Bulgarian-Turkish border by German forces. The day the ultimatum expired (Aug. 28, 1943), the Bulgarian prime minister announced the death of King Boris "after a brief but grave illness." The German radio spoke of angina pectoris. Neutral sources attributed the death to assassination, and Russian broadcasts said that the king had been poisoned by the Germans.

On September 7, a special session of the subservient Bulgarian parliament nominated a regency to rule until the late king's 6-year-old son, Simeon II, became of age. The council's members were approved by Berlin. The regents yielded to all German demands except one: assistance against Russia. Allied bombing of Sofia on Dec. 10, 1943, bolstered popular anti-German feelings, which were strong after the Bulgarians came to know the Germans in their ill-fated partnership in World War I. On Dec. 11 and 27, 1943, the United States and the USSR issued joint warnings to the Bulgarians to withdraw from the war. These warnings could not be acted upon by the people, who lacked organization, and they met with no response from the Gestapo-controlled government.

On May 28, 1944, Hitler presented another ultimatum to Philov. It demanded: an immediate break with the USSR, the placing of the Bulgarian Army under German command, greater contributions to the German war effort, the mobilization of 20,000 laborers for the construction of fortifications in western Europe, and the appointment of a "strong cabinet" to carry out German demands.

The regents appointed Ivan Bagrianov to head the strong cabinet. Although they formally yielded to the German ultimatum, they did not put its terms into full effect. On June 13, 1944, Hitler, infuriated by Bulgarian recalcitrance, sent Joseph Neubacher to Bulgaria to govern the country. Neubacher was unable to live up to his führer's expectations. After Turkey adjusted its political stand (Aug. 2, 1944) by breaking off diplomatic relations with Germany, Bagrianov made a pro-Allied gesture by reassuring Turkey of Bulgaria's friendliness (Aug. 26, 1944). He also assured the Russians that Bulgaria was neutral. Bagrianov remained in office until September 7, when Russian might cast its shadow over the country.

Hungary: Since Hungarian forces suffered severely in the defeat of Voronezh, only a few reinforcements were sent to the eastern front thereafter. On March 18, 1944, Hitler brought pressure to bear on Regent Admiral Nicholas Horthy to mobilize at least 300,000 more men and bring Hungary into a state of total war. The regent countered by suggesting that the Wehrmacht should release Hungarian divisions already deployed in other sectors for the defense of the threatened homeland. The next morning, the Germans formally proclaimed the occupation of Hungary, which had actually been in effect for three years. Admiral Horthy, after being detained in Hitler's headquarters for a while, named a new cabinet on March 22 under Field Marshal Doeme Szotajay, "for more effective cooperation against bolshevism." Extremists of the Nazi type held leading posts in the government. The ensuing reign of terror and pogroms failed to increase Hungary's war effort.

Finland: The strategic value of Finland as a German operational base had vanished with the Russian advance. Economically it had always been a liability and was in a state of semistarvation. The once important air base of Petsamo was neutralized by the growing strength of Murmansk. Yet Finland still tied down a number of Russian divisions, a more important contribution to the Germans than the survival of the Finnish nation. Col. Gen. Eduard Dietl's German Lapland Army in Finland did little if any fighting in 1944. Its mission was to encourage pro-Nazi elements and to frighten those who wanted to break away.

The Finnish people were still strongly anti-Russian, but they were also anti-German. Torn between rival aversions and uninformed about world affairs because of iron censorship, the average Finn could see no way to get out of the war. The Finnish president, government, and other military and civilian collaborationists feared personal consequences if the country acknowledged defeat. Field Marshal Mannerheim, opposed to both the USSR and Germany, had little political skill and was only an aging symbol of confused Finnish nationalism.

The U.S. government, not at war with Finland, exerted pressure for a separate peace between Finland, the USSR, and Great Britain Contact between Russian and Finnish representatives was established at Stockholm, Sweden. On Feb. 16, 1944, Dr. Juho K. Paasikivi, negotiator of the Finno-Russian treaty of 1940, met Soviet Ambassadress Alexandra Kollontai to discuss armistice conditions. Dr. Paasikivi was informed that the Moscow government asked for an immediate break in German-Finnish relations, internment of all German troops in Finland, restoration of the 1940 peace terms, and release of Allied prisoners and internees. Further negotiations at Moscow would determine conditions of demobilization, reparations, and the future status of Petsamo. Despite appeals by the president of the United States and the king of Sweden, the Finnish government rejected the terms on March 17.

On June 22, preceded by infiltration of the Finnish capital by troops of the German Lapland Army, German Foreign Minister von Ribbentrop and Field Marshal General von Keitel arrived in Helsinki. Four days later, President Risto Ryti of Finland unconstitutionally pledged that Finland would not make peace without Ger-

man consent. On June 30, 1944, Secretary of State Cordell Hull charged the Finnish government with having become a puppet of Nazi Germany and announced the severance of United States-Finnish diplomatic relations, although no state of war was declared.

THE ROAD TO ROME

Although Allied efforts in Europe were concentrated on the impending invasion of France, the drive in Italy had to be continued in order to tie down the greatest possible number of German divisions in this secondary theater of war and to gain air bases closer to the Reich's southern border.

Three roads led to Rome from the Allied positions in early 1944: the Appian Way along the Tyrrhenian coast, a highway across the peninsula from Pescara on the Adriatic, and the Via Casilina from embattled Cassino. The Appian Way led through narrow ground between hills and the sea north of the mouth of the Liri (Garigliano) River and then farther north through the flooded Pontine Marshes. The cross-country road from Pescara—longer than the other routes of approach—crossed snowbound mountains. Along Via Casilina, strong German positions blocked Allied advances.

Anzio and Cassino.—The French Corps under General Juin took over the right sector of the Fifth Army front, and the United States 6th Corps withdrew to participate in the new invasion. In mid-January, an Allied convoy assembled in Naples harbor, while the German radio announced that the Allied navies had withdrawn from the Mediterranean to England to prepare for the invasion of western Europe. The United States naval forces assigned to the impending attack, called "Operation Shingle," were under the command of Rear Admiral Frank J. Lowry; the British forces were commanded by Rear Admiral Thomas Troubridge. Some French, Dutch, and Greek naval units joined the action. The objectives of the invasion were the beaches on both sides of Anzio, a small town 55 miles to the rear of the main German line and 30 miles from Rome. Landing forces, 40,000 strong, included the United States 3d Division, American Ranger and Parachute units, and one British division. They were reinforced later.

The convoy left Naples on Jan. 21, 1944, sailing first in the direction of Corsica and then toward the mouth of the Tiber River—to mislead German observers—and finally toward Anzio. The first landings met no opposition. Heavy mining of the beaches, however, delayed operations and caused some casualties. Operations began at 2 A.M., Jan. 22, 1944. German observers on surrounding hills did not realize what had happened until just before daybreak. With remarkable speed, German 88-mm. cannon, tanks, and aircraft arrived to prevent further disembarkations. But the Germans failed to demolish Anzio and neighboring Nettuno as they had planned. Both towns were occupied by the Allies on D-day. The Luftwaffe used all available craft to bomb the landing grounds. Allied fighters based in Naples battled with the German Air Force. German tanks, in small groups, attempted to slice through Allied bridgeheads. A group of Allied cruisers and destroyers, successfully substituting for land artillery, which was still not unloaded, fought the panzers.

Strong German forces continued to mass around the beach. The Allied High Command had expected such reinforcements to be drawn from the German Tenth Army, but they came from northern Italy and the Balkans instead. Gales delayed landings and accounted for the loss of many small vessels. On January 24, German heavy railroad guns went into action. A perimeter was formed of German forces, which rose to seven divisions during the first month of operations. The beachhead forces attempted to break out but failed. The Americans drove toward Cisterna and the British against Campoleone, but both attacks were repulsed.

On the main Fifth Army front in the south, the Allied offensive fared no better. The entry into the Liri Valley, gateway to Rome, was blocked by the fortifications of Cassino. Thick-walled stone houses with deep cellars were made into pillboxes. The deep and swift Rapido River was another formidable obstacle. The narrowness of operational space prevented armored enveloping moves, while two German tanks in the lobby of a Cassino hotel held off attacking infantry. Monte Cassino rose to the rear of the town. The Allies insisted that the Wehrmacht was using the ancient Benedictine Monastery at the top of Monte Cassino as an observation post. The Allies spared the priceless shrine for a while, but the monastery was destroyed on February 13 to save the lives of Allied soldiers. The Liri River, emptying into the Tyrrhenian Sea, constituted another barrier.

The attack on Cassino and the Liri crossing produced heavy casualties but failed to gain. It was temporarily discontinued after February 3.

In the meantime, the situation at Anzio became critical. Bad weather eliminated the only factor of Allied superiority—air power. On January 27, local German thrusts were stepped up and developed into a full scale offensive. Kesselring aimed to split the beachhead and annihilate the Allied forces ashore. The United States 3d and 45th divisions (the latter landed after the initial invasion) stopped furious German assaults. Allied naval shelling brought temporary relief, but German artillery kept the entire beachhead area under constant fire, and the pressure was severe. On February 10, when German victory seemed almost certain, a break in the weather enabled Allied airpower to go into action. After 48 hours, the German offensive was stopped and disaster prevented, although the bridgehead remained precariously narrow.

On February 16, six German divisions—among them the Hermann Göring Division and the 29th Panzer Grenadiers—attacked Allied lines after a heavy artillery barrage. The British, bearing the brunt of the fight, were pressed back, but an Allied air assault restored the situation. The Germans resumed their drive with 10 divisions. Kesselring then had two armies under his command, the Tenth and Fourteenth. The Wehrmacht used a new weapon, a miniature crewless cable-controlled tank, loaded with up to 150 lbs. of high explosives to be blown up through the control cable. The length of the cable (1,800 feet) limited the vehicle's range and effectiveness. Neither this weapon, nor an improved and enlarged crewless tank, introduced by the Germans two months later, seriously affected the final outcome of the campaign. Two days of fierce struggle brought no important changes of position. After that, the fighting subsided. Kesselring contented himself with hemming in the Anzio beach-

head to prevent extensive maneuvers by Allied forces, which had increased to almost 150,000.

In the south, Allied attacks were resumed on February 8. A precarious foothold across the Rapido River could not be expanded sufficiently to cut the Via Casilina behind Cassino. Small French advances in the hills west of the city failed to unhinge the German positions. The continuation of the offensive concentrated on Cassino and Monte Cassino, the latter held by troops of the German 1st Parachute Division. After the monastery was destroyed by air attack and artillery fire, artillery pounded Cassino for three more days. But the subsequent assault was again repulsed after two days of hard fighting.

On March 15, another attempt was made to break through into the Liri Valley. Five groups of medium bombers and eleven groups of heavy bombers raided the ruins of Cassino with 1,400 tons of bombs, and an artillery barrage by 900 guns poured 85,000 rounds of shells into the rubble. But cellars remained intact and sheltered by debris. When New Zealanders and Indians launched the infantry attack, they were met by withering fire. Some blocks of ruins were seized at heavy cost, but the crucial southwest corner of Cassino, covering the Via Casilina, remained in German hands. Ghurka detachments tortuously inching up Monte Cassino did not reach its top, and the operation was called off on March 23.

Rome.—Until May 11, there was little activity on either Italian front. Fair weather then permitted continued air activity and on dry ground mechanized units could penetrate into regions inaccessible in winter. Mobility of American-built vehicles permitted attacks in sectors which the Germans had considered secure from tank assault.

The Fifth and Eighth armies launched a coordinated drive from the south. On the Anzio front, Maj. Gen. L. K. Truscott prepared to join the offensive. Truscott's forces included the 3d, 34th, and 45th Infantry divisions, the 1st Armored Division, the first Special Service Force (85th and 88th Divisions), two British divisions, and the 100th Infantry Battalion, composed of Americans of Japanese descent.

Close to the ruins of Cassino, Polish units attacked high ground held by German parachutists. The Poles had been assembled in Russia, but the refusal of their commander to fight under Russian orders led to their transfer to the Middle East and later to Italy. British and Canadians, pushing past the southwestern edge of Cassino, crossed the Rapido River in assault craft. To their left, the French attacked the Aurunci hills close to the Tyrrhenian coast, while American troops pressed along the coastal highway beyond the mouth of the Liri River. The Poles were unable to score substantial gains, but the French, clearing the Germans from hill crests, threatened the upper Liri Valley from the rear, and eased the task of the British and Canadians. The Americans also overcame stiff German resistance.

On May 13, the Eighth Army held a bridgehead five miles wide and one mile deep beyond the Rapido and pressed through a region of extensive minefields where villages were transformed into labyrinths of pillboxes. Three days later, the Via Casilina was reached beyond Cassino and the town was by-passed. On May 18, 1944, the remainder of its garrison of 1,500 men surrendered. The Americans broke through Santa Maria Infanta and reached Formia on the same day. The French, on their right flank, seized Esperia. The Poles under General Anders resumed the attack and drove on Monte Cairo, anchor of two German defensive systems. One of them, the Gustav Line, was already shattered, while the other, referred to as the Hitler Line when it seemed secure and as D-Line when it crumbled, was in the path of the Allied advance west of the Polish sector. Its strongest section was near Pontecorvo. On May 22, the Canadians broke through north of that town, and the line gave way.

The break out from the Anzio beachhead also took place on May 22. Fierce fighting continued around Cisterna until May 25, when the town fell into Allied hands. Advancing beyond Cisterna, General Truscott aimed to cut the Via Casilina to the rear of the retreating Germans from the south. Other beachhead forces marched along the Appian Way to meet the Americans coming up from the opposite direction. On May 25, 1944, spearheading patrols of both groups met on the coast.

The Allies had two objectives: to advance to Rome and beyond, and to trap Kesselring's main forces. The Via Casilina was the Wehrmacht's chief artery of retreat. One lateral road, connecting with the Via Casilina at Frosinone, was used by the Germans falling back from the Pontine Marshes; another, departing from Velletri, was used by the Wehrmacht forces which had been defeated at Cisterna. Stubborn rearguard action enabled most of the German forces from the Pontine Marshes to escape. Few prisoners were taken when the Canadians captured Frosinone on May 31. A determined American attack on Velletri drove a wedge into German lines and reached the heights beyond the town. Velletri was occupied on June 2, but not many Wehrmacht forces from Cisterna were captured. Rome, a most vital road center, was passed by German divisions retreating in a northerly direction. The Alban Hills, on the approaches to the Eternal City, were defended to cover their movements. The Wehrmacht continued rear guard operations beyond the Alban Hills into Rome's southern suburbs. The most historic parts of the city were spared when the Germans pulled out, and the Allies entered Rome on June 4, 1944.

Total German losses in the beachhead area were 25,000, slightly higher than Allied casualties. On the former southern front, the Wehrmacht lost almost 60,000 men, one third of whom were prisoners. Although the Allies had won a victory, they had failed to annihilate their opponents, who retreated toward new defensive positions far south of the Po Valley. But the Fifth and Eighth Armies carried on the pursuit beyond Rome.

THE INVASION OF FRANCE

(The following account of the invasion of France and the subsequent fighting in western Europe is based primarily upon the report by the supreme commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force, June 6, 1944, to May 8, 1945.)

On Feb. 12, 1944, Gen. Dwight D. Eisenhower, supreme commander of the Allied Expeditionary Force, received the following directive: "You will enter the continent of Europe and, in conjunction

with the other United Nations, undertake operations aimed at the heart of Germany and the destruction of her armed forces. The date for entering the Continent is the month of May 1944... It is understood that the Soviet Forces will launch an offensive at about the same time as OVERLORD with the object of preventing the German forces from transferring from the Eastern to the Western front. The Allied commander in chief, Mediterranean Theater, will conduct operations designed to assist your operation, including the launching of an attack against the south of France at about the same time as OVERLORD."

"Overlord" was the code name for the invasion of the European continent. No detailed cooperation with the USSR was worked out, and mutual understanding was confined to broad outlines of strategy.

The ill-fated Dieppe Raid had made it clear to the Combined Chiefs of Staff of the United States and British armed forces that an invasion could be carried out successfully only by forces large enough to penetrate the perimeter of German defenses. This type of operation required very substantial shipping space, a large number of landing craft, complete mastery of the air, and the disorganization of enemy communications.

The Germans also understood the importance of air supremacy in the invasion battle. The Wehrmacht generals could not agree among themselves, however, if the main battle should be fought on the beaches or if the invaders should be allowed to advance some distance inland where they could be hemmed in and annihilated by counterattacks. The former attitude represented by Field Marshal General Rommel, had a greater following, because the Dieppe raiders were defeated at the beaches. The second theory was not completely abandoned. Its chief advocate, Field Marshal General von Rundstedt, retained direct command of the threatened areas, while Rommel was appointed field commander. The Todt Organization who were in charge of the construction of fortifications sided with Rommel. It was impossible to establish a complete first line of defense within the anticipated time limit, and the construction of defenses in depth was out of the question. In order to achieve air supremacy, Reichsmarshal Göring planned to mass a special Luftwaffe force of 10,000 planes. German aircraft construction in 1943 was supposed to be increased to 3,000 planes a month.

Although German records later claimed achievement of the production goal, the number of planes actually available lagged far behind Göring's blueprint.

The Military Plan of Attack.—Before the nomination of General Eisenhower as supreme commander, the plan approved by the Combined Chiefs of Staff called for an assault by land, sea, and airborne forces on the coast of Normandy between the mouth of the Seine at Le Havre and the Cotentin Peninsula. After the establishment of beachheads with adequate ports and a breakthrough into the open, the drive was to continue along the Loire and Seine rivers in order to free France and destroy German strength. May 1, 1944 was the date set for this part of the operation which was referred to as "Cossack." A total of 29 divisions was to be available. Three infantry divisions were to land in the first wave, and two in the second, while two airborne divisions preceded the seaborne invaders. Two more divisions would follow quickly, the other 20 gradually as needed. Landing craft were allotted for simultaneous landings by five divisions. Port facilities would have to be made available for all 29 divisions, with three to five more a month coming in later. Landing beaches were to be established in the Caen area first and later on the Cotentin Peninsula. A drive to capture Cherbourg was planned within two weeks after D-day.

On Nov. 29, 1943, directives for Operation Cossack were issued to the Twenty-first Army Group, including the United Stat s First Army and the British Second Army. Headquarters for the operation were in Norfolk House, London. Later, General Eisenhower moved his headquarters to Bushy Park, London. Maj. Gen. Walter Bedell Smith was appointed Eisenhower's chief of staff. Other major appointments were as follows: deputy supreme commander—Air Chief Marshal Sir Arthur W. Tedder; deputy chief of staff—Lt. Gen. Sir F. E. Morgan; chief administrative officer—Lt. Gen. Sir Humfrey M. Gale; commanding general of the 21st Army Group—Field Marshal Sir Bernard L. Montgomery; commander of the Allied Naval Expeditionary Force—Admiral Sir Bertram H. Ramsay; and commander of the Allied Expeditionary Air Force—Air Chief Marshal Sir Trafford Leigh-Mallory.

Experiences in Sicily proved that first-wave-attack force of three divisions was inadequate, so that a minimum of five divisions was ordered. This required a postponement of plans in order to provide additional landing craft. According to a decision reached on Feb. 1, 1944, the invasion was to take place no later than May 31, 1944. On May 17, the date was changed to June 5. An attack on Cotentin Peninsula was included in the initial operations to speed up the establishment of adequate port facilities. The total strength available on D-day was set at 37 divisions (23 infantry, 10 armored, 4 airborne). The planned influx of reserve divisions remained at three-to-five a month. Allied strength at the end of the campaign actually amounted to 61 American, 13 British, 5 Canadian, 10 French, and 1 Polish divisions, plus 3 incompletely equipped French divisions, small Czech, Belgian, and Dutch units, and the French Forces of the Interior whose fighting value was estimated to be the equivalent of 15 divisions. Allied divisions, including tank, antitank, and anti-aircraft units, averaged 17,000 men. On June 1, 1944, United States Army troops in Britain numbered 1,562,000.

The final estimate for D-day of the Twenty-first Army Group under Field Marshal Montgomery was as follows: Canadian First Army (2 Corps), under Lt. Gen. H. D. G. Crerar; British Second Army (1st, 8th, 12th, and 30th corps), under Maj. Gen. Sir Miles C. Dempsey; British 1st and 6th Airborne divisions under Lt. Gen. F. A. M. Browning; and the United States First Army (5th, 7th, 8th, and 19th corps, with parts of the 82d and 101st Airborne divisions) under Lt. Gen. Omar N. Bradley.

Two airborne divisions were to land ahead of the seaborne forces in the rear of the beachhead areas to capture vital bridges and disrupt enemy communications. Air Chief Marshal Leigh-Mallory feared that such operations might result in the loss of 75 to 80 per cent of the men and

aircraft involved, but losses were actually less than 10 per cent.

The assault on D-day was aimed at the beaches between Ouistreham and Varreville. Initial objectives were the capture of Caen, Bayeux, Isigny, Carentan with its adjoining airfields, and the seizure of the city, port, and airbase of Cherbourg. A subsequent advance on Brittany was to capture the ports south to Nantes. The next objective was a drive to the east along the Loire on the right wing and across the Seine on the left wing, in the general direction of Paris, destroying as many German forces as possible in this area. As the ultimate intention was to supply American troops from the United States through the ports of Cherbourg and of Brittany Peninsula, the United States First Army was to take over the right flank, while the British and Canadians (to be supplied from Britain) took the left. The British-Canadian drive was to seize continental Channel ports as far northeast as Antwerp.

The United States First Army was assigned to the beaches of Varreville (code name "Utah") and of St. Laurent (code name "Omaha"). Maj. Gen. J. Lawton Collins' 7th Corps, spearheaded by the 4th Infantry Division, was assigned to make the Utah attack. The 82d and 101st Airborne divisions, dropping near Ste. Mère-Église, were to capture the crossings of the Merderet River, to hold the Douve River barrier, and to assist the advance of the 4th Division. The 7th Corps was to cut through Cotentin Peninsula and seize Cherbourg on D-day plus 8. Omaha's 7,000-yard beach was assigned to the 5th Corps (Maj. Gen. Leonard T. Gerow), with combat teams of the 1st and 29th Infantry divisions (16th and 116th regiments). During the initial advance, forces of the United States Third Army under Lt. Gen. George S. Patton were to land and remain under the operational control of the First Army until D-day plus 30.

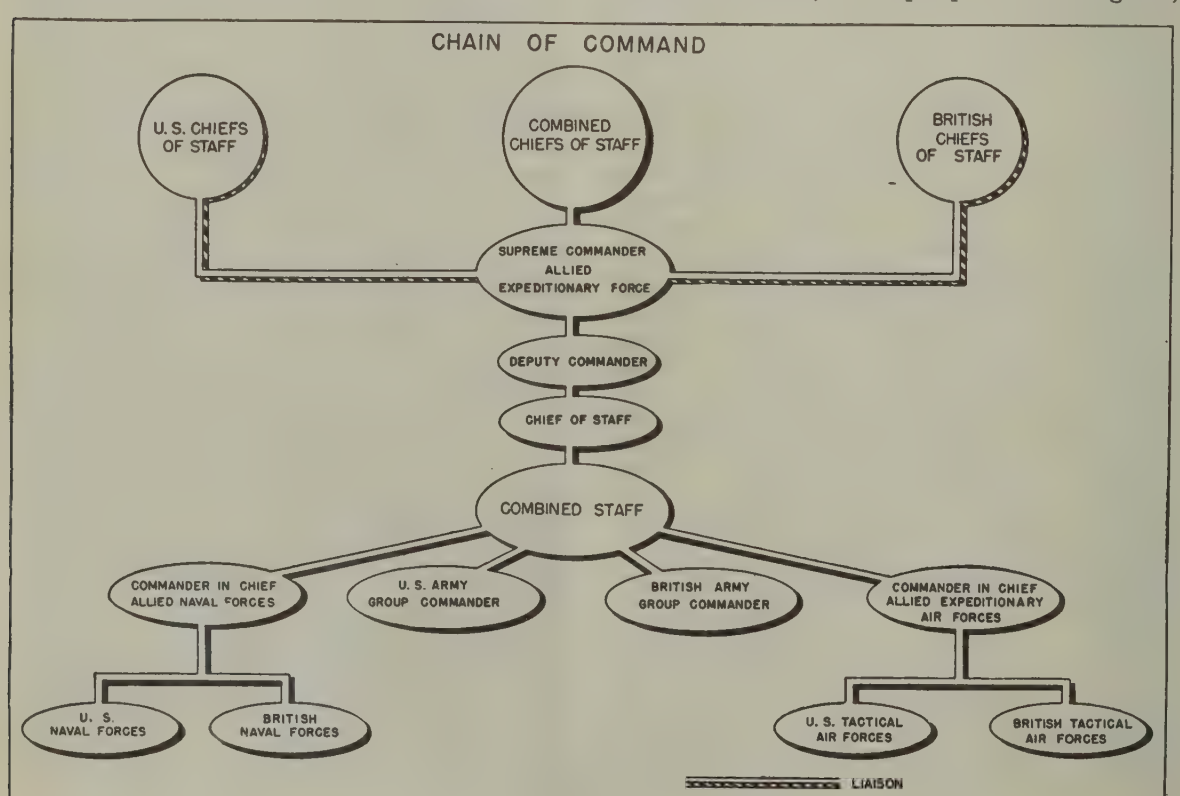
On D-day plus 30, the First Army was to turn into Brittany in the direction of St. Malo, leaving the reduction of the peninsula to the Third Army, and to swing east along the Loire to a line beyond Angers and Le Mans, which was to be reached on D-day plus 40.

The British and Canadian forces, established on the beaches of Ouistreham (Sword), Courseulles (Juno), and Asnelles (Gold), were to protect the Allied flanks against counterattacks from the east and to advance south and southwest of Caen where the terrain was well suited for the deployment of armor and the establishment of airfields.

The first seaborne wave in the eastern sector was formed by the 3d and 50th British divisions and the 3d Canadian Division, while the British 6th Airborne Division was to secure bridges over the Caen Canal and the Orne River. By D-day plus 20, these forces, with follow-up troops, were scheduled to reach the Vire-Falaise line and to continue along the general line of the Seine.

On D-day plus 90, the Allied front was to stand along the Seine River from its mouth at Le Havre to Paris, and along the Loire from Nantes to Orléans. Brittany Peninsula was to be fully occupied. The Allies were to take Paris, or encircle and isolate the big city if the Germans refused to evacuate it, cross the Seine and advance along the Marne to the Somme toward the borders of Belgium, Luxembourg, and Germany.

Further operations envisaged an advance on a broad front, with the main impact on the northern flank, a thrust toward Metz, and a junction with Gen. Jacob L. Devers' forces coming from the Mediterranean coast of France. The invasion of southern France (operation "Anvil" under the supreme command of Field Marshal Sir Henry Maitland Wilson) was postponed to Aug. 15,



1944. The subsequent penetration of the Siegfried Line (Westwall) aimed at inflicting decisive defeat upon the Wehrmacht west of the Rhine. If resistance should continue, Rhine crossings were to be effected in great strength in the direction of the Ruhr, and in lesser strength via the Frankfort Corridor developing into pincers to close east of the Ruhr.

In the early stages of the campaign, Field Marshal Montgomery had operational control of all land forces, including the United States First Army. After sufficient forces were on land, a United States Army group was to come into being under American command, on an equal footing with Montgomery's Twenty-first Army Group. Relations between the British and Americans, according to General Eisenhower's report, remained smooth and effective.

The Role of the Navy.—Naval forces engaged in Overlord amounted to more than 5,000 craft, about half of which were American. On April 15, 1944, an allotment by the Combined Chiefs of Staff assigned 6 battleships (U.S.S. *Texas, Nevada,* and *Arkansas,* and H.M.S. *Warspite, Nelson,* and *Ramillies*), 2 monitors, 22 cruisers, and 93 destroyers to the invasion forces. The naval assault area was divided into the western part (American), and the eastern part (British and Canadian), under the respective commands of Rear Admiral A. G. Kirk and Rear Admiral Sir P. L. Vian. The dividing line ran north from Port-en-Bessin to the parallel of 49° 40′.

Five naval assault forces were assembled as follows:

THE AMERICAN

U (Utah), under Rear Admiral D. P. Moon at Plymouth.
O (Omaha) under Rear Admiral J. L. Hall, Jr. at Portland.

THE BRITISH AND CANADIAN

S (Sword) under Rear Admiral A. G. Talbot at Portsmouth.
J (Juno) under Commodore G. N. Oliver at the Isle of Wight.
G (Gold) under Rear Admiral C. Douglas-Pennant at Southampton.

Two follow-up forces, B and L, were concentrated at Falmouth, Plymouth, and Nore. Vessels of similar speed and design were herded together, landing craft ahead of all other ships. Landing craft included the following types:

LCP—landing craft personnel
LCM—landing craft mechanized
LCS—landing craft support (rocket firing)
LCT—landing craft tank, some of them capable of carrying the heaviest type of armor
LCC—landing craft control
LCI—landing craft infantry, carrying 6 officers and 182 men or 75 tons of cargo
LCVP—landing craft vehicles or personnel
LST—landing ship tanks, 345 feet 10 inches long, with crews of 7 to 9 officers and 204 to 220 men, carrying 27 twenty-five-ton or 15 forty-ton tanks in addition to 168 troops.

The port problem remained troublesome. A delay in the capture of Caen, Cherbourg, and Brittany Peninsula was to be avoided if possible. Engineers and technical experts simplified the problem by designing huge artificial harbors, code named "Mulberries," and smaller installations, called "Gooseberries." Prime Minister Churchill took a personal interest in the construction of two Mulberries, one of which was to operate in the American sector and the other in the British-Canadian sector. Portable breakwaters were made of hollow, concrete caissons up to 60 feet high. The caissons were floated to the beaches and then sunk at predetermined places. The British War Office developed portable Loebnitz piers resembling pontoon bridges, which were built out 3,000 feet to reach water deep enough to accommodate LST's at low tide. A line of ships sunk inshore formed the end of the harbor. A device invented by a Scotsman, Robert A. Lockner, reduced wave levels.

The caissons required 30,000 tons of steel and 500,000 tons of concrete. It took 20,000 men to build them. The Mulberries could handle 10,000 to 12,000 tons of traffic a day, in addition to hundreds of vehicles. The total cost of the artificial harbors amounted to £100,000,000. By Sept. 5, 1944, a total of 2,086,000 men, and 3,446,000 tons of supplies had been landed.

The installation of Mulberries and Gooseberries of similar construction was begun on June 7. Ten days later, the first LST could be brought in. On June 19, the worst gales recorded in 80 years hit the invasion coast. After three days of storms, the American Mulberry was ruined beyond repair, although the British one was kept in operation. The Gooseberries, one per beach, also resisted the elements.

The Allies had 11,000 planes of various kinds available for the invasion. Other surprises for the Germans were rocket-firing Typhoons and several glider types, including the British Hamilcar (net weight 18,500 lbs., carrying capacity 7.8 tons), the British Horsa medium glider, the United States GG-4A Hadrian, and the heavier CG-13A. The Hamilcar could carry 60 airborne troops, or two jeeps or armored cars, or similar heavy matériel such as one self-propelled Bofors gun or one bulldozer. The United States CG-13A accommodated 30 men or an equivalent cargo. Air preparation preceding the invasion was code-named "Point-blank."

General Eisenhower assumed operational control of the Allied air forces in the European theater of war on April 14, 1944. Prior to this date, large scale preparatory operations had begun, including the bombing of critical industrial and military targets. Six industrial systems were considered indispensable to the German war effort: submarines, aircraft, ball bearings, oil, rubber, and communications. During Operation Pointblank, 700 light and medium bombers and 2,434 fighters attacked rail and road targets, bridges, airfields, coastal batteries, and radar stations. The attack on railroads opened on D-day minus 60, on bridges on D-day minus 46, and on airfields within 130 miles of the invasion area on D-day minus 21. During the invasion, 171 fighter squadrons protected naval forces, destroyed remaining enemy radar installations and still intact beach defenses, and covered established beachheads.

On Feb. 9, 1944, civilian travel between Great Britain and Eire was suspended in order to prevent the numerous German agents in Eire from gathering information. On April 1, at General Eisenhower's request, the British government imposed a ban on visitors to coastal areas where the invasion was in preparation. On April 17, the movement of diplomats and their couriers into and out of the United Kingdom was banned, and censorship was extended to hitherto immune correspondence. On May 25, an artificial delay of ten days was imposed on the forwarding of mail to the United States. As a result of these measures, German intelligence failed to learn the initial objectives of the Allied invasion.

In February 1944, von Rundstedt and Rommel had 53 divisions in France, Belgium, Holland, and Luxembourg. By June 3, the number had increased to 60, ten of which were armored, but many divisions were under normal strength. The influx of reserves was slow because of lack of manpower and equipment and the disruption of communications. Sixty per cent of the forces were concentrated in the north, from Holland to the French port of Lorient. The strongest group, the Fifteenth Army, was on duty in Pas-de-Calais; the next strongest, the Seventh, assembled west of that French department. The German High Command was convinced that the Allied invasion would concentrate on Pas-de-Calais. Even after the landings in Normandy, the Germans continued for several weeks to consider them a diversion and refused to send the Fifteenth Army to the crucial sector. The Allied command, aware of the German mistakes, concentrated available surplus shipping in the Thames estuary, close to Pas-de-Calais, and moved embarkation places farther east than was necessary in order to mislead the Germans still further.

The Wehrmacht High Command understood the importance of adequate harbor facilities to the invasion forces. All the main harbors from Den Helder to Brest were heavily fortified, and Cherbourg and Le Havre became primary strong points. The harbor garrisons were ordered to continue resistance even after being by-passed by Allied drives. Lack of supplies would reduce the power of the attackers and prevent deep penetrations. Concrete positions, coastal and flak (AA) batteries, mine fields, and wire entanglements were built between the ports, and obstacles, occasionally connected with mines, were planted in the shallow waters of the beaches. Fixed heavy and medium guns threatened approaching ships. Medium and light artillery, two to three miles inland, was to lay down a tight barrage on invasion beaches. German underground fortifications were reminiscent of the Maginot Line. The morale of their garrisons was influenced by the "Maginot spirit" of total defense. The German defenses did not reach any notable depth except in the harbor zones, and even in Pas-de-Calais they were not really continuous.

German available naval forces (as estimated by the Allies) consisted of 5 destroyers, 9 to 11 torpedo boats, 50 to 60 E-boats, 50 to 60 R-boats, 25 to 30 minesweepers, 60 miscellaneous surface craft, and 130 submarines. An additional 70 submarines, on duty in the Atlantic, were supposed to reach the critical zone within a maximum of 14 days.

Although the Luftwaffe's first-line strength in France was estimated at no more than 3,000 planes, and actually numbered even less—there were fears in the Allied camp concerning jet-propelled aircraft. German construction of this new, fast aircraft began as early as 1937 and had progressed to a point well beyond that reached by the Allies. Large-scale use of it by the enemy could have upset Allied air supremacy, but the actual output of such planes in the Reich was extremely low.

Like the British in 1940, the German General Staff had to wait for the enemy's opening move. But the British still had some doubts about the impending German attack, whereas the Wehrmacht generals were sure that the invasion was coming.

The first United States Navy amphibious training base in Britain for the preparation of the European invasion was commissioned on July 29, 1943, at Appledore. Fourteen more were added by May 11, 1944, including training, operational, and supply bases, the largest of which were at Plymouth and Exeter. LST's and LCT's could be loaded directly from the shore on concrete-surfaced beaches. Installations, naval stores, machinery, and other commodities were obtained by reverse lend-lease. Admiral Stark was in charge of overall administration and in logistic command of bases and ships.

Ships and men poured into the United Kingdom for the naval part of the invasion, referred to as operation "Neptune." A strong enemy bomber force, or an earlier completion of the German V bombs (V standing for *Vergeltung,* which means *reprisal*), might have raised havoc among the anchored vessels. Amphibious rehearsals were held from January through April 1944. In one of the rehearsals, called exercise "Tiger," German E-boats intercepted a group of LST's near Plymouth, sinking two of them and damaging a third.

Attack from the Sky.—The Combined Chiefs of Staff listed the following among the prerequisites of invasion: the inflicting of heavy losses on the German fighter air force; a prolonged bombing offensive against sources of production and supply, and against first-line units of the German Air Force; the disorganization of Luftwaffe units and disruption of field installations within fighter range of the invasion area; the disorganization of the main elements of the German fighter command and control organization in the same area. The disruption of German communications, starting inside the Reich and ending up in the battle zone, was another objective which was more successfully attained than the reduction of the German war potential.

The results of total air war against Germany were overestimated before the occupation of the Reich showed the actual results. Although the widespread ruin was impressive, most of the industrial targets of Allied attack were by no means eliminated beyond hope of reconstruction.

German economic planners, mapping a defensive strategy against growing Allied air attacks, displayed remarkable efficiency in transferring plants into safer areas and in breaking up large production units into smaller ones. Until 1943, Silesia, southwestern Poland, the Czech "Protectorate," Slovakia, Austria, and Hungary were comparatively safe from raids, and the first four of these regions remained so until the last year of the war. Many German plants moved into these "safety zones." The Erla factory of Leipzig spread from 5 units to 25, and the main Messerschmitt factory moved to Wiener Neustadt, Austria, from Augsburg, Germany, and was broken up into 40 units. Moreover, underground factories continued their operations undisturbed by air raids. Labor priority for the construction of such plants was granted only late in the war, explaining why there were so few of them. In general, the German industrial output continued high through 1944 and declined sharply during the last four months of the war.

The number of foreign slave workers drafted into the service of the German war machine reached a total of 12,000,000. German statistics listed "foreign workers" at only 60 per cent of this figure. The rest were considered draftees,

i.e., workers pressed into compulsory labor by the puppet governments of Germany's "allies." Despite the vast number of foreign laborers, many German workers remained deferred from military service because of the tremendous task of repairing bomb damage.

Special German squads repaired damage to railroads and highways. Even so, they could not prevent the disruption of timetables and increased destruction of rolling stock and marshalling yards. During the crucial weeks after the Allied landings in Normandy, German divisions with heavy equipment could travel only a little more than 20 miles a day.

On March 26, 1944, Winston Churchill announced that the American Air Force in the British Isles outnumbered the RAF. The total weight of bombs dropped on Germany and German-controlled areas in the western theater rose constantly from March to May. It reached 37,000 tons during the first five days of June 1944. On D-day, the strength of the United States air forces in the United Kingdom exceeded 9,500 planes, of which more than 3,000 were heavy bombers.

The attack on German aircraft production actually began on April 17, 1943, with the raid on the Focke Wulff plant in Bremen and continued through the year on a limited scale. Allied estimates that the 1943 raids prevented the production of 2,500 Luftwaffe fighters were not confirmed by the facts.

In 1944, Allied raids against German aircraft production centers were greatly intensified. Fighter plants at Aschersleben, Brunswick, and Hanover were among the targets in January and early February. Leipzig was hit with 2,300 tons during the night of February 19. This was followed by a day attack by 1,000 Flying Fortresses, which hit six additional aircraft production centers and added to the destruction of the blazing city. During the following week, Stuttgart, Brunswick, Bernburg, Aschersleben, Halberstadt, Regensburg, Gotha, Hanover, Schweinfurt, Augsburg, and Steyr (Austria) became targets of heavy bombers, while lighter craft struck at Luftwaffe bases in Germany, France, and the Low Countries. Approximately 18,000 tons of bombs were dropped, and the Luftwaffe lost at least 641 fighters against 148 British and 232 United States bombers.

Raids on aircraft plants were stepped up in March and April. In May, attacks on aircraft factories were reduced, and oil and synthetic oil production facilities became the priority targets. Five raids hit Ploesti. Eastern Galician oil wells suffered damage, and refineries in Leipzig were attacked. The raiders of Galicia continued on to Russian bases and returned to Britain and Italy respectively six days later, bombing the targets again on their return trips. Up to early July, 55 refineries and synthetic plants had suffered damage. Allied sources estimated fuel production had been reduced by 70 per cent. The Germans suffered a great loss later in the year when the Red Army occupied Ploesti.

After being hit by five major RAF raids in January and February 1944, in addition to numerous night attacks by Mosquito bombers, Berlin experienced its first all-American raid on March 4. On March 6 and 8, 1,660 bombers and 1,920 bombers respectively, dropped 350,000 incendiaries and 10,000 explosive bombs, at a loss of 134 planes. Production in the Ruhr region was reported in full swing in the early spring of 1944. Essen, Cologne, Friedrichshafen, Mannheim, Ludwigshafen, Frankfurt, and Kassel, among other industrial cities, felt the impact of Allied air power again.

After Germany's unconditional surrender, Field Marshal Gen. von Rundstedt explained the German defeat in the Battle of France by saying: "We had no mobility and could not bring up reserves. Between Paris and Rouen, there was not a single bridge across the Seine." Initial communications-bombing hit two main transportation systems from Germany to the west: one through Hanover and Brunswick to Antwerp, the other through the Ruhr and Cologne to Paris—in addition to alternative lines from Coblenz, Frankfurt, and Stuttgart to France and French railway networks centered in Paris. As damage to rails had no lasting effect, Allied bombing concentrated on bridges, marshalling yards, and junctions. In April, heavy night bombers hit many communications targets. In May, marshalling yards in northern France, Belgium, and Luxembourg were attacked. The center of gravity of air operation switched later toward the middle Rhine, while Italian-based planes hit communications targets in southeastern France. The weight of single bombs used in such raids was greatly increased. A last furious crescendo hammered away at communications serving the invasion area immediately before D-day. The Reich's dwindling rolling stock suffered the loss of more than 900 locomotives and 16,000 freight cars during May 1944. When the invasion of northern France was launched, 50 out of 82 main railway junctions were heavily damaged and 26 out of 29 main bridges between Paris and Normandy were closed to traffic. Loire bridges from Orléans to the mouth of the river suffered almost equal damage.

Radar-bombing technique, first employed by the Allies in the fall of 1943, was improved. German radar stations were severely damaged. Allied scientific countermeasures neutralized most of what remained of German radar.

During the winter of 1943–1944, Rommel ordered coastal guns to be casemated and thicker concrete walls used for pillboxes in the "Atlantic Wall." Heavy coastal guns were frequently silenced but rarely destroyed by air attack. The bombardment did account for substantial delays in the strengthening of German fortifications and the failure to install the large number of underwater obstacles which the German field commander requested.

Germany's Secret Weapons.—The heaviest bombings failed to smash German morale. Later research even led to the conclusion that willingness to fight to the end was highest after raids.

As plans for a 10,000-plane, anti-invasion Luftwaffe could not be realized, the Germans reorganized their air force. The construction of bombers was greatly reduced, and fighter production was stepped up. New weapons were also developed as rapidly as possible, although the destruction of laboratories slowed up their output. The new devices, although they did not interfere with the invasion or delay the Allied victory, gave the British Isles a severe pounding.

The first V–1 missile hit southern England during the night of June 12, 1944. The V-1 resembled a small aircraft, with an overall length of 25 feet and a wing span of 17½ feet. It was launched from platforms along the Channel

coast and propelled by a primitive combustion engine, giving the robot a range of 150 miles at a speed of 200 m.p.h. Flight stability and direction were established by a system of compressed air in spherical bottles. The nose of the missile carried a war head charged with one ton of high explosive, designed to detonate when the bomb dived to its target. The V-1 was not accurate. Its relative slowness made it vulnerable to AA fire and interception by fast fighter craft. Of 8,070 V-1s launched against England up to August 31, 1944, 29 per cent penetrated British defenses, and 92 per cent of those hit the London area. A total of 5,497 persons was killed and 15,934 injured by the V-1 during that period.

The V-2, invulnerable to AA defenses and aircraft, was first mentioned publicly by Prime Minister Churchill on Nov. 10, 1944, after having been in operation since October. It was a wingless rocket, 46 feet long and 5½ feet in diameter, carrying the same weight and kind of explosive as the V-1. Its fuel, 7,500 lbs. of alcohol and 11,000 lbs. of liquid oxygen, was electrically ignited. Travelling at a maximum speed of 3,000 miles an hour, the V-2 had a range of 200 miles and greater accuracy than the V-1. Despite all the damage they caused, the new weapons were useless in the struggle for air superiority.

D-DAY AT NORMANDY

Weather forecasts, unfavorable for the period between June 3 and 5, were rather hopeful for June 6 and 7. June 6, 1944 was set as the final date for Operation Overlord. Between midnight and the dawn of that day, 5,853 tons of bombs were dropped on 10 coastal batteries between Cherbourg and Le Havre. At daybreak, the United States 8th Air Force, preceding the invaders, dropped another 1,763 tons within 30 minutes. Other raids were carried out by medium, light, and fighter bombers of the Allied Expeditionary Air Force. During June 6, the Strategic Air Forces flew 5,309 sorties, hitting various targets with 10,395 tons of bombs, and the Tactical Air Forces made 5,276 sorties.

There were only 50 Luftwaffe sorties on June 6. This was due to the destruction wrought by preparatory Allied assaults on German airfields, to the breakdown of German radar, and to the German insistence on concentrating their depleted air force in the Calais sector. When the Luftwaffe appeared in greater strength, the Allies were already well established on the beaches.

Ahead of the seaborne invaders by an average of 30 minutes, airborne assault forces dropped on both flanks of the Seine Bay. There were in action 1,662 United States planes, 512 United States gliders, 733 British planes, and 355 British gliders. The British 6th Airborne Division descended precisely in the assigned area east of the Orne River, seizing bridges across the Orne and the Caen Canal. Counterattacking elements of the German 21st Panzer Division arrived too late to dislodge the paratroopers. United States airborne landings were hampered by low clouds and high winds. Troops and supplies of the 101st Airborne Division were scattered over an area 25 by 15 miles, and 60 per cent of its supplies were lost. The division nevertheless held the approaches to Utah beach. The United States 82d Airborne Division met heavy resistance at Ste. Mère-Église, but its operations confused the defenders and aided the assault forces at Omaha beach.

Initial seaborne landings, with landing craft spaced 75 yards apart, took place in heavy surf, limiting the use of amphibious DD tanks. Supporting fire from naval vessels was very effective.

German garrisons of permanent fortifications included some very young men and others beyond normal military age. They were mixed with troops recruited forcibly from occupied countries and a number of Russian deserters. Their fighting quality was mediocre but that of field troops was considerably better.

In the British-Canadian sector, seaborne landings starting around 6:00 A.M. were carried out according to plan. The British 3d Division west of Ouistreham (Sword beach) was favored by surf conditions and could use its DD tanks to overcome moderate opposition. The Canadian 3d Division, followed up by the British 51st (Juno beach), pushed through rather heavy gun and mortar fire in the direction of Caen. The British 50th, on Gold beach near Asnelles-sur-Mer, met unexpectedly weak resistance and occupied Arromanches, Meuvaines, and Ryes on D-day. The British 49th and 7th Armored Divisions joined the operations on Gold beach.

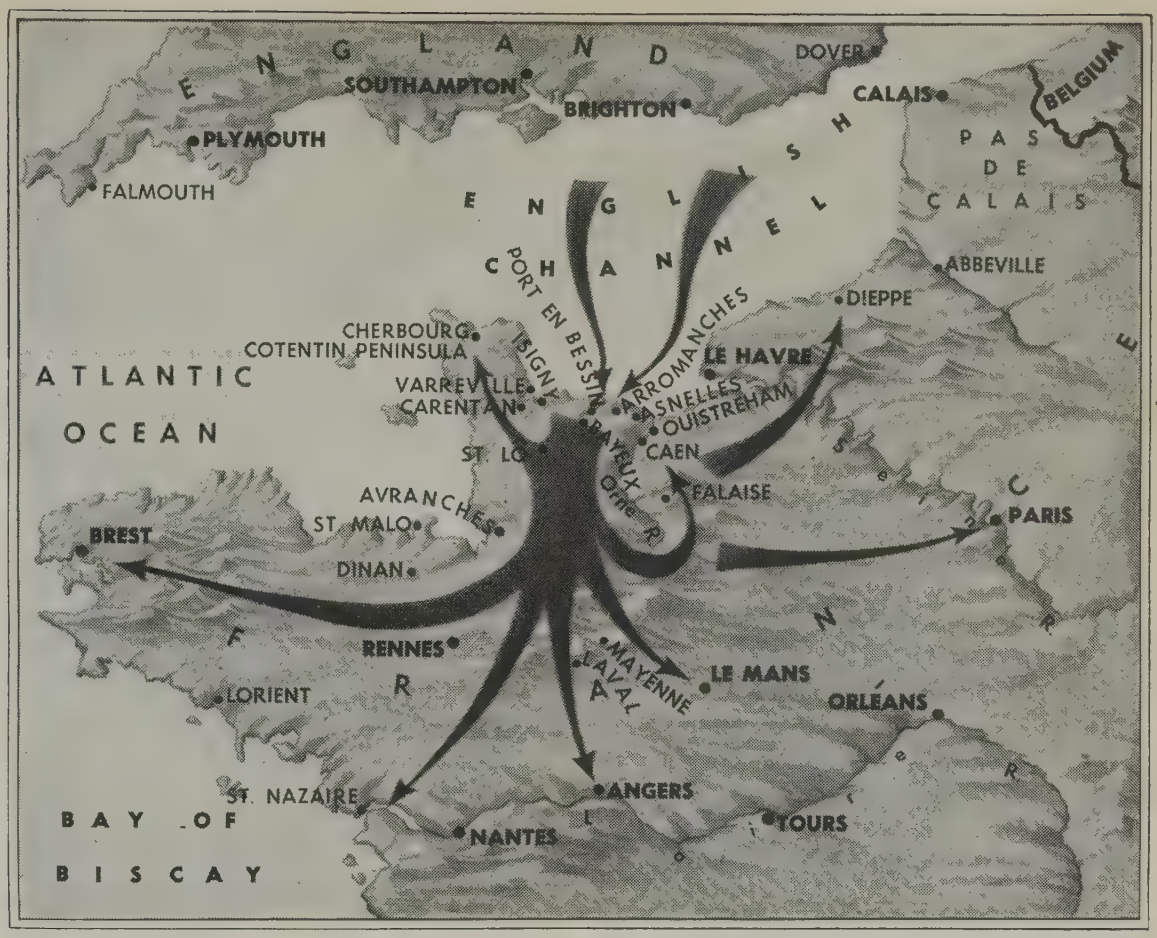
The Americans at St. Laurent (Omaha beach) had more trouble than other invasion forces. The leading elements of the 16th and 116th Infantry regiments not only encountered the Atlantic Wall garrisons, but also the full German 352d Infantry Division. Surf and underwater obstacles destroyed many amphibious tanks and landing craft. Preparatory bombing and shelling had less effect at Omaha beach than in any other sector. The invaders were pinned down and suffered heavy casualties (the 16th Regiment lost one third of its effectives). General Eisenhower's report to the Combined Chiefs of Staff stated: "by their unflinching courage, they turned what might have been a catastrophe into a glorious victory." Omaha beach was secured and the United States 1st, 2d, and 29th divisions went ashore.

The United States 4th Division, west of the Vire Estuary (Utah beach), fared better. The Germans in that sector relied upon flooded rear areas to hold the attack, but airborne troops seized the causeway through the inundated region and the 4th Division, joined by the 9th and 90th Divisions, cut through thinly manned German lines to strike northwest on the road to Cherbourg.

The problem of unloading vast numbers of men and vehicles and many thousands of tons of supplies on bare beaches strewn with mines and obstacles was complicated by heavy seas which did not permit full use of special landing devices. Beach organizations were set up under heavy German artillery fire. Continued rough weather added to the troubles caused by enemy action. By June 11, the unloading of stores and vehicles was 50 per cent behind schedule. Even so, 326,547 men, 54,186 vehicles, and 104,428 tons of supplies were brought ashore over the beaches during the first six days of the invasion.

The German Seventh Army opposing the Allied landing forces was commanded by Field Marshal General von Kluge. Kluge scrupulously obeyed Rommel's order to seek a decision on the beaches and not to allow the Allies to penetrate inland. He even committed his armor close to the landing places.

The British and Canadians, exploiting their initial success, reached a line 2 to 3 miles from Caen. But before their armor arrived in strength, the German 21st Panzer Division, supported by



the 12th SS Panzers, drove a wedge between two Allied divisions and pushed almost to the beaches. The first attack on Caen had failed. The breakout across the Orne and the advance toward the Seine were delayed.

In the center, Bayeux was taken on June 8. The United States 5th Corps advanced toward the Bayeux-Carentan road and established contact with the British 50th Division. On June 11, the 5th Corps reached a line from Caumont to Isigny, where the advance slowed down on the slopes of the hills covering St. Lô.

On the western wing, German resistance was strongest at Montebourg. Kluge wanted to protect the Cherbourg road and to prevent a junction between the Utah and Omaha forces. On June 10, however, the junction was made, and the Allies held an unbroken coastal stretch from Quinéville to the east bank of the Orne. Carentan was captured on June 12.

The Luftwaffe rallied, increasing its daily sorties to an average of 300-350, with a maximum around 450, against 4,000 by the Allies. The German Fifteenth Army in the Pas de Calais remained immobile. Reinforcements from other sources reached Kluge, via long detours, at a rate of about half a division a day. Allied bombing and sabotage by French Forces of the Interior reduced German transportation facilities still further.

The Capture of Cherbourg.—After the fall of Carentan, Kluge dispatched his 77th Division to stop the drive by the United States 9th and 82d Divisions toward St. Sauveur-le-Vicomte, which threatened to isolate Cherbourg. The Americans continued their advance in the woody countryside, where narrow fields were divided by tree-topped embankments, each of them a formidable tank obstacle and hiding place for snipers. Camouflaged machine-gun posts plagued the attackers. The drive on St. Sauveur-le-Vicomte reached its goal on June 16. Three days later, Montebourg was captured by the United States 4th and 90th Divisions. The Germans split into two groups. One of them (two complete divisions and parts of two other divisions) reinforced the naval garrison of Cherbourg; the other, including the 2d Panzer Division, fell back to escape entrapment in Cotentin Peninsula. The United States 4th, 9th, and 79th Divisions pressed on toward the prize port on the heels of the Wehrmacht.

The assault on Cherbourg opened on June 22. The German military and naval commanders, General von Schlieben and Rear Admiral Hennecke, exacted no surrender pledges from their men. This did not prevent them from giving up personally on June 26, when street battles were raging for the second day. Their example was soon followed by the rest of the garrison. By July 1, all resistance in Cherbourg and northern Cotentin Peninsula had ceased. The Allies had gained their first major victory in western Europe. Port installations in Cherbourg were thoroughly wrecked and their use was delayed. A naval fire support group, including the United States battleships *Nevada, Texas,* and *Arkansas,* the United States cruisers *Quincy* and *Tusca-*

loosa, the British cruisers *Glasgow* and *Enterprise,* and 11 destroyers, assisted the army's operations against Cherbourg and silenced opposing batteries on June 25.

While the United States 5th Corps pushed inland in the direction of Caumont, the British Second Army on its left succeeded in holding the German drive, which had been joined by elements of two more panzer divisions. Kluge had thrown six panzer divisions piecemeal against the British to prevent them from giving flanking support to an Allied army which the Germans still expected to land at Calais. Discomfited by the loss of Cherbourg, the German commander had to reinforce the western sector. One more panzer division, the Lehr (instruction) Division, and the 2d Parachute Corps joined the battle against the Americans.

After rapidly expanding United States forces were regrouped, Gen. Omar N. Bradley opened a drive southward on July 3. On July 9, the United States 8th Corps broke through German positions at La Haye-du-Puits. The 7th Corps scored small and costly gains along the Carentan-Périers highway, and the 9th Corps crossed the Vire River. A counterattack by German armor on July 11 was defeated by the United States 9th and 30th Divisions. American forces pressed toward St. Lô, strongly defended by the 2d Parachute Corps.

Not until July 8 could Field Marshal Montgomery resume his attack on Caen. From a total of 900 German tanks in operation, 700 were deployed in this sector. An air attack by 500 heavy bombers, naval shelling by H.M.S. *Rodney, Roberts,* and *Belfast,* and a land artillery barrage preceded the drive. The attackers penetrated into Caen but failed to take the section across the Orne River. The attacks soon slowed down, and another stalemate developed on the Allied left wing. To the right, the United States 29th Division took St. Lô on July 18. West of the city, the 9th and 30th Divisions reached high ground beyond the Vire.

By July 18, 15 United States divisions (three of them armored), and 15 British and Canadian divisions (4 of them armored), faced 27 German divisions, 8 of which were armored. The German Seventh Army had already lost 160,000 out of 540,000 men and 30 per cent of its original 1,200 tanks. Kluge was named field commander in France under Rundstedt, in place of Rommel, who had lost the führer's favor. In his headquarters at Rastenburg, East Prussia, Hitler issued orders to hold and crush the western Allies before the Russians invaded the Reich.

The Battle of the Falaise Gap.—On July 16 and 17, vigorous feints by the British Second Army misled von Kluge, causing him to believe that the main Allied efforts for the breakthrough would be concentrated in the Caen sector. The German field commander directed more armor to the Seventh Army's right wing. The Allied plan, however, contemplated action on both wings. The Second Army's offensive, starting July 18, was to drive across the Orne from Caen toward the Seine basin. On July 19, General Bradley's Americans were to attack across the Périers-St. Lô road, aiming at a complete breakthrough. Spearheads were to swing to Coutances, isolating the Germans between St. Lô and the coast, and then strike down through Avranches in an encircling move, designed to annihilate the bulk of the Seventh Army in cooperation with the British and Canadians closing in from the opposite direction.

The drive across the Orne began on schedule. Air bombardment accounted for considerable confusion. Enemy casualties, however, were smaller than expected. For a few hours, German resistance was scattered. The British 7th, 11th, and Guards Armored divisions, followed by infantry of the 1st and 2d Corps, reached a general line running from Émieville through Cagny to Soliers, where resistance stiffened. Bad weather interfered with air support, and muddy ground with tank operations. No breakthrough toward the Seine was achieved.

Bradley's drive was postponed until July 25 on account of weather conditions. When the assault began, 1,883 heavy bombers showered 4,700 tons of heavy explosives on the Germans. Medium bombers and rocket-carrying fighter bombers brought the total of sorties to 4,979, of which 39 planes were lost. Some bombs fell short, causing losses to American troops, including Lt. Gen. Lesley J. McNair, commander of the ground forces, who was one of the victims.

The United States 7th Corps (1st, 4th, 9th, 30th Infantry divisions, 2d and 3d Armored divisions) crossed the Périers-St. Lô road on July 25 and the St. Lô-Coutances road on the following day. The United States 8th Corps (8th, 79th, 83d, 90th Infantry divisions, 4th Armored Division) also pushed across the Périers-St. Lô road. In the swing toward Coutances, Périers and Lessay fell to the Americans on July 27. The Wehrmacht belatedly attempted an orderly retreat. Kluge's insistence on holding ground as long as possible caused the Germans to be squeezed into narrowing sectors. Columns jammed the roads and offered excellent targets to Allied aircraft. The Wehrmacht suffered higher casualties in retreat than in battle. On July 28, the United States 4th Armored Division penetrated Coutances, the United States 19th Corps reached Tessy-sur-Vire south of St. Lô, and the 5th Corps attacked south of the Cérisy woods. On the eastern wing, British and Canadians probed a German belt of antitank guns, embedded tanks, and mortar emplacements covering Falaise. The Wehrmacht still held firm in the east. In an attempt to bring the retreat from Coutances under control, Kluge dispatched one panzer division and elements of two infantry and one parachute division to his right wing. Of the German Seventh Army, only elements of two divisions in Brittany plus a division immobilized in the by-passed Channel Islands were unshaken.

The Wehrmacht's High Command finally realized that there would be no Allied landings in the Pas-de-Calais area and that the Fifteenth Army had been immobilized in vain. Reserves were drawn from its divisions, but transportation was slow and disorderly.

American progress allowed the establishment of the United States Third Army (Lt. Gen. George S. Patton, Jr.) which came into official existence on Aug. 1, 1944, including the 8th, 12th, 15th, and 22d corps. The 5th, 7th, and 19th corps remained as the United States First Army under Lt. Gen. Courtney H. Hodges. The First and Third armies as a group were under General Bradley's command. The British and Canadians already formed two armies; the Canadian First Army (Canadian 2d and British 1st corps) under General Crerar and the British Second Army under General Dempsey. Together they formed the

Twenty-first Army Group under Montgomery.

General Patton's assignment was to break through Avrancnes into Brittany, to seize Rennes, then to secure St. Malo, the Quiberon Bay area, and Brest, clearing the Brittany Peninsula. Simultaneously, the United States First Army was to seize the Mortain-Vire area, and the British Second was to concentrate near Caumont.

The United States 4th Armored Division took Avranches on Aug. 1. Knocked-out German vehicles, jamming the roads, impeded the American advance more than resistance by scattered remnants of German panzers.

The British Second Army resumed its attack from the area south of Caumont. Twelve hundred bombers supported its drive. Through a mistake, the ground attack failed to open up immediately after the air preparation ceased. Two panzer divisions opposed the British. Vire and Villers-Bocage were taken on August 5 after hard fighting.

In an amazing but characteristic burst of speed, General Patton's army invested Rennes on August 2, took Dinan, and by-passed St. Malo. Four days later, the Brittany Peninsula was cut, and the line of the Vilaine River was held from Rennes to the sea. The United States 5th Infantry Division reached the Loire River between Nantes and Angers. Nantes fell on August 10. On the same day, the United States 6th Armored Division stood before Brest. French Forces of the Interior, some 30,000 strong, effectively aided the Americans in Brittany. The Germans abandoned the interior of the peninsula and used what forces they had left to reinforce the garrisons of the ports of Brest, St. Nazaire, St. Malo, and Lorient, bringing their total strength up to 75,000 men.

The United States 8th Corps and the French Forces of the Interior were left to lay siege to the ports, and the main forces of the Third Army turned their backs to Brittany. The 15th Corps, after seizing Mayenne and Laval on August 6, switched to the east in the direction of Le Mans, supported by the 12th and 20th corps, and from there turned north toward Argentan to join with the Canadian First Army driving on Falaise. The junction was to throw a trap around the German Seventh Army. Kluge's stubbornness in Normandy recalled his costly tactics in Russia, which culminated in the establishment of the hedgehog system.

Field Marshal General von Rundstedt, who had foreseen the failure of a static defense, decided to throw a surprise blow at a weak spot in the Allied lines. The speed of Patton's drive had spread American divisions west of Avranches over a rather wide area, and their supplies were running short. The German capture of Avranches would have enabled the Wehrmacht to cut through to the sea and to isolate parts of the United States Third Army. Five panzer divisions and some infantry, supported by Luftwaffe bombers, formed an assault group. On August 7, the German attack was launched near Mortain against the United States 4th, 9th, and 30th Infantry divisions and the 3d and parts of the 2d Armored divisions. The initial advance reached hills overlooking Avranches. Ideal weather conditions enabled rocket-firing Typhoons of the Second Tactical Air Force to intercept the panzers with striking success. Rundstedt had no reserves available to feed the advance. The German attack subsided five days after it began. Runstedt's maneuver did not delay the Allied move of encirclement. Taking Le Mans on August 9 and Angers on August 10, the United States 5th Corps reached the outskirts of Argentan on August 12.

The United States First and British Second armies, from Vire and Mont Pinçon, and the Canadian First Army, violently opposed by the newly organized German Fifth Panzer Army, reached Falaise on August 17. The Allies pressed to close the narrow corridor of escape. Two panzer divisions attempted to keep the pocket's eastern exit open long enough to permit extrication of the armor.

In general, British and Canadian progress had been less impressive than American, but General Eisenhower, in his report, had this to say: "Without the great sacrifices made here by the Anglo-Canadian armies in the series of brutal, slugging battles, first for Caen and then for Falaise, the spectacular advances made elsewhere by the Allied forces could never have come about."

The trap was closed on August 20. Parts of eight panzer divisions succeeded in escaping, but lost most of their equipment. Two panzer and eight infantry divisions were caught inside the vise around Falaise. For five days, Allied air and ground forces battered the trapped Germans, who suffered terrific casualties. Then the pocket was liquidated. German losses in the west amounted to 400,000 (half of them prisoners) from D-day to August 25, in addition to 1,300 tanks, 20,000 vehicles, 500 assault guns, and 1,500 guns of various other types, not including fixed coastal batteries. The Luftwaffe lost 2,378 planes in the air and 1,167 on the ground.

The remnants of the German Seventh Army and Fifth Panzer Army were in headlong flight toward the Seine. Von Kluge, relieved of his command, committed suicide. Field Marshal Walther von Model became field commander in the west. What was left of the German Seventh Army was under the command of Gen. Hans Eberbach until August 31, when the general and his staff were captured at breakfast in Amiens.

The Liberation of Paris.—As the Allied advance progressed, the resistance movement in Paris came into the open. On August 19, the Germans laid siege to the Police Prefecture of Paris, and the police went on strike. Barricades were built in the streets. The German commander, Gen. Dietrich von Choltitz, made an unsuccessful attempt to negotiate a truce with the French resistance forces to allow his 10,000 men to withdraw across the Seine. Unable to hold the Paris streets, the Germans finally withdrew into buildings converted into strong points.

While the United States 15th and 5th corps were engaged in the Battle of the Falaise Pocket and the 8th continued operations in Brittany, Patton's 12th and 20th corps dashed eastward along the northern bank of the Loire. After the encirclement at Falaise was completed, the 15th Corps joined the other two under Patton's command in the race toward the Seine. Each corps was spearheaded by an armored division. The speed of the drive made it unnecessary to seize the strategic Paris-Orléans gap by airborne operations, as originally planned. On August 19, the 15th Corps reached the Seine at Mantes-Gassicourt, severing roads between Paris and Normandy. The 12th Corps took Orléans on

August 17. Its vanguards, cooperating with patrols of the 20th Corps, reached Fontainebleau three days later. While Allied armor drew a sickle-shaped line around the southeastern approaches to the French capital, German rearguards outside Paris fell back to the right bank of the Seine. On August 25, in another lightning sweep, vanguards of the 12th Corps reached a point 40 miles east of Troyes and continued toward the German border, only 60 miles away.

A fighter-bomber group of the 14th Tactical Air Force was attached to each armored division, providing the "eyes" for the columns and smashing the enemy's troop concentrations, armor, and supply system in advance of the ground forces.

The Wehrmacht's situation resembled that of the French armies in 1940 after the collapse of the Somme position, but the Allied supply situation was not as good as that of the Germans four years earlier. A dense net of intact communications had fed the Wehrmacht, advancing in a country of plenty which their occupation later transformed into a region of want. In 1944, by contrast, the Brittany ports were still in German hands; the wreckage of the port of Cherbourg had not been cleared; beaches and artificial harbors were overworked; railroads were out of operation; and truck transportation was not adequate for the needs of the advancing Allied armies. By air cargo, 2,000 tons of supplies per day did reach the onrushing Third Army. The planes needed for this purpose had to be taken from those allotted to the newly created First Airborne Army, under Lt. Gen. Lewis Brereton.

To satisfy French patriotic feelings and in recognition of the merits of the French Forces of Resistance, the honor of entering the capital ahead of other Allied units was bestowed upon the French 2d Armored Division, which, equipped with American matériel, had formed part of the Third Army spearhead at Argentan. This division had fought its way from Lake Chad to Tunisia in 1942–1943 and had a proud share in the liberation of Africa. On August 24, its tanks were in the outskirts of Paris. On August 25, the commander, Gen. Jacques Leclerc, received the surrender of the German garrison.

Remnants of the panzers from the Falaise gap crossed the Seine River on ferries and pontoons. The latter, well camouflaged, had largely escaped the attention of Allied airmen and facilitated German movements across the river. A single crossing ferried an average of 9,000 troops per night. Dense concentrations on their way to the ferries, however, offered ideal targets for air attacks, stepped up to 2,000 sorties a day. The British and Canadians closed in from the west against stubborn German rearguard action. This advance along the sea was supported by naval artillery. A delaying stand on the Touques River was broken on August 24, and another German resistance center at Elbeuf was captured on August 25. By August 30, the only German soldiers west of the Seine were beleaguered, port garrisons. The German Fifteenth Army, after diverting most of its divisions to the battered Seventh and Fifth Panzer armies, was badly mauled.

The Battle for the Brittany Ports.—German garrisons in the ports of Brittany rejected appeals to surrender. By August 8, all resistance ceased inside the peninsula. The attack on St. Malo opened immediately thereafter. The city was occupied on August 14, but the Germans held the citadel in a desperate stand for three more days. When the citadel was overwhelmed, resistance continued on the Isle of Cézembre, where heavy batteries commanded the approaches to the harbor. The British battleship *Malaya* assisted the attackers, and Cézembre gave up on September 2.

Brest, formerly the chief Atlantic U-boat base, had a garrison of 30,000 men under the command of Lt. Gen. Hermann Ramcke. Land attacks against Brest were supported by air bombardment and naval shelling. Progress was slow, and the Germans fought block by block within the city. Ramcke did not surrender until September 18. German demolition squads completely wrecked the once magnificent harbor installations, making it impossible to use the port as a major supply base.

It seemed more important to reinforce Allied armies advancing toward Germany than to continue the struggle for the remaining Brittany ports: Lorient, St. Nazaire, and Quiberon Bay. On September 5, the Third Army was freed from commitments in the west to take part in operations near the German border, and its 8th Corps was transferred to the newly created Ninth Army under Lt. Gen. W. H. Simpson. After the fall of Brest, the Ninth Army moved to the German border. French Forces of the Interior, equipped with United States matériel, besieged the ports in a sort of mutual blockade. The Germans were unable to break out, and the French were too weak to capture the ports.

The Invasion of Southern France.—Allied operations in southern France formed an integral part of overall strategy in western Europe. Their success was essential to a rapid continuation of the Allied sweep toward and beyond the German border.

By the beginning of 1944, Vice Admiral Henry K. Hewitt, commander of the Eighth Fleet, had been appointed naval commander for the operation (code-named "Anvil") with the designation of Commander Western Task Force. Beaches selected for landings were east of Toulon, in the Cavalaire-Fréjus area, from where the invaders could thrust rapidly up the Rhône Valley. German coastal defenses were stronger than those along the channel coast. German land forces available for possible counterattacks were inadequate, and the Luftwaffe in the Mediterranean was no longer a major factor.

Eleven divisions were allotted to Operation Anvil. The United States 3d, 36th, and 45th Infantry divisions and the French 1st Armored Division plus small British units, formed the assault forces. The remaining divisions were French and constituted the French First Army, under Gen. Jean de Lattre de Tassigny. The American Seventh Army, under Maj. Gen. Alexander M. Patch, consisted of elements of General Truscott's 6th Corps and the 1st Special Service Force. British and American airborne task forces were assigned to an assault west of St. Raphaël. These reinforced armies were combined into the 6th Army Group under Lt. Gen. Jacob L. Devers on Sept. 15, 1944. The air commander was Brig. Gen. Gordon P. Saville. The Supreme Allied Commander in the Mediterranean was Gen. Sir Henry Maitland Wilson. The German Nineteenth Army, opposing the invaders, was badly deployed and poorly led. It was un-

able to offer resistance comparable to that which the Allies encountered in Normandy.

Air attacks against invasion targets in southern France began on April 29, when the airfields of Toulon were heavily raided. They continued according to a plan coordinated with the bombing of German-occupied Europe and the pattern used in the northern areas. Far-reaching isolation of the assault region was achieved by damage to bridges, tunnels, viaducts, and marshalling yards. On the eve of the invasion, the Mediterranean Allied Strategic Air Force flew 5,400 sorties, dropping 6,700 tons of bombs.

As a preparatory operation, the island of Elba, five miles off the coast of Italy, was invaded on June 17, 1944. The Germans on Elba numbered little more than 2,000 men, but they were alert and strongly entrenched at the invasion beaches. A naval task force under the command of Rear Admiral T. H. Troubridge transported the invaders: the French 9th Colonial Division and support elements, under the command of French General Henri Martin. The struggle on the landing grounds lasted for several hours. On June 19, organized resistance ended. Heavy batteries, subsequently set up opposite the mainland, curtailed the movements of German convoys sneaking along the coast.

Early in August, Allied naval forces assembled for Operation Anvil. They included 515 United States, 283 British, 12 French, and 7 Greek vessels, and 63 merchant ships of various nationalities. On August 9, the first assault convoy sailed from Naples. On August 14, all the ships and 1,370 shipborne landing craft assembled in the assault area.

Shortly after midnight on Aug. 15, 1944, French commandos and units of the United States First Special Service Forces landed near Cap Nègre and on the Hyères Islands. These vanguards, under the command of Rear Admiral L. S. Davidson, were assisted by naval gunfire from support ships under Rear Admiral R. S. Chandler. No opposition was met on the islands, and only inaccurate small arms fire was encountered at Cap Nègre. Diversionary groups operated in the Nice-Cannes area and between Toulon and Marseille. A mock landing and repulse was staged at La Ciotat. At dawn, more than 1,300 heavy and medium bombers attacked the assigned beaches for one hour and 20 minutes. Their assault was joined by shells from 53 gunfire support ships and a shower of 14,000 rockets.

The main amphibious landings were made at 8:00 A.M. in the Fréjus-St. Raphäel sector under the command of Rear Admiral S. S. Lewis, in the St. Marine-St. Tropez area under Rear Admiral B. J. Rodgers, and on the beaches of Pampelonne and Cavalaire Bay under Rear Admiral F. J. Lowry.

In an appeal to the French people, General Wilson declared that the new invasion's objective was to join up with the Allied forces advancing from Normandy. To reach this objective, the Allies had to cut through the southern part of France in an advance northward and later eastward toward the German border. The southern coast of France and its harbors were also to be seized to serve as channels of supply.

The Luftwaffe was absent from the invasion beaches for many hours. German shore batteries and pill boxes remained almost inactive, and isolated resistance was rapidly overcome. Allied casualties during the opening operations did not exceed 300.

Beachheads 50 miles long were established and linked on August 15, including St. Tropez, Dramont, and Hyères, and high ground between Cannes and Toulon. The next day, spearheads penetrated up to 35 miles inland. Some forces were 10 miles from Toulon and in the outskirts of Cannes. Two German corvettes were engaged and destroyed in the Ciotat area by the United States destroyer *Endicott* and two British gunboats on August 17.

Toulon came under artillery fire on August 17 also. Some German opposition was encountered outside the naval base and near Cannes. Most of General de Lattre de Tassigny's French forces operated along the coast. The United States Seventh Army and the remaining French troops turned north. The 36th Division under Brig. Gen. Frederic B. Butler raced straight from the beaches through Gap and seized Grenoble on August 23. There it split into two groups. One continued to the north; the other turned toward the Rhône Valley to cut off parts of the German Nineteenth Army. The main forces of the 6th Corps, advancing through the Rhône Valley from the river's estuary, pressed on in pursuit of the Wehrmacht, but the speed of the German retreat prevented a complete German débacle. The Allies had taken 10,000 prisoners three days after the invasion began.

Meanwhile French forces by-passed Toulon and pushed on toward Marseille, the biggest French commercial port in the Mediterranean. Cut off fom the main German forces, the defenders of Toulon and Marseille did not fight to the end. Both ports, only slightly damaged, were in Allied hands on August 29.

The American column advancing northward beyond Grenoble reached the Swiss border north of Annecy on August 25. French Forces of the Interior, operating in the Savoy Alps under the command of Gen. Jean Gabriel Cochet, assisted the drive by harassing German garrisons. Six German militia battalions surrendered to the F.F.I. American forces in the Rhône Valley, joining hands with the other column from Grenoble near Avignon, reached the great industrial city of Lyon on September 3.

On September 5, southern French territory held by the Allies extended from Narbonne and Monaco on the Mediterranean to Mâcon in the north. German rearguard action in the Saône Valley stiffened to gain time for the Nineteenth Army to reach the Belfort Gap and to organize a determined stand along what was to become the southern wing of the unified battlefront covering the border of the Reich.

On September 6, troops of Patch's army, advancing through Chalons-sur-Saône, were reported to be only 60 miles from the United States Third Army at Bar sur Seine. On September 11, patrols from both armies established contact west of Dijon. Contact in force was made ten days later west of Épinal.

THE ROAD TO GERMANY

On September 1, General Eisenhower's headquarters moved to the European continent. Montgomery continued in command of the Twenty-First Army Group, designated as the Northern Group of Armies. General Bradley's command, known as the Twelfth or Central Group of Armies, consisted of the United States First Army,

Third Army, and Ninth Army. On September 15, the French First Army and the United States Seventh Army, organized as the Sixth or Southern Group of Armies under Lieutenant General Devers, also came under General Eisenhower's supreme command.

The Northern Group of Armies was accompanied by the Second Tactical Air Force under Air Marshal Sir Arthur Coningham; the Central Group by the Ninth Air Force under Maj. Gen. Hoyt Vandenberg; the Southern Group, originally supported by units of the Twelfth Tactical Air Force, was accompanied by what constituted the First Tactical Air Force.

All British and American Airborne Forces, under the command of General Brereton, formed the First Allied Airborne Army. They included the United States 18th Corps (82d, 101st, and 17th Airborne divisions), the British Airborne Troops Command (1st and 6th Airborne divisions), the United States 9th Troop Carrier Command, and the RAF 38th and 46th groups.

In his report to the Combined Chiefs of Staff, Eisenhower tells that it was decided to attack northeastward in the greatest possible strength, as the bulk of the Wehrmacht was reported to be there. Flying bombs, hitting England in increasing numbers, were launched from sites along the coast. Antwerp's port facilities were strongly needed, and possession of Belgian air bases would facilitate future advances. There were also other important reasons for this direction of attack. In late summer and early autumn, the lower Rhine offered the best avenue of advance into Germany and, if pushed through speedily, both the Siegfried Line and the Rhine River might be crossed, and strong bridgeheads established before the enemy could recover sufficiently to make a definite stand in the Arnhem area in Holland. Strong United States forces were assigned to support the Northern Army Group, while the First Airborne Army was made available to Sir Bernard Montgomery.

On August 30, the Canadian First Army broke out of bridgeheads across the Seine on both sides of Rouen. Rouen and Dieppe were occupied September 1. The garrison at Le Havre refused to surrender on September 4, but eight days later, following an aerial bombing with 11,000 tons of explosives and a naval shelling by forces that included the British battleship *Warspite* and the monitor *Erebus,* an attack by the 49th British Infantry Division led to the capitulation of the city with 7,000 troops. The Somme River, undefended by the Germans, was crossed September 4. Boulogne and Calais were surrounded on September 6, but were not captured until September 23 and 30 respectively. Smaller harbors at Fécamp, St. Valery-en-Caux, Le Tréport, and Abbeville were occupied without opposition.

Penetrating into Belgium, the Canadians seized Ostend on September 8. Turning east, patrols entered Bruges on September 9. The Canadian 2d Corps invested Dunkerque on September 11, while the Canadian 4th Armored Division took Blankenberghe on the Belgian Channel coast. As Dunkerque resisted, it was decided to encircle its garrison of 12,000 without staging an assault.

The British 11th Armored Division, advancing 30 miles from its bridgehead across the Seine at Vernon, took Amiens and crossed the Somme River on August 31. Other British units, including the Guards Armored Division, turned northwest toward the Channel and captured Albert, Bapaume, and Doullens on September 1. The British 11th Armored Division, after crossing the Belgian border at Tournai and advancing 60 miles in 36 hours, raced toward Brussels, which was reached in the late afternoon of September 3. The Germans made no attempt to defend the Belgian capital. Before leaving, however, they told the people by radio that they would return. Part of the British 11th Armored Division turned east and reached Louvain. The remainder continued toward the port of Antwerp, which was seized almost intact on September 4. The harbor, however, was useless until the Scheldt estuary was cleared of mines, and German positions commanding the sea lanes, on South Beveland and Walcheren Island, were reduced.

The British took Ghent on September 6. Northeast of Louvain, the forces of the British 30th Corps established a deep bridgehead across the Albert Canal, seized Bourg Leopold on September 7, and crossed the Dutch border to a point seven miles from Eindhoven on September 12. Other units of the corps advanced almost to the Meuse River. These advances were no longer made in sweeping drives against negligible resistance. The Allied lines were stretched, and the Germans, assembling substantial forces, strongly contested their further progress.

The American First Army's 7th Corps crossed the Aisne on August 29. Its 3d Armored Division cleared Soissons and Laon after a sharp fight and, supported by infantry, crossed the Belgian border to Charleroi and Mons on September 3. The United States 19th Corps, spearheaded by the 2d Armored Division, raced from Montes to Montdidier, and from there to the Belgian border south of Tournai, which was reached on September 2. German forces, in a pocket extending from Mons to Compiègne which was by-passed by the advance of the 7th and 19th Corps, briefly opposed the progress of the United States 5th Corps. On September 5, mopping up operations liquidated the pocket and took 25,000 prisoners. Then the 5th Corps moved to the right of the First Army, crossing the Meuse north of Sedan. The latter town fell to the 5th Armored Division on September 5. Five days later, the same division liberated the city of Luxembourg. On September 11, it reached the German frontier and the Siegfried Line.

The 7th Corps captured Namur and the Meuse crossings near Dinant on September 4 and 5, took Liège on September 8, and reached Limbourg on September 9. The closer it moved to the German border, the stiffer German resistance became. The Wehrmacht fought hard at the Meuse. But the Americans continued to advance and, at 5:23 P.M. on Sept. 10, 1944, the artillery of the 7th Corps shelled German territory. Land war returned to the western border of the Reich four years and four months after France and the Low Countries were invaded by what seemed then to be the invincible Wehrmacht. On September 11, the 19th Corps, paralleling the 7th Corps drive, reached the edge of Maastricht and crossed the Meuse, and the 7th captured Eupen and Malmédy.

General Patton's 4th Armored Division took St. Dizier and the 80th Infantry Division captured Châlons-sur-Marne on August 30. On September 1, the 20th Corps of the Third Army occupied Verdun and crossed the Meuse in the direction of Metz. On September 2, the 12th Corps

approached Nancy, which was taken thirteen days later. Additional crossings of the Meuse resulted in the seizure of St. Mihiel on September 2. Pont-à-Mousson, 13 miles south of Metz, was occupied by the Americans but remained under German artillery fire.

Between September 7 and 11, units of Patton's army, despite furious German opposition, established positions on the eastern bank of the Moselle between Metz and Nancy. On September 13, Thionville, 12 miles north of Metz, was reached. Further advances were blocked by substantial German forces. Other Third Army troops wheeled southward from Toul to compress the Belfort gap through which the German Nineteenth Army was withdrawing. After firm contact was established with General Patch's columns, the Allied line in the south extended from due south of Épinal to the Swiss border.

The United States 83d Division, far to the rear of the main front and southwest of Orléans, encountered German troops of the First Army formerly stationed in the Biscay Bay area. The German commander suggested a *pro forma* battle, in which one battalion of each force should take part, after which he would surrender. On September 16, the Americans asked for and obtained unconditional capitulation of the enemy troops, numbering approximately 20,000.

A few more Allied divisions, plus more ammunition and fuel, might have shortened the duration of the war by many months, but they were not available, and nothing short of complete success in the impending airborne operations on the Allied left wing could bring about quick victory.

The Battle of Supplies.—Allied merchantships numbering 2,000, with an aggregate displacement of four million tons, were prepared and took their place in the plan of massing supplies for the Allied Expeditionary Forces. Their crews of 70,000 men were not under direct naval discipline, but, to quote General Eisenhower, "they served the cause with consistent courage and devotion to duty."

Although the amount of supplies and matériel unloaded in northern France fell short of expectations, 1,000,000 men were ashore on D-day plus 28 and, ten days later, 300,000 vehicles and one million tons of supplies had been made available to the invading armies. Rhine ferries and many minor landing craft proved too lightly built for rough seas, and their serviceability rarely rose above 50 per cent.

A large proportion of the men and supplies still had to be landed on the beaches. Between D-day and September 30, Omaha beach handled a daily average of 10,000 tons of supplies, and Utah 5,000 tons. Cherbourg did not begin to function until August and did not reach its full capacity until October. Brest was thoroughly wrecked, and Antwerp was useless as long as the Germans could block the Scheldt estuary. Small anchorages, such as Ouistreham, Courseulles, Port-en-Bessin, Granville, St. Malo, and Morlaix, could not contribute much to the solution of the tremendous supply problem.

After D-day, the Germans attempted to disorganize Allied beaches and anchorages, but Allied navies and air forces were on guard constantly against German aircraft, E-boats, explosive motor boats, and human torpedoes. Losses due to such enemy action remained small in proportion to the tonnage involved. Land artillery fire hit the beaches as long as they were within German range. The reduction of Cotentin Peninsula removed this menace fairly soon in the west, but the eastern sector, particularly Sword beach, remained under prolonged shelling.

The cross-channel supply of fuel constituted a special problem. Submarine pipelines were laid across the Channel according to a plan known by the code name of "Pluto." Each line, three inches in diameter, was expected to discharge 250 tons of gasoline a day. Construction of the pipe lines was a hazardous operation and was greatly hampered by bad weather. The first line was not completed until August 12, and the second nine days later, the date by which 10 lines were to have been in operation. Leaks and stoppages further delayed their full use, while fuel consumption rose enormously, and the transportation of gasoline in cans put a heavy strain on the already overloaded supply system. When Operation Pluto was finally completed, 16 pipe lines were available.

During the most vital period of the campaign, the Allies had to rely on crippled Cherbourg, the remaining Mulberry, five smaller Gooseberries, and the beaches. On the continent, bridges and railroads had to be constructed, and major junctions and assembly points had to be repaired. Only 1,800 of 2,700 locomotives urgently needed were available in France. The rest had to be shipped over from England. Paths had to be cleared through the rubble of ruined towns and villages to enable Allied vehicles to pass.

Transport planes were not available in sufficient numbers to get enough food, ammunition, and fuel to the armored spearheads, and a network of trucks was introduced known as the "Red Ball Express." A circular, one-way traffic route led across France from the beachheads to the fighting zone and back again. Along the Red Ball Highway, from which all civilian and local military traffic was barred, an unending stream of truck convoys rolled at high speed day and night. On single track railroad lines, never intended for heavy traffic, trains loaded to capacity pushed eastward in a close and continuous chain.

Consumption of artillery and mortar ammunition in northern Europe averaged 8,000,000 rounds a month (80 per cent of the grand total used by the AEF in World War I). Approximately 36,000 small arms, 700 mortars, 500 tanks, 2,400 vehicles, and 100 field pieces had to be replaced each month. Gasoline requirements were one million gallons a day.

Although Allied transportation experts and technicians performed what can properly be termed miracles, logistic difficulties slowed up the Allied advance. When Antwerp became usable, it handled an average of 25,000 tons of supplies a day despite heavy fire by V-weapons (which at one time fell at the rate of one every 12½ minutes, causing thousands of military and civilian casualties). Antwerp was not available, however, until late in November 1944. The German tactics of restricting Allied port facilities in every possible way was the most successful scheme devised by the supreme command of the Wehrmacht to counter the invasion.

A daily average of 18,000 tons of supplies moved through Toulon and Marseille after they became operational in late September, although these ports were relatively far away from England, the main Allied storehouse. Railroads and trucks carried matériel and 14 reserve divisions to meet the requirements of the Southern Army

Group and part of the Central Army Group. This supply channel was helpful, but neither adequate nor in time to bring Germany to its knees in 1944, since the great airborne operation failed to reach its decisive objectives.

The Bridge at Nijmegen.—General Eisenhower decided to make a daring move to gain flanking bridgeheads across the lower Rhine beyond the main fortifications of the Siegfried Line. In his own words: "the main highway to Berlin—the plains and level fields of northern Germany—lay beyond the Rhine in the north, and . . . the southern country was unsuitable for the desired rapid advance and continued exploitation by reason of its mountainous and forested terrain."

The Allied commander in chief planned to turn the German right flank by a combined airborne and land operation. The airborne part, called Operation "Market," was designed to capture the vital bridges over the Maas, the Waal, and the Lower Rhine at Grave, Nijmegen, and Arnhem. The forces employed included the United States 82d and 101st Airborne divisions, the British 1st Airborne Division, and the Polish 1st Paratroop Brigade. The British 1st was to drop farthest north in the Arnhem area, the United States 82d around Nijmegen, and the 101st north of Eindhoven near St. Oedenrode. In the supporting land operation, "Garden," the British Second Army was to advance northward from the line of the Albert and Escaut canals. While the airborne forces held the bridges, the armor, pushing on to the Zuider Zee, was to cut off enemy troops in western Holland. The axis of advance, in a narrow sector with but one road as a supply line for most of the distance, lay through Eindhoven, St. Oedenrode, Veghel, Uden, Grave, Nijmegen, Arnhem, and Apeldoorn. During the first two days of this greatest airborne operation ever attempted, 2,800 planes and 1,600 gliders were employed. Between September 17 and 30, 20,190 troops were dropped by parachute, 13,781 landed in gliders, and 905 landed on a strip made ready by preceding airborne troops. Equipment and supplies amounting to 5,230 tons, 1,927 vehicles, and 568 artillery pieces were transported by air. In support of the airborne troops, the air forces flew 7,800 sorties, in which heavy bombers battered enemy AA positions and neutralized Luftwaffe bases in the vicinity of the planned operation. Initial losses en route and in the dropping zone were slight.

On September 17, the United States 101st Airborne Division seized Eindhoven, and the 82d took Grave. The British Guards Armored Division, overcoming heavy German resistance, established contact with both divisions on September 18. Nijmegen and the vital 6,000-foot long road bridge over the Waal were strongly held by the enemy. A regiment of the 82d Division crossed the river north of the span in boats, while the British seized the southern end. Confused and heavy fighting raged between Nijmegen and Arnhem, where the 1st British Airborne Division, after a successful landing, was opposed by superior German forces. The British infantry of the 30th Corps did not reach the lower Rhine in force until September 24. The corps found it impossible to cross the Lower Rhine and join the paratroopers on its northern bank, where they were being forced into a contracting perimeter, 1,000 by 1,500 yards. On September 25, the position of the heavily strafed and shelled division became untenable, and the order was given to withdraw during the night. From a total of almost 10,000, only 2,163 men made their way back to the southern bank.

After the arrival of infantry reinforcements near Nijmegen, British and Canadian troops pushed on to establish a line running along the Waal and the Maas. Bridgeheads were secured across the rivers, and the Northern Group of Armies was brought into line with the Central Group to strike at Kleve. These bridgeheads proved valuable in the later advance to the Rhine, but they could not be enlarged for the time being. Operations Market and Garden did not turn the German flank, and the space gained was inadequate for large-scale enveloping movements.

The Importance of Antwerp.—On Sept. 21, 1944, General Eisenhower wrote General Marshall as follows: "Right now our prospects are tied up closely with our success in capturing the approaches to Antwerp. All along the line maintenance is in a bad state—reminiscent of the early days in Tunisia—but if we can only get to using Antwerp it will have the effect of a blood transfusion."

Elimination of the Germans from South Beveland and Walcheren Island, both of which were blocking Antwerp, was planned at the headquarters of the Canadian First Army. It involved the employment of amphibious forces with air and naval support.

On October 15, the Canadians attacked north of Antwerp toward the South Beveland Isthmus. After nine days, resistance at Woensdrecht was broken and the Canadian 2d Division, fighting waist-deep in water, advanced through the narrow neck connecting South Beveland with the mainland. Units of the British 52d Division landed on the south shore of South Beveland during the night of October 25, and achieved a junction with the Canadians on October 29. The next day, the whole of South Beveland was cleared, and the British and Canadians assaulted the causeway connecting the isthmus with Walcheren. Remnants of a German division from Beveland joined with units of the Fifteenth Army in the defense of Walcheren. On Nov. 1, Allied naval assault craft, supported by British naval forces, landed Royal Marine Commandos and two British infantry battalions at Westkapelle and Vlissingen. Air support, although hampered by bad weather, was effective. The amphibious and land forces attacked in three directions. By November 9, German resistance on Walcheren ceased and 10,000 prisoners were taken. The first supply ships were unloaded at Antwerp 15 days later under the fire of German flying bombs.

The Allies Enter Germany.—By the end of September, German casualties in France and the Low Countries since D-day totalled approximately 1,000,000 men. But, after the shock of the previous defeats was overcome, the Germans, according to General Eisenhower, battled "with a stubbornness and Teutonic fury born of the desperate knowledge that they were fighting on their own 'holy soil'. Our logistic situation, coupled with the fact that the terrain was suitable to the defense, aided the enemy . . . we experienced weather conditions which admirably suited him. The rains which fell in November were the worst known on the Continent in many years and created flood conditions along our whole front, reducing the lesser roads to quagmires and

impeding tank operations and vehicular movements. All these factors made it more easily possible for the enemy, exploiting a comparatively static situation, to mine and booby-trap the areas ahead of us, contributing further to our problems."

On September 11, United States First Army forces entered Germany near Trier. The next day, other units crossed the border toward Aachen. On September 20, Aachen came under artillery fire. On October 21, after prolonged and furious resistance, the garrison surrendered to the 1st Infantry Division of the 7th Corps. North of Aachen, other First Army units breached the outer fortifications of the Siegfried Line on October 2, investing heavily defended Stolberg.

On October 3, the United States Ninth Army (13th, 16th, and 19th corps), commanded by Lt. Gen. Simpson, moved into the line between the First and Third armies. On October 23, it was transferred to the left wing of the First Army above Aachen, with the British Second adjoining it on the north. On the Third Army front, Metz resisted until November 22. South of the great fortress, progress was made only along the Moselle. The United States Seventh Army and the French First Army, pushing into the high Vosges Mountains and against the Belfort gap, brought their lines up to conform with those of the Third Army.

Except for the small breach north of Aachen, the Siegfried Line (Westwall) was intact. Hurriedly formed German *Volksgrenadier* divisions manned the forts. The Allied commanders felt that stabilization of the lines should not continue beyond mid-November, unless the Wehrmacht was greatly strengthened.

The Continued Offensive.—With the promise of a large increase of supplies through Antwerp, and with more than 3,000,000 men on the continent (although many of them were service troops) the Allies planned that the Northern and Central Army groups should advance to the Rhine from its mouth to Frankfurt if possible, but at least as far as Düsseldorf. While the river served as a defensive barrier for holding forces, enormous power could then be concentrated for a breakthrough into the heart of the Reich. The Northern and Central Army Group advance was to be supported by less ambitious offensive operations in the south.

On Nov. 15, the Twenty-first Army Group began another eastward drive under adverse weather conditions. The United States First and Ninth armies in the Aachen sector began their advance on November 16, while Allied air forces, including 1,200 United States heavy bombers, attacked German positions around Eschweiler and Düren, obliterating both towns. East of Aachen, Stolberg was taken after more than six weeks' resistance, and Eschweiler fell on November 22. Southeast of Aachen, United States troops, tortuously fighting their way step by step through the dense Hürtgen Forest, approached Düren. To the north, the Ninth Army captured Geilenkirchen on November 19 and reached the Roer River on December 3.

It was already doubtful that a decisive success could be scored quickly. "Unless some trouble develops from within Germany," General Eisenhower reported, "a possibility of which there is now no real evidence, he [the enemy] should be able to maintain a strong defensive front for some time, assisted by weather, floods, and muddy ground."

When the Ninth Army reached the Roer, the Schmidt Dams, controlling the flooding of the Roer Valley, remained in German hands. By flooding the valley, the German Sixth Panzer Army might have been able to trap American forces beyond the river. The First Army was ordered to capture the dams. This operation was not completed when the German counteroffensive was launched.

On November 8, the Third Army in the Ardennes resumed its drive in the direction of the Saar. After linking several Moselle bridgeheads, the German border was reached and crossed in various places on November 18. Four days later, the city of Metz fell to Patton's men, although diehard defenders of seven forts resisted until December 13. On December 5, the Third Army stood along the Saar on a line 16 miles wide. Three bridgeheads were secured in the area of Saarlautern, and contact was made with the main fortifications of the Siegfried Line. Regroupments were necessary prior to opening the assault on the line, scheduled for December 19.

Gen. de Lattre de Tassigny's French First Army, after one week of fighting, breached the Belfort Gap and reached the Rhine. This breakthrough assisted the American Seventh Army's advance through the passes of the Vosges. The United States 44th Infantry Division took Saarebourg on November 21. The French 2d Armored Division to its right penetrated the Saverne Gap and, on November 23, reached Strasbourg, capital of Alsace and the last big French city under German occupation. Four days later, the outer forts of Strasbourg were cleared, and the city was liberated. The Germans were firmly established across the Rhine. A German pocket remained west of the upper Rhine in the Colmar area, and attacks by units of the French First and the United States Seventh Armies were unable to eliminate it for the time being.

In the south, the Wehrmacht showed signs of aggressiveness. On November 24, the United States 44th Division lost some ground to a determined German counterattack in the sector of Saarebourg. The territory was recovered, however, with the support of the United States 79th Division, and the advance was resumed in the direction of Haguenau, which was taken on December 12. Other German counterattacks forced a temporary French withdrawal from positions along the Rhine east of Mulhouse. By November 27, however, the situation was restored.

On November 27, the Seventh Army was ordered to regroup for an attack northward to breach the Siegfried Line west of the Rhine, and to drive on west of the hills of the Pfälzerwald toward Wissembourg in conjunction with the Third Army's operations against the Saar. Fourteen German divisions were contained in the Saar and Wissembourg area. The Seventh Army's offensive was expected to lead to the diversion of additional German divisions to the south, aiding the Allied main effort in the north.

Concentration of Allied strength in sectors considered most important for offensive operations led to weakness in other regions. Between Trier and Monschau, west of the Ardennes, where difficult terrain seemed to give added security to defensive positions, four divisions of the First Army held lines 75 miles long. This was called by General Eisenhower a calculated risk, based

on the absence of strategic objectives or large depots in the area. It was realized, however, that the Germans were gradually assembing six divisions in this quiet part of the front. Wherever Allied thrusts slowed down, German armor was withdrawn and replaced by Volksgrenadiers. Allied intelligence failed to locate the whereabouts of the panzer divisions thus replaced.

THE DECLINE OF NAZI POWER

Although recurrent disasters had some effect upon the average German's faith in ultimate victory, official propaganda, well fitted to the German mentality, prevented the spread of defeatism. Reverses were attributed to "disgraceful desertion by unfaithful allies" rather than to German military inferiority. Glowing accounts were given of the effect of new weapons already in use, and more new weapons were reported to be ready to turn the tide in Germany's favor.

A number of German generals, former conservative politicians, and disappointed Nazi fellow travellers did not believe the propaganda. They felt that the war was irrevocably lost. Watching public announcements in Allied countries, they were gratified to realize that the guilt of aggression was attributed to the Nazi Party rather than to the general German attitude. They believed that the elimination of Hitler might offer them an opportunity to obtain lenient peace conditions and to assume control of a Reich that was basically intact. This group also aimed to split the Western Allies from the USSR and to negotiate with the Western Powers and Russia separately to their own advantage. Overtures to obtain Anglo-American approval of a separate peace after the removal of Hitler and his inner circle met with no response.

On July 20, 1944, according to reports from Germany, a bomb was detonated in Hitler's headquarters by Colonel Count Klaus von Stauffenberg. Hitler was said to have been slightly burned and bruised. This was the signal for a purge in which some 3,500 persons were executed, among them Dr. Karl Goerdeler, mayor of Leipzig and former government price administrator, Field Marshal Gen. Erwin von Witzleben, and Count Wolff von Helldorff, one-time Nazi terrorist and Potsdam police chief.

It was alleged that Field Marshal General von Witzleben not only advocated a separate peace with the Western Allies but was also in contact with the Seydlitz Committee in Moscow. This committee sponsored broadcasts by 17 captured German generals, including Colonel General von Seydlitz and Field Marshal General von Paulus. These broadcasts, backed by Soviet authorities, urged peace and future German-Russian cooperation. The committee was enlarged by a number of prisoners of war of lower rank and a few civilian refugees from Germany. In calling on the Germans to break away from Hitler, less emphasis was placed on outrages committed by the Germans than on military blunders attributed to the führer. Neither the broadcasts from Moscow nor ruthless oppression within the Reich led to any noticeable internal resistance against the German government. The Western Allies' propaganda designed to bring about a German uprising was equally unsuccessful.

On Oct. 18, 1944, Hitler decreed the organization of a *Volkssturm* (people's militia) to include all men between the ages of 16 and 60, capable of bearing arms. On Nov. 12, 1944, Joseph Goebbels, the propaganda leader, proclaimed: "The Home Army is ready to defend Germany house by house and street by street." In reality, the Volkssturm did not contribute effectively to the defense of German soil nor did it solve the Wehrmacht's manpower problems. In June 1942, the draft age had been lowered to 17½ years, and in October 1943, men up to the age of 60 had become eligible for military service. New drafts in the fall of 1944 produced a total of 615,000 men, compared to 2,050,000 in the spring of 1942, and 1,150,000 in the spring of 1944.

By September 1944, according to statistics discovered inside the Reich after its capitulation, total German losses amounted to 3,875,000 dead, permanently disabled, and missing. This figure did not include civilian casualties or wounded who were capable of returning to duty, even if this duty was no longer in the front line. The organization of the Volkssturm failed to offset losses during the summer campaign of 1944. The total number of German draftees reached 13,000,000 in late 1944. The Reich's own resources, as well as those of annexed countries and of German minorities in occupied territories, were taxed to the limit.

The Italian Campaign Through 1944.—Between mid-June and the last of July 1944, more than a division a week was withdrawn from the Allied forces in Italy to get ready for Operation Anvil. The United States 4th Corps (Maj. Gen. Willis D. Crittenberger) moved into the line to replace the 6th Corps. The French Corps of four Moroccan and Algerian divisions was withdrawn between July 2 and 21 and replaced by the 2d Corps. A number of antiaircraft units, no longer required as a result of Allied air superiority, were retrained as infantry. The 442d United States Infantry Regiment, composed of Americans of Japanese descent, was sent to the front. During the late summer, the 92d Infantry Division, one of the United States Army's two Negro divisions, reached Italy and was assigned to the 4th Corps. On September 15, a combat team of a newly formed Brazilian Expeditionary Force joined the Fifth Army. By the end of the year, the Brazilian force was increased to a full division and fought with distinction with the Allied forces in Italy.

German reserves in northern Italy were adequate to fill the gaps torn in the ranks of the Tenth and Fourteenth Armies. Field Marshal General von Kesselring was greatly helped by the terrain. The historic road of conquerors of the Apennine Peninsula led from north to south. The Allies had to fight their way in the opposite direction across many natural barriers. Although the pursuit of the German armies beyond Rome was pressed to the limit, it failed to disrupt the Wehrmacht. Heavy, unseasonable rainfalls delayed the Allied advance. Kesselring organized formidable rear guard positions on both sides of Lake Bolsena, covering the Rome-to-Florence highway, and a good trans-peninsular road. It took the Allies three days to break up the rear guard stand, while the Wehrmacht continued to reorganize a defense well to the south of the crucial Po Valley.

On June 22, the Germans hurled a surprise counterattack against Allied forces near Lake Trasimeno, in the center of the peninsula. Three more days were spent beating off the assault. On

the west coast, the advance reached Cecina on July 2, although the Germans fought the attackers almost to a standstill.

Inland, the Fifth Army captured Siena. A few miles beyond the historic city, French units were halted outside Poggibonsi, an important road crossing south of Florence, but a renewed assault captured Poggibonsi. Further advances eased the pressure on the Fifth Army's left wing. The wrecked harbor of Leghorn (Livorno) was captured on July 18, and the outskirts of Pisa were reached on July 26. The Eighth Army, bearing the brunt of the fighting near Lake Trasimeno, took Arezzo and Ancona, on the Adriatic coast.

Mopping-up operations cleared the Germans from the south bank of the Arno River and paved the way for the occupation of Florence on Aug. 12, 1944. This priceless shrine of Italian art and architecture was not bombed, but the damage inflicted upon Florence by German demolitions and street fighting was moderately severe.

Another German line—the Gothic—ran across the peninsula from north of Pisa on the Mediterranean to Rimini on the Adriatic. It was technically similar to German positions encountered previously. In its eastern part, the line covered the city of Bologna, gateway to the upper Italian plains, where the Allies could make use of their superiority in mechanized equipment, and the defenders could find less shelter from air attack than in mountainous regions.

The Allied objective was to penetrate to Bologna and beyond and to wage a battle of annihilation against Kesselring's forces south of the forbidding barrier of the Alps. The available forces, however, were inadequate for a speedy victory. Further regroupments lasted until late in August 1944. The bulk of the Eighth Army concentrated along the Adriatic, while the Fifth Army massed its main forces north of Florence and south of Bologna.

On August 26, a Canadian night attack forced the crossing of the Metauro River and pushed toward the Adriatic hinge of the Gustav Line. Through mine fields, antitank ditches, and scattered pill boxes, the Eighth Army drove through Pesaro in the direction of Rimini. Heavy rains swelled the small rivers into torrents, preventing extensive tank operations. The Eighth Army infantry fought its way across rivers and ridges step by step. On September 21, Greek units captured Rimini. It took the attackers six days to cover the last four miles on their way to the city and nine more days to advance ten miles beyond. At that point, the Wehrmacht held towering hill positions, protected by the swollen Fiumicino River and deep mud. The Eighth Army was unable to break through.

British and Indian forces from the Eighth Army were then transferred to assist the Fifth which was fighting a furious battle for Imola and the approaches to Bologna. During September 1944, Allied advances on the west coast went beyond Pisa, but were stopped short of La Spezia. Despite strenuous Allied efforts, Bologna was not reached in 1944. Twenty German and four Italian Republican divisions, plus fortifications and mud, barred the way to the north.

On Dec. 12, 1944, Field Marshal Sir Harold Alexander replaced Field Marshal Sir Henry Maitland Wilson as supreme commander in the Mediterranean area. After the death of Sir John Dill, Field Marshal Wilson became senior representative of the British chief of staff in Washington, D.C. Lt. Gen. Mark W. Clark assumed command of the Allied armies in Italy and Lt. Gen. Lucian K. Truscott of the Fifth Army.

The Surrender of Finland.—It was generally expected that the Red armies, coinciding with Allied landings in Normandy, would strike the next blow between the edge of the Pripet Marshes and the Carpathian Mountains, almost due east of the Upper Silesian industrial area and the German capital beyond.

Political considerations, however, had a growing influence on Soviet strategy as the war moved closer to the Reich. Future Russian spheres of interest became priority targets. Finland was next on the Soviet offensive schedule.

Col. Gen. Dietl's successor in command of the German Lapland Army, Col. Gen. Lothar Rendulic, made no attempt to aid the Finns in their last ditch stand against the Russians. Instead, the Germans gave an unconvincing display of might in the Finnish hinterland to keep their satellites in the war.

In June 1944, two Red armies were massed against Finland: Govorov's Leningrad Army and Meretskov's Karelian Army. The battered Finnish forces, deprived of modern equipment previously supplied by the Germans, were under the field command of Lt. Gen. Hjalmar Siilasvuo of 1939–1940 fame.

The main Russian attack was aimed at the Karelian Isthmus. The former Mannerheim Line had been incompletely reconstructed. In front of its ruins, the Finns had built the State Line, much weaker than their former defenses. On June 10, Marshal Govorov's forces, following overwhelming artillery and air preparations, penetrated the State Line on a 25-mile front. For five days, the Finns threw in all the forces they could muster, including boys and elderly men (members of the Schutzkorps) in a vain attempt to close the breach. Battered on the ground, from the air, and from the sea, where the antiquated Red Fleet hurled heavy shells against shore fortifications, the Finnish lines collapsed. The former Mannerheim Line did not delay Govorov's drive. Koivisto fell on June 18 and Viipuri two days later. On June 21, Meretskov's army attacked in the direction of the Murmansk-Leningrad railroad, supported by an amphibious thrust across Lake Onega and a flanking drive by Govorov's troops beyond the Sir River. Petrozavodsk was captured on June 29 and the railroad was cleared. The fate of Finland, gasping for life in a Russian stranglehold, was sealed, but the Russians were in no great hurry to inflict the *coup de grace*.

President Ryti resigned on August 1, and Field Marshal Mannerheim was named as his successor in a procedure of dubious legality. On August 7, the new president declared: "Fighting for the existence and future of the country goes on." A new government was appointed with Anders W. Hackzell, who had conservative affiliations, at its head. "Fighting for the existence of the country" was a euphemism covering an effort to obtain lenient terms. On August 25, the Finnish minister to Stockholm, George A. Gripenberg, handed Russian Ambassadress Mme. Alexandra Kollontai his government's request for the opening of armistice negotiations. The Russian government insisted on the severance of

Finnish-German relations and the withdrawal of German troops from Finnish soil no later than September 12 as primary conditions. Prime Minister Hackzell announced in a broadcast that his government had requested the Germans to withdraw no later than Sept. 15, 1944. On September 4, he issued an order to all Finnish troops to cease firing. Relations with the Reich were severed.

A Finnish peace delegation, headed by the prime minister, left for Moscow on September 6. Eight days later, Hackzell was incapacitated by a stroke and was succeeded by Foreign Minister Enckell. Conditions of the armistice, concluded September 19, were substantially identical with the terms previously offered, except for the cession of Petsamo to Russia. A Russian-dominated Allied Control Commission, established in Helsinki, gained considerable influence in Finland's internal affairs.

On September 15, the German Lapland Army made an unsuccessful attempt to seize Suursaari, a strategic island in the Gulf of Finland. In the north, skirmishes developed between Rendulic's main forces and the Finns when the latter attempted to enforce the German withdrawal. The Lapland divisions were finally driven from Finnish territory early in 1945 with Russian assistance.

The Collapse of the Fatherland Line.— Only 15 panzer divisions, organized into three panzer armies, were left on the Russian front in the summer of 1944. The general deployment of the German troops gave evidence of the absence of strategic aims beyond holding as much ground as long as possible. Two German armies, including Rumanians, held the southern sector from the Carpathians to the Black Sea. Their former commander, Field Marshal Gen. Paul Ludwig von Kleist, was succeeded by Field Marshal Gen. Ferdinand Schoerner. From the Carpathians to the Pripet, two German armies plus two of the panzer armies were under the command of Field Marshal von Model, Mannstein's successor. The Third Panzer Army and two more armies (Field Marshal Gen. von Busch) held the central front between the Pripet Marshes and the Dvina River, formerly under the command of von Kluge. The defense of the Baltic States was entrusted to Colonel General Lindemann, in charge of two armies previously commanded by Field Marshal General von Kuechler.

Eighty Russian divisions, outnumbering the Germans almost 3 to 1, faced Kluge's forces. According to later reports, Hitler's furious insistence upon holding territory regardless of its military value, particularly the defensive system referred to as the Fatherland Line, accounted for the fact that the Wehrmacht's front, instead of being straightened out and shortened from Kowel roughly through Vilnius to Riga, to save manpower and improve communications, bulged widely in an arc running east and north.

Russian superiority was brought to bear heavily on the central front. The Red forces were divided into the First Baltic Army (Bagramian) from Nevel to Vitebsk, the Third White Russian Army (Gen. Ivan D. Chernyakhovski) from there to Orsha, the Second White Russian Army (Zakharov) adjoining Mogilev, and Rokossovski's White Russians continuing the line to Kowel. The opening Russian drive aimed at Vitebsk. On June 23, Bagramian struck to the north and Chernyakhovski to the south of the town, both breaking through the German lines. Their pincers closed, trapping five depleted divisions. On June 27, the garrison of Vitebsk was wiped out. Moscow reported the capture of 10,000 German prisoners and 20,000 Germans killed. The Wehrmacht crumbled under spreading Russian blows. Orsha fell to Chernyakhovski on June 27, Mogilev to Zakharov on June 28, and Bobruisk to Rokossovski on June 29. The Germans suffered another major defeat when a trapped force of 34,000 was annihilated at Bobruisk.

Russian armies rolled on through trenches, minefields, antitank ditches, and blockhouses on a 250-mile front, meeting little resistance. In the north, Bagramian aimed at Daugavpils (Dvinsk). The three other assaulting armies converged on the communication hub of Minsk, which fell on July 2. Again formidable German forces, estimated at 55,000 by the Russians, were trapped. The Wehrmacht belatedly attempted to consolidate a shortened line, sacrificing men and matériel in stubborn rear guard actions for road and railway junctions. Zakharov's advance beyond the Berezina River was delayed, but the other Red armies swept on toward Vilnius, Baranowicze (Baranovichi), and Daugavpils. The railway junction of Baranowicze fell to Bagramian on July 8, and Rokossovski captured Kowel on July 5. From Kowel, the White Russian Army advanced in the direction of Brest-Litovsk, an old fortress town and vital hub in the former czarist-Russian military railroad system. Local counterattacks, stepped up by the German Central Army Group, failed to gain ground, but they slowed down all Russian drives and gave evidence that stiff fighting was still ahead.

The German defenders of Vilnius, holding out until July 13, fell to an encircling drive. Bagramian turned the defenses of Daugavpils and invested the city on the same day. He was assisted in this operation by Yeremenko's Second Baltic Group, which had joined the offensive two days earlier and had broken through enemy lines south of Pskov, threatening the railroad to Riga. The Russian attack spread toward the Estonian border regions, where Maslennikov captured Ostrov, while the bulk of Govorov's forces, withdrawn from Finland, unhinged the northern anchor of the German positions, captured Narva, and crossed into Estonia on July 26. Lindemann's army group in Latvia and Estonia was caught in a Red vise when Bagramian, swinging northward beyond Vilnius and Kaunas, closed in on the Gulf of Riga and reached the Baltic shore on August 1. German counterattacks to break the ring started almost immediately.

This phase of the fighting north of the Pripet, however, was overshadowed by the long awaited offensive in southern Poland, which opened on July 16 when Konev's First Ukrainian Army attacked the German lines between Luck (Lutsk) and Tarnopol on a 125-mile front. The Germans tried to chop up the Red columns penetrating through their positions by widespread local counter-thrusts, but the impact of the Russian drive brushed such attempts aside. Four Wehrmacht divisions were routed in the capture of Rawa Ruska on July 20, and the last railroad link between southeastern Poland and the northern and central regions of the country was severed. Another Russian offensive in the direction of Stanislawow was launched to pin down the enemy on an even broader front in the Carpathian

range. In a brilliant move which required regrouping during the attack, General Popov reinforced Konev's southern wing to enable Konev's forces to aid Rokossovski. Stanislawow was overrun, and German and Hungarian puppet divisions abandoned a considerable part of Galicia province. Lwow, outflanked in the north and south, fell on July 27 after a brief fight. Przemyśl, a fortress on the San River of World War I fame, and nearby Jaroslaw were captured the following day. The Wehrmacht clung to the western bank of the San, despite Red bridgeheads established across the river.

The foremost objective of Russian operations in Galicia was to outflank future German defenses on the Vistula River to the north. This goal was reached by establishing bridgeheads in the region of Przemyśl. A German attempt to hold positions on the Bug River, in order to delay the Russian advance toward the Vistula from the east, was frustrated. On July 22, the Russians stormed across the Bug near Chelm and seized Brest-Litovsk on July 28. The way was cleared for a sweeping drive by Rokossovski's columns toward Warsaw through the railroad city of Siedlce, captured July 31. Continued advances by Zakharov's army beyond Bialystok (occupied July 18) broadened the Red attacking front to the north. The Second White Russian Army's progress strengthened Chernyakhovski's drive against East Prussia, enabling him to enter Suwalki and to press on toward the Masurian Lakes. After crossing the Nemunas (Niemen) River on July 15, taking Grodno on July 16, and assisting in the capture of Bialystok, Chernyakhovski's divisions captured Kaunas in Lithuania on August 1.

Rokossovski's advance stopped in front of Warsaw, after investing Praga, an eastern suburb of the Polish capital. Russian guns were heard in Warsaw, and Polish patriots staged an uprising on August 1 to help the Red Army to liberate their city. Their struggle, lasting for 63 days, was one of the most heroic and depressing chapters of World War II.

Sixteen German divisions, scraped together from occupation forces and reserves, strengthened German lines around the Polish capital, but they could not prevent the Red forces from reaching the Vistula River south of Warsaw and establishing a wide bridgehead across that river. This bridgehead constituted a deadly threat to the German defenders on the left bank of the Vistula.

In the Baltic region, Yeremenko's forces pressed on to Riga, mopping up Daugavpils and capturing Rezekne, while Bagramian took Siauliai. On August 25, Maslennikov seized Tartu in Estonia and cleared the western shores of Lake Peipus. These operations, however, did not destroy the Lindemann army group. One week after the vise closed on the Gulf of Riga, German counterattacks reopened a corridor from the west.

In late August 1944, the center of gravity of the Russian attacks switched southward and action along the Vistula subsided. This was again due not only to military but also to political considerations.

EUROPEAN CONTROVERSIES

While the Polish government in London adamantly claimed that no change in Poland's prewar eastern border could be considered, and the governments of the United State and Great Britain hoped for some compromise, Moscow insisted upon establishing control of Poland within frontiers to be largely determined by the Russians.

On Dec. 31, 1943, according to Soviet-sponsored sources, a group of representatives of peasants, trade unionists, youth organizations, and partisans met in occupied Warsaw to establish an anti-Mikolajczyk, National Council of Poland and a Polish People's Army. The same sources reported that, in May 1944, participants in the meeting made their way to Moscow. There, in cooperation with the Russian-sponsored Union of Polish Patriots, they formed a Polish Committee of National Liberation (PCNL). Other members of the National Council of Poland, including Edward Osubka-Morawski, a former factory worker, also went to Russia to confer with the Soviet government and Polish organizations.

The Polish government in exile in London was accused in Russian broadcasts of opposing the establishment of friendly relations with the USSR and of sheltering anti-Soviet and anti-Semitic reactionaries. The Russian radio stated that unless the Mikolajczyk government was purged of these reactionaries, its return to Poland would not be allowed. Moscow also announced the organization of a Polish Army Corps in Russia to fight alongside the Red Army.

On June 5, 1944, Polish Premier Stanislaw Mikolajczyk arrived in Washington to seek support and advice. He met with President Roosevelt and State Department officials and declared that he believed his country could count on the backing and friendship of the United States. Mikolajczyk, however, found no support for his government's boundary claims, and it was difficult to comply with the advice he received to seek a settlement with Moscow. This advice was repeated by Prime Minister Churchill and Foreign Secretary Eden on June 22, after Mikolajczyk's return to London.

On July 1, the Moscow Poles declared that the London Polish government in exile was illegal and called for the establishment of a provisional government. When Chelm, east of Lublin and west of the Polish boundaries as defined by Russia, fell to the Red Army on July 23, Moscow announced that the National Council of Poland in Moscow had asked the PCNL to take charge of the civilian administration of the liberated areas. Two days later, the Soviet government announced that the Red Army was interested only in routing the German armies and helping the Polish people to liberate themselves from the German invaders. The USSR also promised that an independent and democratic Poland would be established as a sovereign, friendly, allied state. The next day, the Soviet High Command and the PCNL signed an agreement. On Jan. 1, 1945, the PCNL, established in Lublin, proclaimed itself the provisional government of Poland. A spokesman of the Polish government in London had previously called the PCNL representatives, headed by Osubka-Morawski, a group of usurpers, nobodies, turncoats, and communists. The ambassador representing the Mikolajczyk government in the United States denounced the PCNL as a typical puppet government imposed by Moscow.

Through the intervention of Prime Minister Churchill, Mikolajczyk and two aides were invited to Moscow, where they arrived on July 31, 1944. Stalin and Molotov requested that they dis-

cuss a merger of their regime with the PCNL and the National Council representatives. Speaking on behalf of the Russian-sponsored groups, Osubka-Morawski offered two cabinet posts to the representatives from London. Most members of the government in London were excluded as unacceptable to the PCNL and to Russia. Counter-proposals, made after Mikolajczyk's return to England, included the broadening of the Polish cabinet in London by including some of the Leftist extremists. The London Poles also offered to postpone discussion of boundary issues. A provisional parliament was to be set up, and free elections were to be held at the earliest opportunity.

Neither the London government's concessions, nor American and British attempts to mediate, led to any progress toward a reconciliation. The PCNL insisted upon immediate acceptance of Russian territorial claims, predominant Leftist influence in a future government, and far-reaching economic reforms along communist lines. This attitude strengthened ultraconservative elements in the London cabinet who opposed Mikolajczyk's policy. On November 24, Mikolajczyk resigned and refused to enter another London Polish cabinet, formed by Tomasz Arciszewski. He did not immediately reply to an invitation by Osubka-Morawski to come to Lublin. Events inside Warsaw had further complicated the situation.

The Ordeal of Warsaw.—Despite the brutal vigilance of the German occupation authorities, a secret army of Polish patriots had been formed to fight for their country's liberation. Its numbers rose to almost 300,000 across the country. Forty thousand members of the Polish Home Army stayed in Warsaw in disguise. Lt. Gen. Tadeusz Komorowski, called General Bor, was in command.

Although loyal to the London government, the Polish Home Army considered the defeat of the German invaders more important than political considerations and was ready to cooperate with the Red Army and Soviet-sponsored organizations. Toward the end of July 1944, broadcasts from Moscow were heard in Warsaw as follows: "Poles, the time of liberation is at hand! To arms! Make every Polish home a stronghold in the fight against the invader! There is not a moment to lose!" The appeals were made in the names of Molotov and Osubka-Morawski and were not addressed to any particular group in Poland. General Bor and his aides outlined an operation code-named Storm, to seize control of the capital.

The German Second Army, defending the eastern approaches to Warsaw, was reinforced by troops moving up through the capital. It seemed most important to prevent the Wehrmacht from using Warsaw as a pivotal center. On July 30, officers of General Bor's Home Army, on patrol beyond the Vistula, met a Russian tank column and were told by exuberant Russian officers that the Soviet forces expected to be in Warsaw any day.

In accordance with Operation Storm, the Home Army moved to assigned quarters and blocks at important strategic points and opened fire on the Germans on August 1, at 5 P.M. Polish equipment consisted chiefly of rifles, hand grenades, and a few automatic weapons. Ammunitions and food were scarce in the looted city. The Germans attempted to crush the uprising within a few hours by using their heaviest tanks and medium artillery. Failing to subdue Bor's men, they called upon the Luftwaffe, which raided Warsaw on August 3 without opposition from the Red Air Force.

The Polish Home Army's attempts to establish contact with Marshal Rokossovski and arrange for cooperation were unsuccessful. The Western Allies dropped some light arms and ammunition from planes. German squads meanwhile dynamited their way through Polish-held blocks and launched robot tanks against the Home Army. A fanatical defense held the Germans in check, although transit through Warsaw still remained blocked.

On August 14, the Russian news agency issued a statement to the effect that Polish circles in London had sponsored the Warsaw uprising and had failed to coordinate this action with the Soviet High Command and were therefore responsible for its results. The Poles, despite the loss of Soviet cooperation, decided to fight on in the hope that the Red Army would eventually resume its advance.

The offer of assistance from the Polish Home Army forces outside Warsaw could not be accepted because of a lack of supplies. Civilians inside the capital aided Bor's men in every possible way. On the seventeenth day of the struggle, the Germans brought huge siege guns to bear against a center of resistance in the Stare Miasto district. Of 1,100 houses, overcrowded with 200,000 people, 400 were destroyed, and 300 more were burned in three days. For two more weeks the Poles clung to the ruins. Realizing that the Poles were increasingly dependent on airborne supplies, unmarked German craft, joining Allied supply raids, dropped poisoned biscuits.

On September 13, Russian vanguards entered Praga suburb, and Russian planes dropped some arms and ammunition. Next day, broadcasts from Moscow were heard: "The hour of liberation is near . . . Relief is coming . . . Keep fighting. . . Whatever may have been the motives of those who started the uprising prematurely, and without agreement with the High Command of the Red Army, we are with you with all our hearts!"

It was extremely difficult to keep fighting, as disease was spreading, ammunition was scarce and food even scarcer. Some blocks had to be abandoned. A large quantity of airborne supplies dropped by British and American planes fell into evacuated areas and were captured by the Germans. Two days later, the last stores of grain were exhausted. On September 24, transmitters of Marshal Rokossovski's army contacted Bor's radio station for the first time. The Russians asked for information about German artillery positions but failed to make any commitments. The Red forces gave no help when the Home Army's Czerniakow stronghold, separated only by the Vistula River from Red outposts in Praga, was wiped out by the Germans.

The water system was destroyed, and the few remaining wells were under constant artillery fire. Thirst added to the sufferings of fighters and civilians. Medical stores were exhausted, and surgical operations had to be performed without anaesthetics and dressings. There was no milk, and almost no babies survived. The Poles continued to fight under these indescribable conditions, many of them risking their lives to capture German robot tanks in order to get explosives. They ignored demands to surrender.

On September 27, a radio message informed Marshal Rokossovski that hunger and German pressure could not be endured for more than 72 hours. The fighting Poles were already confined to a few blocks. No reply came, and German attacks were intensified. Finally, on October 2, General Bor was forced to capitulate but refused to extend the capitulation to the Home Army outside Warsaw, despite German attempts to exploit his bitterness toward the Red Army. Nearly 250,000 Poles, most of them civilians, perished in the 63-day ordeal.

The Allied Conquest of Rumania.—Prince Barbu Stirbey, unofficial Rumanian peace envoy, got in touch with Allied diplomats in Turkey late in 1943. Prince Stirbey had the backing of influential leaders of former Rumanian political parties and the confidence of young King Michael. After some informal talks, the prince was allowed to proceed to Cairo, where he disclosed that Rumania was ready to surrender to American and British forces if they reached the country. It was hinted that such a capitulation would not be effectively opposed by Marshal Antonescu but that Rumania was not willing to surrender to the Russians. Prince Stirbey was informed that no such agreement could be considered and that his suggestions would be reported to the Soviet government. On March 27, 1944, Moscow replied that Russia would accept nothing short of Rumanian surrender to the Red Army, but that the integrity of the kingdom, except for Bessarabia and northern Bucovina, would be guaranteed.

The Germans learned of Stirbey's mission and threatened reprisals if Rumania attempted to break the alliance. Fear of these reprisals and distrust of Russia's intentions delayed further progress in the negotiations. It was obvious, however, that Rumania had no desire to make a last ditch stand for Germany's benefit.

When operations in Poland slowed down, Russian armies attacked between the Carpathians and the Black Sea. On Aug. 20, 1944, Malinovsky's Second Ukrainian Army resumed its advance southward in the direction of Iasi, while Tolbukhin's Third Ukrainian Army pressed westward toward Chisinau (Kishinev) and the Galati Gap, harassing the defenders of Iasi's right flank. After three days of fighting, the Second Ukrainian Army captured Iasi and achieved a breakthrough between the Siret and Prut rivers. The fall of Iasi and the cutting of a railroad linking that city with Chisinau led to the fall of that city on August 24.

This German defeat gave the signal for a coup d'état in Rumania. On August 25, King Michael, who was the head and symbol of anti-German forces which included the overwhelming majority of the people, summoned Marshal Antonescu and the members of his cabinet to a meeting in his palace. There they were summarily arrested.

Prior to the arrests, the king requested Field Marshal Sir Henry Maitland Wilson to support the coup by dispatching Allied airborne units to Bucharest. If the Allied commander had complied, the Rumanian capital could have been occupied by troops of the Western Allies before the Red Army arrived there, but the Western Powers had already agreed to give the Russians priority in Rumania. No Allied troops arrived. King Michael appointed a predominantly military government. The Germans bombed Bucharest and vainly attempted to establish a puppet government composed of members of the Iron Guard. On August 25, Rumania declared war on Germany. The Rumanian Army turned vengefully against its former partner. The contemptuous treatment and frequent abuse that most of its officers and men had suffered from the Wehrmacht, plus German looting and ruthlessness in Rumania, made the war-weary Rumanians eager to do as much damage as possible to the Germans. Rumanian resentment against Hungary, another unwelcome partner which had profited territorially at Rumania's expense, was equally bitter.

A few Rumanian divisions, sandwiched into German lines, pulled out and thereby wrecked the Wehrmacht's defenses. Red divisions poured through the gaps. Twelve German divisions in Bessarabia were wiped out. Another disaster hit Schoerner's armies when the Rumanians in the Galati Gap joined the onrushing Red forces and threw the Germans into headlong flight. Galati and its Danube harbor fell to the Ukrainian Third Army on August 27. The Germans suffered a still greater loss when the Russians occupied Ploesti and its oilfields on August 30. Rumanian troops also marched beyond the Carpathian range to harass the retreating Germans and to recover the northern part of Transylvania.

Red Army forces entered Bucharest on August 30, to the dismay of the Rumanian government. The Russians rapidly mopped up the rest of Rumania, including the naval base of Constanta on the Black Sea. In addition to the 12 German divisions destroyed in Bessarabia, 10 other divisions were severely mauled.

A Rumanian armistice mission, arriving in Moscow on August 30, learned that the country would be occupied, despite recognition of its co-belligerent status. As a co-belligerent, Rumania was ordered to provide 12 divisions. Rumanian territory was to be administered according to instructions issued by the Russian High Command, and an Allied Control Commission with a Russian chairman was installed in Bucharest. Andrei Y. Vyshinski, Russian vice commissar of foreign affairs, became Soviet commissioner in Bucharest. He directed the country's policies through Rumanian Leftists, who facilitated the use of Rumania as a springboard for the further expansion of the Soviet zone of influence.

The Occupation of Bulgaria.—In spite of Bulgaria's refusal to join the war against the USSR, the Russian government did not accept the contention, reiterated by Bulgaria's prime minister on Sept. 1, 1944, that the country had maintained unreserved and reliable neutrality. The Western Allies, resenting Bulgaria's hostile and rapacious attitude and the brutal treatment of Allied airmen forced down in Bulgarian territory, were unresponsive to Constantin Muraviev's attempts to restore peaceful relations. Muraviev was plainly anxious to forestall a Russian invasion and indicated that he would much prefer control of his country by the Western Powers.

On September 5, the Soviet Union declared war on Bulgaria, claiming that the country was continuing to assist the Germans. Two days later, while his troops were preparing to cross the Danube from Rumania, Marshal Fedor Tolbukhin urged the Sofia government to break with Germany and join the Allies. Muraviev complied on September 8 by declaring war on Germany.

Russian troops, however, moved into the country. The continued presence of German vessels in the Bulgarian Black Sea port of Varna was cited to justify their intervention. On September 9, while the Red Army advanced without meeting resistance, the Muraviev government and the regency council were displaced by pro-Soviet elements. Tolbukhin's forces entered Sofia on September 19, and an armistice with all the Allies was concluded on Oct. 28, 1944. The subsequent occupation of Bulgaria by very substantial Russian forces allowed the communist-dominated Fatherland Front to rule Bulgaria, despite the country's industrial backwardness and the almost total absence of feudal estates.

The Confused Balkan Campaign.—Prior to the Russian drive through the Galati Gap, the German front in the east ran between the Baltic and the Black Sea. Thereafter, the southern wing was unhinged, and the front, according to strategic precedents, should have been expanded to the Aegean Sea. The Balkan Army under Col. Gen. Baron Weichs had neither the strength nor the freedom of movement for such an extension. Harassed in Yugoslavia and Greece by guerrilla fighters, threatened with the prospect of Allied landings on the Aegean, Mediterranean, and the Adriatic coasts, Weich's army could not establish a reliable southern anchor. A total German collapse in the Balkans would soon have followed if the Russian and Partisan forces in the Balkans had been able to draw a line rapidly across the peninsula, and if the Western Allies and Russia had cooperated, regardless of zones of influence.

Guerrilla fighters in the Balkans could not be organized easily into regular armies. In Greece, rivalries between political groups prevented cooperation between them. In Yugoslavia, where the Chetnik organization was in the last stages of dissolution, Tito's Partisans were spread over mountainous regions remote from communication centers. Besides, guerrilla armaments were inadequate for regular modern warfare. Tolbukhin's Red Army had to concentrate most of its power for a drive up the Danube Valley against Hungary and could not divert many divisions in other directions. The British were getting ready to land in Greece, but their forces were not strong enough to go much beyond that country's borders, nor were they supposed to trespass on territories in the Russian zone of influence, which included all of the Balkan states with the exception of Greece.

All these circumstances enabled the Germans to "organize chaos" by breaking up their Balkan forces into relatively small units, part of which slowed down British, Russian, and partisan actions and fought their way out of traps and encirclements to the north, while others reinforced the Wehrmacht and what remained of its Hungarian satellites in Hungary.

On September 18, Red Army forces crossed into the Vardar River Valley from southern Bulgaria to establish contact with Tito's men. Twelve days later, Red divisions penetrated the Iron Gate and reached northeastern Yugoslavia. Joining with the Partisans, they took Pančevo on October 7. Belgrade (Beograd) came within artillery range the next day. Progress was not fast enough to prevent substantial German forces from crossing into Hungary. Weather again favored the Wehrmacht, as heavy rains transformed the Balkan dirt roads into quagmires.

Early in October, the British carried out various landings in southern and western Greece. Assisted by patriots, they occupied Patras on October 7 and continued toward Athens. The Greek capital was freed on October 15. Albanian guerrillas, led by Enver Hoxha, the "Albanian Tito," took over Vlora.

The Wehrmacht was driven from badly damaged Belgrade on October 15. Shortly thereafter, Niš, a railroad city west of the Bulgarian border, was taken, and the Belgrade-Kragujevac highway was cut in a drive across the Balkans. From Niš, Yugoslav Partisans pressed through Macedonia, while British forces in Greece, coming up from the opposite direction, made their first fighting contact with the Wehrmacht 240 miles north of Athens on October 31.

The British in Greece were bitterly opposed by Leftists. EAM-ELAS leaders called for the end of what they termed "British intervention," and their partisans fought against the government and the British. The government's counteraction, carried out by regular troops with British assistance, was equally sharp. Particularly heavy fighting raged through the week of December 10–17, when the British cleared Athens and the port of Peiraeus (Piraeus) of rioters.

The Russian Drive West.—Events in Rumania hastened the invasion of Hungary and exposed the Hungarians to Rumania attack. Although this situation had been foreseen, the Hungarian government had no opportunity to prepare countermeasures. Its military forces, inadequate to resist a strong Russian-Rumanian drive for any protracted period, could not even organize an effective delaying action. The Wehrmacht High Command directed Hungarian troop movements, and the bulk of the Hungarian forces were shifted to the border regions of their country to face an attack from the north rather than from the east.

On Aug. 29, 1944, Hungarian Regent Nicholas Horthy appointed a "non-political cabinet of generals," headed by Col. Gen. Vitéz Géza Lakatos (Vitéz meant "hero," an honorary title bestowed upon distinguished veterans of World War I). A secret Hungarian peace mission was sent to Moscow. No agreement was reached, however, as Russia was determined to award northern Transylvania to Rumania, and the Hungarians were anxious to retain it. On October 15, as the military situation grew desperate, Regent Horthy, in an appeal to the Hungarian people, stated his intention of making a separate peace. The regent declared that Germany had pressed Hungary into belligerency, had deceived the country, and had already lost the war. Admiral Horthy was taken into German custody.

Generals Béla Miklos de Danok and János Voeroes, commanders of the Hungarian First and Second armies, refused to take orders from the Arrow Cross government illegally established by the Germans in Hungary. Some of their troops laid down their arms and others went home. General Miklos was appointed head of a rival Hungarian cabinet in Debrecen on December 21. On December 30, his government, supported by a provisional assembly, asked for armistice terms and declared war on the Reich, but it lacked the means to make the declaration effective.

The Russians drove through the Carpathian mountain passes and broke into the plain of

southern Transylvania in the direction of Arad. They were only 100 miles from Budapest when the Wehrmacht made a stand east of Debrecen on September 3.

On October 1, Russian and Rumanian forces penetrated a line between Szeged and Oradea, and other Russian troops surged forward from eastern Czechoslovakia. The most effective drive came from the south. Advancing along the left bank of the Danube toward the capital on a 55-mile front, forces of the Second Ukrainian Army reached a line running from the southern outskirts of Budapest to Szolnok. On November 4, German resistance was overcome, and a siege arc was formed which was roughly six miles from the capital.

On November 12, Red forces crossed the Tisza River, 70 miles northeast of Budapest, and pressed on westward to broaden the siege front and to increase the pressure on the Germans in Slovakia and Austria. On December 9, Szallassy's puppet government fled to Sopron, a few miles from the Austrian border and, on December 10, the Russians reached Lake Balaton, less than 50 miles from Austria.

The Germans attempted to prevent further progress in the encirclement of Budapest by making a stand in the mountains northeast of the city. According to German reports, 18 Red divisions smashed this stand on December 24, and Russian troops pushed on to the left bank of the Danube beyond Budapest, 104 miles from Vienna. South of the river, Székesfehérvár, communications hub between Lake Balaton and the Danube, was taken. The arc around Budapest tightened and widened, and street fighting raged in the southern and eastern suburbs on Dec. 31, 1944.

Govorov's forces resumed their attack on the Estonian front on September 17 and reached the railway junction of Rakvere on September 22. General Maslennikov's Third Baltic Army blasted its way toward Riga from the north in an attempt to re-close the trap on the Lindemann army. To the right, the southern shore of the Gulf of Finland was cleared when Tallinn, Estonia's capital, fell on Sept. 23, 1944. By October 1, all Germans were driven from Estonia except for the outlying island of Ösel, where an isolated garrison held out for seven more weeks.

Riga fell on October 14, but the bulk of Lindemann's forces made their escape through the Corridor along the Baltic. Bagramian's First Army, Yeremenko's Second Army, and Maslennikov's Third Baltic Army, in concentric operations, isolated 12 of Lindemann's divisions in an arc closing around Latvia's peninsula. The trapped Germans, despite strong pressure, held out all through 1944.

Chernyakhovski's army, supported by Bagramian, was also unable to seize East Prussia in 1944. Russian attacks gained little ground, and no breakthrough was achieved. The front in central Poland remained stalemated.

A SUMMARY OF STRATEGIC BOMBING IN EUROPE

The United States Strategic Bombing Survey gives seven reasons for the defeat of the Luftwaffe:

1. It was originally designed for direct support of ground operations and lacked a long-range bomber force.

2. The full capacity of the German aircraft industry was utilized only after the initiation of the combined bomber offensive in June 1943.

3. Attacks on German airplane production in 1943 and in February 1944 contributed significantly to the winning of air supremacy in the critical air battles early in 1944.

4. Shortage of aviation gasoline resulted in the curtailment of flying training, reflecting a deterioration of the quality of personnel, a primary cause of the defeat of the German Air Force.

5. The Luftwaffe never regained control of the air after it had lost it.

6. Air attacks on the German petroleum industry in the summer of 1944 prevented the revival of the Luftwaffe's using the conventional type of aircraft.

7. The creation of a small force composed of high-performance, jet-type aircraft, manned by qualified personnel and operating on low-grade fuel, was not achieved in time. Ball bearings became a priority target after Aug. 17, 1943, when Schweinfurt, site of the most important German ball-bearing factories, was raided by Flying Fortresses. Between August 1943 and December 1944, more than 11,000 tons were dropped on ball-bearing plants, 52 per cent of which hit Schweinfurt, 12 per cent hit Steyr in Austria, 8 per cent hit Cannstatt, 7 per cent hit Erkner, 6 per cent hit Leipzig, 5 per cent hit Wuppertal, and 10 per cent hit other manufacturing centers. By the second quarter of 1944, production had dropped to 50 per cent of its pre-raid level, but it recovered in full by September 1944. Actual loss of production through the entire period of air attacks did not exceed two to three months' normal output.

Allied air attacks upon the Reich and its plants and supplies in occupied territories reached their peak in the last phase of the war. Strategic bombing operations were independent of tactical bombing which supported ground operations. The Red Air Force did not participate effectively in strategic bombing.

A total of 2,697,473 tons of bombs were dropped by the combined Western Allied air forces over Europe throughout the war, 54.2 per cent of which were dropped by the United States AAF and 45.8 per cent by the RAF. German territory was hit by 50.3 per cent of the total number; France by 21.8 per cent; Italy and Sicily by 13.7 per cent; Austria, Hungary, and the Balkans by 6.7 per cent; and other countries by 7.5 per cent. Classified according to targets, 32.1 per cent of the bomb tonnage hit land transportation; 23.7 per cent hit industrial areas; 11.1 per cent hit military targets; 6.9 per cent hit airfields and aircraft; 4.2 per cent hit naval vessels and water transportation; and 2 per cent hit V-weapon launching sites.

The weight of bombs dropped by the Allied Strategic Air Forces in the European theater since the beginning of 1940 was disclosed in a survey on the effects of strategic bombing on the German war economy by the Overall Economic Effects Division, published Oct. 31, 1945.

Tons of Bombs

	1940	1941
1st quarter	31	4,684
2nd quarter	2,451	11,281
3rd quarter	5,983	13,551

The United States Army Air Forces in Europe flew a total of 754,818 bomber and 991,750 fighter sorties; the RAF flew 687,462 and 1,695,049 respectively. Losses of bombers were listed as 9,949 for the United States AAF and 11,965 for the RAF, fighter losses as 8,420 American and 10,045 RAF. Air personnel lost in action included 79,265 Americans and 79,281 of the RAF.

In the spring of 1945, 7,177 United States and 6,956 RAF bombers were assigned to combat units. Fighter planes numbered 6,203 for the AAF in May 1945, and 7,728 for the RAF in August 1944. A total of 57,445 enemy aircraft was destroyed (or probably destroyed) by the Western Allied air forces, 35,783 of them by the AAF.

Records of the German Air Ministry show that by January 1945, a total of 250,253 civilians had been killed and 305,455 seriously injured by air attacks. Total German civilian air raid casualties throughout the war numbered 305,000 killed and 780,000 injured. Records were kept for identified victims only. Persons reported missing and unidentified casualties were not listed.

Sixty-one German cities of 100,000 inhabitants or more were bombed. Of their combined population of approximately 25,000,000 (35 per cent of the German total) 7,500,000 were made homeless by the destruction of 3,600,000 dwelling units. A survey made in 10 raided German cities gave the following percentages of houses destroyed by bombs: Hamburg—31, Augsburg—29, Wuppertal—29, Düsseldorf—22, Bochum—14, Dortmund—12, Hagen—12, Oberhausen—11, Leipzig—10, and Bremen—7. Fires added to the bombing damage, bringing Hamburg's destruction to almost 60 per cent. These cities recovered up to 80 per cent of their contribution to Germany's production within one to five months after the heaviest damage was inflicted and, except for Hamburg, Bochum, and Düsseldorf, regained full production within three to eleven months. Berlin's destruction was estimated at 60 to 70 per cent, caused mostly by fire.

In 1939, the Luftwaffe had 8,395 planes, less than 60 per cent of which were fighters. In 1944, according to official German reports, the Luftwaffe accepted 39,807 planes from German manufacturers, almost 80 per cent of which were fighters. The 1944 figure is questionable. The poor showing of the German Air Force in 1944 and 1945 would be hard to explain if so many planes had been produced.

Earlier plane acceptances by the Luftwaffe were listed as 4,733 in 1939, 10,826 in 1940, 11,776 in 1941, and 15,566 in 1942. Combined American and British production of combat planes amounted to 11,485 in 1940, 21,564 in 1941, and 42,300 in 1942.

Field Marshal Gen. Erhard Milch of the Luftwaffe later commented on Allied raids as follows: "It is true that air attacks on the airplane factories did hold up our production, but they did not reduce it. I have never understood why you did not attack the engine factories in 1944. If you had attacked them at once, it would have been far worse for us."

Actually, the Allied air raids on the German engine industry reached their peak in July 1944. In April 1944, German production of the principal types of engines reached a high mark of 6,000, but it dropped to 3,400 in August and to 2,700 in October. In December 1944 the number rose again to 4,200 and continued to meet requirements until May 1945.

Imports of oil products to Germany never reached their last peacetime level of 5,165,000 metric tons during the war, but the development of domestic crude oil and synthetic production made the Reich's oil supply situation fairly comfortable until the end of 1943.

Figures for 1940–1943 (not including booty) were as follows:

(Figures are in thousands of metric tons)

Year	Imports	Domestic Oil	Synthetic Production
1940	2,075	1,465	3,348
1941	2,807	1,562	4,116
1942	2,359	1,686	4,920
1943	2,766	1,883	5,748

Prior to May 1944, only 4,000 tons of bombs hit oil targets, but raids on German oil supplies were then stepped up. In May, 5,146 short tons were dropped on oil targets; 17,697 in June; 21,404 in July; 26,320 in August; 10,997 in September; 12,542 in October; 35,023 in November; 13,900 in December 1944; 12,505 in January 1945; 22,635 in February; 30,937 in March; and 6,451 in April. Total production and imports of oil fell from a monthly average of 918,000 tons in the first quarter of 1944 to 319,000 tons in the last quarter of that year. Imports of oil products from Rumania dropped from a monthly average of 189,000 tons in the first quarter of 1944 to 50,000 in June. They ceased entirely in August, when the Red Army occupied Ploesti. By Jan. 27, 1945, 17 out of 36 refineries still in German hands were out of production, and nearly all of the remainder were running at a fraction of former capacity.

Synthetic rubber production reached an all-time peak of 12,787 tons in March 1944. Plant bombing reduced that figure to 2,000 tons in December 1944. It recovered to 3,500 tons in February 1945.

From May 1944 to the end of the war, 62,915 tons of bombs were dropped on chemical plants. The production of nitrogen, a most important war chemical, fell from 75,000 tons a month early in 1944 to 20,000 in December 1944. The production of powder, 24,000 metric tons in May 1944, declined to 16,600 metric tons in December 1944, and to 11,000 in February 1945. Explosives produced amounted to 51,000 tons in June 1944, 22,800 tons in December 1944, and 12,000 tons in February 1945.

German panzer production (tanks, self-propelled guns, and assault guns) was systematically attacked during August, September, and October 1944, and in February and March 1945. Output reached its peak in 1944 and was not considerably reduced before 1945, according to the following German statistics of production:

1944	Tanks	Assault and self propelled guns
1st quarter	2,030	2,107
2nd quarter	2,372	2,420
3rd quarter	2,239	2,598
4th quarter	1,703	3,533

1945	Tanks	Assault and self-propelled guns
1st quarter	998	2,934

In 1942, submarine bases became priority targets of air attack. In 1943, priority shifted to ship yards. After the summer of 1943, raids against German submarine construction subsided and were resumed in strength only between November 1944 and April 1945. The 1944 attacks had little effect. Among the raided yards were *Blohm & Voss,* the *Hochwaldtswerke, Deschimag, Germaniawerft,* and *Deutsche Werke.* German U-boat production in 1939 was 23 craft, or 11,939 tons. In 1944, it was 387 craft, or 275,306 tons. Slowed-down engine production and general transportation difficulties accounted for the fact that less than half of the U-boats produced in 1944 became operational. In December 1944, 36 submarines of types 21 and 23 were completed against a planned figure of 40. In January 1945, production fell to 24, in February to 16, and in March to 12, against planned construction of 42, 44, and 46 respectively. The Strategic Bombing Survey states, however, that the difference between planned and actual production cannot be ascribed entirely to direct air attacks on the industry.

Plants producing guns and ammunition numbered about 5,000 and were so widely scattered that the organized bombing of such factories presented an almost insoluble problem.

Bombing of German rail transportation was intimately interrelated to the development of ground operations. In the fall of 1944, when the Allied Expeditionary Force invested the Reich's western boundaries, heavy raids hit the *Reichsbahn* system in the Saar area and in the Cologne plain, gradually spreading through the entire territory from the Ruhr to the Swiss border. These attacks were supported by raids on inland waterways. On September 23, the Dortmund-Ems and the Mitteland Canals were blocked, halting traffic between the Ruhr and points on the north coast and in central Germany. By October 14, the Rhine River was similarly blocked at Cologne. Carloadings of the Reichsbahn fell from 899,091 cars during the week ending Aug. 19, 1944, to 703,580 during the week ending October 28, and 547,309 for the week of December 23. During the week ending March 3, 1945, the figure declined to 214,001.

Transportation troubles affected German coal production. Output of hard coal in the Ruhr fell from 10,417,000 tons in August 1944 to 4,778,000 tons in February 1945.

Serviceable German merchant shipping tonnage declined from 1.1 million in 1941 to 0.7 million in 1944. As coastwise shipping at no time handled more than 3 per cent of the German rail tonnage, these losses had no noteworthy effect.

Truck transportation was highly important. In 1944, producers were subjected to precision raids. Monthly truck production, averaging 9,095 during the first six months of 1944, fell to 8,522 in July, 7,872 in August, 6,013 in September, 4,796 in October, 4,093 in November, 3,203 in December, recovered to 4,319 in January 1945, then hit new lows in February and March of 2,917 and 2,082 respectively.

Loss of working time through air raid alarms, shortages of gas and power, and transportation difficulty added to actual bombing damage, reducing German steel production from a monthly average of approximately 2½ million metric tons from January 1943 through July 1944 to one million in December 1944. Although strategic bombing constituted the most important factor in the reduction of German output, general disorganization, spreading with repeated military disasters and Allied advances, played a notable part in the decline of German production.

ISLAND-HOPPING IN THE PACIFIC

The United States Navy's shipbuilding program for 1944 exceeded 3,000,000 tons. The average age of United States fighting ships was not only much lower than that of the Japanese, but the United States Navy, mostly built according to lessons learned in recent battles, became the best balanced in the world. The personnel of the Navy consisted of 300,101 officers and 2,833,904 enlisted men and women on Dec. 31, 1944, in addition to 84,627 officer candidates and 8,893 nurses. There were also 169,832 in the Coast Guard and 472,682 in the Marines.

Fighting ships added to the navy in 1944 included a number of carriers, the new *Iowa* class battleships *Missouri* and *Wisconsin,* the large cruisers *Alaska* and *Guam* with 12-inch guns, and a number of heavy cruisers of the *Baltimore* class.

Jet-propelled fighters were built in 1944 to modernize the navy's air arm. The Sea Hawk replaced earlier models as a standard scout observation plane, and the Helldiver became the outstanding dive bomber. The Avenger (torpedo bomber) was being replaced by more modern craft, and the Catalina long-range patrol bomber was supplanted by the Mariner and Liberator for scout work and by the Ventura and Privateer as bombers.

The commander in chief of the United States Pacific Fleet and Pacific Ocean Areas, Admiral Chester W. Nimitz, had his headquarters at Pearl Harbor. Eventually Hawaii became too remote from the theater of operations, and his headquarters were moved to Guam in January 1945. The Northwest Sea Frontier, including the coasts of Oregon and Washington, was abolished on April 15, 1944, and the 17th Naval District was created, including the territory of Alaska and its waters. All sea frontier and correlated activities on the United States west coast were consolidated under the commander of the West Sea Frontier, Vice Admiral David W. Bagley. On Nov. 8, 1944, the duties of the commander of the West Sea Frontier were substantially enlargened, and Admiral Royal E. Ingersoll took over nine days later, while Bagley was placed in charge of the Hawaiian Sea Frontier. The Philippine Sea Frontier was established after the invasion of the Philippines was under way. Rear Admiral James L. Kauffman assumed command on Nov. 13, 1944, under the command of the Seventh Fleet.

The Marianas Campaign.—After a 700-mile advance from Tarawa and Makin to Kwajalein, and another 400-mile advance to Eniwetok, an even more ambitious move was undertaken: a 1,200-mile jump across the Central Pacific to the Marianas. Its objective was to recapture Guam and to seize the Japanese strongholds of Saipan and Tinian. Previous Pacific battles had been serious, but the forces involved in the Marianas were larger than in most of the previous engagements. On Saipan, 30,000 Japanese faced 48,000 United States Marines and 20,000 soldiers in an area of slightly more than 71 square miles. On Guam, 18,500 Japanese opposed 40,000 marines

and 20,000 soldiers. The Japanese garrison of 4,500 at Tinian faced the marines from Saipan after the occupation of the latter island was completed.

Despite United States superiority, the invaders faced a formidable task. Limited space hampered the deployment of large numbers of men. Use of heavy matériel was restricted by unloading difficulties. Under these conditions, substantial losses were to be expected, but high casualties were a necessary price to pay for control of the Marianas, crossroads of the Pacific. These islands formed part of an almost continuous chain extending 1,350 miles southward from Tokyo through the Bonin and Volcano Islands. Another island chain led from the Marianas through the Palau group toward the Philippines. The Mariannas offered an ideal opportunity to establish bases for air attacks on Japan proper.

The initial plan of attack, code-named Operation Forager, called for the 2d and 4th Marine divisions (5th Corps) to hit Saipan on June 15, while the 3d Corps, including the 3d Marine Division and the 1st Provisional Brigade (4th and 22d Marine regiments) were to attack Guam, 100 miles to the south, on June 18, 1944.

Admiral Spruance was in command of naval operations. The amphibious forces were under Vice Admiral Richmond K. Turner, and Lt. Gen. Holland M. Smith, USMC, was in charge of the expeditionary forces which were to attack Saipan. The ground forces for the assault on Guam were under Maj. Gen. Roy S. Geiger. Smith was to assume command of all invasion forces in the Marianas when beachheads were established, and Maj. Gen. Harry Schmidt was to replace him as commander of the 5th Corps.

The ships which would carry and assist the expeditionary forces were assembled and trained at many points in the Pacific area. They included more than 600 vessels: battleships, aircraft carriers, cruisers, high speed transports, destroyers, and tankers. The total number of navy, marine, and army personnel exceeded 300,000. More than 2,000 United States aircraft took part in the operation.

From the beginning of June 1944, land-based aircraft from the Admiralty Islands, Green Island, and Hollandia made neutralizing attacks on Japanese bases, including Truk, Palau, and Yap. Fast carriers and battleships of the Fifth Fleet under Vice Admiral Marc Mitscher ranged up and down the Western Pacific, hitting Japanese airfields at Iwo Jima, Rota, Guam, and Tinian. On June 11, carrier planes opened the assault on the Marianas to destroy aircraft and their facilities and to soften up defenses. Off Saipan, 124 enemy planes were destroyed. A Japanese convoy west of Pagan Island had 10 ships sunk and an equal number damaged, and another convoy, consisting of one cargo ship escorted by four destroyers, was sunk. On Saipan, cane fields, which were potential hiding places for snipers, were shelled and set on fire.

Saipan.—After assembling at Eniwetok on June 8, the invasion forces reached the shores of Saipan on June 15, 1944. The fleet's guns opened the barrage at 5:45 A.M. The attack was directed against the island's west side. Two beaches were selected, north and south of the sugar mill town of Charan (pop. 2,500), separated by a 500-yard gap. Troops had to reach the shore in "amtracks," the only craft capable of climbing over a forbiddingly jagged reef. Tanks and heavier equipment could not be unloaded until a deep water channel was secured. To the north of Charan, the 2d Marine Division was to drive on Garapan, the island's capital (pop. 10,000) and toward Mt. Tapotchan (height 1,554 feet), an ideal observation and defense position. South of Charan, the 4th Marine Division was to drive across the island in the direction of Magicienne Bay, and fan out northward to assist the 2d Marine Division. The 27th Infantry Division, put ashore on D-day plus 1, aimed at Aslito airfield to the south of the 4th Marine Division's projected line of advance.

At 7:00 A.M., an air attack paved the way for the marines, who reached the beaches at 8:40 A.M. and suffered heavily from mortar and small caliber gun fire. Many Japanese pillboxes had not been destroyed. Light tanks plagued the invaders and added to their mounting casualties. Japanese artillery observers, overlooking the beaches and nearby waters from hill positions, directed fire with great precision. At nightfall, savage counterattacks started from the direction of Garapan. Twenty-nine of the Japanese tanks involved in the counter-blow were destroyed by antitank devises. On the first and second day, some progress was made, and Aslito airfield was taken, but the 4th Marine Division alone had lost 2,200 men by June 17. The severity of the fighting on Saipan led to a last-minute postponement of the invasion of Guam. The 3d Corps was sent back to Eniwetok where it joined the "area reserve."

The Japanese concentrated in cave positions in the hills, letting themselves be burned and killed by flame throwers rather than fall back or surrender. Half of the island was occupied after one week of terrific fighting. The capture of Mt. Tapotchan was one of the most difficult objectives of the campaign. In a drive east and north against the mountain and the island's capital city, the 2d Marine Division was on the left wing, and the 4th on the right. The center was held by two regiments of the 27th Infantry Division. Subsequent events led to angry controversy over whether the army forces had delayed the general advance by overcautious tactics or if they had cooperated effectively.

On June 25, the 2d Marine Division entered Garapan, while the 8th and part of the 29th Marine regiments reached the summit of Mt. Tapotchan. The attackers used bulldozers to clear the way to hidden Japanese emplacements and TNT to blast them into ruins. On June 28, a communiqué by Admiral Nimitz listed United States casualties on Saipan: killed—marines 1,289, army 185; wounded—marines 6,337, army 1,023; missing—marines 827, army 61.

A number of Japanese civilians, mostly government officials with their families, resided on Saipan. Many of them committed suicide in an orgy of self-destruction. On Marpi, Saipan's northern point, entire families drowned or killed themselves with hand grenades; infants were thrown from high cliffs; and children unquestioningly obeyed when they were ordered to kill themselves with explosives. Civilian deaths were estimated at about 800.

After the fall of Garapan and Mt. Tapatchan, although the situation of the defenders was hopeless, their fighting spirit remained unbroken. A last *banzai* (hurrah) attack was ordered by their commander, Lt. Gen. Yoshihi Saito. The general issued the following message to his troops: "During the more than 20 days since the American

devils attacked, the officers, men, and civilian employees of the Japanese Army and Navy have fought well and bravely . . . We have fought in unison up to the present time, but now we have no matériel with which to fight, and our artillery has been completely destroyed . . . We are dying to no avail under the violent shelling and bombing. Whether we attack or whether we stay where we are, there is only death . . . However, in death, there is life. We must use this opportunity to exalt true Japanese manhood. I will advance with you to deliver still another blow to the American devils, and leave my bones on Saipan, the bulwark of the Pacific. As it is said in the *Senjikun* (battle ethics) : 'I will never suffer the disgrace of being taken alive and I will offer up the courage of my soul and calmly rejoice in living by the eternal principles.'" As the general was too old and too clumsy to lead the charge personally, he ordered his adjutant to shoot him.

Three thousand Japanese soldiers made the charge on July 7. It temporarily pierced the lines of the 27th Infantry Division, but the situation was soon restored, and the attack was smashed. The 4th Marine Division's advance was still delayed by nests of resistance, but the 2d made good progress. On July 9, Saipan was declared secure, although mopping up operations continued for some time. Over 20,000 Japanese bodies were buried; at least half that number had already been burned, drowned, or otherwise disposed of. Of the 1,707 prisoners counted, most were noncombatants by non-Japanese standards. The price of the victory was extremely high: the marines lost 2,382 killed or missing, the army 1,059; 8,769 marines and 2,696 army men were wounded.

The Battle of the Philippine Sea.—United States naval forces off Saipan were attacked by carrier-borne torpedo bombers on D-day but suffered only minor damage. On the same day, Admiral Spruance received a report that a large group of Japanese carriers, battleships, cruisers, and destroyers was headed toward the Marianas. The United States commander decided to take the offensive. A large proportion of his carriers and battleships, however, could not move too far from the landing grounds, because they were needed to protect amphibious forces offshore. On June 15 and 16, some of the fast carriers and battleships much farther to the north, attacking bases on Iwo Jima and Chichi Jima, were ordered to join the main forces west of Saipan.

The possibility could not be ignored that the Imperial Navy was about to make its supreme attempt to turn the tide in the Philippine Sea between Saipan and the Philippines, but the Japanese actually threw into battle only a part of their remaining vessels. Four battleships (mostly modernized old ones) and six carriers of the *Hayataka* class (converted passenger ships) formed the bulk of the fleet. The engagement began on June 19, when 545 Japanese carrier-based craft raided the American fleet. The Japanese planned to continue to Guam and Tinian to refuel and then to make a second run. In violent air battles, partly fought over Guam, the Japanese lost 402 aircraft compared to 17 United States planes. Minor damage was inflicted upon four United States ships, including one battleship and two carriers. With their air power decisively reduced, the Japanese attempted to escape westward through the channel between the Philippines and Formosa. As the United States Fleet could not move too far away from the Marianas, air attacks on the Japanese Fleet had to be made at long range. Early on June 20, Japanese surface units were located. It was nearly sunset, however, when the United States carrier-based planes assaulted the enemy, sinking two carriers, two destroyers, and one tanker. One battleship, three carriers, three cruisers, one destroyer, and three tankers were severely damaged. Sixteen United States planes were shot down, but 73 more were lost due to lack of fuel and landing crashes. Scouts sighted the remainder of the Japanese Fleet again on June 21, but fighter planes failed to make contact, and the chase was abandoned.

Fast American carriers and battleships continued operations to prevent the Japanese from augmenting their strength in the Bonins and the Volcanoes. On June 23 and 24, Pagan Island was heavily raided. Air attacks hit Iwo Jima on June 24 and July 4, assisted on July 4 by shelling from cruisers and destroyers. Chichi Jima and Haha Jima were also hit by air raids on July 4. From their remaining bases in the Marianas and the Carolines, Japanese planes harassed the ships off Saipan until July 7. The battleship *Maryland,* one escort carrier, two fleet tankers, and four smaller craft were damaged. One LCI was sunk. Bombers of the Seventh Air Force (Maj. Gen. Robert W. Douglass), based on Saipan, joined the navy's aircraft in striking at the Bonins and the Volcanoes.

The Recapture of Guam. — On June 16, when the invasion of Guam was supposedly impending, surface ships shelled the island of 206 square miles. Shelling and bombing were resumed in full strength on July 8. Saipan-based planes joined aircraft from escort carriers. Destruction of air facilities on Guam, Rota, and outlying bases gave the Americans full control of the air. Preparatory attacks accounted for the far-reaching destruction of prepared defenses on the beaches. On July 21, amphibious operations were launched against Guam. The 3d Marine Division, the First Provisional Brigade, and the 77th Army Infantry Division went ashore east and south of Apra harbor. Beach conditions were unfavorable, and landing craft had to transfer loads to amphibious vehicles or to pontoons at the edge of a reef. Landings began at 8:30 A.M. Some mortar and machine gun fire was encountered, but initial resistance was rather light on a whole. As the troops advanced beyond the landing grounds, the Japanese furiously defended the rugged terrain and their remaining pillboxes. From July 21 to July 30, the United States forces, sustaining heavy losses, fought for Apra harbor. Agaña, the capital of Guam, was captured on July 31. The capture of Orote Peninsula made the Apra area available for speedier unloading. With more supplies ashore, the invasion forces pushed across the island to the east coast and thence northward to the tip of Guam. Organized resistance ceased on August 10. Even after Guam was once again a major base, a few hundred Japanese diehards held out in hills and undergrowth, occasionally ambushing American men and vehicles, until their country surrendered. These few were all that remained of the 18,500 Japanese defenders of Guam. United States casualties were listed as 1,484 killed and 4,957 wounded for the marines and 591 killed and 2,818 wounded for the army.

Tinian.—The 2d and 4th Marine divisions rested for 13 days after Saipan was declared safe

In the meantime, their next objective, 32-square mile Tinian, was heavily hit by sea and air bombardment. On July 24, amphibious operations, under the command of Rear Admiral Harry W. Hill, led the Marines across a channel four miles wide which separated the southern tip of Saipan from the northern end of Tinian. The Japanese did not expect the assault from that direction. Their commander made an attempt to evacuate his 4,500 men in small boats but was prevented from doing so by United States warships offshore. The Japanese, although surrounded and greatly outnumbered, dug in for a last ditch stand on Tinian Island. It took the marines nine days to seize the island and annihilate its garrison. American losses amounted to 416 killed and 1,735 wounded.

The Air Assault on Japan.—Full strategic control of the Marianas was established by the seizure of Saipan, Tinian, and Guam, although there were 12 more islands in the archipelago. The Japanese defeat led to the resignation of Prime Minister Tojo and his replacement by Gen. Kuniaki Koiso. The new premier, another typical exponent of militarist policies, tried to increase the country's war effort rather than lead it back to peace. The Battle of the Marianas was the turning point in air operations in the Pacific and greatly hastened Japan's collapse. Up to 1944, even when the Japanese were losing the battle in the air, their home islands and their industrial reserve arsenal in Manchuria were comparatively safe. With the Americans in the Marianas, the safety period came to an end.

Decisive progress was made in American plane construction. The B-17 Flying Fortress of the early days of the war was surpassed by the B-29 Superfortress which could carry bomb loads of more than 10 tons, had a range of more than 5,000 miles, and a cruising speed of 300 mph. Large-scale production of B-29's, well under way in June 1944, was one answer to the problem of battering Japan proper. The other was suitable bases for the big planes. Early in 1944, it was planned to establish B-29 bases in China. Half a million native laborers were put to work with incredibly primitive tools on the construction of runways one and one half miles long. Bombs, gasoline, and other supplies had to be flown in over the "Hump." Installations in China were precarious, as Japanese bases were not far away. The general trend of the war in China was unfavorable in 1944.

The capture of Saipan and Guam solved the problem. The islands were reasonably safe from air attack, and water transportation permitted an easy and abundant supply of everything needed for intensive raids. The most modern equipment was at hand to build airdromes in a short time.

The first test raid by B-29's was carried out against Bangkok, Siam, from Asiatic mainland bases. On June 15, another blow hit the Japanese steel center of Yawata. On November 24, Superfortresses took off from the Marianas for the first air attack on Tokyo since General Doolittle's memorable raid. Systematic bombing of Japanese and Manchurian cities and industries continued from that time until the end of the war. As many as 800 B-29's took off simultaneously from the Marianas. The high inflammability of Japanese "tinder box cities" accounted for terrific damage. Japanese authorities ordered a partial evacuation of Tokyo, and 630,000 persons left the city. No underground plants existed in Japan, and decentralization of industry lagged far behind the German example.

Planning the Next Moves.—The Central Pacific drive could fan out in two directions; one through the Volcano Islands and the Bonins straight north toward Japan, the other to the west and southwest to the Palau Islands first, and then, joining General MacArthur's advance, to the Philippines. Plans to occupy by-passed Truk were finally abandoned after the seizure of the Marianas. The island of Yap, between the Palaus and Guam, was considered a more important objective, and the 24th Army Corps (7th, 77th, and 96th divisions) was assigned to take it. In August 1944, however, when the 24th Corps was already at sea, the operation was called off. The island was to be by-passed, and the 24th Corps was loaned to General MacArthur by Admiral Nimitz. The drive toward the Philippines, with the seizure of the Palaus and Morotai as the initial operations, was given first priority.

General MacArthur's original plan to invade the Philippines scheduled the opening invasion of Mindanao, in the southern Philippines, for Dec. 20. The Octagon Conference of the Joint Chiefs of Staff, meeting in Quebec, Canada, received a copy of a communication from Admiral Halsey to Admiral Nimitz on Sept. 13, 1944. He recommended an early attack on Leyte, in the central Philippines, instead of Mindanao. General MacArthur's views were requested, and he replied that he was prepared to shift his plans to land on Leyte and to advance the date of the invasion of the Philippines by a full two months. Immediately thereafter, both General MacArthur and Admiral Nimitz were urged to execute the Leyte operation on Oct. 20, 1944.

The earlier plan assumed air support of the Philippine campaign by Maj. Gen. Claire L. Chennault's 14th Air Force in China, but General Stilwell informed the War Department that the Japanese offensive in central China would soon result in the capture of eastern Chinese airfields. The success of United States carrier-based air attacks, however, was considered adequate to reduce Japanese air strength in the Philippines to a degree which made support by the 14th Air Force unnecessary.

From October 1944 to February 1945, the bulk of the Pacific Fleet was engaged in operations connected with the Philippine campaign. No large forces were available for continued operations in a northerly direction and amphibious troops in the Central Pacific were out of combat during that period.

The Palau Islands Campaign.—The Palau Islands, western outposts of the Carolines, consist of 7 large and 20 smaller islands. Admiral William F. Halsey, commander of the Third Fleet, directed the sea operations in which nearly 800 vessels participated. The Third Fleet, considerably reinforced by newly commissioned ships, gained unmatched fighting strength. Vice Admiral Wilkinson commanded the joint expeditionary forces conducting the Palau landing operations. Vice Admiral Mitscher remained commander of the fast carrier force. Maj. Gen. Julian C. Smith, USMC, commanded the troops, including the 1st Marine and 81st Army Infantry divisions.

To divert and destroy Japanese forces which might have been able to interfere, planes from the fast carriers raided Chichi Jima, Haha Jima,

and Iwo Jima from August 31 through September 2. Chichi Jima and Iwo Jima were also shelled by cruisers and destroyers. Forty-six Japanese planes and six ships were destroyed at a loss of five United States aircraft. Yap Island was raided by carrier planes on September 7 and 8.

The air assault on the Palau Islands opened on September 6. Extensive damage was inflicted in two days of frequent raids. On September 9, the onslaught switched to Mindanao Island in the southern Philippines. On September 10, a cruiser-destroyer raid destroyed a Japanese convoy of 32 small freighters in that area. Between September 12 and 14, the carrier task force attacked the Visayas, destroying 198 Japanese planes. Operations on September 14 and 15 hit Mindanao, the Celebes, and Talaud. These actions not only paved the way to the invasion of the Palaus but also to landings on Morotai.

The First Marine Division of 25,000 men sailed to attack Peleliu. The 81st Army Division of about 10,000 proceeded to nearby Angaur. A Japanese garrison of no more than 8,000 was expected on Peleliu, but there were 10,500 troops there. Defensive installations, hit by a carrier task force raid between March 29 and 31, 1944 (which cost the Japanese 214 planes and 28 ships) were battered by September attacks. Still, parts of them remained formidable. Terrain conditions—precipitous coral reefs, sharp rocks, and swamps—favored the defenders.

Covered by intensive bombing and naval shelling, the marines went ashore on September 15, securing a two-mile beachhead. The defenders staged vicious counterattacks out of the cover of dense tropical vegetation. On D-day plus 1, the Peleliu airfield and most of the southern part of the island were captured. Further progress was slow. A rough ridge, forming the north-south backbone of the island—called Bloody Nose Ridge by the marines—offered natural obstacles which the Japanese astutely employed as emplacements for automatic weapons. The tactical scheme of the Japanese defense of Peleliu was superior to that encountered in previous island campaigns. After the capture of Angaur, army forces assisted the marines on Peleliu. On Sept. 26, the Japanese were trapped on Bloody Nose Ridge. They continued to resist until Oct. 12, and mopping up operations lasted beyond that date. The battle of Peleliu was among the bloodiest of the Pacific war.

On Angaur, six miles south of Peleliu, Japanese troops offered comparatively weak resistance. Landings took place on September 17. Three days later the opposition was overcome except for one spot on high ground where it continued for a brief period. On September 22, parts of the 81st Division joined the marines on Peleliu. A heavy bomber field was established at Angaur. On September 28, troops from Peleliu landed on Ngesebus Island to the north. Light resistance ended the next day. Konguran and Ulithi, other islands in the group, were seized later.

Babelthuap, the largest island in the Palaus, was not invaded. It was heavily garrisoned and had a rough terrain, which would have made its capture a costly venture. By-passing worked effectively. Babelthuap was neutralized permanently by the occupation of Peleliu and Angaur. Japanese bodies, numbering 13,354 were accounted for, and 433 prisoners were taken in the Palau campaign. The marines had 1,241 killed and 4,883 wounded, and the 81st Division had 264 dead and 1,465 wounded.

Capture of Morotai.—Between General MacArthur's New Guinea bases and the southern Philippines, Japanese positions on the Molucca Islands threatened the advance. It was decided to invade Morotai, northernmost island of the group, a formidable Japanese strongpoint with a good airstrip. Early in September, army planes of the Fifth Air Force and the Thirteenth Air Task Force staged violent assaults on Morotai and other Moluccan islands. On September 15, a force of 800 Allied ships, under the command of Rear Admiral Barbey, steamed into Morotai Straits. General MacArthur was aboard Admiral Barbey's flagship, the *Nashville*. Practically no enemy opposition was encountered as parts of the United States 11th Corps (31st Infantry Division and 126th Infantry Regiment of the 32d Division) went ashore. Coral obstacles and depressions in the reef adjacent to the landing areas, however, caused unloading difficulties. The airfield was seized, and the 40-by-25-mile island was declared secure. This claim was premature.

The Japanese garrison, realizing the immense superiority of the invaders, withdrew to the interior and continued to raid United States positions after the main forces left. It became necessary to bring in the United States 136th Infantry Regiment (33d Division) from New Guinea. In a difficult campaign, lasting from Dec. 26, 1944, to Jan. 14, 1945, the garrison was destroyed, losing 870 killed and 40 captured. United States casualties amounted to 46 dead and 127 wounded.

"I SHALL RETURN"

On September 10, Vice Admiral Mitscher's task force became active in the Philippines. Japanese air opposition above the southern islands was surprisingly weak. Admiral Halsey therefore ordered Mitscher to the central and northern areas. In the Visayas, 123 Japanese planes were destroyed on the ground and 75 in the air; 5 ships and 35 small craft were sunk, and 6 ships and 36 small craft were damaged. On September 21 and 22, the task force was almost within sight of Luzon. Japanese airfields in the suburbs of Manila, and Clark Field, 70 miles north of the capital, were attacked. On the ground, 110 Japanese planes were destroyed, and 95 in the air.

Then carrier-based dive bombers and torpedo bombers struck at Japanese shipping in Manila Bay and Subic Bay for the first time since the fall of Corregidor. Results observed were 40 ships and 6 small craft sunk; 11 ships were left in a sinking condition; 35 ships, 11 small craft, and 2 floating drydocks were damaged. Eleven United States planes were downed in action. Scattered Japanese attacks on the United States task force failed to inflict much damage. Admiral Nimitz reported that the operations of the Third Fleet had broken the Japanese air force in the Philippines, as operations of the Fifth Fleet had broken the enemy's carrier-based air force in the battle of the Philippine Sea. The Japanese air force in the Philippines, however, was not permanently paralyzed.

D-day for the invasion of Leyte was Oct. 20, 1944. The date set for the landings fell in the monsoon season, when torrential rains frequently swamped the eastern sections of the islands and made the establishment of air fields extremely difficult. Landings on the west side of Leyte were

not feasible, as the Japanese controlled the approaches.

Col. Ruperto Kangleon, leader of the guerrillas on Leyte and Samar, reported to the American command that the Japanese had only 24,000 men on both islands, most of them belonging to the reinforced 16th Infantry Division of ill repute as "butchers of Bataan." Total Japanese forces on the Philippines amounted to 260,000 men.

Admiral Nimitz offered General MacArthur the full support of the Third Fleet. The Central Philippine Attack Force, organized to carry on naval operations, was composed of the Seventh Fleet augmented by units of the Pacific Fleet, and 16 escort carriers were assigned to give tactical air support during the landings.

The Central Philippine Attack Force was under Admiral Kinkaid, who took orders from General MacArthur. It was subdivided into the Northern Attack Force (Seventh Amphibious Force, Rear Admiral Daniel E. Barbey), the Southern Attack Force (Third Amphibious Force, Vice Admiral Wilkinson), and a number of fire support, mine sweeping, and supply groups. The entire force comprised 650 ships, capable of landing four army divisions on D-day. To the extent that it was not engaged in amphibious operations, the Third Fleet, under Admiral Halsey, was to continue air strikes on Luzon, Formosa, and the Visayas, and to protect the landings against Japanese naval attacks. The Sixth Army in charge of land operations was assigned to the field commander, Lt. Gen. Walter Krueger. It was made up of the 10th and 24th Army corps.

On October 10, Admiral Halsey's forces were bearing down on the Ryukyu chain between Japan and Formosa. Searching planes and submarines were dispatched ahead of the main units to destroy Japanese scouting planes and picket boats. Okinawa Island was raided October 10. Airfield facilities suffered considerably, and many ships were sunk. On October 11, fighter planes attacked airfields at Aparri on the northern end of Luzon. Carrier planes struck at Formosa and the Pescadores on October 12, hitting aviation facilities, warehouses, wharves, and coastal shipping. On the first day 193 Japanese planes were downed and 123 more on the second day of the attack. Japanese torpedo planes hit the heavy cruiser *Canberra* and the light cruiser *Houston.* Both ships were safely brought to a base for repairs. On October 20, support was given to the amphibious operations, and long-range searches were made for the enemy fleet.

The Invasion of Leyte.—On October 17, the first American force en route to the Philippines appeared in the mouth of Leyte Gulf. The naval advance guard was commanded by Rear Admiral Arthur D. Struble. The 6th Ranger Battalion (commander—Lt. Col. Henry A. Mucci; acting commander—Maj. Robert W. Garret) sent patrols ashore at Dinagat, Sulau, and Homonhon, to secure the approaches to Leyte. Some resistance was overcome on Dinagat and Sulau. Underwater and minesweeping units cleared shipping lanes. On October 20, the main invasion fleet, assembled in New Guinea and in the Admiralties, steamed into Leyte Gulf after travelling between 1,000 and 1,500 miles.

The 10th Corps (Maj. Gen. Franklin S. Sibert), in the northern sector, was to strike toward the provincial capital of Tacloban and airfields at Calaisan Point with the 1st Cavalry Division. The 24th Infantry Division (less one regiment), on the left of the cavalry, was to push into Leyte valley. The 96th Infantry Division, right wing of the 24th Corps (Maj. Gen. John R. Hodge), was to invade beaches near Dulag. On the left, the 7th Infantry Division aimed at Burauen and its air bases. The beachheads selected were 11 miles apart and both were about 3½ miles wide. The gap was to be closed as soon as possible. The 21st Infantry Regiment, detached from the 24th Division, was assigned to occupy Panaon Island, off the southern tip of Leyte, close to Dinagat and Mindanao.

A lone Japanese plane appeared as the warships lined up along the shore to open the shelling. Among the vessels were the *California, Pennsylvania,* and *West Virginia,* badly damaged at Pearl Harbor, and the *Phoenix* and *Boise,* which had narrow escapes when the Japanese invaded the Philippines. General MacArthur was on board the *Nashville* again. Most of the beaches were undefended, and only a few elements of the 24th Infantry Division ran into heavy mortar fire before their landing craft hit shore.

General MacArthur went ashore four hours after the assault troops. Broadcasting through a signal corps microphone, the general proclaimed: "This is the voice of freedom! General MacArthur speaking. I have returned. By the grace of Almighty God our force stands again on Philippine soil, consecrated by the blood of our two peoples. Rally to me . . . Let the indomitable spirit of Bataan and Corregidor lead on."

Initial objectives were secured on schedule. The Japanese, quickly regrouping their air forces, attacked the invasion fleet offshore. During the voyage, one small ship was sunk in a storm, and the United States destroyer *Ross* struck a mine. More serious damage was suffered off the beaches, where Kamikazes were used for the first time.

Formation of the Kamikaze Special Attack Corps was announced in October 1943. The Japanese used different types of Kamikazes between October 1944 and August 1945. The first was a medium bomber or fighter plane, stripped of its armor and most of its equipment, and loaded to the limit with high explosives. The pilot, without a parachute, steered his craft into the selected target. The hit ignited the explosives. A later version was a missile resembling the German V-1, carried to the vicinity of the target by a bomber and then released to be rocket-propelled into the target at a speed of 500 miles an hour. This steering also was done by a pilot without parachute. The later type, referred to as Jinray by the Japanese and as Baka by the Americans, had a fuselage length of 19 feet 10 inches, a wingspan of 16 feet 5 inches, and an explosive charge of 2,645 pounds of Trinitroanisol. Kamikaze pilots had no chance to survive. Among Allied ships damaged offshore in the opening stages of the Leyte invasion were the cruisers *Honolulu* (hit by an aerial torpedo) and *Australia.*

The airfields of Dulag and Tacloban were quickly captured, and work was begun to put them into operation on October 25 as scheduled. The escort carriers, which had provided most of the tactical air support, had no facilities to carry fuel, bombs, torpedoes, or ammunition for prolonged operations. Frequent refueling and reloading were necessary, and army aircraft had to take over from newly established bases. The big carriers of the Third Fleet were busy neutralizing

Japanese airpower on neighboring islands and guarding adjacent waters against a naval threat. They were to support ground operations only in an emergency.

Adverse weather conditions and inadequate planning delayed the completion of the air bases. On October 25, severe storms transformed the ground into a sea of mud before steel mats for the runways were completely laid. Japanese planes, operating from better bases on the western part of Leyte, carried out 17 raids against Tacloban in one day. On October 27, when runways were ready and escort carriers could no longer be relied upon, a sufficient number of army planes was not available. A successful Japanese sneak attack accounted for the loss of 27 P-38's. General MacArthur was forced to ask Admiral Nimitz to order the Third Fleet back to protect the beachhead.

Field Marshal Count Hisaichi Terauchi, Japanese commander in chief in the southern areas, controlled 17 armies with a total of 925,000 men. He succeeded in reinforcing the troops on Leyte via the west coast. On November 1, four large transports unloaded in Ormoc Bay. Two days later, three more transports came through, followed by seven on November 7, and four on November 9. On November 11, the Japanese met disaster when four transports were sunk, in addition to five destroyers and one destroyer escort. The Third Fleet air arm delivered heavy blows at Japanese air and naval forces all through November. Air combat losses of the fast carrier task force amounted to 97 planes through November 1944.

Ground operations on Leyte, after a successful beginning, were not progressing according to plan. Inadequate air installations and continuous bad weather hampered maneuvers. A fast twin envelopment operation had been planned to annihilate the Japanese before they could be reinforced or man defensive positions in rugged terrain. But the reinforced Japanese did succeed in entrenching themselves in last ditch dugouts. One month before the Leyte invasion took place, Field Marshal Terauchi's staff transmitted estimates of American intentions to Lt. Gen. Shigenori Kuroda, in charge of the 14th Area Army in the Philippines, stating that a two-pronged attack on Luzon would open the Philippine offensive. General Kuroda prepared for such an attack rather than a maior assault on Leyte. Field Marshal Terauchi, later blaming Kuroda for the miscalculation, relieved him and replaced him with Gen. Tomoyoki Yamashita. The latter began his activity by transmitting a laconic imperial order to General Makina, commander of the 16th Division: "Enemy ground forces will be destroyed."

In reality, the destruction of United States forces was out of the question, even after the Japanese 1st Division from China landed piecemeal at Ormoc Bay. But it was possible to rally in the difficult terrain of the Leyte mountains.

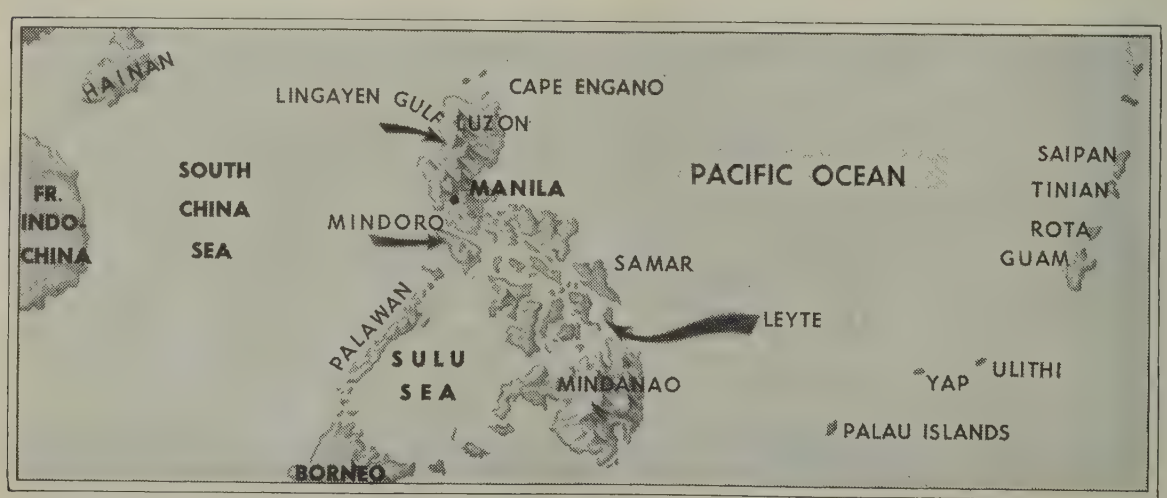
By Nov. 5, Dagami and Burauen were in American hands. The 10th Corps, sweeping across San Juanico Strait, had seized the south coast of Samar and landed troops on the north coast of Leyte in a short amphibious operation. The vicinity of Limon was reached, but annihilation of the Japanese was not achieved.

The support of carrier-based planes enabled General MacArthur to send large bodies of reinforcements to the beaches after November 13. They included the 32d (Red Arrow) Division, the 11th Airborne Division, and the 77th Division.

Pressure against the Japanese, who abandoned more than two thirds of the island in order to rally more solidly, was stepped up. The decisive operation took place near Ormoc Bay, in the western sector of Leyte, which had been thrown open by the Third Fleet's offensive.

Action had to be swift to take the Japanese by surprise and avoid interception. An American destroyer squadron, raiding Japanese shipping in the nearby Camotes Sea on December 2 and 3, inflicted some damage but lost the new 2,200 ton destroyer *Cooper*. On the night of December 7, 80 ships commanded by Rear Admiral Arthur D. Struble steamed into Ormoc Bay, carrying parts of the 77th Infantry Division to a beach three miles south of the town of Ormoc. The landing, meeting only sporadic opposition, was already well established when Japanese torpedo planes attacked the amphibious forces. The United States destroyer *Mahan* and the destroyer transport *Ward* were so heavily damaged that they had to be sunk by United States guns. Still another destroyer, the *Reid,* was sunk in Ormoc Bay on December 11.

On December 10, the city of Ormoc was captured. The Japanese garrison on Leyte was completely surrounded and compressed into a narrowing perimeter in the northwestern corner of the island. On Dec. 26, 1944, General Mac-



Arthur's communiqué reported the end of the Leyte campaign except for mopping up operations. It was stated that 54,338 Japanese dead were counted on the ground. Additional casualties, most of them suffered at sea, brought the total to 113,221. Operations were turned over to Lt. Gen. Robert L. Eichelberger's Eighth Army who accounted for an additional 26,000 Japanese dead during the first half of 1945. During the later stages of operations, the Fifth Air Force under Lt. Gen. George C. Kenney contributed greatly to the Japanese defeat.

The Attacks by Sea.—The bulk of the Japanese fleet was based at Singapore. Reconnaissance reported that it still included 7 battleships, 17 cruisers, and 26 destroyers. As the Allied offensive was moving closer to the approaches of Japan, the Japanese Naval High Command decided to make a desperate attempt to reestablish control of the limited areas in which the Imperial Fleet was still able to operate.

The Japanese planning and timing were better than in previous land operations. They assumed that the Allied landings at Leyte would result in crowded beaches on D-day plus 5. By then the escort carriers would have to leave for refueling, and air protection would be reduced. If caught by an attacking force, the highly vulnerable landing craft would not be able to reload and escape. The Third Fleet was the most dangerous obstacle to the Japanese attackers. Therefore, the Third Fleet was to be lured far enough away to prevent it from taking part in the action. A Japanese force of carriers and carrier-battleships (an experimental type of converted battleship) coming down from north of Luzon was to engage the Third Fleet. After establishing contact, the Japanese vessels would withdraw northward, decoying the fast task force away from Leyte Gulf. In the meantime, another Japanese fleet, mostly ships with heavy guns, would split into two groups. One of these groups would penetrate Leyte Gulf from the north and the other from the south, to annihilate the United States invasion fleet between pincers, and then, leaving the gulf in a northerly direction, the combined groups would attack the Third Fleet from the rear. The Japanese hoped that their opening moves would not be detected.

On the morning of October 23, however, the United States submarines *Darter* and *Dace,* on offensive patrol in the South China Sea, sighted a huge Japanese surface force. The submarines radioed all details and then launched a torpedo attack, sinking two heavy cruisers and damaging a third. The *Darter* later ran aground on a reef, but her crew was saved by friendly Palawan guerrillas. The *Dace,* joined by another submarine, the *Guitarro,* continued to shadow the Japanese. On the morning of October 24, search planes from Third Fleet carriers located the Japanese southern and central groups. As they did not include carriers, Admiral Halsey deduced that another force, including carriers, was not far away. On the afternoon of that day, his deduction was confirmed by the report that one large carrier, identified as the 29,000 ton *Zuikaku,* three light carriers, two battleships with flight decks (battleship carriers), five cruisers, and six destroyers were on their way southward in the vicinity of Cape Engaño, the northern tip of Luzon. The fast United States northern task force was attacked by planes based on Luzon and on Japanese carriers. About 110 Japanese aircraft were downed, but the United States light carrier *Princeton* was so heavily damaged that it had to be abandoned, the first carrier loss suffered by the United States Navy in almost two years. Explosions on the Princeton killed 229 men and injured 420 on the light cruiser *Birmingham* while the latter was attempting to help the stricken carrier.

The southern Japanese task force was reported to consist of two battleships, two heavy and two light cruisers, and 13 destroyers. The central force included two new superbattleships, the *Yamato* and the *Musashi* (listed at 42,000 tons each), and three lesser battleships.

Three groups of fast carrier task forces from the United States Third Fleet went into action on October 24. One group, under Rear Admiral Frederick Sherman, was about to engage the Japanese carrier force in the north. Part of the second group (Rear Admiral Gerald F. Bogan) was supporting Admiral Sherman, while another part turned its attention to the Japanese central group. The third group (Rear Admiral Ralph Davidson) established contact with the Japanese southern group on the morning of October 24. Air attacks on the Japanese southern force, closing in on Surigao Strait, failed to produce conclusive results. Admiral Kinkaid assigned a powerful force of the Seventh Fleet (under Rear Admiral Jesse Oldendorf), to meet the Japanese in the south. Admiral Oldendorf ambushed his opponents with six United States battleships (mostly old), nine United States and Australian cruisers, and a number of lesser craft. Shortly after midnight on October 25, the Japanese southern force, entering Surigao Strait, was engaged in a battle fought by naval gunners. Both Japanese battleships and three destroyers were sunk almost before they could open up. One heavy cruiser escaped with severe damage but was sunk later by army bombers. All of the other participating Japanese ships were subsequently sunk or badly damaged by aircraft. Only one United States ship, the 2,100 ton destroyer *Grant,* suffered serious damage. Not a single shell from the Japanese southern force hit the invasion fleet off Leyte.

The Japanese central force, heading for San Bernardino Strait and the east coast of Samar, on Leyte Gulf, came within range of Third Fleet aircraft on October 24 at 8:00 A.M. The *Musashi,* one cruiser, and one destroyer were sunk. Other ships were hit, although not as badly as originally presumed. As no further attack was expected from that force, Admiral Halsey threw the full strength of his available fast carriers and battleships against the Japanese northern group. Several carriers had to refuel, but 10 of them and 8 battleships were ready for action. No capital ships were left behind to guard against a return of the Japanese central force.

Most of the United States escort carriers were still in the vicinity of Leyte, supporting ground operations to the limit of their dwindling resources. A group of six escort carriers, three destroyers, and four destroyer escorts, under Rear Admiral C. A. F. Sprague, was near Samar when the Japanese central force, having resumed its previous course, suddenly reappeared. The escort carriers were not armored, their planes lacked fuel, bombs, and torpedoes, and they carried only light and medium guns. The Americans fought gallantly against overwhelming equipment: 14- and 16-inch guns against 5-inch. The

engagement began at 6:45 A.M. on October 25. By 8:00 A.M., the "jeep" carrier *Gambier Bay,* the destroyers *Hoel* and *Johnston,* and the destroyer escort *Roberts* had been sunk. Soon after, the escort carrier *St. Lô* was destroyed by air attack. Other United States ships, including the *Suwanee, Santee, White Plains,* and *Kitkun Bay,* were heavily damaged, and 105 planes from escort carriers were lost. But the Japanese commander decided to withdraw from the engagement before Rear Admiral Sprague's force was annihilated, fearing that his ships were about to be trapped by the United States Seventh and Third Fleets. The Japanese had lost one cruiser and one destroyer, and another cruiser was heavily damaged.

On October 25, Admiral Halsey's forces hit the Japanese carrier group in the vicinity of Capa Engaño. All Japanese carriers with the exception of the converted battleships were sunk, and heavy damage was inflicted on the remaining units by air attacks, followed by cruiser and destroyer action against crippled ships. Forty American aircraft were lost in all these operations.

When Admiral Halsey learned of the attack on the United States escort carriers, he dispatched units to deal with the Japanese central group. But when the American carriers and battleships arrived, all Japanese ships except the damaged cruiser had gone. On October 26, the central Japanese fleet was located again. Two cruisers were sunk, and the battleship *Yamato* suffered damage from two bombs hits. Another Japanese battleship, bombed in the pursuit, was sunk on November 21 off the China coast by the United States submarine *Sealion.*

The Japanese Navy's supreme bid to regain the upper hand ended in total failure. Reduced to a negligible fraction of its former strength, its position had become hopeless beyond recovery.

The Invasion of Mindoro.—The seizure of Mindoro Island was decided upon as the next amphibious operation in order to obtain better air bases and to carry the attack closer to Luzon. Air bases on Mindoro also would threaten Japanese shipping in the South China Sea.

This was a fairly risky venture. The naval attack force, on its way to Mindoro (nearly 300 miles northwest of Leyte) had to pass the inner seas of the Visayas close to numerous Japanese airstrips. Moreover, not all of the 50 or more airfields on Luzon from which the convoy could be intercepted had been eliminated by preparatory attacks.

From December 14 to 16, Third Fleet carrier planes hit Luzon's air and naval installations. Two hundred sixty-nine Japanese planes were destroyed, 27 vessels were sunk, and 60 were damaged. On their way to selected landing beaches near San José, the amphibious forces were attacked from the air, but damage was less than expected. Units of the 24th Division and the 503d Parachute Infantry Regiment under Brig. Gen. William C. Dunckel were greeted enthusiastically by Filipino guerrillas when they landed. Scattered Japanese air attacks on the invasion craft offshore continued on D-day (Dec. 15, 1944), but no resistance was encountered on land, and engineers immediately began to work on air strips. On December 17, a violent typhoon did more damage to United States landing craft than Japanese air attacks. Three United States destroyers, the *Hull, Spence,* and *Monaghan,* were lost.

On December 26, a Japanese naval force, consisting of one battleship, one heavy cruiser, and six destroyers, was driven off by air attack while attempting to raid the invasion fleet off Mindoro. American air installations on the island were already in operation.

The Recovery of Luzon.—General Krueger's Sixth Army moved next to Luzon, main island of the Philippines. The logical point to invade the island was in the north. The Americans, effectively supported by Luzon guerrillas, cleverly misled the Japanese area commander, General Yamashita. Navy mine sweepers operated conspicuously off the island's southern coast; army air forces from Leyte hit southern areas, and guerrillas ostensibly grouped in the same region. United States transport planes dropped dummies over Batangas and Tayabas to simulate an airborne invasion which Japanese headquarters claimed to have repulsed.

General Yamashita decided to spread his forces, originally massed in the north, over wider areas and to keep them mobile, thereby weakening his position in critical sectors. This dispersion of Japanese strength, plus the immense superiority of American mechanical equipment, gave the Sixth Army a decisive advantage in future operations.

The United States Army never planned to make initial landings in the south. Lingayen Gulf was the primary objective. From there, a good military highway led to Manila through the central plain, which was about 100 miles long by 30 to 50 miles wide, and well suited to mechanical warfare. The central plain included the capital city, numerous airfields, a network of roads and railways, and most of the island's wealth and population. Its seizure would provide bases to support further operations and would add threat to Japanese shipping in the South China Sea.

Although the Japanese Air Force was depleted, it still threatened sea lanes through which the assault force had to travel. Aircraft of the Third Fleet struck at Formosa again on Jan. 3 and 4, 1945, destroying 316 planes. On January 6, Task Force 38 (Third Fleet) accounted for 225 Japanese planes on Luzon. Three days later, United States carrier-based planes were back over Formosa and the Ryukyū Islands as far north as Okinawa, destroying 108 more planes. About 110 ships and barges were also hit. On January 12, powerful forces of the Third Fleet steamed into the South China Sea. Naval and air blows, continuing for four days, struck Saigon, Cam-ranh, Quinhon, Canton, Hongkong, Hainan, and Swatow. The Japanese suffered heavy losses. No Japanese aircraft was able to approach within 20 miles of the task force on its 3,800-mile trip.

The Luzon Attack Force, commanded by Vice Admiral Kinkaid under the overall command of General MacArthur, was composed of the Seventh Fleet augmented by Pacific Fleet forces. Numbering more than 850 ships, it was divided into the Lingayen Attack Force (Vice Admiral Wilkinson), the San Fabian Attack Force (Vice Admiral Barbey), a reinforcement group (Rear Admiral Connolly), a fire support and bombardment group (Vice Admiral Oldendorf), and surface and air covering groups (Rear Admirals Berkey and Durgin). On the way to Lingayen Gulf, between January 2 and 5, the attack force was repeatedly hit by Japanese planes and Kamikazes. The escort carrier *Ommaney Bay* and

three fast minesweepers were sunk, and a number of other units were damaged.

Action at Lingayen Gulf began on Jan. 6, 1945. For three days, Admiral Oldendorf's group, including battleships, cruisers, and destroyers, bombarded the area while mine sweepers cleared the beaches. Assault waves were preceded by rocket-firing and mortar-carrying landing craft, which blasted the beaches while heavy caliber rifles switched their fire farther inland. The San Fabian Attack Force, (6th and 43d divisions of the 1st Corps, commanded by Maj. Gen. Innis P. Swift), was assigned to hold and extend the left sector. The Lingayen Attack Force (37th and 40th divisions of the 14th Corps, under Maj. Gen. Oscar W. Griswold), to its right was to penetrate the central plain and race toward Manila at full speed.

On January 9, the Sixth Army's attack forces went into Lingayen Gulf. By the end of the day, 68,000 troops had gone ashore and controlled a 15-mile beachhead, 6,000 yards deep. The landings found every major hostile unit in motion except the Japanese 23d Infantry Division and its supporting 58th independent mixed brigade. The Japanese 2d Armored Division attempted to block the road to Clark Field. The 10th and 105th divisions rushed from Manila to guard the eastern edge of the central plain but did not arrive soon enough to hamper the American advance.

Beyond the beaches, the 1st Corps met stiffer resistance than the 14th. Artillery positions blocked a terrain which the Japanese had intended to hold as a line of strategic retreat. This resistance did not seriously delay American progress. A potential Japanese defense line in the Agno River bend was not manned when fast-moving United States forces reached the river. Despite continuous Japanese air attacks on the invasion fleet, reinforcements poured ashore. The 25th, 32d, and 33d divisions, the 158th Regimental Combat Team, the 6th Ranger Battalion, the 1st Cavalry Division, and the 112th Cavalry Regiment joined the invaders of Lingayen Gulf. Disorganized Japanese forces attempted suicidal stands, but they were broken up in sharp but brief engagements.

The fully motorized 1st Cavalry Division was one of the fastest American units. The 37th Division, too, advanced with great speed and other divisions did not lag far behind. By January 21, the advance had carried 58 miles to Tarlac, and patrols reached Clark Field on January 24. Japanese units north of Lingayen Gulf were prevented from infiltrating the American left flank by strong protective forces deployed in the sector. Fighting stiffened after Clark Field was reached, and sizable United States forces were engaged in guarding communication lines in that area.

Another major amphibious operation was successfully carried out to circumvent a large-scale Japanese retreat into Bataan Peninsula, which would have prevented the Americans from using Manila harbor. The 24th and 38th divisions of the 11th Corps were released from mopping up operations on Leyte. On January 29, some of their forces went ashore in the San Narciso area northwest of Subic Bay, and on January 30, others landed on Grande Island in the bay. The landings, protected by naval forces under Rear Admiral Struble, led to the seizure of Subic within a few hours.

Another amphibious and airborne threat from the south enveloped Japanese troops in and around Manila. The 11th Airborne Division, landing from boats, invaded Nasugbu near Manila on January 31. Three days later, the 511th Parachute Infantry Regiment, flying over the heads of 11th Division forces, dropped at the Tagaytay ridge on the way to the capital and reached Nichols Field on February 6.

During the night of February 4, units of the 1st Cavalry Division, racing through Novaliches, reached Grace Park in the northeastern section of Manila and freed Allied civilian internees in Santo Tomas, while the 37th Division broke Japanese resistance on the Pampanza River. On February 6, the liberation of Manila was announced, although fighting in the thickly walled section continued until American infantry penetrated the center of the city on February 23. The Japanese seized Filipino civilians as hostages and frequently used them as shields. Corregidor came under air attack on January 23. In less than one month, 3,128 tons of bombs hit "the rock."

On February 15, while minesweepers cleared Manila Bay, small American forces went ashore, against negligible opposition, at Mariveles Bay on Bataan. On February 16, a combined sea and airborne operation hit Corregidor. Formations of C-47 army transports dropped the 503d Parachute Regiment over the fortress island. Troops of the 34th Infantry Regiment hit the shore in assault boats. The Japanese offered suicidal resistance, in American-built tunnels, for nearly two weeks. Finally, the defenders blew up the tunnel system and themselves. Not counting those killed or buried alive under the debris by the explosion, 4,215 Japanese lost their lives on Corregidor. A total of 3,038 Americans had been engaged in the operation; 136 were killed, 531 wounded, and 8 were missing. Manila Bay was open to shipping by early March.

The Fifth Air Force, after supporting the Luzon campaign from outlying bases, established itself at newly won bases in the Philippines. It was subsequently merged with the Thirteenth Air Force (Maj. Gen. St. Clair Street) to form the Far East Air Force under Lt. Gen. Kenney. General Kenney's planes ranged over Timor, the Celebes, Java, and Borneo, further reducing Japanese ability to supply isolated forces in these islands. On Luzon, as in most of the Philippine Islands, native guerrillas, joined by a few escaped American prisoners of war, were extremely helpful to MacArthur's forces by killing many Japanese, disrupting communications, and supplying the Americans with useful information.

The War in China, 1944.—Major operations in the Chinese theater of war in 1944 did not get under way until April 18. The armies of Generalissimo Chiang Kai-shek made no serious attempt to seize the initiative. Their lack of equipment was still appalling, and the internal quarrel between the Nationalist government and the Chinese Communists—who failed to fight the Japanese on a large scale—was also a severe handicap.

Despite their Pacific setbacks, the Japanese were offensive-minded in China. The idea persisted that, even in case of total defeat in the Pacific and the invasion of the Japanese home islands, the war might be continued on the Asiatic mainland.

A Japanese drive, opening April 18, aimed at improving land communications by seizing complete control of the Peiping-Hankow railway By May 12, the attackers had seized a 174-mile stretch from Chenghow to Sinyang. Chinese

forces opposing the aggressors fought valiantly, but their organization was poor.

On May 28, the Japanese pushed toward Changsha. Their offensive now had the objective of eliminating United States air bases in China. With almost no modern equipment on hand, damaged air fields could not be rebuilt quickly. Changsha was captured on June 21. On June 30, the Japanese progressed to Henyang, forcing the evacuation of one of the United States 10th and 14th Air Force bases. If the operation in the Marianas had failed, the outlook for a sustained and devastating American air offensive against the Japanese mainland and Manchuria would have been very poor.

On September 7, the 14th Air Force base at Lingling, 75 miles southwest of Henyang, was lost. Tanchuk, site of another airfield, was evacuated on October 1. On October 28, it became necessary to destroy the major base at Kweilin to save its installations and equipment from falling into the hands of the advancing Japanese. On November 13, the Linchau field suffered the fate of Kweilin. American bases were pressed back almost 400 miles. The Japanese offensive expanded by a drive from Canton northward. A land corridor to Indo-China was established, and unoccupied China was temporarily split in two.

Gen. Joseph W. Stilwell attributed the loss of United States airbases and other Chinese setbacks partly to Chiang Kai-shek's reluctant over-all strategy and his apparent unwillingness to give Stilwell an opportunity to improve Chinese training and organization. General Stilwell's criticism led to his removal from the command of the China-India-Burma theater of war. Although the general was occasionally very outspoken, he was a distinguished commander who had contributed greatly to the crushing of the Japanese offensive in India earlier in the year.

THE CLIMAX IN EUROPE

The opening of Antwerp harbor, the rehabilitation of French Atlantic ports, and an increased flood of supplies from French Mediterranean ports to Allied battlelines solved the urgent supply problem of the Allied Expeditionary Force (AEF). In the near future, reinforcements of men and equipment would eliminate weak spots in the Allied deployment and increase the pressure on the Wehrmacht to the breaking point. Improving weather conditions enabled the Allies to make the most of their air superiority. Mud, snow, and high water, aiding the German defensive, could not last forever. Allied strategic bombing was having a serious effect on German war production. The German fuel situation was becoming increasingly critical. German casualties could no longer be replaced, either in numbers or in fighting efficiency, by new inductions.

If the Wehrmacht did not venture an offensive before the end of 1944, its opportunity would be lost. Weather conditions prevented the Allies from using their air strength to full advantage. Operations on the Russian front still continued on a reduced scale, permitting the deployment of substantial German armored forces in the west. Moreover, General Eisenhower's calculated risk in weakening the front between Trier and Monschau (known to German Intelligence) suggested a line of attack familiar to the Germans, who had penetrated into France from this direction before.

Unless the German offensive succeeded quickly, it was bound to end in failure. Fuel was short, and there were not enough reserves available to maintain a prolonged drive against continued resistance. The capture of huge Allied stores, not far to the rear, was the only solution to the problem of keeping the panzers rolling.

Battle of the Bulge.—Field Marshal General von Rundstedt, reinstated with unusual powers as commander on the western front, took personal charge of the impending attack.[1] Rundstedt secretly massed the Fifth and Sixth Panzer Armies and the reorganized Seventh Army opposite the weak Allied sector. The attack force included 14 infantry and 10 panzer divisions and a relatively large air force. The Germans employed one panzer brigade, operating with captured American equipment, to spearhead combat units and to spread panic and confusion in and behind the Allied front line. Groups of combat parachutists were to be dropped in the Malmédy area. Paratroop saboteurs, many of them in American uniforms, were to attack key bridges and Allied headquarters as far back as Paris. German Army and SS (Schutzstaffel) units were instructed to be ruthless. Orders were given to the SS to stage a *Rabatz* against the Americans, which in SS slang meant an orgy of cruelty. These orders were carried out by the German armed forces, as shown by the subsequent mass slaughter of United States prisoners of war.

According to General Eisenhower's report, the German plan was to break through the thin Allied line of defense in a sudden blitz drive to the Meuse in the Liège-Namur area. Having seized Liège (the main supply center feeding the Twelfth Army Group from the north), the Wehrmacht hoped to drive rapidly to Antwerp. If the Allies were to lose the use of this port, the British armies, together with the United States Ninth Army and part of the First Army in the north, would be split from the American and French forces in the south. The Germans could then destroy these forces piecemeal.

Even if destruction was not achieved, Rundstedt expected the AEF to fall back as far as the Seine River to restore communications between the northern and southern groups. This would reduce the AEF to a precarious defensive.

On the morning of Dec. 16, 1944, thick fog covered the countryside. The four United States divisions deployed in the critical 75-mile Eifel-Ardennes sector (the 4th, 28th, and 106th Infantry, and the 9th Armored Divisions), were attacked by superior German forces, including considerable armor. The Wehrmacht penetrated Allied lines, chopping up the defenders into isolated groups, most of which were routed, mopped up, or bypassed. Fortunately for the Allies, the road center of Saint-Vith, vital to the deployment of German forces, was held for several days by units of the 7th Armored Division which had been rushed to the spot. The initial German advance was therefore somewhat delayed. When news of the German penetration reached Allied Headquarters, the 10th Armored Division from the south, as well as the 7th from the north, was thrown into the battle. The 101st

[1] Information gained some months after the surrender of Germany indicated that Field Marshal Walter Model, commander of German Army Group "B" exercised command during the Battle of the Bulge and was responsible for planning the operation. Rundstedt was nominally in command of all German forces on the western front, including Army Group "B."

Airborne Division was sent to Bastogne, another vital road junction well behind Allied front lines, when the break-through occurred.

General Eisenhower immediately suspended further Allied attacks. All available reserves were ordered to strike the rapidly deepening penetration on both flanks. The shoulders of the bulge were to be firmly held in order to prevent a German penetration west of the Meuse or in the Liège-Namur area. General Patton's Third Army prepared to counterattack in the direction of Bastogne. This push was to be followed by another assault by Field Marshal Montgomery's forces.

A gap, 45 miles wide at its base, was torn in the Allied lines between Echternach and Monschau. On December 19, the penetration grew steadily deeper, but the shoulders of the bulge held firm. General Bradley's left flank was separated from the right. The position of his headquarters in Luxembourg limited the scope of his command and communications to the area south of the German wedge. General Eisenhower fixed a boundary running east and west through the breach from Givet to Prüm. All forces north of this boundary, including the bulk of the United States First and Ninth Armies and part of the Ninth Air Force, were placed under the operational command of Montgomery and Air Marshal Coningham. Bradley retained command of the forces on the southern flank, composed mainly of the United States Third Army and the considerably reinforced 19th Tactical Air Command. Air activity was hampered at first by weather conditions, greatly to Germany's advantage.

The United States 82d Airborne Division, moved up from Reims, was assigned to the command of the Twelfth Army Group, and the 101st in Bastogne was reinforced by armor. The United States 11th Armored Division, newly arrived from England, was directed to protect the center (which was still critically bared on December 19) and, if necessary, to meet a head-on German attack on the Meuse. Infantry divisions, assembling in England, were rushed to the continent ahead of schedule. The Germans continued to advance in the center of the penetration. In the north, the Meuse bridges were protected by the 17th Airborne and the 11th Armored Divisions, but the crossings south of Givet remained alarmingly weak. All available rear echelon troops and service units, including six French battalions, were moved to the river to hold the crossings. After December 22, the fog began to lift, and Allied air forces opened paralyzing attacks.

The 101st Airborne Division at Bastogne had an immortal share in the final repulse of the German attack. Completely surrounded for five days, the 101st refused to surrender and defended the road center against almost impossible odds. If Rundstedt had been able to take Bastogne, his offensive might have achieved at least a part of its aims.

General Patton's counterattack against the southern flank of the penetration began on Friday, December 22. The general's problem was compounded by the need to guard against a German threat from the Trier region and to husband his forces until Field Marshal Montgomery could join the attack from the north. The drive began to gain ground on December 24.

The Allied air forces continued to range far and wide over enemy-held areas, depriving the Wehrmacht of fuel, food, and ammunition. The Luftwaffe, in greater strength than at any time since the landings in Normandy, flew up to 800 sorties a day. Although the Allies suffered substantial losses. their air superiority was securely maintained.

On December 26, the German offensive was finally halted. It had penetrated over 60 miles westward, to within four miles of the Meuse River near Celles and a few hundred yards from an Allied depot with millions of gallons of gasoline. None of the major German objectives were reached.

On the same day, the 4th Armored Division of the Third Army established contact with the defenders of Bastogne. The initiative passed to the Allies. General Eisenhower planned to cut into the flanks of the salient toward its communication centers, and to destroy as many German forces as possible by coordinated ground attacks from the north and south. On Jan. 3, 1945, the counterattack from the north was launched by the First Army. The United States Third Army, continuing its pressure in the Bastogne area, launched another attack from the south toward the road center of Houffalize. By January 10, the gap between the attacking forces had narrowed to a distance of 10 miles. The Germans resisted strongly to keep the eastern exit of the bulge open. Rundstedt avoided another Falaise trap but sustained heavy losses in men and matériel. On January 16, attacking forces from the United States First and Third Armies established firm contact at Houffalize and turned eastward in pursuit of the retreating Germans. Saint-Vith was recaptured by the First Army on January 23. By the end of the month, the Allies were practically back to the point of departure Advance forces attacked beyond this point in the direction of Bonn on the Rhine.

During the month after the opening of the German attack, losses suffered by the Wehrmacht were estimated at 120,000 major casualties, 600 tanks and assault guns, and 1,620 planes. By the time that the Allied counteroffensive had restored the initial position, German casualties had increased by another 100,000, and 110,000 prisoners were taken.

While the tide of battle was turning in the north, the Germans opened another drive in the south. It was originally planned to throw the southern Allied armies into confusion after the breakthrough split their lines. As the big offensive was about to collapse, its objective became less ambitious—to regain the plains of Alsace-Lorraine westward to the Vosges. The Sixth Army Group in that sector was left with minimum forces to defend its lines, since General Devers' troops were helping Patton's drive. The Allied High Command considered withdrawing the 6th Corps to the Vosges Mountains, thus exposing Strasbourg to capture, in order to establish strong defensive positions that could be held by fewer troops. The French, informed of the plan, insisted vigorously that Strasbourg should not be abandoned. French commanders said they would fight for Strasbourg without assistance rather than evacuate the city.

General Eisenhower finally decided that French civilian unrest, likely to result from the loss of Strasbourg, might seriously interfere with the security of rear areas and Allied communications. The 6th Corps merely withdrew from a

sharp salient. Its left flank then rested on the Vosges and its right extended protectingly toward Strasbourg.

On Jan. 1, 1945, the Germans attacked between Sarreguemines and Neunhofen with a force of 14 divisions and advanced more than 15 miles into Alsace. On January 7, German spearheads, crossing the Rhine north of Strasbourg, gained ground in the direction of the Colmar pocket. Stubborn American and French resistance stabilized the line before strategically essential ground was lost, and Strasbourg and the Alsatian plain were saved. The German drive was finally stopped on January 20.

Allied casualties in the Battle of the Bulge were reported as 55,421 by January 21, including 18,418 prisoners, a number of whom were murdered by their captors. There was a loss of 2,000,000 tons of stores from a depot containing 7,000,000 tons. The Germans directed many V-1 and V-2 missiles at Liège and at Antwerp.

The Allied offensive against Germany was to be resumed, taking advantage of the weakening of the opposing forces. Close cooperation with the Russian High Command and mutual understanding of respective plans became more essential than ever. It was not until late in 1944 that the first liaison with Moscow could be effected, and it accomplished little beyond establishing bombing lines. General Eisenhower's willingness to supply the Russians with all such information concerning his overall plans as the Soviet Army might desire, failed to evoke an equal response.

The Allies were greatly concerned about the reduced activity of the Soviet Army during the crucial days of the Battle of the Bulge. At Christmas time, President Roosevelt finally obtained Marshal Stalin's agreement to receive a representative of the AEF in order to discuss the correlation of their respective efforts in future campaigns. In January 1945, Air Chief Marshal Tedder, accompanied by Maj. Gen. Harold R. Bull and Brig. Gen. Thomas J. Betts, journeyed to Moscow. Stalin was told about the nature and timing of Allied plans and, in turn, explained about a great offensive, involving 150 to 160 divisions, which the Soviet Army was preparing to launch.

The Big Soviet Drive.—Most sectors of the eastern front remained static during the last days of 1944 and the earliest days of 1945. The German counteroffensive inside the Danube bend northwest of Budapest (which is the united towns of Buda and Pest) bogged down after taking Székesfehérvár, failing to reach the ring of encirclement around the Hungarian capital. Violent fighting continued within the boundaries of the city, with Malinovski's forces attacking Buda on the right bank and Tolbukhin's army attacking Pest on the left bank of the Danube. Pest was cleared block by block by January 18, but Buda was not taken until February 13. Russian reports listed German losses in the battle for Budapest as 49,000 killed and 110,000 captured.

The comparative inactivity of the Russians in Poland was primarily due to difficulties in reorganizing communications and carrying out necessary regroupments for attack. Despite continuous lend-lease deliveries, Russian transportation was strained to the limit. Late model American trucks and less modern Russian motor transports were used side by side with horse-drawn vehicles, including droshkies (old fashioned cabs) of the czarist period. While the Western World anxiously awaited the outcome of the German offensive in the west, the Russian offensive lineup was completed. The Soviet High Command chose to delay rather than to strike immediately. In the event of a major German victory in the west, offensive Wehrmacht forces might have been freed for action on the eastern front, and it seemed advisable to the Russians to maintain a consolidated position.

The Germans estimated the Soviet strength at 340 divisions. The Wehrmacht's forces in the east were estimated at 200 divisions. The average strength of a Russian division was greater than that of a German division but less than that of a complete division of the AEF.

Russian forces were divided into eight army groups. From north to south, the First Baltic Army (Col. Gen. Ivan C. Bagramian) besieged the remnants of the German Sixteenth and Eighteenth Armies in the Latvian pocket. The Third White Russian Army (Col. Gen. Ivan D. Chernyakhovski) held the border region of East Prussia under pressure. The Second White Russian Army (Marshal Konstantin K. Rokossovski) faced the Polish Corridor from positions north of Warsaw. The First White Russian Army (Marshal Georgi K. Zhukov) was aligned along the Vistula River near the Polish capital. The First Ukrainian Army (Marshal Iva S. Konev) extended along the Vistula south of Warsaw to the Carpathian range, including the Sandomierz bridgehead. The Fourth Ukrainian Army (Marshal Ivan Y. Petrov) operated in the mountainous regions of northern Slovakia. The Second Ukrainian Army (Marshal Rodion J. Malinovski) held the sector which included the southern foot-hills of the Carpathians and ranged to Budapest. The Third Ukrainian Army (Marshal Fedor I. Tolbukhin) covered the area from Budapest to the Drava River, inside the Danube bend. On its left flank, Yugoslav Partisans harassed rear guards of the German Balkan armies and Croatian puppet forces. Russian staff officers worked strenuously to train the partisans for regular warfare. Supplied with armor, artillery, and aircraft from the USSR (some of which were of American make), the Yugoslavs increased their fighting strength.

Konev's army was the strongest of all the Russian groups, and Zhukov's came next. Their combined numbers were only a little less than 50 per cent of the Soviet total. Marshal Zhukov proved to be one of the ablest commanders of the Soviet Army in World War II.

Prior to their attack, the Russian armies in Poland displayed cardboard dummies of tanks and guns, designed to mislead the Germans about the impending drive. It was obvious, however, that the Soviet Army would concentrate in the bridgehead area between Sandomierz and Baranow. On January 12, preceded by a colossal barrage from greatly superior Russian artillery, Konev's attack was launched from the bridgehead. The first trench line was practically undefended. Resistance in the second line, reinforced by concrete blockhouses and dug-in tanks, failed to stop the attackers. Konev's offensive was aimed at Kraków, in southwestern Poland close to the German and Czechoslovak borders. Its progress outflanked the Wehrmacht to the north, and threatened German forces in the Carpathians with encirclement. On January 14, Zhukov joined Konev's offensive; on January

15, the Third White Russian Army attacked on the right wing, while the Fourth Ukrainian Army, on Konev's left, stepped up pressure to prevent the Germans from sending divisions from northern Slovakia to the relief of Kraków. The attacking front widened to 560 miles. Zhukov threw pincers across the Vistula and around the Polish capital.

On January 17, the First White Russian Army, including Russian-trained Polish forces loyal to the Moscow-sponsored Polish government, captured the ruins of Warsaw. In the meantime, Konev's drive made rapid progress. On January 19, Premier Stalin, in five orders of the day, announced the capture of Kraków, Lódź, Tarnow, Praszka, and Leczyca. After seizing Warsaw, Zhukov pushed on to Poznań. His advance was even faster than Konev's who covered an average of 18 miles a day, while Zhukov progressed 150 miles in six days.

The Germans had begun to construct huge fortifications to bar the southwestern approaches to Danzig, the Corridor, and southwestern East Prussia. This "Blue Line" was never finished. Rokossovski's armored spearheads in that sector cut through the skeleton Blue Line. The Wehrmacht made no determined effort to extricate its forces in East Prussia from the rapidly closing Soviet vise. The German High Command also failed to organize a straight line of defense from the Baltic to the Carpathians. Almost amateurishly, the proud military scholars did not even try to shorten their line to minimize some of the effects of their numerical inferiority. The Germans again established hedgehogs, which were utterly useless in a region where beleaguered cities could be bypassed almost at will on good highways.

On January 22, a Soviet official communiqué announced the seizure of 1,750 populated places. On January 24, the number of captured places was claimed to be 3,500, almost half of which were in German territory. These figures included everything from tiny hamlets to good-sized cities, such as Bydgoszcz (Bromberg) inside the former Polish Corridor. On January 26, Konev's armies, after switching the main weight of their attack against Silesia, were operating well inside that province and captured Oppeln, key industrial center of Upper Silesia. On January 25, Breslau, provincial capital of Silesia, was invested from the east and Zhukov's troops encircled Toruń (Thorn) and Poznan. Toruń fell on February 1. An earlier Russian special order of the day announced that Russian forces had reached the Baltic coast between Elbing and Königsberg. The siege of East Prussia by Chernyakhovski and Rokossovski exposed Pomerania and Brandenburg to invasion. On January 27, advancing vanguards of Konev's and Zhukov's forces were 91 miles from Berlin. By the end of the month, the Russian avalanche had swept over a distance of 280 miles since January 12.

Adolph Hitler, in a message to the stunned German people on the 12th anniversary of his rise to power (January 31), claimed: "the horrid fate that is now taking shape in the east will be warded off in the end." When this statement was made, Russian positions on a 50-mile front along the Oder River were only 46 miles from eastern suburbs of the Reich capital. They had been 1,400 miles away when the Wehrmacht was battling inside Stalingrad.

Air transportation, which was successfully employed by the AEF to keep spearheads rolling, was not adequately available to the Russian armies. The Soviet foot soldiers showed magnificent endurance in prolonged advances, but inevitably they became fatigued, and the advance had to slow down in order to readjust the lines before pushing on in full strength. The center of the Russian front between the Carpathians and the Baltic was further to the west than the wings. The flanks had to be advanced to create a broad front for renewed attack. The supply system was thrown off balance. The Wehrmacht, however, was unable to take advantage of the temporary Russian vulnerability to improve its positions.

Hitler empowered Heinrich Himmler to take drastic steps to consolidate German defenses. Himmler's measures, ruthless as they were, fell short of that objective.

The Soviet High Command made good progress in strengthening Russian positions and consolidating the supply system. The most advanced lines remained static while the wings were moved up, and German islands of resistance were eliminated. Chernyakhovski pressed toward Königsberg, provincial capital of East Prussia, and Rokossovski continued in the general direction of Danzig. A part of Konev's forces progressed toward the Moravian gap, southwest of Kraków, in the general direction of Morawska Ostrava, a Czechoslovak center of heavy industry. The Fourth Ukrainian Army to the south, then under the command of Colonel General Yeremenko, approached the gap from the east and southeast.

Nearly 1,000 American Flying Fortresses, supporting Russian operations east of the German capital, raided Berlin on February 4. A considerable part of the German strategic reserves in men and armor (tanks were prepared for action still with wet paint) were massed in and around the big city. The shattering air attack reduced their mobility and accounted for many casualties.

During the first weeks of February, fighting continued on the left bank of the Danube. The Wehrmacht used its latest and most powerful tanks, the King Tiger and the Royal Tiger, both equipped with high velocity 88-mm. guns, in this secondary theater of war. The Russians countered with their Joseph Stalin Super (K V), mounting 122-mm. cannon. The Russian tank proved superior to the German, but the most effective Soviet tank was the medium T-34. After the fall of Budapest, Russian siege forces joined front line troops in preparing a drive into Austria and to Bratislava, the capital of Slovakia.

General Chernyakhovski was killed in action on February 18 and was replaced by Marshal Alexander M. Vassilevski who wiped out the East Prussian pocket in slow and methodical moves. After splitting the defenders, he eliminated the Braunsberg bridgehead on March 20. On April 9, Königsberg and its garrison of 92,000 men surrendered to the Russians.

On March 23, the bay between Danzig and Gdynia was reached by Rokossovski's forces. Gdynia was captured on March 28 and Danzig two days later. A total of 45 German submarines were seized in their pens. The Soviet Fleet joined in the struggle for the Baltic harbors, as the capture of Kolberg by Zhukov, on March 18, provided a good operational base. Its

share in the Russian victory, however, remained negligible.

The First White Russian Army extended the Oder front down to the river's estuary. East of the lower course of the Oder, Pomerania, the Corridor, and East Prussia were mopped up, and Poznań was cleared by March 1. First White Russian vanguards reached the Baltic east of Stettin on March 4. Driving westward along the shore, they seized Kolberg and reached Altdamm, on the east bank of the Oder estuary opposite Stettin, on March 20. One week earlier, the Oder positions farther to the south were consolidated, and an important bridgehead was established when the ancient fortress city of Küstrin surrendered after a 35-day siege. Konev's forces closed the ring around Breslau, which continued to resist until May 7. In the south, the Oder was outflanked by Soviet divisions pushing into western Upper Silesia through six lines of field fortifications.

In March 1945, Col. Gen. Ferdinand Schoerner, German field commander in Silesia, was appointed commander in chief on the eastern front and promoted to the rank of field marshal general. Under his command, the German eastern armies continued their vain efforts to establish effective defenses.

The Yalta Conference.—President Roosevelt, Prime Minister Churchill, and Premier Stalin met at Yalta in the Crimean Peninsula from Feb. 4 to 11, 1945, to reach agreements about the future conduct of the war and to attempt a solution of the many political problems still unsettled despite previous discussions. The timing of the conference was not propitious for the western powers. The AEF had not yet resumed its advance, while the Soviet armies were rolling on toward the heart of Germany. The Russian government pursued its political aims with great energy and not in the spirit of compromise. Russia's bargaining position was further strengthened by the Far Eastern situation. It was estimated that the war in the Pacific would last at least 18 months beyond the end of the European war. Russian participation in the war with Japan was urgently desired to minimize anticipated heavy sacrifices by the western Allies and to speed Japan's surrender.

China was not represented at Yalta. The Soviets still insisted on keeping the appearance of strict neutrality in the Far East and gave this as the reason for excluding representatives of the Chungking government. General deGaulle, heading the provisional government of France, emphasized his right to participate in the parleys in order to present French claims against Germany. The general was not invited to Yalta, however, and he refused to accept President Roosevelt's invitation to a conference in North Africa after the Crimean meetings.

At Yalta, Russian border claims in Poland were accepted in principle. Full recognition was given to the Moscow-sponsored provisional government of Poland, and London and Washington withdrew recognition from the Polish government in exile in London. It was agreed, however, that the provisional government should be reorganized on a broader democratic basis with the inclusion of democratic leaders from Poland itself and among the Poles abroad.

Poland was compensated for its territorial losses to the USSR at Germany's expense. Most of Germany east of a general line running from Stettin southward to the western border of Silesia provinces was awarded to Poland, nominally as an occupation area, but it was obvious that this decision largely determined the country's future western boundaries. Extensive transfers of population were necessary to protect Poland from a dangerously large German minority. Russia claimed part of East Prussia, including the big city of Königsberg, for itself. This claim was not contested.

A *pro forma* compromise was reached in the case of Yugoslavia. Gen. Draža Mihajlović and his Četniks were abandoned to their fate, despite their services to the Allied cause. Tito was to form a coalition government, including Ivan Subašić, former governor of Croatia and head of the royal cabinet in exile. Elections were to determine the future regime in Yugoslavia. The formula seemed to satisfy the western Allies.

An international organization to preserve future peace was also discussed at Yalta. The Yalta Conference firmly established Russian zones of influence in eastern and central Europe. The ultimate fate of Germany was left unsettled, but the conference agreed on divided zones of occupation of the country after its defeat and defined the boundaries of the regions to be occupied by the Soviet Army and the AEF. It was also agreed at Yalta that Austria would be occupied by the Allied armies and broken up into zones for an indefinite period. This contradicted the Moscow declaration of 1943 and compromised Austrian freedom before it was gained.

The USSR agreed to enter the war in the Far East within three months after the end of the war in Europe. On April 5, 1945, Moscow notified Japan of its intention not to renew the treaty of nonaggression expiring on April 25 of that year. (For further discussion of Yalta Conference, see PACTS AND CONFERENCES.)

The Invasion of Austria.—On March 24, Malinovski and Tolbukhin took the offensive in Hungary and southern Slovakia. Two days later, Yeremenko joined their drive westward.

Malinovski pierced the German lines on a front 62 miles wide and pressed forward in southern Slovakia in the direction of Bratislava. Yeremenko took Banská Bystrica and progressed toward the Vah River. Tolbukhin's opening assault, assisted by a Soviet Danube flotilla, swept through Székesfehérvár and around the northeastern tip of Lake Balaton toward the Austrian border. Large bodies of mounted Cossacks joined in the pursuit of the routed Germans. In rapid succession, Györ, Szombathely, and Sopron fell to Soviet forces. On March 30, 1945, Russian spearheads reached the region of Lake Neusiedler on the border of Austrian Burgenland Province.

On April 1, the Soviet Army entered Austria, the first victim of German aggression, more than seven years after it was invaded by Hitler's forces. The left wing of the Third Ukrainian Army captured the southwestern Hungarian oil center of Nagykanizsa. After taking Bratislava on April 4, Malinovski's Second Ukrainian Army moved into Moravia Province in the direction of its capital city of Brno (Brünn), textile center and site of important armament plants. The occupation of eastern Austria was left to Tolbukhin. After taking industrial Wiener Neustadt, the Third Ukrainian Army approached Vienna from the south on April 5. On April 10, street fighting was under way in the Austrian

capital. According to Russian accounts, the Viennese population gave valuable assistance to the attackers. Vienna was spared the prolonged ordeal of Budapest, both because the fighting spirit of the Wehrmacht had diminished and because the German defenders failed to block the city's canal system. The Austrian capital is criss-crossed underground by an intricate system of canals wide enough everywhere to let men pass and to permit the passage of the men-drawn cannon used by the Soviet Army. Guided and informed by Viennese experts, Soviet troops infiltrated the rear of German strongholds through the canals. On April 13, Vienna was free from the Germans.

While the fight inside the city was going on, Russian forces advanced through Lower Austria Province toward the Enns River. The advance halted there, and a junction was effected with United States forces. Further to the south, other Soviet units approached Styria Province. Contact was established with the Eighth Army from Italy along a line fixed by agreement, and mopping up operations in Austria were begun.

Yugoslav Drive.—On the southern wing, the Croatian provincial capital of Zagreb was taken by Tito's forces. On April 11, the Russian hold on Yugoslavia was further strengthened by the signature of a treaty of friendship, mutual assistance, and postwar collaboration which supplemented the existing alliance between the Moscow and Yugoslav governments.

The Yugoslavs, with Russian consent, were anxious to create a territorial *fait accompli* by seizing Istria, Gorizia Province, the city of Trieste, and even parts of Austrian Carinthia. On April 25, the Partisans, crossing from Sušak into Fiume, advanced across the neck of the Istrian Peninsula toward Trieste, less than 50 road miles away. Continuing along the Gulf of Trieste, they passed Monfalcone, where contact was made with British troops from the southwest. Other Yugoslav patrols, after crossing Slovenia, invested Carinthia. Tito's troops were subsequently compelled to evacuate Carinthia and Trieste and to withdraw to a predetermined line of demarcation.

Regroupment on the Western Front.—The German High Command transferred part of the remnants of Rundstedt's attack force to the eastern front. The Sixth Panzer Army was withdrawn, taking away seven panzer and panzer grenadier divisions, two panzer brigades, and three infantry divisions, all of them badly mauled. The replacements dispatched to the west in their place were mostly second-rate troops. As long as the front remained basically static, the Wehrmacht retained considerable defensive strength, particularly as long as the weather favored the defenders. February thaws made the ground extremely soft and waterlogged (attackers sometimes had to advance waist deep in water).

Allied strength of 71 front-line divisions in January rose to 85 divisions in March, 6 of which were airborne. Five to eight additional French divisions were being organized for later use. It was estimated that the Wehrmacht might be able to concentrate 100 divisions in the west if the Russian offensive should fall below expectations. Otherwise, only 80 divisions were expected to face the AEF. German divisions were greatly inferior in numerical strength to replenished Allied divisions.

General Eisenhower envisaged three stages in the campaign for final victory: first, the destruction of enemy forces west of the Rhine; second, the seizure of bridgeheads across the Rhine; and third, the destruction of remaining enemy forces east of the Rhine and the advance into the heart of the Reich.

When the Battle of the Bulge was virtually concluded, the American First Army reverted to the Twelfth Army Group under the command of General Bradley.

Reaching the Rhine.—Three phases were decided upon for operations west of the Rhine: Phase I, to consist primarily of Operations Veritable and Grenade, included the advance of the Canadian Army and the United States First Army to the Rhine below Düsseldorf. In addition, the Americans were to seize the line of the Erft west and northwest of Cologne. In Phase II, while Rhine crossings were being prepared farther to the north, the Wehrmacht was to be driven back to the river north of its confluence with the Moselle. At the same time, Allied southern forces, initiating an offensive to capture the Saar basin, were to begin their advance to the Rhine. Phase III envisaged consolidation and expansion of bridgeheads in the north, holding action on the central front, and completion of the advance to the Rhine in the south.

The first phase was to be under the control of the Twenty-first Army Group. The United States Ninth Army, built up to four corps (12 divisions), remained under the command of Field Marshal Montgomery. The date for the attack was set at no later than February 8. The Canadian First Army, employing seven infantry and four armored divisions (including the British 1st and 30th corps), was to conduct a strong offensive southeast from the Nijmegen area between the Rhine and the Maas as far as the line from Xanten to Geldern, clearing the whole area and establishing a firm flank along the Rhine. The Twelfth Army Group was to extend as far as Jülich, and the Ninth Army was to hold a front on the Roer River from Jülich to Roermond. A strong attack was to be launched toward the Rhine.

It was hoped that dry ground conditions would facilitate the drive. When the attack was launched on February 8, conditions were the reverse of what had been desired. Overcoming violent resistance in the *Reichswald* (Reich's forest), and in the outskirts of Kleve, the Canadian Army cleared that town on February 12 and the forest on February 13. On February 15, the Rhine was reached opposite Emerich. The city of Goch, held by the German First Parachute Army, resisted until February 21. Operation Grenade began on February 23. It had been scheduled originally for February 10, but the Germans, by opening the sluices of the Schwamenauel Dam, had caused the level of the Roer to rise about four feet. The attack had to wait until the floods subsided.

In clear moonlight, the 7th Corps of the First Army began the crossing of the Roer south of Düren. Before daybreak, the 19th and 13th Corps of the Ninth Army crossed the river in the Jülich sector. German resistance slackened as the drive gained momentum. Jülich fell on February 24 and Düren on February 25. The First Army pushed on toward Cologne and the Ninth toward München-Gladbach and Grevenbroich. By March 1, the Germans had lost

München-Gladbach, Grevenbroich, Neuss, Venlo, and Roermond. The German First Parachute Army, stubbornly opposed the Canadian Army between the Rhine and the Maas rivers, but the combined Veritable-Grenade operations were successfully completed. On March 4, the Allied armies made contact in the Geldern area, and six days later the Neuss-Homberg bridgehead was eliminated. The number of German prisoners taken by the AEF since D-day exceeded 1,000,000.

The First Army's continued advance toward Cologne formed part of the next phase, referred to as Operation Lumberjack. The Sixth Army Group south of the Moselle was still to remain basically on the defensive, while the Twenty-first Army Group was to complete its preparations for a major assault across the Rhine north of the Ruhr. The First Army was to seize high ground east of the Erft River and close to the Rhine south of Düsseldorf. Farther south, after the capture of the road center of Euskirchen, the drive was to converge with the Third Army's advance toward the Rhine. General Patton's objectives included the crossing of the Kyll River, seizure of the Mayen-Coblenz area, clearing the enemy from the west bank of the Rhine between the Moselle and the Ahr, and, tentatively, the establishment of a bridgehead across the Moselle River. The strategy of converging major thrusts was designed to prevent an organized German withdrawal across the Rhine.

Three panzer formations trying to stem the advance toward Cologne were dispersed by air attack. The city was invested on March 5 and firmly held two days later by troops of the 7th Corps. German *Volkssturm* battalions engaged in the battle lacked training and morale. On March 7, the west bank of the Rhine was cleared as far north as Düsseldorf.

The 3rd Corps reached the Rhine at Remagen on March 7. When fast-moving forces of the 9th Armored Division approached the river at 4:30 P.M., they found the huge Ludendorff railroad bridge still standing. Demolition charges had damaged it, but the bridge was passable. General Eisenhower stated that this offered "one of those rare and fleeting opportunities which occasionally present themselves in war, and which, if grasped, have incalculable effects in determining future success." The golden opportunity was seized, and General Bradley put five divisions across the river. The Wehrmacht was not prepared to meet this unexpected emergency. Reserves thrown piecemeal into attempts to destroy, or at least to contain, the rapidly expanding bridgehead were repulsed. The superhighway east of the Rhine was severed by the First Army. By March 24, the First Army held an area 25 miles wide and 10 miles deep east of the Rhine near Remagen, manned by three corps. The end of the war was in sight.

The center span of the bridge collapsed on March 17. By that time, supplementary floating bridges were in service, and the Allied forces east of the Rhine continued to expand.

Poor weather did not prevent Allied tactical air forces from supporting ground operations and beating off attempts by the Luftwaffe to interfere in the battle. German ground forces were isolated by air action. The largest air operation in the early months of 1945, known as Clarion, was carried out by almost 9,000 aircraft from bases in England, western Europe, and Italy. It covered an area of 250,000 square miles, including Berlin, Dresden, and Vienna.

While the 3d Corps was establishing the Remagen bridgehead, the 5th Corps on its right struck out to establish contact with the advancing Third Army. The German Fifth Panzer Army was too disorganized to hold up the American advance. Bad Godesberg and Bonn fell on March 10. The next day, elements of the First and Third Armies made contact at Andernach, trapping the Fifth Panzer Army's five understrength divisions. The Third Army had achieved substantial successes before the junction. Its 20th Corps eliminated resistance in the Saar-Moselle triangle on February 23, crossed the Saar River, seized Trier on March 2, and, after defeating German Seventh Army forces, gained the first bridgeheads across the Kyll River on March 4. The 7th Corps, spearheaded by the 11th Armored Division, broke through north of Kyllburg on March 7, and the 4th Armored Division of the 12th Corps charged across the Moselle River toward its confluence with the Rhine. By March 10, the left bank of the Rhine from Coblenz to Andernach was cleared. Phase II of the operations was virtually completed, and Phase III was well under way.

In the south, attacks by the French 1st Corps, aimed to destroy the German Colmar pocket, made little headway at first. After the United States 21st Corps (3d, 28th, and 75th Infantry and 12th Armored Divisions) joined the drive, the German Nineteenth Army began to crumble. Organized resistance west of the Rhine in that zone ceased on February 9, after the Germans had suffered more than 22,000 casualties.

The strength of the Sixth Army Group increased as the Seventh Army grew to 15 divisions. Operation Undertone, closing in on the Rhine from Coblenz southward, began on March 15. The 20th Corps (Third Army) struck from bridgeheads across the Saar and the Moselle into the Hunsrück hills. The 6th and 15th Corps (Seventh Army), including French elements, attacked northward between Haguenau and Saarbrücken. The German First Army lost Haguenau on March 15, and Zweibrücken and Saarbrücken five days later. Farther to the east, however, the defenders of the Siegfried Line offered stronger opposition.

General Patton launched an attack across the lower Moselle River into the rear of the Germans facing the Seventh Army. When Patton's 12th Corps crossed the Moselle, the Wehrmacht was unprepared to oppose its advance. Koblenz, Bingen, and Mainz were occupied by March 22. Taking advantage of German confusion, General Patton established an improvised bridgehead across the Rhine near Oppenheim, south of Mainz, in an ideally planned and executed night attack on March 22. The Fifth Division, which made the crossing in landing craft of the LCVP type, suffered only slight casualties.

Phase III was successfully concluded by March 25. The Wehrmacht had suffered severe casualties, its structure was shaken beyond hope of reorganization, and the Allies had two well established bridgeheads across the Rhine. not envisaged in original plans.

In March 1945, German emissaries in Stockholm, made overtures for a truce to the British Embassy. One school of thought in Germany advocated a separate peace with the western powers and concentration of remaining Wehr-

macht forces to halt the Russians. The separate truce proposal was summarily rejected.

The Rhine Crossing.—In the latter part of March, the AEF had been built up to nearly 4,000,000 men. Fresh divisions had arrived from the United States. French Colonials, withdrawn during the winter, were back in line, and the Twenty-first Army Group was reinforced by three divisions from the Eighth Army in Italy.

Operation Plunder, the assault across the Rhine north of the Ruhr, involved three Allied armies under the command of Field Marshal Montgomery. The United States Ninth and the British Second were to cross the river between Rhineberg and Rees, capturing Wesel and preparing for another crossing at Emerich. The Canadian Army was to hold the line of the Rhine and the Maas westward to the sea. After the successful establishment of the Second Army's bridgehead, the Canadian 2d Corps was to join the British Second Army to take Emerich, where a bridge was to be constructed. To aid the Second Army, the First Allied Airborne Army was to drop the United States 17th and the British 6th Airborne Divisions north and northwest of Wesel in an operation code-named Varsity.

Preparatory to the operation, air attacks were to isolate the Ruhr and to cut off the northwestern area of Germany. The air program began on February 21. Within one month, 40 major blows were struck by heavy and medium bombers. The RAF used a superbomb weighing 22,000 pounds for the first time. On March 11, 5,000 tons of bombs hit the rail center of Essen; on March 12, 5,487 tons hit Düsseldorf. Fighters and fighter bombers of the RAF Second Tactical Air Force and the United States 29th Tactical Air Command supported attacks on communications. Of 18 vital railroad bridges in the assigned area, 10 were destroyed, 2 were blocked by damage, and 2 were seriously damaged. Luftwaffe bases in northwest Germany were raided to keep German jet planes out of the air. Between March 21 and 24, American and British air forces flew over 42,000 sorties against Germany.

The Rhine crossing was essentially an amphibious operation, involving naval personnel. Training of naval crews on river courses where bank and current conditions were similar to those of the Rhine began in England in October 1944. LCM and LCVP craft were especially suitable for the operation. Five LCVP units of 24 each were formed in England and moved to the continent under the administrative control of Vice Admiral Alan G. Kirk. The craft measured 45 feet in length and were 14 feet wide. The LCM could load a Sherman tank or 60 men, the LCVP a bulldozer or 35 men.

At 10 P.M., on March 23, 1945, the offensive opened with a one-hour artillery barrage against German positions on the east bank of the Rhine. At 11 P.M., the British 1st Commando Brigade spearheaded the crossings, seizing Wesel. During the night, in the Second Army zone, the 15th Division led the 12th Corps assault north of Xanten, and the 51st Division led the 30th Corps around Rees. In the Ninth Army zone, the 30th and 79th Divisions launched the assault south of the Lippe Canal. On March 24, Allied bridgeheads were expanded, and additional forces were ferried across the river in the presence of Prime Minister Churchill and General Eisenhower.

Airborne Operation Varsity was the most successful of its kind up to that time. The British 6th Airborne Division was flown in from bases in East Anglia in 669 planes and 429 gliders of the RAF 38th and 46th Groups. The United States 17th Airborne Division came from Paris in 903 planes and 897 gliders of the 9th Troop Carrier Command. Fighter escort was provided by the RAF Fighter Command and the Ninth Air Force and cover over the target area by the British Second Tactical Air Force. The United States Eighth Air Force established a tight screen east of the Rhine. A total of 46 Allied planes were lost. The Airborne landings lasted from 10 A.M. to 1 P.M on March 24. On the next day, the 6th Airborne Division joined the 15th Division's advance, while the 17th linked with Ninth Army forces. Rees fell on March 25. The 16th Corps on the Ninth Army began to press southward into the Ruhr. Emerich was taken by the Canadians on March 30.

The Central Group of Armies under General Bradley conducted operations designed to establish a firm grip in the Frankfurt region, from which an advance in strength could be made toward Kassel. The First Army drove south from the Remagen bridgehead.

General Patton's Third Army, farther to the south, had extended its Rhine bridgehead to a length of 9 miles and a depth of 6 miles by March 24, taking 19,000 prisoners in 24 hours. Parts of the 12th Corps seized Darmstadt on March 25 and continued their drive to capture bridges across the Main at Aschaffenburg. The Germans fell back across the Sieg River under pressure from the 3d, 5th, and 7th Corps advancing from the Remagen bridgehead.

The 8th Corps of the Third Army established bridgeheads across the Rhine at Boppard on March 25. On the following day, two more crossings were effected at St. Goarshausen and Oberwesel. Third Army forces seized Wiesbaden on March 29. Aschaffenburg was reached on the same day, and Frankfurt was cleared of its weary defenders. The Seventh Army established bridgeheads near Worms on March 26. A junction with the Third Army was effected south of Darmstadt on March 27, and Mannheim surrendered on March 29.

On April 1, the French 2d Corps crossed to the east bank of the Rhine at Philippsburg to strike toward Stuttgart and clear the right bank of the Rhine as far as the Swiss border.

Field Marshal General von Rundstedt was replaced by Field Marshal General von Kesselring as commander in chief in the west. General Eisenhower later said this about the situation facing the new commander:

> Allied spearheads were thrusting eastward, isolating corps and divisions, and cutting off one German army from another . . . disintegration of the entire Western front developed rapidly . . . the task of exercising unified command over the German detachments was becoming almost an impossibility . . . Communications were breaking down . . . Kesselring could never be sure what the position at a given moment might be . . . and found himself increasingly unable to exercise any real control over the situation, and the organization of the Western Front collapsed completely.

DOOM OF THE WEHRMACHT

The Wehrmacht in the west was broken into isolated groups: some very strong and others extremely weak. They had only the supplies which the men and their vehicles could carry and, at best, some local reserve stores which did not permit prolonged large-scale action. Between these groups

and the objectives of a strategic retreat, if attempted, lay bombed and shattered communications. In many places, Allied armored vanguards, moving at lightning speed, had advanced beyond German positions. Envelopments continued, and attempted stands by a few diehard units, mostly SS men, invariably resulted in disaster. Local civilian authorities disagreed as to whether or not their localities should be defended. Recently drafted German soldiers tried to make their ways back home in civilian garb. Mass surrenders occurred daily on a scale exceeding the French collapse in 1940. The number of German prisoners taken in the west assumed fantastic proportions.

Early German Offers of Surrender.—The German military organization was based upon three largely independent front areas: west, east, and south. Each had its own supplies, supply lines, and operational reserves, interconnected through central strategic reserves and production centers. As the AEF progressed beyond the Rhine, distances between the various fronts shrank; communications overlapped; reserves became a disorganized mass; and whatever central organization still existed was thrown into chaos. During the last phase of World War II, the Wehrmacht's Supreme Command showed no more skill or initiative than the lesser European forces had when the Germans were battering them into submission.

Propaganda Minister Joseph Paul Goebbels, striking a Wagnerian chord, foretold that the downfall of the Reich would become "a twilight of the gods," destroying victors and vanquished alike. Another propaganda release warned the Allies and German defeatists that hundreds of thousands of "werewolves," members of a mysterious organization of avengers, would ultimately destroy the occupation forces and collaborationists.

Official efforts concentrated on attempts to negotiate a separate peace with the western powers, but the western Allies insisted on unconditional surrender to all Allied powers. If any serious attempts were made by certain German military groups which still favored cooperation with the USSR to contact the Seydlitz (Free German) Committee at Moscow in order to achieve a separate peace with Russia, they were equally ineffective. In February 1945, according to General Eisenhower, Gen. Karl Wolff, chief SS officer in northern Italy, approached Allied representatives with a view to a capitulation confined to the Mediterranean theater. The Allies replied that no terms would be discussed, and nothing short of unconditional surrender accepted.

Heinrich Himmler tried to contact the western Allies during the last week of April 1945. The chief of the Gestapo insisted that Adolf Hitler was "incapacitated" and that he (Himmler) was the designated head of the Reich. With his new authority, he offered to surrender all German forces on the western front. Count Folke Bernadotte of Sweden served as mediator. The Allied reply again stated that nothing but simultaneous unconditional surrender on all fronts would be acceptable. There is reason to believe that Himmler acted without Hitler's knowledge and that his claim that the führer was incapacitated was not correct. Himmler obviously was ready to liquidate Hitler if the Allies had accepted his proposal.

The National Redoubt.—Late in 1944, it was reported that the Wehrmacht planned a last stand in a national redoubt if the rest of Germany were occupied. The so-called national redoubt was partly on non-German (i.e. Austrian) territory, in Alpine regions, extending from Lake Constance to the Enns River and from the Bavarian Alps to the Drava Valley. The defenders would be fairly safe from air attacks in deep ravines and narrow valleys, and from the top of high mountains they would be able to check offensives which could not be effectively supported in that terrain by armor and heavy artillery. The national redoubt blocked communication lines both from north to south and from east to west. Elite troops, fanatically loyal to the Nazi Party, were to undertake lightning sorties from the redoubt into territory occupied by the Allies.

SS General Ernst Kaltenbrunner, a veteran terrorist with scant military education, was one of the authors of the plan. Some of the top Nazis liked the idea, but it was opposed by generals who realized that hardships, disease, and lack of supplies would force the national redoubt to surrender. Even the SS leaders split among themselves, but the plan was adopted in principle. Kaltenbrunner set up temporary headquarters in Bad Aussee, in the Austrian province of Styria. Between 200,000 and 300,000 men were assembled and trained for the type of warfare which was expected, but manning of the redoubt and other preparations for defense remained inadequate. The bulk of the German forces, defeated on the eastern and western fronts, made no serious attempt to reach it. Neither Hitler nor Himmler took up residence there, although Göring was captured in the Austrian Alps.

The Superiority of the AEF.—During the closing stages of the war, the AEF, in which the United States forces were predominant, was the most effective striking force engaged in European operations. Its air arm gave the first display of real air strategy in history, hitting at the most vital sources of enemy power. The Luftwaffe's methods inflicted surface wounds on the enemy. The United States and British air forces struck at his heart. The AEF introduced no revolutionary innovations of strategy on the ground, but followed age-old basic rules, such as penetration, outflanking, and envelopment. A superlative performance, however, was given in the field of elasticity of operations, with rapid, smoothly executed adaptations to the fluctuations of battle. The AEF excelled all other armies in matériel. It had not only the largest number of automatic weapons, artillery, armor, aircraft, and motorized equipment per unit, but the most minute and heretofore neglected details were incorporated into the construction of its mechanized equipment.

The AEF functioned as a gigantic machine of destruction, operated by skilled and intrepid specialists. Its technical perfection was largely due to American production power, unsurpassed by the combined potentialities of all other belligerent nations. Neither the state-owned and controlled industries in the USSR nor the privately owned and state-supervised industries in Germany or Italy could compete with United States production based upon individual initiative.

In addition to personal bravery and discipline —qualities shared by many other armies—the American soldiers displayed a technical skill and

familiarity with the mechanical devices of modern warfare far beyond that of the men of other countries. Even raw recruits could quickly learn to operate intricate mechanisms. The introduction of new types of weapons, frequently delayed in other armed forces by the difficulty of training soldiers to handle them properly, was never a serious problem to the United States Army. Thus, the high American standard of living—which European military traditionalists believed would weaken American fighting spirit—became in reality a source of exceptional strength and military efficiency.

The only field in which Germany surpassed the Allies was that of propaganda. The United States Office of War Information employed a large and expensive staff to incite the German people to rise against the German ruling party and military leaders. Their efforts produced no appreciable results. There were some questionable reports of internal popular resistance to the Hitler regime in Germany, such as the melodramatic story of a mysterious youth organization called "Edelweiss Pirates," but unbiased observers could not find any conclusive evidence of popular anti-Nazi activities. Allied forces had no support from German citizens in their drive through the Reich, whereas a number of cases of civilian violence against Allied troops were reported. These acts of violence, however, were never serious enough to confirm the predictions of Dr. Goebbels' propagandists.

Encirclement of the Ruhr.—On March 30, 1945, the United States Fifteenth Army was activated under the command of Lt. Gen. Leonard T. Gerow (as a part of the Twelfth Army Group), with the function of occupying, organizing, and governing the parts of Germany already conquered. Its area of control was extended as the other armies advanced to the east.

By far the greatest single concentration of German troops in the west was massed in the Ruhr area. Before driving deeper inside Germany, the Allied High Command decided to encircle the Ruhr and eliminate the pocket. The productive capacities of the Ruhr industries were no longer helpful to the Reich's war effort. It was hard to understand why Field Marshal Gen. Walther von Model (in command there) failed to attempt an evacuation of the Ruhr prior to the Allied attack. General Eisenhower attributed this in part to the innate insistence of the Germans upon fighting where they stood in preference to retreating.

The 16th Corps of the United States Ninth Army penetrated the industrial area from the north, while the 19th Corps on its left flank pushed eastward. The 7th Corps of the United States First Army struck from the south. Contact between the First and Ninth Armies was established on April 1, near Lippstadt. The junction sealed off the Ruhr, and mopping up operations began. By April 18, when the Ruhr pocket was liquidated, 325,000 had been captured, including 30 general officers. A total of 21 German divisions were destroyed, including 3 panzer, 1 panzer grenadier, and 3 parachute divisions. The entire German Army Group B and two corps of Group H were annihilated. German resistance to the liquidation of the pocket collapsed after Field Marshal von Model's attempts to strike out from Hamm in the north and from Siegen in the south were frustrated.

After the elimination of the Ruhr, the northern route of advance lay across the north German plain toward the Baltic and the Reich capital. According to General Eisenhower, "Berlin was the symbol of victory before the eyes of every Allied soldier from the day we set foot in Normandy." Berlin, however, did not lie within the limits of advance set for the AEF at Yalta. Although American and British forces could probably have outraced the Russian drive to Berlin, other goals were set for them. German forces located in occupied parts of Holland, in Denmark, in Norway, and along the southwestern shore of the Baltic were to be cut off by a thrust to that sea. German ports, naval bases, and shipyards were to be seized, ending the fading threat of submarines.

In central Germany, the trapping of Army Group B opened an easy avenue of advance from Kassel through Erfurt toward Leipzig and industrial Saxony. In the south, the axis of advance led through Nürnberg and Regensburg into Austria via the Danube Valley.

The greatest Allied strength was engaged in the center, where General Bradley's Twelfth Army Group (which by then included the Ninth Army), was operating. The city of Kassel was cleared on April 4, 1945. From there, the Central Group of armies was to launch an offensive toward Leipzig, establishing its right flank on a line from Bayreuth to the Erzgebirge (Ore Mountains). General Bradley was instructed "to seize any opportunity of capturing a bridgehead over the Elbe River and to be prepared for operations farther east." The Russians, however, were expected to reach the Elbe River or even its left (western) bank before the Twelfth Army Group, which would make operations east of the Elbe unnecessary.

In the south, General Devers' Sixth Army Group was to protect the right wing of the central advance, to prepare for a thrust in the direction of Nürnberg-Regensburg-Linz to prevent German concentrations in that area and, if necessary, to penetrate into the national redoubt from the north.

In its advance to the Baltic, Field Marshal Montgomery's Twenty-first Army Group was to mop up the whole northern area from Kiel and Lübeck westward, to advance toward Bremen and Hamburg, and to protect the Central Group's left flank on the Elbe. The Canadian Army, under Montgomery, was assigned to clear northeast Holland, the coastal belt eastward to the Elbe, and west Holland, in that order of priority.

The Atrocities of Buchenwald.—General Patton's Third Army, spearheaded by the 20th Corps, carried the central drive eastward with remarkable power and speed. Scattered German forces, precariously entrenched behind roadblocks, were quickly overrun. Weimar was reached on April 11, Erfurt on April 12, and Jena the following day. The capture of Weimar gave the Americans possession of the Buchenwald concentration camp, where unspeakable horrors paled any previous description of German atrocities. Camps captured later, such as Gardelegen, Bergen-Belsen, and Mauthausen, confirmed the Buchenwald reports. The overwhelming majority of the victims were non-German nationals and Jews who were not considered Germans by the Reich government regardless of their birthplace. Germans living in the vicinity of the camps denied knowledge of any atrocities, displaying their contempt for Allied credulity. Top German war

criminals assumed the same attitude. The existence of concentration camps was common knowledge in Germany, however, and conditions inside these "death factories" were no secret either. The psychological effect of German atrocities added to the determination of Allied soldiers to bring the war to a swift and victorious end.

Deathblows from the West.—On April 13, the United States 4th Armored Division reached the outskirts of Chemnitz, an industrial city in Saxony close to the northwestern Czechoslovak border. Strong defensive positions in the Erzgebirge Mountains were rapidly overcome by the advancing Americans. The population of former northwestern Czechoslovak border cities, annexed to Germany under the Munich Pact and composed almost entirely of German nationals, displayed hostility toward Allied troops. Czechoslovakia was invested by the western Allied armies on April 18. First Army forces broke down German resistance in Saxony, where the 69th Division of the United States 5th Corps cleared the big city of Leipzig on April 19 after a two-day struggle. A German salient, extending westward from the line of the Mulde River to the Leipzig-Halle area, was eliminated.

To the left (north) of the United States First Army, the United States Ninth Army established a bridgehead across the Weser River at Hameln on April 6. Advancing at the rate of 20 to 30 miles a day, it reached the Elbe south of Magdeburg on April 11. On the east bank of the Elbe River, huge masses of disorganized German troops faced the onrushing Americans. The United States 2d Armored Division established the first bridgehead at Brunswick on April 12. The next day, the 5th Armored Division of the 13th Corps crossed the river south of Wittenberge. Sharp resistance had to be overcome at Magdeburg, but the city was in American hands on April 18. Another Elbe bridgehead was gained and secured at Barby, despite German attempts to destroy bridges by floating mines. The Yalta Agreement set limits to the AEF's advance. With the Soviet Army moving rapidly westward toward the Elbe, there was no sound strategic reason to continue the drive. Only the Barby bridgehead was kept under AEF control.

South of the Harz Mountains, the United States First Army pushed on against generally disorganized resistance. On April 14, the 3d Armored Division of the 7th Corps reached Dessau. About 10,000 Germans, almost encircled in the Harz, raided Allied communications in determined sorties. In one of the last flare-ups of German fighting spirit, the Clausewitz Panzer Division, undertook a swift 50-mile dash back through territory lightly held by Americans to reinforce or relieve the pocket in the Harz Mountains. Before the Clausewitz Division could reach its objective, however, the drive was stopped. On April 21, the Harz Mountains were cleared.

The operations of the Twenty-first Army Group north of the Ruhr proceeded according to plan. The Second Army advanced with the 30th Corps on the left flank, the 12th Corps in the center, and the 8th Corps on the right. North of Münster, the First German Parachute Army disintegrated. On April 6, the 8th Corps, after establishing a bridgehead across the Weser River, continued toward the Elbe, which was reached by the 11th Armored Division near Lauenburg on April 19. The 12th Corps overcame stubborn resistance and reached Harburg on the south bank of the Elbe, opposite Hamburg, on April 20. The drive of the 30th Corps to Bremen was contested. The edges of the big port were reached on April 22. The last vestiges of German opposition were overcome on May 3.

The Canadian Army, moving into Holland, met little resistance in the north of the country. The sea was reached on April 15, and most of that region was liberated six days later. In the west, the Germans made an attempt to hold the Ijssel River line at Deventer and Zutphen. On April 10 the Canadians broke through near Deventer. In the south, the Canadian 1st Corps, attacking from Nijmegen, cleared the lower Rhine by April 5 and took Arnhem 10 days later. The Germans, controlling the Dutch system of dykes and dams, succeeded in flooding water lines and creating the inner "Fortress Holland." Large-scale attacks to penetrate the fortress bastions would have had disastrous effects upon the Dutch people. A prolonged siege, too, would have caused terrific misery. German looting had reduced civilian supplies to almost nothing. The Wehrmacht could have held out for some months, but the Dutch would have been doomed to mass starvation. Besides, the Germans were capable of loosing additional floods, which would put almost the entire country under water and ruin its fertility for a long time. The Allies wanted General Blaskowitz, German commander in Holland, to abstain from further flooding, and pointed out to him that the retention of Holland could not prevent the collapse of Germany. The German commissioner for Holland, Dr. Artur Seyss-Inquart, proposed a truce. A representative of the Supreme Command of the AEF met Seyss-Inquart in the presence of a Russian representative. Agreements were reached as to the immediate alleviation of the needs of the Dutch population by the Allies. No surrender was negotiated, as Blaskowitz insisted, according to Seyss-Inquart, that this could not be considered as long as any form of resistance continued in Germany. The Canadians held fast on the Grebbe Line until the general German surrender relieved Holland.

In the south of Germany, the Sixth Army Group pushed the Seventh Army to a line running roughly from Ludwigsburg via Crailsheim and Nürnberg to Bayreuth, where a junction was established with the Third Army. On April 11, the 21st Corps captured Schweinfurt. The 6th Corps seized Heilbronn and Würzburg, and crossed the Neckar River on April 12, after one week of fighting. On April 16, the 15th Corps reached the Nazi shrine of Nürnberg. German fanatics held the city for four days. The beautiful mediaeval buildings of Nürnberg were almost completely destroyed.

During the last week of March, the 15th Corps of the United States Seventh Army (Maj. Gen. Wade H. Haislip) bridged the Rhine river on a 15-mile front between Gernsheim and Mannheim. Advancing 25 miles, it established contact on April 1 with the 1st Corps of the French First Army (Gen. Jean de Lattre de Tassigny) south of Heidelberg. General de Tassigny's forces took Karlsruhe on April 4 and Baden-Baden on April 12. The French 1st Corps, breaking out from Strasbourg, took Kehl, on the opposite bank of the Rhine, on April 15, and pursued the Germans through the Black Forest.

On March 9, the AEF and the Soviet Army

were still 300 miles apart. By April 7, the two armies were separated by 175 miles, and the distance had shrunk to 78 miles by April 15, due chiefly to AEF advances. Then the Russian offensive against Berlin began, and the AEF came to a prearranged halt along the central Elbe River. The Soviet Army, in its final drive, covered the remaining distance in the central sector.

On April 25, at 4:40 P.M., patrols of the United States 273d Infantry Regiment (69th Division, 5th Corps) met elements of the Russian 58th Guards Division in the Torgau area on the Elbe. The eastern and western fronts were joined; Germany was cut in two; the object of the central thrust had been achieved. Any German chances of recreating an organized front vanished completely. The German administrative system as a whole was paralyzed. Communications could no longer be used even for the purpose of carrying mail.

There were still some 50 German divisions north of Torgau. Their striking power hardly equalled that of five Wehrmacht divisions during the early years of World War II. A force estimated at 100 nominal divisions (each between battalion and brigade strength) was reported south of the dividing line. Prior to the German surrender, the possibility could not be overlooked that some of the southern German forces might attempt to retreat to the national redoubt, or that northern group forces might attempt to reach Denmark and Norway for another last ditch stand.

Even the superlative AEF ground supply organization could not carry all necessary matériel to the front. Airborne supply had to help out again. "Flying boxcars" (transport planes) were very valuable in the closing stages of the war. Overcoming many obstacles, 1,500 C-47's of the 9th Troop Carrier Command supplemented by heavy bombers, which flew over 20,000 sorties in April 1945, carried nearly 60,000 tons of freight, including 10,255,509 gallons of gasoline, to assist ground elements.

Mopping up operations in the north were carried out by the Twenty-first Army Group, with the United States 18th Airborne Corps under its command. The strong German naval fortress on the island of Helgoland had been neutralized by a heavy air attack on April 18.

After the fall of Bremen, the British 8th Corps crossed the Elbe at Lauenburg. The United States 18th Airborne Corps, fighting on the ground, protected the British right flank. The British 11th Armored Division dashed across Schleswig-Holstein on May 1, reaching Lübeck on the Baltic the next day, to seal off the German garrison in Denmark. The British 6th Airborne Division reached Wismar on May 2. On May 3, the British 30th Corps completed the mopping up of the area between the Elbe and Weser rivers. Also on May 3, another junction with the Soviet Army was achieved when the United States 18th Airborne Corps established contact with Russian troops who had driven through Mecklenburg in pursuit of dissolving German units after taking Stettin. Allied forces in the north met no further resistance. Fleeing westward before the Soviet Army, enormous bodies of German troops attempted to cross the central Elbe to give themselves up to the AEF rather than to the Russians. Innumerable civilians joined the panicky soldiers. One AEF corps alone set an all-time mark by taking 300,000 prisoners in the course of a single day.

In the south, the United States Third and Seventh Armies lashed out for the finishing blow on April 22, 1945. On April 25, the 20th Corps crossed the Danube on both sides of Regensburg, which was taken on the following day after some fighting, and drove on toward Austria along the right bank of the river, while the 12th Corps did the same on its left bank. By May 2, the 12th Corps reached Passau, on the border of Upper Austria province. Its 11th Armored Division received the surrender of the provincial capital of Linz on May 5. The 5th Corps of the United States First Army reverted to the left wing of Patton's forces for a drive into Czechoslovakia through the Bohemian Forest. The advance into Czechoslovakia spread to a broad front along the line Budějovice-Plzen (Pilsen)-Karlsbad (Karlovy Vary). Plzen fell to the Third Army on May 6. The Czechs gave the Americans a rousing welcome. It was agreed among Allied commanders that the AEF should not move beyond a line running from Karlsbad to Budějovice, then along the railroad to Linz, on the south (right) bank of the Danube to the confluence of the Enns River, and then up toward the watershed between Upper and Lower Austria provinces.

In Prague, capital city of Czechoslovakia, armed uprisings against the German garrison were carried out by patriots. On May 5, the Czechs seized strategic positions inside the city but were violently attacked by the Wehrmacht. Frantic Czech calls for help reached both the AEF and the Red forces. Although the AEF was only a score of miles away and did not face serious opposition, it could not heed the call because of the agreement with the Russians. The latter finally succeeded in entering Prague before the patriots or the city suffered great harm.

South of the Danube, on the right flank of the Third Army, units of the 20th Corps moved eastward to reach the Inn River opposite Braunau, the birthplace of Adolf Hitler. On their right flank, the 3d Corps bridged the Danube near Ingolstadt on April 26, the Isar on April 28, and reached the Inn River at Wasserburg (Bavaria) on May 2. This sector was subsequently taken over by the Seventh Army.

The 15th Corps advanced toward Munich, capital city of Bavaria, which was taken on April 30 after moderate resistance. One SS panzer division opposed the American drive eastward along the foothills of the Alps. On May 4, the 3d Division of the 15th Corps cleared Berchtesgaden. American soldiers went sightseeing in Hitler's legendary mansion and his "Eagle's Nest." Other American units cleared Salzburg in Austria, while remnants of German units in Salzburg and Upper Austria provinces collapsed.

The United States 21st and the 6th Corps crossed the Danube at Dillingen on April 22 and at Donauwörth on April 24. The drive continued toward the Alps. Infantry moved ahead of armor in difficult terrain, weakly defended by the enemy. On May 3, Innsbruck, provincial capital of the Austrian Tyrol, was reached, and the 103d Division of the 6th Corps moved southward across the Brenner Pass. At Vipiteno, on the southern side of the Brenner, the 103d Division established contact with the 88th Division of the United States Fifth Army, which was pushing

northward after the surrender of the German and Italian Republican Fascist troops.

The French 1st Corps reached Lake Constance on April 22 and established contact with the United States Seventh Army two days later. The industrial city of Stuttgart had been captured by French forces on April 21. Three remaining Wehrmacht pockets in the southern Black Forest, near Stuttgart and near Sigmaringen, were eliminated by April 27. Driving along the northern shore of Lake Constance, the French reached the Austrian border on April 30, and seized Feldkirch, in Vorarlberg Province, on May 4.

Far to the rear of the battlefields, some Wehrmacht enclaves still held out. An attack was launched against the Gironde stronghold on the French Atlantic coast on April 14. German resistance came to an end on the north bank of the Gironde River on April 18, and on the south bank on April 21. The island of Oléron was reduced on May 1. German garrisons at Lorient and St. Nazaire held out until the general surrender.

General Eisenhower said this about the final attitude of the Luftwaffe and the German Navy:

> Of enemy offensive activity in the air there was no sign. As the area left to the Germans decreased, the congestion of planes on the remaining airfields grew worse, and the number of aircraft destroyed on the ground mounted in proportion. The demoralization of the German Air Force personnel was too far developed for any suicidal effort to be made with the jet aircraft squadrons left in Austria and Czechoslovakia, and by the beginning of May practically the only flights undertaken were for the purpose of desertion.
>
> The end of the German Navy was even more unspectacular. Having put to sea only on rare occasions throughout the war, then invariably to be hounded to their destruction or driven crippled back to their bases where the Allied air forces repeatedly undid any repair work attempted, the heavy units lay helpless in the northern ports as these fell into the hands of the advancing armies. Only three of the larger ships were in anything approaching a condition for effective action when the last naval bases surrendered. The coastal craft had ceased to operate during April, and it was left to the submarine forces—the only truly successful naval weapon of which the enemy had enjoyed the use—to carry on the fight to the end.

Final Victory in Italy.—Except for one local drive, the Italian front remained quiet through the first three months of 1945. This drive, opening on January 5, in the eastern sector near Ravenna, was carried out by the Eighth Army on the isthmus between Lake Comacchio and the Adriatic. Meeting strong resistance, it did not fully achieve its objective, which was to eliminate all German positions east of the Senio River. The German command, however, had no illusions about the ultimate outcome, as shown by SS General Wolff's surrender overtures in February.

Allied forces in Italy included 14 British and Dominion divisions (Indians, New Zealanders, and South Africans), 7 United States divisions, 2 Polish divisions and 1 Brazilian division, in addition to smaller Greek and French formations and Italian auxiliaries. They had some support from anti-Fascist Italian partisans in parts of the country still occupied by the Germans and under nominal Republican Fascist rule. Attacks by the Allied Mediterranean Tactical Air Force and the Strategic Air Force were extremely effective. During the year preceding the German surrender, the Tactical Air Force flew a total of 38,787 sorties and almost isolated northern Italy.

On the eve of the final offensive, the Fifth Army (Lt. Gen. Lucian K. Truscott) held approximately two thirds of the total length of the front, from the Ligurian Sea (Mediterranean) to the Senio River. The rest of the trans-peninsular line to the Adriatic was manned by the Eighth Army (Lt. Gen. Sir Richard L. McCreery). German forces numbered 25 divisions in line and strong echeloned reserves. After Kesselring's appointment as commander in chief in the west, Col. Gen. Heinrich von Vietinghoff-Scheel took charge of the Wehrmacht in Italy.

The Eighth Army opened the assault on April 9. It was preceded by a clever infiltration of the rear of the German Tenth Army. Since April 6, small groups of Allied soldiers, travelling in rowboats and other light craft, had been crossing Lake Comacchio and fanning out behind the Wehrmacht's lines. Heavy aerial bombardment with fragmentation missiles and flame-throwing tanks shattered German ranks. Five days after the Eighth Army's attack, the Fifth Army started an offensive, spreading from the western wing toward the center and piercing the Appennine Mountains. After capturing Massa and Vergato, the vanguards of the Fifth Army entered the Po plain, well west of Bologna, on April 20. Under heavy pressure from Polish units of the Eighth Army, in the east, the garrison of that city could not counter the surprise drive from the west. On April 21, Bologna fell to combined Fifth and Eighth Army forces.

A huge gap was torn in the German center. Both wings were unanchored and disintegrated. The Allied drive sped through northern Italy with irresistible might. Moving up the Adriatic coast, the Eighth Army crossed the Po River while the Fifth took La Spezia on the Mediterranean on April 24 and rode into Genoa the next day. Armored columns raced toward the Swiss border near Como to cut off the retreat of all Axis forces in the northwest.

At Como, Benito Mussolini met his fate. The former Fascist dictator and later German puppet had left Milan after its evacuation by the Germans, when anti-Fascist partisans gained increasing control of the city. Accompanied by a few followers, including Achille Starace, former leader of the Black Shirt militia, and by his young mistress, Clara Petacci, Mussolini tried to reach Switzerland, but the Swiss government refused to admit the fugitives. The party was seized by Italian partisans, summarily sentenced, and shot. Their bodies were carried to Milan on April 28 and hung by their heels in Piazza Loretto.

On April 30, General Mark Clark was able to announce: "Troops of the Fifteenth Army Group have so smashed the German armies in Italy that they have been virtually eliminated as a fighting force. The military power of Germany in Italy has practically ceased."

In a broadcast directed to Germans and Republican Fascists alike, Italian Marshal Rodolfo Graziani, who backed Mussolini after his downfall in 1943, urged surrender. At the time the broadcast was made, the surrender was already under way. The subsequent count of prisoners revealed that the Fifteenth Army Group had been faced by no less than 1,000,000 enemy soldiers at the end.

Allied troops had conquered the Italian peninsula from the south. They had reached European soil when German strength was still near its peak, and some of their formations had come

all the way from the western desert. Unfortunately, the remarkable achievements and heavy sacrifices of the Allied forces in Italy were not fully appreciated by the public, since the Italian victory was overshadowed by events in Germany.

Forced marches carried Fifth Army units through the towering mountains of the Southern Tyrol to a junction with Seventh Army forces. Other Fifth Army troops reached the French-Italian border from the Riviera to Switzerland. The Eighth Army, meeting no resistance beyond the Po plain, established contact with Yugoslav partisans and marched into the Austrian provinces of Carinthia and Styria.

The Last Soviet Assault.—Premier Stalin appointed Marshal Zhukov as field commander on the eastern front. Despite the promotion, Zhukov also retained specific command of the First White Russian Army. By April 10, the crucial sector of the eastern front ran almost straight north and south from the Baltic near Stettin to the Czechoslovak-German border in the region of the Neisse River. The Second White Russian Army then held the right wing, the Third, on its left, ranged to the north of Küstrin, the First continued beyond Frankfurt on the Oder, and Konev's First Ukrainian Army was facing Saxony and the northwestern border region of Czechoslovakia. These four groups numbered about 2,000,000 fighting men.

The German government harangued its soldiers and citizens, urging them to repel the Russian onslaught at all costs and to defend Berlin to the last. Outnumbered, outgeneraled, and outmatched in equipment and morale, the Germans were beaten before the final Russian assault opened.

After a stunning barrage, Konev's First Ukrainian Army crossed the Neisse River on April 14, 1945. The initial push carried Konev westward in the direction of Dresden and Leipzig. Field Marshal General Schoerner made an attempt to rally a few divisions to hold the Russians——advancing at a speed increasing from 6 to 18 miles a day—east of these cities. Konev suddenly switched his main forces northward toward the Spree River. Masses of German armor and infantry were assembled to strike a surprise blow at Zhukov's left flank if the White Russians invested Berlin from the east. Konev broke into these German reserves from the south and routed them.

On April 16, Zhukov's army, supported by the bulk of the Soviet Air Force and 4,000 tanks, broke loose, followed immediately by Vassilevski and Rokossovski. The latter's forces were assigned to occupy northernmost Germany to the "boundary" with the western Allies. Zhukov faced stronger opposition than Konev, but the previously established bridgehead of Küstrin proved highly advantageous. On April 18, outflanked from Küstrin, the German central Oder positions crumbled. Red tanks poured into the gaps, and the lines collapsed. Russian columns reached the eastern outskirts of Berlin about 48 hours later. Throwing pincers around the city, Zhukov's forces sped to Oranienburg, north of the capital, and Konev's men to Bohnsdorf, south of Berlin. Converging patrols of both armies met west of the capital on April 24. On the following day, the encirclement of the city was complete. No attempt was made to break the Russian siege lines from outside the capital.

Red forces north of Berlin took Königswusterhausen, site of the big radio transmitter *Deutschlandsender*. Other troops of Konev's army reached Senftenberg, 14 miles from Dresden. Malinovski's Second Ukrainians hammered away at Wehrmacht divisions inside eastern Bohemia. Stettin, Rostock, and Warnemünde were captured on April 27. The Germans who remained in Latvia were annihilated. Berlin remained the crucial point.

Tempelhof airdrome fell on April 26. On April 27, the industrial suburb of Siemensstadt was in Russian hands, and the attackers penetrated the innermost section of Berlin, Unter den Linden, and the Tiergarten. Endless Russian columns poured into the bomb-scarred city, colorful, strangely spectacular, and intoxicated with victory. Some German units still fought block-by-block in subway shelters and makeshift forts. The last days of Berlin were a holocaust of destruction. On May 1, the Russian victory flag was raised over the Reichstag building. The next day, Artillery General Weidling surrendered all sections of Berlin still held by the Germans. Approximately 135,000 prisoners were taken—all that remained of a defense force of 500,000 men.

On May 6, Swinemünde on the Baltic fell to the Russians. The last pockets in the rear of the Soviet Army were cleared. Breslau was taken, and Malinovski completed the conquest of Moravia. The very last German stand was made south of Olomouc, in Moravia. It lasted for one day.

Germany's Unconditional Surrender.—A German communiqué of May 1, 1945, reported that the führer, Adolf Hitler, had died in action at 3:30 P.M. This claim was immediately revised to state that he had committed suicide. The magnitude of events minimized the stature of the man who had been visualized, for more than 12 years, as the sinister demon of the world. During the months preceding Germany's ultimate débacle, Hitler was hardly more than a fading symbol of a terrific evil that befell the post-World War I generation: that of self-abandonment to the spirit of a new tyranny and terrorism, generated by mass propaganda and maintained by mass persecution. This evil found its most violent expression in traditionally aggressive Germany. News of Hitler's death was far less electrifying than it might have been earlier in the war or even prior to its outbreak. His orders were invoked as an excuse by men who claimed to have acted upon his commands when committing their untold crimes, and by countless German fellow travellers who insisted they had been duped. In reality, all these men had acted according to their true instincts. No final evidence of Hitler's death, or the circumstances under which it occurred, was ever presented, nor was the evil eradicated by his disappearance. The communiqué issued on May 1 was the preface to complete German surrender.

Grand Admiral Karl Doenitz broadcast on May 1 from his headquarters at Flensburg, close to the Danish border, announcing that he had formed a new government whose first duty was "to save Germany from destruction by the advancing Bolsheviks," adding that "as far and as long as the achievement of this aim is impeded by the British and Americans, we [the German government] shall be forced to carry out our defensive fight against them." Doenitz and his Cabinet—men with aggressive pan-German rec-

ords—neither could be nor were considered to be the legally established government of the Reich and, for the time being, there was no Allied intention of allowing any such government to exist. To bring about organized surrender, however, the Allies chose to deal with whatever agency presented itself in Germany. Piecemeal surrenders had already begun.

On April 26, SS General Wolff again offered capitulation of the German forces in Italy, including Italian Republican Fascists. On April 29, his representatives signed the terms of surrender by which all hostilities in Italy were to cease on May 2. At that time, General Wolff inquired with whom the capitulation of the German North Alpine troops could be negotiated. He was told to apply to General Devers but was warned that only unconditional surrender would be acceptable. On behalf of the North Alpine German Army Group G (First and Nineteenth Armies), their commander, General Schulz, signed the surrender terms at Haar, Bavaria, to take effect at noon on May 6. In mid-April, Field Marshal General Busch had expressed his willingness to capitulate in the Hamburg area as soon as the western Allies reached the Baltic. General Lindemann, German commander in Denmark, was ready to yield at the same time as Busch. On April 30, a German emissary, arriving at Stockholm, confirmed these offers, but insisted that the two commanders would not surrender to the Soviet Army under any circumstances.

The western Allies did not want a surrender which did not include the forces facing east. On May 3, Admiral von Friedeburg, Doenitz' successor in command of the German Navy, appeared at Field Marshal Montgomery's headquarters and asked to be allowed to surrender the German Third Panzer Army, and the Twelfth and Twenty-first Armies, which had been fighting the Russians. Montgomery refused to discuss any terms which avoided the necessity for surrender to the Soviet Army but informed them that individual soldiers who surrendered would be treated as prisoners of war. The German representatives returned to Field Marshal Keitel, chief of the German High Command, for further instructions. On May 4, Admiral Friedeburg announced that he had permission from his superiors to offer unconditional surrender of all German armed forces, land, sea, and air, in northwest Germany, including the Frisian Islands, Helgoland and all other islands, Holland, Schleswig-Holstein, and Denmark. This capitulation was regarded as a tactical matter, and it was arranged that a Russian officer should be present on behalf of the Soviet High Command when it was accepted. This part of the German surrender was signed on May 4 and became effective on May 5 at 8 A.M.

Also May 4 it was learned that a representative of Admiral Doenitz would arrive at General Eisenhower's headquarters the following day and that all German U-boats had been ordered to return to port. The Soviet High Command was immediately informed and agreed with General Eisenhower's suggestion that a Soviet officer should be present in order that a simultaneous capitulation on all fronts could be arranged. This assignment was given to Maj. Gen. Ivan Suslaparov.

At a modest brick building—an industrial school at Reims, France, which was the site of Supreme Headquarters Allied Expeditionary Force—Admiral Friedeburg arrived on the evening of May 5, 1945 and was informed that only unconditional surrender would be considered. He said that he did not have the power to sign a document of capitulation. When he was shown the hopelessness of the Reich's position, Friedeburg communicated with Doenitz and learned that Col. Gen. Alfred Jodl would be sent for the negotiations.

General Eisenhower in his report states:

> Jodl arrived on the evening of May 6. It was at once obvious that the Germans were merely playing for time so that meanwhile they could evacuate the largest possible number of soldiers and civilians from the Russian front to behind our lines. They persisted even now in attempting to surrender the Western Front separately, going so far as to say that, whatever my answer might be, they intended to order their armies to cease firing upon the Anglo-Americans. They asked for an adjournment for 48 hours before signing the final surrender, allegedly to enable them to get the necessary orders to their outlying units, but actually, it was clear, only to gain further respite for the purpose above mentioned.
>
> They were informed that unless they agreed to my terms forthwith, I would break off all negotiations and seal my front, preventing, by force if necessary, any further westward movement of German soldiers and civilians. They then drafted a cable to Doenitz, asking for authority to make full surrender, but specifying that actual fighting would cease 48 hours after signing. Since this solution obviously placed the decision as to when fighting should cease in the hands of the Germans, I refused to accept it, and finally told them that unless all hostilities should terminate on both fronts within 48 hours of midnight that night, my threat to seal the western front would be carried out.
>
> This declaration at last had the desired effect. Doenitz gave his approval for the acceptance of my terms, and at 0241 hours [2:41 A.M.] on 7 May the act of surrender was signed by Jodl on behalf of the German High Command. My Chief of Staff [Lt. Gen. Walter Bedell Smith] signed for me, and General Suslaparov signed for the Soviet High Command. General Savez of the French Army, Deputy Chief of Staff for National Defense, signed as witness. The terms were to become effective at midnight, 8–9 May.
>
> In addition to the act of military surrender, Jodl signed an undertaking that the Chief of the German High Command, with the Commanders-in-Chief of the Army, Navy, and Air Force, would appear at a time and place to be designated by the Soviet High Command and myself for the purpose of executing formal ratification of the unconditional surrender on behalf of the German High Command. This meeting was held in Berlin on the night of 9 May, when Air Chief Marshal Tedder signed on my behalf, and Marshal Zhukov for the Soviet High Command. General Spaatz of the United States Air Forces and General de Lattre de Tassigny (representing the French government) were present as witnesses.

Field Marshal General von Keitel signed as chief of the German High Command and for the Wehrmacht Heer, Admiral Friedeburg for the Wehrmacht Marine, and Col. Gen. Paul Stumpff for the Wehrmacht Luftwaffe.

General Eisenhower reported:

> With this final capitulation by the German leaders, the mission of the Allied Expeditionary Force placed under my supreme command on 14 February 1944 was accomplished.

Norway's liberation was achieved by Germany's surrender. Victory in Europe came five years, eight months, and nine days after the attack on Poland. The magnitude of the German military defeat was unparalleled in history. Once again a great coalition, partly forged by the Reich's aggressiveness, prevented Germany from subjugating most of the world. Statesmen in Allied countries pledged themselves to prevent the revival of German aggressive power. To fulfill this pledge, unity in peace was needed, as well as a coordinated policy to eliminate sinister elements of tyranny. Disunity, expansionist aims, and short-sighted egoism in peace would pro-

mote resurrection of German militarism. It was equally important that the true facts of German outrages should not only be known but well remembered in all Allied countries. Ignorance and forgetfulness would help the Germans to try again what they narrowly failed to accomplish in World War II. The ink was hardly dry on the instrument of surrender when a propaganda of sympathy developed in the United States and Great Britain to create pity for the Germans and to minimize their misdeeds. Disagreements between the former Allies obscured the German threat, warded off but not permanently eliminated by victory.

CONTINUED VICTORIES IN THE PACIFIC

(The following account of the conclusion of the war in the Pacific is based primarily upon Gen. George C. Marshall's report to the Secretary of War, *The Winning of the War in Europe and the Pacific,* and Fleet Admiral Ernest J. King's final official report to the Secretary of the Navy, *United States Navy at War.*)

Events in Europe gradually freed Allied forces for service in the Far East, but transportation was the serious problem. Consequently, the full superiority of the western Allies could be made effective only by slow degrees. The Soviet Far Eastern armies were very formidable. Once they entered the war, it was expected that the Japanese would soon be driven from Manchuria, southern Sakhalin, and even Korea, but it was plain that a Russian campaign beyond these areas would have to surmount major obstacles. The air assault on Japan continued, but in the spring of 1945 it was still doubtful if the enemy could be decisively defeated in this manner and, if so, how long it would take. When Germany surrendered, United States and British official sources rightly emphasized that the war was far from won.

The arrival of substantial British naval forces in the Asiatic theater of war was greeted by Fleet Admiral Ernest J. King in his *Second Official Report* as follows:

> Recently we have had the pleasure of welcoming the arrival in the Pacific of a strong task force of the Royal Navy, commanded by Admiral Sir Bruce A. Fraser, G.C.B., K.B.E. This potent addition to the Allied naval power in the Far East has been placed under the operational control of the Commander in Chief, United States Fleet, and will work side by side with our armed forces in the common effort against the Japanese. . . . Australian cruisers, destroyers and attack transports . . . have continued to operate as an integral part of our naval task forces, as they have in previous years.

The United States Pacific Fleet and Seventh Fleet submarines had an important share in Pacific offensive operations. Their patrols, according to Admiral King, "carried them to the interior lines of Japanese sea communication, where they have littered the bottom of the ocean with the sunken wrecks of a large part of

Japan's once great merchant fleet, as well as many naval vessels." Submarines rendered invaluable service on reconnaissance missions and accounted for the rescue of many Allied aviators shot down during raids upon various Japanese bases.

Carrier aircraft of the Fifth Fleet attacked Tokyo for the first time on Feb. 16, 1945. After this date, attacks by naval aircraft spread all over the Japanese home islands.

Other United States naval forces kept Japanese positions in the Kuril Islands under attack from bases in the Aleutians. As early as June 13, 1944, a task force of cruisers and destroyers, under the command of Rear Admiral Ernest G. Small, shelled Matsuwa Island in the Kurils and followed this up, on June 26, with an assault on the air base of Kurabu Zaki on Paramoshiri. Matsuwa was again attacked on Nov. 21, 1944, and Paramoshiri on Jan. 5 and Feb. 19, 1945, both by a United States task force commanded by Rear Admiral John L. McCrea.

To enable medium land-based bombers to join the air bombardment of Japan by Superfortresses based on the Marianas and to open the assault on the inner defenses of the empire, the central Pacific advance had to be carried to the Volcano Islands. Iwo Jima in the Volcanos, only 750 miles from Tokyo, afforded three sites for airfields which could be used by bombers as well as escorting fighter planes.

Capture of Iwo Jima.—The island of Iwo Jima, 5 miles long and less than 2 miles wide (8 square miles), was heavily fortified. Admiral King wrote in his Final Official Report:

The defensive organization of Iwo Jima was the most complete and effective yet encountered. The beaches were flanked by high terrain favorable to the defenders. Artillery, mortars, and rocket launchers were well concealed, yet could register . . . on any point of the island. Observation was possible, both from Mount Suribachi at the south end and from a number of commanding hills rising above the northern plateau. The rugged volcanic crags, severe escarpments, and steep defiles sloping to the sea from all sides of the central Motoyama tableland afforded excellent natural cover and concealment, and lent themselves readily to the construction of subterranean positions to which the Japanese are addicted.

Knowing the superiority of the firepower that would be brought against them by air, sea, and land, they had gone underground most effectively, while remaining ready to man their positions with mortars, machine guns, and other portable weapons the instant our troops started to attack. The defenders were dedicated to expending themselves—but expending skillfully and protractedly in order to exact the uttermost toll from the attackers. Small wonder then that every step had to be won slowly by men inching forward with hand weapons, and at heavy cost. There was no other way of doing it.

Of the performance of the United States Marines who conquered Iwo Jima, Admiral King had this to say:

American history offers no finer example of courage, ardor and efficiency.

This praise was not exaggerated, for the United States Marines were undoubtedly one of the most gallant and successful fighting organizations of all the armed services engaged in World War II.

Iwo Jima was subjected to air and naval attack for seven months before the invasion. During the last two months, the attacks were intensified. Planes from the fast carrier task force struck the island on June 15, 16, and 24, July 4, Aug. 4-5 and 31, and Sept. 2, 1944. Surface ships shelled installations on July 4 and September 2. Rear Admiral Allan E. Smith's cruisers and destroyers pounded Japanese shore batteries on November 11-12. Early in December, bombers of the Seventh Air Force, aided by marine corps bomber squadrons based in the Marianas, opened daily assaults on the island. On December 8, 24, and 27, Rear Admiral Smith's surface forces resumed action, suffering slight damage and some casualties by shore-battery fire and by a hit from a Japanese destroyer escort which was later sunk. Heavy naval units joined the assault on Jan. 24, 1945. A battleship-cruiser-destroyer force, commanded by Rear Admiral Oscar C. Badger, attacked Japanese installations and shipping in coordinated action with strategic air force bombers and B-29's of the 21st Bomber Command.

D-day was set for Feb. 19, 1945. Almost 60,000 marines were put ashore by a naval force of more than 800 vessels, manned by approximately 220,000 naval personnel. Operations were under the command of Admiral Raymond A. Spruance, commander of the Fifth Fleet. Vice Admiral Richmond K. Turner was in over-all command of the amphibious forces. Expeditionary forces were commanded by Lt. Gen. Holland M. Smith, United States Marine Corps. Maj. Gen. Harry Schmidt was in charge of the Fifth Amphibious Corps, Maj. Gen. Clifton B. Cates of the 4th Marine Division, Maj. Gen. Keller E. Rockey of the 5th Marine Division, and Maj. Gen. Graves B. Erskine of the 3d Marine Division. Vice Admiral Marc A. Mitscher's fast carrier task force supported the assault. The number of the Japanese defenders was correctly estimated at 20,000.

After three days of intensive bombing by navy carrier planes and army shore-based planes, the

4th and 5th Marine Divisions went ashore at 9 A.M. on February 19 and encountered heavy artillery, mortar, and rocket fire. The Japanese used some of the most modern weapons yet encountered. The marines assaulted interlocking caves, pillboxes, and blockhouses, suffering very heavy casualties. Japanese guns, emplaced on 546-foot Mount Suribachi and in northern high ground, commanded the American beaches. By the end of the day, Mount Suribachi was almost isolated. On February 20, after repulsing a Japanese counterattack, the marines captured Motoyama Airfield No. 1. On the third day, the 3d Marine Division moved into the line between the other two divisions. Again the Japanese counterattacked in vain, and the marines captured the southern part of Motoyama Airfield No. 2 on February 23. On that day, at 10:35 A.M., men of the 28th Marine Regiment hoisted the Stars and Stripes on the top of Mount Suribachi. By February 25, with the assistance of tanks, about half of the island had been taken. Admiral King reported:

> The advance was made against fanatical resistance from rockets, bazooka-type guns, pillboxes and interlocking underground strongholds. On one flank alone, 100 caves, 30 to 40 feet deep, had to be knocked out one by one.

On March 2, Motoyama Airfield No. 3 and the village of Motoyama were in the hands of the marines, inching forward with the 4th Division on the right, the 5th on the left, and the 3d in the center. The Japanese retained a horseshoe-shaped area at the northeastern end of Iwo Jima.

On March 6, land-based fighter planes relieved carrier-based aircraft to support ground operations. Airfield No. 2 was fully operational on March 16. Organized resistance was declared at an end as of 6 P.M. on that day. Japanese remnants, isolated in a pocket near Kitano Point, were mopped up.

The island was captured in 26 days of actual combat. United States casualties ashore, as reported on March 17, were 20,196, of whom 4,305 were killed. The navy also suffered casualties, although no naval action took place, and no major fleet units were put out of action. Japanese coastal guns, PT boats, and Kamikazes accounted for most of the naval losses. Japanese forces were wiped out. An advance of 725 miles —almost half of the remaining distance—was gained toward the heart of Japan.

Invasion of Okinawa.—The Ryukyu (Nansei Shoto) Island chain extends in a shallow loop from Kyushu, southernmost Japanese home island, to Formosa. Okinawa, the largest and most densely populated island of the group, is only 350 miles from Kyushu. From airfields on Okinawa—for which numerous excellent sites were available—Japanese sea communications to Korea, to Indo-China, to the Chinese mainland, and to Singapore could be raided by bombers with fighter escorts, tightening the blockade of the Japanese on the Asiatic mainland. Okinawa was one of the final and most vital stepping stones to an invasion of Japan, for which plans had been completed when the Okinawa campaign began. The defenders of Okinawa numbered about 120,000, including native Okinawans drafted into service.

Most of the intelligence information required for the attack on Okinawa was obtained from photographic coverage. The island is 67 miles long and 3 to 10 miles wide, divided by an isthmus into almost equal northern and southern parts. The northern area is wooded, rugged, and mountainous, the southern area generally rolling but frequently broken by steep slopes and ravines. The capital city of Naha (Nawa) and the five Japanese airfields were in the southern part of the island.

The final plan of attack called for extensive air and naval preparations to eliminate air and naval strength available for the defense, and to soften up Japanese ground installations. After this was done, the main attack was to be launched by four divisions on a six-mile beach on the southwest coast, bordering the Yontan and Kadena airfields. The two center divisions were to drive across the island to the east, while the flank divisions were to pivot north and south respectively. Japanese forces on the southern part of Okinawa—where the bulk of the defenders was expected to concentrate—were to be overcome by attack from the north. Coincident with the landings, a demonstration was planned for the southeast coast. The islands of the Kerama Retto group, 20 miles from Okinawa's southwestern shore, and the small island of Keise Shima, 20,000 yards from the landing beaches, were to be seized in preliminary amphibious operations. Supply depots and naval and seaplane bases were to be established in the Kerama Retto group. From Keise Shima, long-range army artillery could command the lower end of Okinawa, including the city of Naha, only 11,000 yards away.

After completion of operations supporting the Iwo Jima campaign, Vice Admiral Mitscher's fast carrier task force turned toward the Ryukyu chain. On March 1 and 2, his cruisers shelled the Okino-Daito-Shima area. On March 18-19, from a position 100 miles off Kyushu, air attacks were launched against airfields on that island. The United States carrier *Franklin* suffered two bomb hits, which severely damaged the ship and resulted in 772 dead and missing. Lesser units also suffered damage and casualties. Operations continued while the fleet moved slowly southward. During a four-day period, the United States task force destroyed 528 Japanese planes, damaged 16 hostile surface craft, and hit numerous hangars, factories, and warehouses, with a loss of 116 American planes. These costly operations prevented the Japanese from launching a strong air attack against the United States forces engaged in the Okinawa campaign until a week after the initial landings. On March 24, battleships of Mitscher's task force, under the command of Vice Admiral Willis A. Lee, Jr., shelled the southeastern coast of Okinawa as a part of the diversionary move.

Two days later, the 77th Division of Lt. Gen. Simon Bolivar Buckner's Tenth Army landed on Kerama Retto. In three days of moderately heavy fighting, the division secured all islands of the chain and placed its long range artillery opposite Okinawa. On March 24, minesweeping operations on the approaches to the beachhead began to clear the path for the main invasion armada.

Operations for the capture of Okinawa were under the command of Admiral Spruance, commander of the Fifth Fleet. The major forces participating under his command were: the joint expeditionary force (all elements engaged directly in the landings) under Vice Admiral Turner; the Expeditionary Troops (all ground forces engaged) under Lieutenant General Buckner; the fast carrier force (Vice Admiral Mitscher), including battleships and other supporting vessels under Vice Admiral Lee; the British Carrier Force (Vice Admiral Henry B. Rawlings); the Logistic Supply Group (tankers and cargo vessels which serviced the fleet while it was operating close to the combat areas) under Rear Admiral Donald B. Beary; Service Squadron Ten (repair, supply, and service vessels of all kinds based on Leyte Gulf, the Marianas, etc.) under Commodore Worrall R. Carter; the Amphibious Support Force (escort carriers, minesweepers, underwater demolition teams, gunboats, and gunnery ships assigned to bombardment missions) under Rear Admiral William H. P. Blandy; and the Gunfire and Covering Force (battleships and other gunnery vessels not with the fast carriers) under Rear Admiral Morton L. Deyo. In the operation, 318 combat vessels, 1,139 auxiliary craft, and about 548,000 men of the United States and British navies, the United States Army, and the United States Marines took part. Troops and cargo were loaded and embarked on the United States west coast, in Hawaii, in the southwestern Pacific, the Marshalls, the Carolines, and Leyte. Movements of all forces to the objective were carried out without enemy interference.

Anchorages at Kerama Retto were protected by nets and seaplane bases. Tankers, ammunition ships, and repair vessels were brought directly to these anchorages, which soon assumed an important role as a haven for ships damaged by kamikaze planes.

For seven days preceding the invasion, Okinawa was hit by intermittent gunfire and bombing. On April 1, the 24th Army Corps and the 3d Marine Corps hit the Hagushi beaches at 8:30 A.M. Four hours later, Yontan and Kadena airfields were captured with light losses. By nightfall, the Tenth Army had 50,000 men ashore, established in a beachhead 4,000 to 5,000 yards deep. The feint against the southeastern coast of the island was carried out realistically. The drive across the island met little resistance. Driving north thereafter, the marines encountered light to moderate opposition. The 24th Army Corps, pushing toward Naha to the south, met the main Japanese forces. The Japanese commander had shrewdly decided not to expose his men on the beaches, where overwhelming firepower could be brought to bear against them, but to concentrate in a terrain farther inland which was admirably suited for defense and delaying tactics. Protected by blockhouses, pillboxes, and caves, and surrounded by double apron barbed wire and minefields, the Japanese, using their artillery skillfully, displayed what was called "artful and fantastic" tactics. General Hodge, commander of the 24th Army Corps, wrote at the end of the first week of fighting:

> There are 65,000 to 70,000 fighting Japanese holed up in the south end of the island, and I see no way to get them out except to blast them out yard by yard . . .
>
> The Japs have tremendous amounts of artillery and have used it far more intelligently than I have ever seen them use it to date. With best estimate, it shows around 500 or more individual weapons of 75-mm or better, including some 169-175 of caliber 105 or better. The most powerful weapon of long-range we have encountered to date is the 150 rifle with range of 27,000 yards which fires occasionally upon the two airfields from the vicinity of Shuri. They are using quite a few of the Spigot mortars (320-mm), 250-mm mortars, and aerial bombs up to 250 kilograms fitted as rockets. They are also using large sized rockets somewhere in the 5-, 6-, to 8-inch class.

After mopping up the northern part of the island, the marines joined the drive toward Naha. In a fight which matched in ferocity the most protracted previous Pacific island battles, the Tenth Army and the Japanese wrestled yard by yard along an 8-mile front. Advances of half a mile a day, as scored on April 19, were considered major gains. On April 21, the United States 27th and 96th Divisions, after a violent artillery barrage, gained ground toward Hill 178, a strong Japanese bulwark. On April 22, the Japanese held only one fourth of the island's area, but this was the most vital part of it.

On April 27, the 7th Division closed in on Shuri, second largest city in Okinawa. By May 5, "Banzai" counterattacks, usually carried out when Japanese defensive strength was nearly exhausted, were begun. On May 13, the suburbs of Naha were invested. Sugar Loaf Hill, a key position, was taken and lost five times before it was firmly held by United States troops. By May 18, United States casualties on Okinawa were reported as 30,526, of which 3,958 were suffered by the navy. Three United States divisions had advanced 15,000 yards in 44 days of fighting. Heavy rains, setting in on May 25, further impeded the American offensive. The count of Japanese dead passed 60,000 on May 31. On June 2, Naha airfield was invested, and Shuri was taken. The fleet supported the land drive with everything it had. Japanese resistance con-

tinued fanatical. As General Marshall stated: "Each successive strong point was cleared only by heroic efforts of our soldiers and marines."

By June 7, pincers had squeezed the remaining Japanese forces into two pockets which were incessantly hammered from land, sea, and air. On June 16, the three strongest remaining hill positions were cleared, and 97 per cent of Okinawa was won. On June 18, Lieutenant General Buckner was killed by Japanese artillery fire while observing the final drive of his assault infantry. This gallant leader was replaced by Gen. Joseph W. Stilwell, whose previous command was assumed by Gen. Jacob L. Devers of AEF fame. Three days later, after 82 days of fighting, Okinawa was declared won, with some mopping up operations still in progress.

United States casualties in the Okinawa campaign amounted to 79,507, including killed, missing, wounded in action, and non-battle casualties. Battle casualties were 21,342 for the army, 16,313 marines, and 9,721 for the navy. Non-battle casualties (largely battle fatigue) amounted to 21,592 for the army and 10,881 for the marines. Enemy casualties were estimated at 120,000.

Okinawa was not only the last major ground battle of the war but the costliest single engagement in the Pacific.

Naval Operations at Okinawa.—After the first week of Japanese inactivity in the air, Kamikaze flyers, attacked the invasion fleet in large numbers. Japanese bombers and fighters joined in action over the beaches and over the battlefields. By mid-June, the Japanese had lost 20 per cent of their total combat air strength in the battle for Okinawa. Over 3,400 Japanese planes were destroyed in the air and 800 on the ground. United States losses totaled more than 1,000 aircraft.

The Allied fleets off shore suffered considerable losses from air attacks. Admiral King explained in the *Final Official Report* the extent of ship losses as follows:

> By its very nature an amphibious invasion implies advancing a huge number of vessels, both combatant and noncombatant, from a zone dominated by one's own land-based air forces into one hitherto dominated by the enemy's. Our vessels are localized by the landings so that the enemy has not the problem of finding them, but only of hitting them. Thus exposed, their protection depends wholly on their own anti-aircraft fire, smoke, and on cover from our own carrier-based air forces, which are to that extent diverted from offensive missions. . . . The longer the Navy must remain in support of assault troop operations, the more vulnerable it is to attack, and the higher is the proportion of personnel and ship casualties. Slow progress on the ground is directly reflected, therefore, in naval losses.
>
> The first enemy air attack at Okinawa occurred on 24 March . . . the first damage was done on 26 March; and by 21 June . . . about 250 vessels of all classes, from battleships and carriers down to destroyers and landing ships, had been hit by air attack, by far the greatest proportion of them in suicide crashes. Some 34 destroyers or smaller craft were sunk. Early warning of impending attacks proved to be the best countermeasure and for this purpose destroyers and other small vessels were stationed as pickets at appropriate distances from the concentration of heavier shipping. These pickets took the heaviest losses themselves, but in so doing they undoubtedly saved many bigger and more valuable vessels during a critical three months.

No United States or British vessel larger than a destroyer was sunk off Okinawa.

During the fight for the island, Allied naval forces continued operations close to and inside Japanese home waters. On April 7, Admiral Mitscher's carrier task force attacked strong Japanese fleet units in the East China Sea off Kyushu. United States airmen sank the battleship *Yamato,* the cruiser *Yahagi,* and four destroyers and started fires on two other destroyers. Of the entire Japanese force, only three destroyers escaped undamaged. Japanese aircraft attacked the United States task force. The carrier *Hancock* was severely damaged by a suicide flyer. On April 11, Japanese Kamikazes resumed their dives on Mitscher's vessels. No direct hits were scored, but 8 near misses accounted for some damage. Four days later, the task force effectively raided southern Kyushu airfields.

As Japanese planes continued to plague the invasion fleet off Okinawa, Mitscher concentrated on its defense. On April 16, 210 Japanese planes were shot down, but the United States carrier *Intrepid* was severely damaged by a kamikaze. On April 19, Vice Admiral Lee's fast battleships bombarded the southeastern coast of Okinawa. On May 4, a large-scale Japanese air raid was aimed at Allied land and amphibious forces. The task force assisted in smashing the raid and intervened one week later in another air battle when the carrier *Bunker Hill* was hit by a kamikaze. In addition to considerable material damage, 373 men were killed, and 19 were missing. The fast carriers again attacked Kyushu fields on May 13 and 14. Few planes were encountered, but one of them damaged the carrier *Enterprise.* The attack on Kyushu airfields was renewed on May 24 and again on June 2 and 3.

On June 4, a typhoon damaged two carriers, three cruisers, and one destroyer in the task force. This prevented the fleet both from raiding Kyushu again on June 8, and from assisting the ground fighting on Okinawa immediately thereafter. The fast carriers and their escorts arrived at Leyte Gulf for supplies and repairs on June 13. The British carrier task force neutralized Japanese air installations on Sakishima Gunto, southwest of Okinawa, in operations between March 26 and April 20 and again from May 4 to 25.

Reconquest of Borneo.—The recovery of Borneo not only meant access to valuable sources of raw materials but also a better approach by sea and air to the Asiatic mainland, in the path of Admiral Mountbatten's drive from India through Burma toward Malaya. The Borneo campaign also was the first step toward the recapture of the Dutch East Indies.

Allied seizure of Puerto Princesa on the east coast of Palawan on Feb. 28, 1945, threatened northern Borneo. Admiral Thomas C. Kinkaid's Seventh Fleet carried operations through the Sulu Sea, the Sulu Archipelago, and the Celebes Sea, between the main Philippine Islands and Borneo. In order to gain control of the passage from the Sulu to the Celebes Sea and to provide another stepping stone toward Borneo, an attack group of light cruisers and destroyers under Rear Admiral Forrest Royal bombarded Japanese positions on Zamboanga, on the southwest tip of Mindanao, from March 8 to 10, 1945. The United States 41st Division, put ashore on March 10, seized the city and two adjoining airfields and drove the Japanese back into the hills. Basilan Island was taken on March 16. The 41st Division then extended its hold on the Sulu Archipelago, landing at Sanga Sanga in the Tawi Tawi group on April 2 and on Jolo on April 8.

The next move to regain Borneo was directed against the island of Tarakan off the northeast-

ern coast of Dutch Borneo, 185 miles southwest of Tawi Tawi. Vice Admiral Daniel E. Barbey commanded the attack force. After preliminary shelling and minesweeping, an attack group under Rear Admiral Royal landed units of the Australian 26th Brigade on May 1 against insignificant opposition. By May 8, the Australians controlled the town of Tarakan and its air base. On May 20, the defenders, initially about 3,000 strong, were split and subsequently mopped up.

In the following Borneo operation, the reinforced Australian Division was transported from Morotai to the Brunei Bay area of northern Borneo. Air support was provided by the United States Thirteenth Air Force and the Australian 1st Tactical Air Force. Cruisers and destroyers under Rear Admiral Russell S. Berkey assisted the invasion. Rear Admiral Royal again commanded the attack group. Three separate landings were carried out on June 10, 1945, at Labuan Island, and on the mainland at Bintang and Cape Polompong. There was little resistance. The location of the beachheads, 700 miles from Indo-China and 800 from Singapore, constituted another bombing threat to these precarious Japanese conquests.

On June 16, the Australians had progressed four miles toward Brunei. Their drive had no objective beyond the nearby oil fields. The size and topography of Borneo gave Japanese diehards an opportunity to hold out indefinitely in the wilderness. There was no point in carrying the pursuit into such areas.

Further operations aimed at Balikpapan were set for July 1, 1945. The attack force consisted of the largest number of ships used in the Southwest Pacific area since the Lingayen landings in the Philippines. In the cover and carrier groups were six United States, two Australian, and one Dutch cruisers, three United States escort carriers, and destroyer escorts. In preparation for the attack, United States Army and Navy and Australian air forces struck at Balikpapan with 100 sorties a day. Sixteen days before the landings, minesweeping and underwater demolitions began under cover of naval artillery. On June 24, United States destroyers succeeded in smothering the Japanese coastal guns. Exactly on schedule, 17 assault waves hit the beaches without casualties. The Australians bore the brunt of the fight which stiffened as the attackers moved inland. An escort carrier group under Rear Admiral William D. Sample provided day and night air cover. Another landing was made unopposed at Cape Penajam on July 5. Balikpapan harbor was captured on July 8. One week later it was open to Allied shipping, and a 14-mile advance secured a valuable seaplane base. The defenders were driven into the wilderness.

Finale in the Philippines.—American victories in the battles for Leyte and Luzon broke the Japanese domination of the Philippines but did not completely liberate the archipelago. The Philippine campaign thereafter was resolved into a large number of isolated actions.

After the capture of Palawan provided an effective barrier on the west and gave United States forces a base for naval and air operations which controlled the Balabac Strait entrance from the South China Sea to the Sulu Sea, an amphibious assault on Lubang Island secured the most direct sea lane to Manila. The islands of Burias and Ticao were seized on March 4, 1945; Romblon and Simara, on March 12. Campaigns for the capture of coastal cities and other strongly held Japanese positions led to a number of landings in March 1945 by the forces of the United States Seventh Fleet.

On March 18, troops of the 40th Division from Lingayen Gulf landed at Iloilo, on the island of Panay, to establish radar and air facilities and PT boat bases. The assault group, under the command of Rear Admiral Arthur D. Struble, secured Iloilo City on March 20 and virtually completed the occupation of Panay and smaller neighboring islands by the end of the month. A successful landing on Cebu was effected on March 26. The attack group was supported by cruisers and destroyers under the command of Rear Admiral Berkey. The city of Cebu fell the next day, but extensive ground operations were required to clear the interior of the island.

On April 17, the United States 10th Corps landed at Malabang on Mindanao and moved across land toward Davao Gulf with little opposition. Rear Admiral Albert G. Noble commanded the participating naval task group; Rear Admiral R. S. Riggs, the covering cruiser force. For the first time there was a successful use of light landing craft on the rivers leading inland. The invading forces captured the city of Davao on May 4. Five days later a United States regimental combat team landed at Macajalar on the island's north coast. A junction of the two forces was established on May 23, and the Japanese garrison was sealed in the interior. Minor landings were effected on northern Negros Island on March 29, at Masbate on April 3, on Busuanga on April 9, and on Bohol Island on April 11.

General Krueger opened the final operations on Luzon in June 1945, the United States 37th Division driving northward from Balete Pass into Cagayan Valley. Japanese troops offered stiff resistance north of Baguio. Filipino guerrillas, assisted by rangers of the United States Sixth Army, cleared areas of northwest Luzon and captured Aparri on June 21. By June 23, a paratroop force of the 11th Airborne Division dropped just south of Aparri and drove 25 miles southward during the next three days to establish contact with the 37th Division.

After the seizure of Cagayan Valley, only pockets of desperate Japanese remained. In the Philippine campaign, the Pacific armies had killed 317,000 Japanese and captured 7,236. American casualties amounted to 60,628 killed, wounded, and missing. Large movements of men and supplies poured into the Philippines, and extensive redeployments were carried out in that area in preparation for projected landings on the Japanese home islands.

Japan Besieged by Sea and Air.—Ever since the establishment of air bases in the Marianas, the Japanese home islands had come within B-29 range. The hammering of Japanese cities from the air was intensified. The degree of destruction achieved in Japan by air bombardment was higher than in the most devastated cities of Germany.

Airfields in the Marianas were built up to accommodate greater numbers of B-29's. After Iwo Jima became available for emergency landings, greater bomb loads were carried, and constant fighter support was provided. Strategic bombing of vital Japanese industries and cities by army planes was coordinated with the activities of naval planes. Many thousands of mines were dropped in Japan's harbors and sea lanes.

Among the most spectacular air raids on Japan was a blow by 200 Superfortresses against Tokyo in February 1945, when 650 acres of the city were engulfed in flames. The first, 1,000-ton raid by 300 B-29's was on March 9, when the use of incendiaries on an unprecedented scale laid waste 15 square miles of the capital and made 1,000,000 people homeless. Other devastating B-29 raids hit Nagoya (March 12), Osaka (March 14), and Kobe (March 17). After the capture of Okinawa, bases were built for Superfortresses on that island. The Eighth Air Force, operating from Okinawa, flew its first and only B-29 offensive mission (the target was Kumagaya on northern Honshu) during the last night of the war. Earlier missions by lighter aircraft hit Japanese positions on the Asiatic mainland and the remnants of shipping in coastal waters.

On July 10, the Joint Chiefs of Staff ordered a revision of the Pacific command. The formerly China-based 20th and 21st Bomber Commands were deactivated. The 21st became the Twentieth Air Force, and the personnel of the 20th Bomber Command was transferred to the Eighth Air Force which had been redeployed from Europe. Lt. Gen. Nathan F. Twining assumed command of the Twentieth Air Force. The Eighth and Twentieth Air Forces, containing the mightiest fleet of Superfortresses ever assembled, were combined into the United States Strategic Air Force. General Spaatz retained command of the strategic air forces in the Pacific. Lt. Gen. Barney M. Giles became his deputy and Maj. Gen. Curtis E. LeMay, his chief of staff. Strategic control of the Superfortress fleet remained with the Joint Chiefs of Staff, with General Arnold as their agent. During July 1945 the Mariana-based B-29's averaged 1,200 sorties a week.

After taking on supplies in Leyte Gulf, the fast carrier forces of Admiral Halsey's Third Fleet, comprising the greatest concentration of sea power ever assembled, started toward Japan on July 1 to complete the destruction of the Japanese Fleet, to conduct a pre-invasion campaign against Japanese war industries, and to keep maximum pressure on the Japanese to lower their morale. On July 10, the force launched planes 170 miles southeast of Tokyo, hitting the capital area. Moving north, it attacked northern Honshu and southern Hokkaido on July 14 and 15. On July 17, Halsey's ships were joined by units of the British Pacific Fleet (Vice Admiral Rawlings), and the first combined British-American bombardment hit the Japanese home islands. Some Japanese fleet units were concealed at Yokosuka naval base in Tokyo Bay. British and American carrier-based planes attacked the enemy vessels on July 18, badly damaging the *Nagato,* one of the two remaining Japanese battleships, and scoring numerous hits on shore installations and transport facilities.

On July 24 and 25, the combined fleets, steaming through Japanese home waters at will, launched extensive air attacks against targets in the Inland Sea area, sinking or putting out of action 22 Japanese naval units totaling 258,000 tons. The Japanese fought back as best they could, losing 113 planes compared with 12 British and American. Another carrier-based plane attack on July 28 added to the destruction and accounted for a score of 144 Japanese against 36 Allied planes. Aircraft from fast carriers, hitting the Tokyo area on July 30, destroyed 121 Japanese planes and caused severe damage on lighter Japanese fleet units. At the same time, the fast battleships spread havoc in the area of Hamamatsu, on the east coast of central Honshu. During the first week of August, Admiral Halsey's fleet was stalled by a heavy typhoon. On August 9, the offensive was resumed. In two days 397 Japanese planes were destroyed and another 320 damaged. The Allies lost 34 planes. At the same time as the air raids, battleships from the Third Fleet bombarded steel mills and other installations at Kamaishi. Admiral Halsey's last blow against Tokyo was on August 13. The next action, scheduled for August 15, was called off when Admiral Nimitz' "cease fire" order was received.

Since July 10, the naval forces of Admiral Halsey had destroyed or damaged 2,804 planes, sunk or damaged 148 warships, sunk or damaged 1,598 merchant ships, destroyed 195 locomotives and damaged 109 more. Powerful blows had been struck at industrial targets, and Japanese sea traffic was virtually wiped out. Land communications in the home islands were hit to an extent which seriously hampered the movement of vital supplies. An army defending the islands against the Allied invasion would have been unable to carry out operations which required even a moderate volume of transportation. Civilian mass starvation seemed inevitable, as even the fishing fleet upon which the Japanese largely depend could not function.

After the loss of Okinawa, the Japanese concentrated most of their remaining submarines for anti-invasion action. A number of German U-boats, not heeding the Wehrmacht's surrender order, operated in Far Eastern waters out of Penang. "Human torpedoes" joined the Japanese submarine effort, which was rapidly descending to the suicide level. Antisubmarine measures were carried out by Allied screening vessels, land- and carrier-based planes, and "hunter-killer" groups. The only important Allied loss due to Japanese submarines in this phase of the war was the sinking of the United States heavy cruiser *Indianapolis* on July 30, 1945.

Tide Turns in China.—Late in 1944, there was a possibility that China might not be able to continue fighting. According to the *History of World War II,* by Francis Trevelyan Miller (The John C. Winston Company, Philadelphia, 1945), the Chungking government asked for Allied landings on the China coast to loosen the Japanese grip on the war-torn country. Admiral Nimitz replied to the effect that the China coast was his objective. This objective, however, was uncomfortably remote before the firm establishment of United States control of the Philippines and before the Volcano and Ryukyu campaigns. Strategic bombing of the coastal area by long-range planes could not compensate for the handicap imposed upon the operations of the Fourteenth Air Force by the loss of seven of its major bases and a large number of its minor bases.

The Fourteenth Air Force and the "Chinese-American Composite Wing" improvised operations as a self-contained task force. General Chennault was able to report that, during December 1944, its planes destroyed 241 Japanese aircraft and sank 73,950 tons of shipping with practically no loss to themselves. The critical situation was slightly improved after a Chinese counterattack, under the command of General

Chen Cheng, drove the invaders back 65 miles in Kweichow Province in December 1944.

In January 1945, the Japanese resumed an offensive in China against American airbases, railroads, and remaining coastal areas not under their control. Suichwan airbase was lost on January 22 and Kukong on the Canton-Hankow railroad on January 28; also, the Chinese positions on the coast west of Hong Kong were pierced. In January, the Allies succeeded in flying 46,000 tons of goods over the hump into China, and the Stilwell (Ledo-Burma) Road was opened to traffic. The building of that road was termed a Herculean job by General Marshall, and its completion was effected under actual battle conditions. While General Stilwell's forces and British and Indian troops drove back the Japanese 15th, 31st, and 33d Divisions, United States engineers, commanded by Brig. Gen. Lewis A. Pick, built the road behind them, frequently operating their bulldozers under fire. On Jan. 28, 1945, a convoy of American trucks and matériel from India crossed the Burma-China frontier, and supplies reached China by land for the first time in almost three years. Increased supplies permitted progress in the reorganization of the Chinese forces. General Stilwell had been able to provide rough training and basic equipment for 35 Chinese divisions in his training centers in Yunnan Province. Maj. Gen. Albert C. Wedemeyer, in accord with Generalissimo Chiang Kai-shek, carried on his mission vigorously. More plentiful supplies also assisted the operations of the Fourteenth Air Force and made it possible to continue sorties by Superfortresses based in China.

A Chinese drive directed by Gen. Ho Ying Chin, newly appointed commander in chief of all Chinese ground forces, attempted to regain control of the Canton-Hankow railway but was repulsed by mid-February 1945. Another offensive, however, gave control of Suichwan to the Chinese on March 11.

Reduction of Japanese shipping by Allied sea and air attack and the extension of Allied control into Chinese coastal and Japanese home waters increasingly isolated Japanese invasion armies from their homeland. Had it not been for war industries in Manchuria and conquered parts of China, the Japanese supply situation might have been hopeless by the early spring of 1945. Communications between Manchuria and the combat area were under Allied air attack. The output of the Japanese war plants on the Asiatic mainland could retard but not prevent the breakdown of the Japanese supply system. A Soviet declaration that the Russo-Japanese Neutrality Pact of 1941 would not be renewed almost amounted to a declaration of war.

The Japanese made another effort to inflict defeat upon the Chinese. On March 22, they struck at southern Honan Province from bases at Yencheng, Chumatien, Kwangshui, and Loyang. Another Fourteenth Air Force base was lost, but the drive achieved no important tactical victories. Japanese offensives subsequently centered on western Hunan Province to eliminate more United States airbases and Chinese training centers.

By the spring of 1945, the impact of the smashing Allied attack across the Pacific islands had made itself felt in Asia. American officers were helping to speed the retraining and reequipping of Chinese soldiers. Brig. Gen. Lucian K. Truscott, Jr. and Lt. Gen. William H. Simpson, released from duty in Europe, were assisting Major General Wedemeyer, and the air forces in China were increased and reorganized. Maj. Gen. Claire L. Chennault was relieved of the command of the Fourteenth Air Force, at his own request, and was replaced by Maj. Gen. Charles B. Stone. Chiefly by the United States Air Transport Command, the American trained and equipped Chinese Sixth Army was moved into the area under Japanese attack. On May 1, its intervention halted the Japanese, and the attackers fell back ten days later.

The idea of continuing an isolated war in China became unpopular among the members of the Imperial General Staff. Japanese forces withdrew from south and central China. Behind them, Chinese troops were applying every possible pressure.

In southern Kwangsi, Nanning was recaptured on May 27, 1945. Japanese communications between Indo-China and central China were threatened. On May 10, the Chinese began operations to recover the city of Foochow which was considered a potential disembarkation port for Allied seaborne forces. Foochow was captured on May 19. Wenchow, another port city farther north, fell to the Chinese on June 18. The former United States airbase of Liuchow was regained on June 14, and another base, Kanhsien, was reoccupied on July 15. From Kanhsien, United States air forces raided coastal installations held by the Japanese.

During July, Chinese forces moved to the borders of Thailand and Indo-China. No large-scale advance into these territories followed. As the war drew to its close, the Chinese were pushing toward Canton. An Allied amphibious attack on the Asiatic mainland was scheduled for August 18, 1945. The target was Hong Kong, but the Japanese surrender cancelled the operation.

Reconquest of Burma.—The Southeast Asia Command under Admiral Lord Louis Mountbatten had approximately 575,000 ground troops at its disposal early in 1945, of which one third were American. Land forces under the command of Lt. Gen. Sir Oliver W. H. Leese were divided into three sections: (1) the Northern Combat Area, under Lt. Gen. Daniel I. Sultan, composed of a United States army including two to four American-trained Chinese divisions, the British 36th Division, and the American Mars Force (a brigade of two regiments); (2) the Fourteenth British Imperial Army (4th and 33d Corps) under Gen. Sir William J. Slim; and (3) the 15th Corps, under Lt. Gen. Sir Philip Christison. The Allied air commander in chief was Air Marshal Sir Keith R. Park, who had 47 American and British squadrons at his disposal. The East Indies Fleet, composed of British units, was assigned to the Southeast Asia Command under the command of Admiral Sir Arthur J. Power. It included four large aircraft carriers, among them the *Indefatigable,* biggest and most modern vessel of that type in the British Navy, the battleship *King George V,* a number of fast cruisers, and many lesser vessels.

The Burma campaign continued with intensity even during the monsoon season of 1944. Air supply played a very important role. British and American carrier squadrons, commanded by Brig. Gen. William D. Old under the direction of Major General Stratemeyer's Eastern Air Command, flew C-46's and C-47's night and day. They

shuttled from numerous bases and air strips in the Brahmaputra Valley in India to points of rendezvous with Allied ground columns in the Burma jungle. Each trip had to be flown over one or more of the steep spines of the Himalayas along the India-Burma border. The troop carrier squadrons averaged monthly 230 hours of flying time for each serviceable plane (normal flying time was 120 hours).

The drive against the most advanced Japanese air and naval base of Akyab came to a successful conclusion on Jan. 4, 1945, when seaborne British and Indian troops drove the defenders from the city and its installations. The Japanese retreat from Akyab was hampered by British and Indian landings on Myebon Peninsula. The next amphibious operation seized Ram Ree Island, 50 miles south of Akyab, on January 25. On January 26, seaborne troops established themselves on the mainland near Kangaw (35 miles from Akyab). Two weeks later, the 23d Indian Division landed at Ru Ywa, and, on March 13, the 26th Indian Division went ashore at Detpan. The East Indies Fleet, after covering amphibious operations, raided Japanese-occupied Sumatra, including the oilwells and refineries of Palembang.

The Fourteenth Army, the strongest Allied force engaged in the Burma operation, assisted by Lieutenant General Sultan's group, drove to recover Mandalay. At the close of the monsoon season, Sultan advanced southward astride the Irrawaddy and by December 1944 had cleared the projected route of the supply road to Bhamo. Meanwhile, the Fourteenth, in western Burma, broke south through Tiddim across the Chindwin River. Japanese rearguards sacrificed themselves to enable the bulk of their forces to rally for the defense of Mandalay. British and Indian troops, smashing the rearguards and overcoming major transportation troubles, moved toward the lower course of the Irrawaddy River and crossed it after capturing Pagan. By mid-February 1945, three bridgeheads were established, the largest of which was in the Singu area. In northeast Burma, Chinese troops advanced toward Lashio. On their right, other forces of Lieutenant General Sultan's group were south of the Shewhi River. The Japanese command considered communications south of Mandalay to be safe, but the troops of the 4th Corps of the Fourteenth Army staged a masterful lightning stroke against these communications.

The 225th Tank Brigade and the 17th Infantry Division, covering 85 miles in 11 days through very difficult terrain, on March 3 reached Meiktila where the command of the Japanese Fifteenth Army, holding Mandalay, had its headquarters. Mandalay was isolated by this maneuver. An attempt by 30,000 Japanese to break the trap failed. Punjabi troops of the 19th Indian Division under Maj. Gen. Wynford Rees entered Mandalay from the northwest on March 8, 1945. The garrison made a 12-day last stand inside old Fort Dufferin. Also on March 8, Chinese troops under Lieutenant General Sultan captured Lashio.

A special communiqué issued by the Southeast Asia Command on April 7 reported that the Japanese Fifteenth Army, pocketed between Mandalay and Meiktila, had been decisively defeated and was no longer an effective force.

Another operation was the recapture of Rangoon. The Fourteenth Army raced on toward Pegu north of Rangoon. Railroads had been captured, but no engines were available, so that transport planes carried small locomotives to the advancing army. The Japanese fled in disorder. On May 1, British paratroopers dropped on both sides of the mouth of the Rangoon River, 20 miles south of the city. Amphibious landings followed. Rangoon was occupied by the British on May 3 with its port still in good condition. Two days later, Admiral Mountbatten announced that between Feb. 1, 1944 and April 30, 1945, the Japanese Fifteenth, Twenty-eighth, and Thirty-third armies had been annihilated and that Japanese losses amounted to 347,000, of whom 97,000 were dead.

The number of Allied troops killed during that period was a little more than 10 per cent of the Japanese death figure, but 250,000 American, British, and Chinese soldiers were temporarily stricken with illnesses. The remnants of the Japanese forces in Burma started on a long and tortuous flight toward Siam. The Battle of Burma was officially declared at an end on July 28, 1945, with the Japanese Twenty-first Army added to the list of major Japanese fighting forces wiped out in the campaign. The way to Siam and Malaya was open.

THE END OF WORLD WAR II

By order of the Joint Chiefs of Staff, Gen. Douglas MacArthur assumed command of all United States Army forces in the Pacific on April 6, 1945. MacArthur and Admiral Nimitz, commander of the naval forces in the Pacific, were directed to prepare for the final operations against Japan. General MacArthur created a new command under Lt. Gen. Wilhelm D. Styer, known as the United States Army Forces in the Western Pacific, to replace the old Southwest Pacific Area. Lt. Gen. Robert C. Richardson, Jr. was appointed commander of the United States Army Forces of the Middle Pacific.

Grand Strategy for the Invasion of Japan. The Japanese had massed an army of 2,000,000 for the defense of the homeland, and the country was honeycombed with pillboxes. After learning from experience that Allied air and naval power made it futile to attempt to crush an invasion on the beaches, the Japanese planned an inland defense utilizing every natural barrier and built-up area to check the Allied forces and inflict disastrous casualties upon them.

General MacArthur and Admiral Nimitz agreed to launch two seaborne operations: the first, known as "Operation Olympic," provided for a three-pronged assault on southern Kyushu in the fall of 1945 by the United States Sixth Army (1st and 11th Army corps and 5th Marine Amphibious Corps). These groups were to land in the order named at Miyazaki, at Ariaka Wan, and on the beaches west of Kagoshima, in order to isolate the southernmost Japanese island and destroy the defending forces there. Preliminary operations in Koshiki Retto and a diversionary feint off Shikoku by the 9th Corps were to precede the main assault.

The second phase of the Japanese invasion, code-named Coronet, was to be carried out in the early spring of 1946. The Eighth and Tenth Armies—9 infantry divisions, 2 armored divisions, and 3 marine divisions—were to assault the Kanto or Toyko plain of eastern Honshu. These two veteran Pacific armies were to be followed ashore by the First Army (10 infantry divisions), redeployed from Europe. The three armies were to destroy the Japanese Army on the main home-island and to occupy the Tokyo-Yokohama area.

The Atomic Bomb.—Many improvements in existing weapons were made by all the major nations participating in the war. The United States, Great Britain, and Canada, however, were the only belligerents to develop an entirely new and revolutionary weapon: the atomic bomb.

Experiments in the use of atomic power were carried out in the United States, the British Commonwealth, Germany, Russia, and—crudely and on a small scale—in Japan. The wealthiest countries, with the best-trained scientists, won the race to use atomic energy for the construction of the most destructive weapon yet known. In December 1941, the United States Office of Scientific Research and Development was created to work on the atomic project. American, British, and Canadian scientists worked in three great plants on United States territory. The development of the bomb required four years and cost approximately $2,000,000,000.

On July 16, 1945, while President Harry Truman, Prime Minister Churchill, and Marshal Stalin were meeting in Potsdam, Germany, a test bomb was detonated in the New Mexico desert. The experiment was shrouded in extreme secrecy, but President Truman was informed of the results. General Spaatz received orders from Potsdam to drop the atomic bomb on one of four selected Japanese cities—to be chosen according to weather conditions—any time after Aug. 3, 1945.

On August 6, at 10:20 A.M. President Truman announced that an American B-29 had dropped one atomic bomb on the Japanese city of Hiroshima 16 hours before. According to the presidential statement, the bomb was equal in explosive force to 20,000 tons of TNT. On August 9, a second atomic bomb was dropped on Nagasaki; smoke rose 50,000 feet into the air and was visible for more than 175 miles.

The number of victims killed by the blast and its after effects was greater in Hiroshima. A report from the Supreme Allied Headquarters in Tokyo announced in February 1946 that casualties from the Hiroshima bomb totalled 306,545. This included 78,150 dead; 13,983 missing; 9,428 with serious injuries; 27,997 with minor injuries; and 176,987 sufferers because of sickness or lack of homes, food, and clothing.

Russian Intervention in the Far East. The USSR, as agreed at Yalta, joined the war against Japan within three months after the German surrender. The Japanese fully realized the strength of Russian forces between Irkutsk and Vladivostok. Two border incidents which amounted to major battles—near Changkufeng in 1938, and near Nomahan (Bar Nor) in 1939—ended in defeats for the forces of the Japanese Kwantung armies. Only limited reinforcements were subsequently drawn from the Kwantung armies to participate in the Chinese campaign. Large-scale deployment of the Kwantung armies in China might have forced the collapse of Chi-

nese resistance before British and American forces could help China materially.

After the conclusion of the Russo-Japanese pact of 1941, mutual watchfulness in the Far East continued. A great Japanese army, bolstered by all the forces the Manchurian puppet government could muster, remained in Manchuria. For their part, the Russians, even during the most critical stages of the war in Europe, did not transfer any substantial portion of their Independent Red Banner armies—as the Far Eastern forces were called—to Europe.

After the expiration of the Russo-Japanese Neutrality Pact on April 25, 1945, the Japanese made several futile attempts to negotiate with the USSR and to obtain Russian mediation for peace with the western Allies. Failure to achieve an understanding with Russia darkened the prospects for Japan. Russia's entry into the war unquestionably helped to influence the Japanese decision to surrender.

The fighting contribution of the Russians to Japan's collapse was not very great. Few if any Japanese accounts are available on events in Manchuria and Korea after the Soviet declaration of war on Aug. 8, 1945, and no neutral or allied observers were given an adequate opportunity to watch the campaign. Three Independent Red Banner armies under Marshal Alexander M. Vassilevski swept across the Manchurian, Korean, and Sakhalin borders. Japanese forces had neither the will nor the strength to offer determined opposition. The Russians advanced as much as 65 miles a day. The mechanized Soviet forces used wood gas combustion engines, as liquid fuel was scarce, and means of transporting it, even scarcer. Wood gas was inferior to gasoline, but it kept tanks and trucks moving.

The First Independent Red Banner Army, under Marshal Kyril A. Meretskov, advanced from the region west of Vladivostok in a twin drive to the Manchurian communications center of Harbin and toward Najin (Rashin) and Chongjin (Seishin) in Korea. A separate group of Meretskov's forces, including Russian marines, invaded the southern part of Sakhalin, near Karafuto, while army forces crossed the border in the center of the island. The Second Independent Red Banner Army under Gen. M. A. Purkayev, starting from Khabarovsk, pushed toward Harbin through the Sungari River valley, and continued to Mukden Port Arthur, and Dairen. The Third (Transbaikal) Army under Marshal Rodion J. Malinovski drove south and west from Russian-controlled Outer Mongolia, completing the occupation of Manchuria and cutting off the northern divisions of the Kwantung Army and its Manchurian auxiliaries.

Japan's surrender did not stop the Russian advance or the capture of Japanese force On September 10, a Soviet communiqué summed up the campaign by stating that 80,000 Japanese had been killed and 594,000 captured. Japanese naval losses were reported as 2 destroyers, 28 transports, 3 tankers, 5 motor launches, and 12 barges and schooners sunk. Russian casualties were claimed to be 8,219 killed and 22,264 wounded.

Japan's Surrender.—The Potsdam Conference issued another stern warning to the Japanese to surrender unconditionally. This was in part a reply to Japan's desperate attempt to avoid such surrender. Naotake Sato, Japanese ambassador to Moscow, met with Soviet Foreign Minister Vyacheslav M. Molotov before the latter's departure for Potsdam. The Japanese ambassador again suggested that Russia should mediate to bring an end to the war. On Aug. 9, 1945, at 3:00 A.M., the first word of the Russian declaration of war was picked up by Japanese monitors. A few minutes later the Kwantung Army reported that Soviet forces were on the move.

At sunrise on August 9, Foreign Minister Shigenori Togo, according to Ralph Chapman's dispatches to the New York *Herald Tribune,* reported the latest events to Emperor Hirohito. At 10 A.M., the Japanese Supreme War Council met for a gloomy three-hour session, in which Prime Minister Kantaro Suzuki expressed the opinion that there was no alternative to acceptance of the Potsdam declaration. War Minister Korechik Anami, abandoning an army plan for the mobilization of the entire Japanese people as a nation of suicide fighters, did not disagree but urged insistence upon four conditions: (1) Hirohito to be maintained as emperor; (2) the Allies would not occupy the Japanese home islands; (3) punishment of war criminals would be left to the Japanese; and (4) withdrawal and disarming of Japanese troops would be carried out according to Japanese plans. The foreign minister contended that such conditions would be tantamount to rejection of the Potsdam declaration. No agreement was reached at the time.

News arrived of the dropping of the second atomic bomb. The emperor summoned the War Council to meet again. More officials were inclined to accept the views of the foreign minister, but Anami remained adamant. The minister of war considered a possible coup d'état by the army but abandoned the idea for fear of going down in history as a disloyal subject of the emperor. The emperor ruled in favor of a suggestion by the foreign minister that the Potsdam declaration should be accepted with the interpretation that it permitted the emperor to retain his prerogatives.

Messages were drafted to Seimasa Okamoto, Japanese minister at Stockholm, Sweden, and Shunichi Kasei, minister at Bern, Switzerland, at 10 A.M., August 10, asking for the mediation of the governments to which they were accredited to transfer the Japanese peace plea to the Allied governments. *Domei,* the official Japanese news agency, broadcast their text for foreign consumption, in order that the Allied governments might learn of the plea without delay and no more atomic bombs would be dropped.

On August 11, it was learned unofficially that the Allies, including the Soviet Union, would not object to the emperor's retention of the throne provided he took orders from the Supreme Allied Command. This did not mean that the Allies guaranteed the emperor's future status.

The official text of the Allied reply reached Tokyo at 8 A.M. on Aug. 13, 1945. Anami demanded that a further inquiry be sent to the Allies regarding the status of the emperor with reference to the Allied supreme commander. Foreign Minister Togo replied that such an inquiry would accomplish nothing and that the Allied reply was the last word. A cabinet meeting came to the conclusion that there were three possible alternatives: acceptance of the Allied terms, resignation of the Suzuki Cabinet, or dispatch of a further note to the Allies to ask them to clarify ambiguities. In the meantime, *Domei* monitors reported indications of Allied impatience.

At 7 P.M., Premier Suzuki suggested to the emperor that the Supreme War Council should convene and reach a final decision before more atomic bombs were dropped. The meeting began a few hours later in the air raid shelter under the palace. The minister of war and the chief of the Navy General Staff, Admiral Soemu Toyoda, expressed fears that restrictions placed upon the emperor by Allied conditions would cause widespread confusion throughout the nation.

The emperor informed the council that he considered the Allied reply satisfactory, although he fully understood the awkward position of the high command since the word "surrender" was "unknown" to the fighting forces. This meant acceptance of Allied terms. An imperial rescript was drafted by Chief Cabinet Secretary Hisatsune Sekomizu, and was signed at 11 P.M. on August 14. Cables of acceptance of Allied terms were transmitted through the Swiss and Swedish governments. At midnight, the emperor made a recording of the rescript. A group of irresponsible younger officers plotted a coup d'état, but it did not take place, and the leaders committed suicide. War Minister Anami also killed himself.

The Japanese people, still not informed about the true situation, learned that the emperor would be heard over the radio on August 15 for the first time in history. Many believed that Hirohito would command them to battle to the last man. Such a command would have been accepted as a divine ordinance. Listeners were stunned when the recording of the imperial rescript ordered the immediate cessation of hostilities. The next reaction was weeping on a national scale and mass hara-kiri (suicide) before the palace.

The Potsdam proclamation called for the complete disarmament and surrender of all Japanese military forces and equipment. Japanese representatives, summoned to present themselves at Manila, received the instrument of surrender from General MacArthur on Aug. 19, 1945. It was provided that the commander in chief of the army forces, Pacific area, should receive the surrender of the Imperial General Headquarters, its senior commanders, and all ground, sea, air, and auxiliary forces in the main islands of Japan, minor islands adjacent thereto, Korea south of 38° north latitude, and the Philippines, whereas the commander in chief of the United States Pacific Fleet was designated to receive the surrender of the senior Japanese commanders of all ground, sea, air, and auxiliary forces in the Japanese mandated islands, the Ryukyus, the Bonins, and other Pacific islands.

The United States Eighth Army was assigned to an occupation zone north and east of a line crossing Honshu west of Yokohama and Tokyo. Naval responsibility for that zone was allotted to the Third Fleet. The Sixth Army and the Fifth Fleet shared in the control of the rest of the Japanese home islands. South Korea was assigned to the 14th Corps and the Seventh Fleet. On August 15, orders were issued to cease offensive operations against the Japanese. Apprehension that Japanese hotheads might not comply with imperial orders was not borne out by events. The emperor's prestige proved stronger than militarist resentment.

On August 28, a small force of United States Army Air Forces technicians landed at Atsugi airfield, 14 miles southwest of Tokyo, to prepare for a subsequent large-scale airborne landing and for the landing of marine and navy units at the Yokosuka naval base. The beginning of the occupation was delayed 48 hours by a typhoon, which also postponed the formal signing of the surrender from August 31 to September 2. On August 27, an advanced unit of the Third Fleet, guided by a group of Japanese naval officers, harbor pilots, and interpreters, moved into Sagami Bay, southwest of Tokyo Bay.

Admiral King's *Final Official Report* gives the following description of the Japanese surrender:

> On 29 August, Fleet Admiral Nimitz arrived from Guam to break his flag in the battleship *South Dakota*. Aboard the *Missouri*, Admiral Halsey, Commander Third Fleet, entered Tokyo Bay and anchored off Yokosuka naval base. The following day General of the Army MacArthur arrived at Atsugi Airfield to set up General Headquarters at Yokohama. With him came an aerial armada of troop-carrying planes. At the same time about 10,000 Marines and naval personnel landed and took possession of the Yokosuka base and neighboring fortress islands. . . . The last day of August many American prisoners of war were freed and the area of occupation was expanded; new forces came ashore from transports, some groups reaching the outskirts of Tokyo.
>
> The Japanese naval base of Tateyama, across the bay from Yokosuka, was occupied by Marines on 1 September, as American control spread smoothly and swiftly throughout the whole area south of the capital.
>
> The formal surrender of the Japanese Imperial Government, the Japanese Imperial General Headquarters, and all Japanese and Japanese-controlled armed forces wherever located, was signed on board the battleship *Missouri* in Tokyo Bay at 0908 [9:08 A.M.] on 2 September 1945. General of the Army MacArthur signed as Supreme Commander for the Allied Powers, and Fleet Admiral Nimitz signed as representative for the United States. . . .

The surrender of Japanese forces widely scattered in bypassed and still not attacked areas was swiftly completed. It included substantial troops, such as 105,000 men in the Ryukyus and 49,000 men on Truk.

> Five days after the formal Japanese surrender, General of the Army MacArthur entered Tokyo, and his troops raised the United States flag over the American Embassy. It was the same flag which had flown over Washington, D. C., on 7 December 1941; which had been hoisted over Rome and Berlin; and which had been flown on the battleship *Missouri* while the Japanese signed the surrender there.

Thus ended the military phase of the most stupendous and the most destructive war the world has known thus far, 3 years, 8 months, and 26 days after the Japanese attacked the United States at Pearl Harbor.

A SUMMING UP

Statistics which have grown out of the war provide some startling information. While mere figures do not tell a complete story and are continually being revised, many mobilization and casualty estimates are available.

World Mobilization.—Peak mobilization in the United States was 14,000,000. The British Empire mobilized 12,000,000, and China, 6,000,000. Figures from the USSR run as high as 22,000,000, including militarized workers of both sexes. Counting Allied nations knocked out of the war and those whose territory was completely occupied by the enemy, total Allied mobilization amounted to more than 62 000,000.

The Germans mobilized 17,000,000 (13 000,000 before September 1944). Total mobilization of Axis and associated powers reached a peak of slightly more than 30,000,000.

The ratio of opposing land forces was not as favorable to the Allies as these figures indicate. In the decisive phases of the war, neither France

nor the smaller Allied nations had a large proportion of this mobilized strength in battle.

The United States, waging war 3,000 to 9,000 miles from its shores, needed very large forces to operate and safeguard communication lines. Great Britain was forced to keep strong garrisons in distant regions of her empire. Chinese official mobilization figures give an exaggerated picture of China's fighting strength. Both the United States and Britain diverted a large part of their manpower to their navies, while the German Navy was relatively small, and the minor Axis satellites had practically no naval forces. On the Axis side, only Japan and Italy had substantial navies. The western Allies also successfully diverted larger percentages of manpower to their air forces than did their opponents.

The following was the estimated number of divisions:

USSR	550	Great Britain (including Dominions)	50
Germany	313	Hungary	23
Japan	120	Bulgaria	18
United States	89	Rumania	17
Italy	70	Finland	13

The figure for China is given at 300 divisions, but the strength of a Chinese division did not exceed that of one United States infantry regiment.

As divisional strength differed widely among countries and as most divisions were frequently reorganized, these figures are not a final clue to the ratio of opposing forces.

Germany had a clear numerical advantage early in the war, diminishing during the winter of 1939–1940 but rising during the period between the collapse of France and the attack on Russia. The odds later turned against the Wehrmacht, which was outnumbered at the time of its defeat.

Japan began the war with superior numbers but was outnumbered during the Allied Pacific Island invasion.

Strength of United States Forces.—On Jan. 8, 1946, President Truman made a statement that the United States Army on V-E Day had its peak strength of 8,300,000. At maximum strength, the United States Navy had 3,500,000; the Marine Corps, 486,000; and the Coast Guard, 180,000.

This made a total maximum strength of 12,466,000 for all United States forces. (General Marshall stated that peak mobilization was 14,000,000.)

On Feb. 13, 1946, the War Department announced that 10,033,640 men and women entered the United States Army between Nov. 1, 1940 and June 30, 1945.

Casualties of United States Forces.—The United States Army and Navy suffered more than 1,000,000 casualties in World War II, including a death and missing toll of 396,637 (as of June 1946).

In June 1946, the War Department published the first complete list of the army dead and missing for World War II. The report provided the following figures:

Killed in action	176,432
Died of wounds	25,493
Died of injuries	929
Died non-battle causes	85,219
Deaths found under Public Law 490, 77th Congress	19,481
Missing	1,424
Total Army dead and missing	308,978
Total Navy, Marine, and Coast Guard dead and missing (as of June 1, 1946)	87,659
Death total for United States Armed Forces	396,637

Infantry Losses for United States.—During World War II, the United States Ground Forces had a total of 4,194,000 enlisted men and 230,000 officers on 10 major battlefronts.

In April 1946, the commanding general of the army ground forces announced that the infantry, which comprised only 20.5 per cent of the total United States overseas strength, took 70 per cent of the casualties.

Total casualties for all branches of the army amounted to 945,904 men; of these, 731,814 were from the ground forces.

The United States had 89 trained divisions: 5 airborne, 16 armored, 1 cavalry, 1 mountain, and 66 infantry. All of them went overseas, and all but one infantry division saw battle action.

The three divisions which suffered the most casualties were the 3d, 45th, and 36th Divisions. All of them fought in North Africa, Italy, France, and Germany, spearheading the invasion of southern France.

The 3d Division, a Regular Army unit, had 33,547 casualties, including 6,571 killed. The 45th Division, a National Guard unit, suffered 27,207 casualties, including 4,030 killed. The 36th Division, another National Guard unit, had 26,718 casualties, including 4,265 killed.

Three other divisions with heavy losses were: 29th Division with 4,612 killed; 4th Division, 4,581 killed; and the 9th Division, 4,474 killed.

Air Forces Losses for United States.—General Marshall states in his report (dated Sept. 1, 1945) that at peak strength the United States Army Air Forces had 273 combat air groups. The air forces suffered nearly 120,000 casualties, including 36,698 dead.

United States Losses from War Crimes.—On July 28, 1946, the assistant secretary of war announced that a total of 142,076 United States and Filipino armed forces and civilians had died from enemy war crimes. These deaths were results of murder, cruelty and torture, starvation and neglect, and other assaults and mistreatments. They were not battle casualties. Of these victims, 131,028 were in the Pacific, a ratio of 13 in the Pacific for 1 from all other theaters of war.

United States Loss of Generals.—In September 1946, the War Department announced that 26 United States generals were killed in action, and 85 others became casualties during the war.

Casualties of Great Britain.—On June 6, 1946, Prime Minister Atlee informed Parliament that 357,116 Britons were killed in the war, including 154,079 for the army; 69,606 for the RAF; and 50,758 for the navy. More than 60,000 civilians were killed, including 30,248 of the merchant navy and fishing fleets; 1,206 of the Home Guard; and 624 from the women's auxiliary services.

Casualties for the British Empire, including dead, missing, and wounded, were over 1,200,000. This included casualties for India of 177,315 (23,295 killed); casualties for Australia of 92,211 (21,415 killed); and for Canada of 101,008 (36,018 killed).

Soviet Losses.—The USSR gave no precise account of its casualties. It was estimated that almost 15,000,000 Russians perished, a large part of them civilians, victims of German deportation and persecution.

China's Losses.—Including a period of more than 4 years prior to Dec. 7, 1941, China's losses

were reported by Gen. Ho Ying-chin to total 3,500,000, almost half of whom were killed.

France's Losses.—France lost 1,925,000 men prior to the armistice in 1940, of which 125,000 were killed and 1,500,000 were captured. Casualties suffered in operations in which French forces later participated were reported to number 150,000, one third of them during the period from August 1944 through the end of the war. Most of the rest were recorded during the Tunisian campaign.

On Aug. 27, 1945, French Minister of Justice Pierre Teitgen said that the war cost France 4,897,000,000,000 francs ($97,940,000,000) or 45 per cent of its national wealth. The major part of this amount was collected by the Germans as "occupation costs."

Other Allied Losses.—Greek casualties were reported at 147,600, with 77,600 killed. One Yugoslav account told of 1,810,000 casualties, of which 125,000 were prisoners of war. Belgium reported 80,000 casualties; the Netherlands, 6,344; Norway, 10,000; and Denmark, 7,000. Polish military losses were figured at 1,045,000. Polish sources also revealed that 5,000,000 Polish civilians (including 3,000,000 Jews) were murdered by German occupation forces.

Axis Losses.—Reports of enemy losses are variable. According to records discovered in Berlin official archives after the downfall of the Reich, Germany had lost a total of 3,875,000 men by September 1944 (85,000 by May 31, 1940; 185,000 by May 31, 1941; 800,000 by May 1942; 1,680,000 by May 1943; and 3,285,000 by May 1944) not including wounded returned to service.

On May 18, 1946, the United States Allied Military Government officially disclosed that of 17,000,000 listed in the Wehrmacht, 2,250,000 were killed and 1,500,000 missing. United States troops had captured more than 8,000,000 Germans; the British took 2,663,000 as prisoners; and the French took 35,000.

General Marshall gives the following breakdown of German and Italian losses against American, British, and French forces, after the landings in North Africa:

	Battle dead	*Permanently disabled*	*Captured*	*Total*
Tunisia	19,600	19,000	130,000	168,600
Sicily	5,000	2,000	7,100	14,100
Italy	86,000	15,000	357,089	458,089
Western Front	263,000	49,000	7,614,794[1]	7,926,794
Total	373,600	85,000	8,108,983[1]	8,567,583

[1]Includes 3,404,949 disarmed enemy forces.

Japan's military casualties, exclusive of the Chinese theater of war, were reported by Japanese sources as follows: army, 310,000 killed, 146,000 wounded; navy, 157,365 killed, 1,483 missing. A total of 4,470,000 army men were listed as ill, 40,000 of whom died. Navy personnel dead from illness were reported to total 1,430.

This report was exposed as unreliable by General Marshall. He listed Japanese losses on Eastern battlefronts, including China, since Dec. 7, 1941, as follows:

	Battle dead	*Permanently disabled*	*Captured*	*Total*
Southern Pacific	684,000	69,000	19,806	772,806
Central Pacific	273,000	6,000	17,472	296,472
India-Burma	128,000	38,000	3,097	169,097
China	126,000	126,000	1,059	253,059
Aleutians	8,000	1,000	30	9,030
Total	1,219,000	240,000	41,464	1,500,464

Italy lost 60,000 killed, 200,000 wounded and 500,000 prisoners as Germany's partner, and claimed to have suffered 44,494 casualties (including 17,494 killed) while fighting for the Allies.

Of the Axis satellite nations, Rumania lost 694,000, most of whom were prisoners. Finland, exclusive of the 1939–1940 war against the USSR, lost 52,609. Hungarian casualties were not reliably reported after the war. Bulgarian losses were small.

Civilian Losses from Air Raids.—In July 1946, the Metropolitan Life Insurance Company announced that a survey showed at least 1,200,000 and possibly 1,500,000 civilians were killed in air raids during World War II. Germany suffered heaviest with almost 500,000 deaths, and Japan second with 360,000.

Naval and Shipping Losses.—Results of the U-boat war in the Atlantic as compared to Allied construction are listed in Admiral King's report:

Year	*German Subs. Sunk*	*Allied Shipping Sunk*	*New Construction U.S.*	*British*	*Total*	*Allied Gains or Losses*
	(Number)		*(In thousands of tons)*			
1939 (4 mos.)	9	810	101	231	332	—478
1940	22	4,407	439	780	1,219	—3,188
1941	35	4,398	1,169	815	1,984	—2,414
1942	85	8,245	5,339	1,843	7,182	—1,063
1943	237	3,611	12,384	2,201	14,585	+10,974
1944	241	1,422	11,639	1,710	13,349	+11,927
1945 (4 mos.)	153	458	3,551	283	3,834	+3,376
Totals	782	23,351	34,622	7,863	42,485	+19,134

United States naval losses were as follows: 2 battleships, 5 aircraft carriers, 6 escort carriers, 7 heavy cruisers, 3 light cruisers, 71 destroyers, 11 destroyer escorts, 52 submarines, 3 minelayers, 24 minesweepers, 18 submarine chasers, 12 gunboats, 15 coast guard vessels, 3 seaplane tenders, 69 motor torpedo boats, 40 tank landing ships, 9 medium landing ships, 67 tank landing craft, 22 infantry landing craft, 6 support landing craft, 10 tugs, 6 tankers, 21 troop transports, 36 district patrol craft, 152 miscellaneous district craft, 4 cargo vessels, and 22 miscellaneous auxiliaries.

Combatant ships added to the United States Navy between Dec. 7, 1941, and Oct. 1, 1945, were as follows: 8 battleships, 13 heavy cruisers, 2 large cruisers, 33 light cruisers, 17 aircraft carriers, 1 large aircraft carrier, 9 light aircraft carriers, 110 escort carriers (33 of which were lend-leased), 352 destroyers, 12 mine layers, 498 destroyer escorts (86 of which were leased), 55 high speed transports, 203 submarines, and numerous lesser craft.

British naval losses as of May 31, 1945, were reported as follows: 5 capital ships (battleships and battle-cruisers), 8 aircraft carriers, 26 cruisers, 128 destroyers, 77 submarines, 16 armed merchant cruisers, 41 large escort vessels, 51 minesweepers, 240 trawelers, 48 drifters, 6 minelayers, 10 yachts, 7 gunboats, 3 cutters, 1 monitor, 63 small craft and auxiliary vessels. The British dominions lost 3 cruisers, 10 destroyers, 14 large escorts, 10 minesweepers, 2 trawelers, and 7 miscellaneous small vessels.

Japan, in addition to losing 6,130,000 tons of merchant shipping, suffered the following losses: 11 battleships (only one survived in damaged condition), 15 aircraft carriers (6 left, none in fighting condition), 5 escort aircraft carriers (none left), 16 heavy cruisers (2 left),

both out of action), 20 light cruisers (2 left, one of which was damaged), 2 training cruisers (1 left), and 135 destroyers (39 left).

On Feb. 2, 1946, the United States Navy announced that during the war United States submarines sank 1,944 major Japanese vessels, including 194 warships, killing 276,000 Japanese. The first American submarine victory of World War II was the sinking of the 8,663 ton *Atsutaan Maru* off Hainan Island by the *Sword-fish,* on Dec. 15, 1941. The last official victory was the *Torsky's* sinking of two destroyer-escorts on Aug. 14, 1945.

Japan had 51 submarines at the end of the war. The United States had 240 submarines on V-J Day, having lost 52 in the war. Of these losses, 7 are known to have resulted from operational causes.

A total of 3,505 United States officers and enlisted men were lost in submarine warfare.

Neutral shipping losses (almost exclusively merchant vessels) amounted to 1,420,000 tons, 930,000 of which were sunk by submarine action and 270,000 tons by mines.

Lend-Lease Summary.—The twenty-second report on lend-lease to Congress disclosed that aid to all countries from March 11, 1941 through Dec. 31, 1945, amounted to $49,096,000,000. More than 60 per cent of that sum, $30,753,304,000 went to the British Empire. Russia was second with $11,141,470,000, and France and her possessions were third with $2,377,072,000. China was fourth with $1,335,632,000; Brazil, fifth with $319,494,000. Other American republics received a total of $114,646,000; the Netherlands, $178,064,000; Belgium, $82,884,000; Greece, $76,838,000; Norway, $37,708,000; and all other countries, $100,186,000.

Reverse lend-lease from other countries to the United States amounted to $7,345,747,000 through Sept. 2, 1945. The British Empire supplied $6,306,149,000 of this total.

Cost of World War II.—In December 1945, James H. Brady and the American University estimated that the total cost of World War II was $1,154,000,000,000 and property damage amounting to $230,900,000,000, excluding China. The United States spent $317,600,000,000 for materials; Russia $192,000,000,000; United Kingdom, $120,000,000,000; Germany, $272,900,000,000; Italy, $94,000,000,000; and Japan, $56,000,000,000.

ERWIN CHRISTIAN LESSNER,
Major, Austrian Army; Author, "Phantom Victory" and "Blitzkrieg and Bluff."

*WORLD WAR II: NAVAL STRATEGY.

Naval strategy in World War II must be discussed in terms of geography, because it was localized. Until the final stages of the war, contending parties proceeded as though they assumed the classic strategic principle of Admiral Alfred Thayer Mahan (q.v.)—that of obtaining command of the sea and then employing it for any desirable purpose—was inapplicable in any but local terms. At the beginning, British strategy was the same as England always consciously or unconsciously used in a Continental war: to deny the waters of Europe to her enemies and to use the sea as a means of liaison with areas of raw materials and as an avenue for the transmission of land forces to support Continental Allies.

Germany had foreseen that England would attempt this classic application of sea power. There is evidence that German naval commanders designed a struggle for control of the seas on classic lines and were shocked when Adolf Hitler launched the conflict before they were prepared. Actually, the Nazi führer had perceived the futility of the struggle that his admirals proposed, involving naval building in competition with a nation of vastly greater industrial resources; however, from her encircled position, Germany could bring her resources up to the British level only by conquests that would ultimately precipitate a British war.

German Naval Strategy.—Hitler sought escape by a new system of sea strategy which probably can be attributed to Dr. Karl Haushofer, the German geopolitician. Although the military philosopher's ideas had a tinge of irrational mysticism, the new sea strategy was developed with a reasonable amount of logic from the concept that modern war is total, engaging all human and material resources of every nation, once it has begun. If this were true, the key lines of communication were not those in battle areas but the lines between sources of raw materials and factories where they were transformed into weapons.

In the historic past, communication by sea had always been cheaper, easier, and more rapid than by land. In Napoleon's day, for example, Toulon was nearer to Plymouth, England, in elapsed travelling time than to Paris. In the efficiency of water transport lay the source of the greatness of England. The new Nazi strategy proposed to make England's dependence on marine commerce her downfall, for, the Germans insisted, transportation had been radically changed by the invention of the internal combustion engine. In its adaptation to the automobile, it had made land transportation as cheap and efficient as that by sea. By adapting it for the submarine and airplane, they could take control of the surface of the sea by denying its use to enemies.

The special theory of war which developed was that Germany could obtain access to all needed raw materials by a career of conquest on land. The lines of communication between sources of raw materials and factories could not be cut by England, because materials would travel in vehicles of small unit value, invulnerable to almost any form of attack except actual occupation of territory. Water transportation is efficient in proportion to the size of the transporting unit. British communications were carried in high-unit value vehicles, which could be attacked by means of small, cheap, rapidly produced military craft, such as submarines and airplanes. Given the respective times for construction, crews involved, and overall value, if Germany could sink two English merchant ships, complete with cargo, for every submarine she lost, she would be the gainer.

This was the mathematical theory of naval strategy with which the Nazis entered the war, supported by facts from less theoretical regions. One was that the British placed great reliance in their sonic and supersonic methods of submarine detection. The Nazis realized that these devices were quite as useful to a submarine in enabling it to escape pursuers as to the hunter in finding the submarine. The Germans proposed to cancel other British advantages by tactical and technical methods. The new U-boats were built with hulls capable of withstanding a considerable amount of depth charging and were able to go to depths

* See page 560i for bibliography.

where detection devices and depth charges alike were relatively ineffective. Submarines of the new attack on England were to operate in groups, several attacking a single convoy, and even if one or two might be lost, the remainder would uninterruptedly sink the convoy.

It did not matter to the Nazis that a large proportion of British overseas trade was carried in neutral ships, because their total-war theory declared that there were no neutrals, only allies and enemies. The fact that Germany lacked raw materials and coastal bases to carry on a successful war with England required her either to conquer or to convert those who might have been neutrals in such a conflict. All neutral ships approaching England were fair game, even those bound from one neutral to another.

From a combination of Nazi totalitarianism and Nazi immorality, a new sea strategy was born, expressed by Hitler: "Everything that comes before our torpedo tubes will be sunk." Its leading feature was the complete release of the German submarine captain or aviator from responsibility: he was to sink anything he saw. It was not a war of ships alone upon which the Nazis counted. They placed surprisingly great reliance upon two new types of mine, the magnetic and the series-switch, both of which could be sowed by airplanes. Hitler ecstatically proclaimed that in these mines he had weapons for which no defense or retaliation was possible. As early as November 1939, a large-scale aerial mining offensive was launched in the English Channel. The rapid discovery by British scientists of effective defenses against the magnetic mine was the first German defeat of the war. This should not conceal the fact that the essential idea behind German naval strategy was not the classic concept of winning control of the sea and and using it for their own purposes, but making it impossible for any ships of any nation to sail the sea in areas Germany could reach.

The small German surface navy thus became an auxiliary. It was perfectly proper in the terms of their strategy to expend the large part of that navy in the capture of Norway, or the remainder of it in commerce-raiding in support of the submarines. Both of these steps were bitterly regretted by many German strategists when England refused to negotiate after the fall of France, and the ships lost in the first year of war would have been very useful in attempting a passage of the Channel.

Italy's Mediterranean Strategy.—Meanwhile, Italy entered the war, and another system of local strategy had come into operation in the Mediterranean. Italy possessed a submarine fleet, but the main force of her navy lay in its surface vessels, all extremely fast and heavily armed, but with exiguous armor and a fuel capacity which limited them to the inland sea. Among the five great naval powers, she alone had no aircraft carriers. The Italians did not doubt the value of the airplane in naval war; in fact, no nation gave more encouragement to the doctrine that the plane had become a dominant force at sea. Italian ships were supposed to operate under cover of planes from shore bases and, with their help, to be able to close the Mediterranean to any ship movement, naval or commercial. This was a localized form of the Nazi strategy which did not aim at seizing sea power but at preventing the enemy from using it. In the Mediterranean Sea this strategy was carried through with success, although not until German airplanes from Italy and Greece accomplished what Italian fleets could not. The Italians had forgotten that ships which have been ordered not to give battle in ordinary circumstances are not able to when the special condition arises, requiring them to fight or to abandon the field.

On Dec. 7, 1941, when the Japanese attacked Pearl Harbor, a wholly new set of ideas began. The contest between the British doctrine of control of the sea and the Nazi doctrine of making the sea unsafe for anybody was still undecided. The Mediterranean was unsafe for either party, as were the Black and the Baltic seas. In the Atlantic, the Germans were gaining slowly; they were getting as many as four or five cargo carriers for every submarine lost, more than their theory required. On the other hand, American productive capacity had been linked to England's and was providing replacements at a more rapid rate than anticipated.

United States and Japanese Pacific Strategy.—United States strategy in the Pacific was based on the classic doctrine of Mahan. The backbone of the American Fleet was its line of battleships, slower than those of any other navy but also more heavily gunned and less vulnerable to every form of attack. The assumption was that battleships could go wherever they pleased; sooner or later an opponent would have to yield an essential objective without a fight or attempt to combat these monsters with his own inferior ships. This concept was as well known in Japan as the English system was in Germany, and, like the European member of the Axis, the Asiatic had conceived a strategy which looked less toward gaining control of the sea than of rendering Allied control valueless within a specific region of action.

Japanese strategy was based on the use of aircraft. It did not contemplate the immediate destruction of either American or British fleets but planned their elimination for a period adequate to the accomplishment of their purposes. The most prominent of the Japanese admirals, Tatsuo Yamamoto, stated that if the United States battle fleet were destroyed in the first rush, an entirely new one could be built in two years' time, an estimate which proved to be remarkable accurate. The ulterior purpose was the seizure of the enormous empire of the Indies with its resources which would make Japan and her colonies capable of sustaining a war of any duration, just as the Germans contemplated erecting a similar unit with their satellite states in Continental Europe. The only difference between the two objectives was the dependence of the German Empire upon land transportation, while the Japanese expected to transport their goods by sea, along protected routes. Japan could obtain this protection on the ocean flank by possession of the great chain of islands sweeping from the Kurils to New Caledonia and back again to Singapore, embracing more than a sixth of the earth's surface.

The Japanese expected to erect airfields and establish squadrons of aircraft. The island screen could be approached only by sea. As soon as an enemy fleet came near, the approaching ships would be attacked by planes based on these fields, while reserves were drawn in from further islands, each of which was within effective supporting distance of the next member in the chain. The Japanese Fleet would lie at the center of the web, ready to strike at the crippled attacker if he persisted after receiving aerial attack from the

islands. The plan was based on the universally admitted superiority of the land plane to that carried on shipboard. Like the German scheme, it was essentially a method for overcoming large, slowly constructed, and expensive warships by means of small, cheap, easily constructed instruments.

Errors in the Japanese Plan.—The first steps were carried through with brilliant success. Within three days, Japanese planes sank four American and two British battleships and obtained not merely the local superiority necessary to carry out the imperial plan (which was executed within three months) but an overall superiority throughout the Pacific. A classic naval strategy would have required Japan at this point to seek out and destroy the remnants of the now inferior American Fleet, but the Japanese clung faithfully to their original plan and in so doing perhaps lost a war. The concept contained at least four fundamental errors, two of them technical, two of appreciation.

The first error was the idea that United States strategy had become so wedded to the thought of the battleline of great gunnery ships that it had no escape and that a Japanese Fleet built around carriers (some of which they had constructed in defiance of their treaties) would possess a permanent superiority. The Japanese overlooked the fact that while battleline thought was dominant in the prewar United States Navy, there was a strong group of officers who regarded the carrier as the true ship of the line and the battleship as its auxiliary. It was from the Americans that the Japanese had taken the idea of a combination of dive-bombing and torpedo plane attack which was the most successful tactical device of aero-naval war, a tactic unknown in Europe. The error the Japanese had made in underestimating American carrier ability was hinted at in the Battle of the Coral Sea, May 5–6, 1942, when American carriers protected only by cruisers engaged Japanese carriers covered by battleships; the Japanese battleships dared not close in after their carriers had their flight decks damaged and their planes shot down.

Coral Sea had been fought when Japan attempted to round out her empire by an extension to the southeast, bringing within it the only area from which the island chain could be approached without a long voyage across water. Yamamoto and his associates misread the import of this setback by thinking that the southeastward extension of the empire could not be carried forward until the United States base at Pearl Harbor was neutralized. Japan sent her fleet to secure a base from which the bombing of Pearl Harbor could be indefinitely repeated, and in the Battle of Midway, a month after Coral Sea, the lesson was thunderingly reinforced.

It was too late for Japan to profit from the truth. She had lost her six months' command of the Pacific and the power of the offensive. In the succeeding phase, the long struggle for the Solomons, a second Japanese error became apparent: the assumption that surface ships were relatively helpless under well-directed air attack. The origins of this date back to the early part of the European phase of the war and to an Allied misconception. In the evacuations of Norway and Dunkerque, German shore-based dive bombers had inflicted destructive losses on Allied light craft, but these were regarded as atypical cases, since the ships were forced to work close to enemy shore bases, without protective air cover of their own. The record of planes against more stoutly built ships was distinctly bad. In the first two years of the war, that is until Pearl Harbor, only three armored ships had been sunk from the air. All three were at anchor in harbor when hit: two had already been seriously damaged by submarine torpedoes, and the third was one of the lightly built Italian battleships, caught at a time when she did not have her guns manned or steam up. The British carrier *Illustrious* had even survived an all-day pounding by German dive bombers in the Strait of Sicily.

The prospect of air attack on heavy ships was regarded without any particular apprehension, except by the Japanese. It was elsewhere considered that the armament of major ships was adequate, the armament being designed to beat off high-level bombing attacks, not the close-in duel form of dive-bomb and torpedo attack which Japanese and Americans shared.

The sinking of two British battleships off Malaya by unsupported planes surprised everyone but the Japanese, who saw in it the justification of their theories of investing a high proportion of their strategic power in outlying island bases. (At about the same time, German submarines attained their maximum effect, and the criticism of the classic theory of sea power appeared to be supported by the event.) The vulnerability shown by carriers at Coral Sea and Midway to the torpedo-dive-bomber system of attack, tended to confirm the Japanese viewpoint that aerial defense by means of their island chain could not be broken. In the meanwhile, research on weapons against close-in air attack had progressed rapidly. At Santa Cruz in October 1942, the first new United States battleship armed with such weapons appeared in action. The ship shot down not only all the planes which broke through the aerial patrols to attack her but also all those that made attempts on the carrier she was covering. After that date, no vessel under battleship protection was sunk by planes.

It is obvious how grave an error this introduced into Japanese calculations for winning the war cheaply and the attitude this error inspired in the Japanese command throughout the Solomons campaign. During those operations, Japan continued to treat naval strategy as ancillary to attaining a result ashore rather than as something which would make all results ashore attainable if carried to a successful conclusion. Consequently, Japanese warships were sent into the Solomons piecemeal and according to the immediate necessities of the Japanese Army, while Japanese aircraft were committed before their pilots were fully trained. In the sanguinary series of battles that continued for nearly a year, Japanese losses were not much heavier than the American except in the air. What was irreparably lost was time, the two years during which the United States built an entirely new navy, as Yamamoto predicted, while Japan's own replacement capacity did not even keep pace with her losses.

The second major error in appreciation concerned United States submarines. From the first day of the war, American submarines completely escaped control, and as construction in the United States brought its full weight to the submarine service, the effects reached into every region of Japanese strategy. The German submarines in

their best days were sinking no more than four or five ships for every submarine launched, but the United States sent down 20 Japanese ships for every loss she sustained.

By the summer of 1943, a third of the Japanese merchant marine had been destroyed, and because many of the necessary items for construction could be obtained only from the empire to the south and by sea, the capacity for replacement went with the ships. The demand for escorts against submarines came into sharp competition with ships and men to implement the nation's major sea strategy at the same moment that the American attack on the Gilberts revealed the fourth of Japan's major errors.

A gigantic program of building destroyers and other escort vessels was undertaken in the United States from the earliest days of the war, but it became evident that convoy by surface vessels alone was inadequate against the new German submarine tactics. A group of submarines could scatter across a wide area, sometimes with planes coming out from the coast to scout for them. As soon as a convoy was reported, they would run on the surface and well beyond sight of the ships to assemble across their path. On the surface the submarine is faster than any convoy, and the attackers had plenty of time to submerge for an approach by night, coming up again for a close-in attack after dark when the submarine's low silhouette and high speed gave it every advantage. Airplanes could force the submarine to remain submerged during the day and could even find them under water by means of magnetic detectors, but the range of planes from shore was relatively limited. There were far too few carriers to spare them for the immense number of convoys necessary to sustain the war. In July 1942, nearly every ship of a large convoy for Russia was sunk.

At this juncture the escort carriers appeared, rapidly converted from merchant hulls. They were slow but fast enough to accompany the convoys; they carried few airplanes in comparison with the usual carriers but enough to keep submarines at such a distance that their ordinary tactics failed. Their planes were equipped with radar which enabled them to discover submarines by day or night far beyond the limit of visibility. The escort carriers were normally accompanied by groups of destroyers or similar ships which followed the bombing attacks of planes with close-in attacks of their own.

Under the counterattack of the escort carriers and of long-ranged, shore-based planes, German submarine losses mounted. By the fall of 1943, the monthly number of U-boats sent down was exceeding that of merchant ships, and the shadow of failure hung over the whole German strategy. The Nazi system required the production of submarines and their crews in enormous numbers, and, as with Japanese aviation production, mechanical output was far greater than the ability to provide trained and skillful operators. The Germans attempted to overcome this defect by making their more skillful leaders squadron commanders whose orders were scrupulously obeyed by the unit commanders, and even by directing individual attacks from Berlin via radio. The first of these devices only caused the better leaders to be the first to lose their lives, since they pressed home their attacks more boldly. The second made it easier for the Allies to locate submarines by means of radio-direction finders and the interception of code messages. German overall strategy was fundamentally faulty, because it required of the Western Allies no division of effort between meeting the attacks of commerce raiders and those of combat fleets. By the close of 1943, it was possible to spare American escort carriers for operations in the Pacific; the total Allied shipping tonnage in service was showing progressive monthly gains, and Admiral Ernest J. King of the United States Navy was able to announce that submarine warfare was no longer a menace but merely a problem.

The aerial losses of Japan in the Solomons campaign had been so serious that the defenses of the outer island chain were weakened at the moment when the United States Fleet and landing forces moved to the attack. The defect that developed in the Japanese system was not the product of this attrition. Even if every airfield in the Gilberts had been manned by a full quota of planes, and these planes had had the best pilots in the world, they would still have been outnumbered in meeting the attacks of the United States air groups: 11 carriers and 4 new escort carriers. The Japanese planes were shot down with insignificant loss to the Americans, and as the reinforcement squadrons poured in from adjacent islands, they were destroyed in great numbers. Japan had been so positive of the tactical mobility of the airplane that she forgot its strategic immobility. Also, a carrier fleet of the size which approached these outer islands represented a far larger concentration of airpower than any system of land bases could give to a small area. Their correct strategic answer would have been to use their own mobile forces in support of the outlying bases, but as in the case of their failure to appreciate the strength of American seaborne airpower, the lesson came too late to be of any value to them.

The Japanese admiral moved his fleet from the central base at Truk to Eniwetok when the Americans attacked the Gilberts under a plan that had been prepared for a counterattack. One element of this plan was that the Japanese counterattack should be delivered while United States forces were still astride the landing beaches with not all their troops and supplies unloaded. The United States Fleet had arrived so rapidly, coming without warning from the ocean under cover of its carrier air patrols, that the conquest of the Gilberts was complete before the Japanese Fleet reached Eniwetok, still several hundred miles from the scene of action. Another element in the counterattack plan was that the planes from land bases should have damaged many vessels in the United States Fleet; yet all those planes were lost with no appreciable damage to the American ships. The counterattack plan provided that its first blows should be delivered by carrier air groups, but there were neither planes nor pilots for the Japanese carriers. Japan was forced to abandon the whole scheme, and the Gilberts went by default.

The campaign there, although only the beginning of the American drive across the Pacific, was strategically decisive. The differences between it and the campaigns that followed until the fall of Japan were tactical or concerned with operations ashore. In the course of those operations, two new features appeared, both in the domain where something that has begun as a tactical technique is extended until it affects the broader problems of strategy.

Development of Amphibious Operations.—Before World War II, it was generally held that landing on a hostile and defended shore could not be effective without prohibitive loss of lives and, even when achieved, seldom led to any results of strategic importance. Cases in point were the utter failure of the Franco-British expedition to the Dardanelles in 1915 and the very qualified success and high casualties of the German expedition against Riga in 1917. After the German airborne attack on Crete in 1941 and the savage fighting on the beach at Tarawa in the Gilberts, it seemed that the point about dangerously high casualties might still hold true. As the Pacific campaign progressed, however, it became clear that Tarawa had been experimental. Through the refinements of its technique and its equipment, the United States Navy and the Marine Corps were able to make landings which not only resulted in the establishment of the troops ashore but also inflicted upon the defense casualties higher than those suffered by the attacker. The application of similar methods on the Normandy beachheads produced similar results. The amphibious operation, whose possibilities must always be taken into account by future strategists, had made a new dimension to naval war: it is not impossible for a fleet to lose one of its major bases to a *coup de main* while the fleet itself is elsewhere.

This is substantially what happened when the United States attacked Saipan in the summer of 1944, and from that date the Japanese were left without a strategy. They sought refuge in the council of desperation which culminated in the individual suicide attacks of the Kamikaze flyers (of which it is worth observing that in a strategic sense this was one more effort to destroy large and expensive units by means of small and cheap ones), and the mass suicide attack of the Japanese Navy in the Battle for Leyte Gulf. Even the attack on Saipan would have been impossible without the other major strategic innovation which, in its inception, was no more than a technique.

Forward Bases.—In the classic days of seapower under sail, bases were of comparatively slight importance. Some of Nelson's ships, for example, remained at sea for as long as three years with no more base facilities than those furnished by a few days' layover in a cove. This was radically changed by the appearance of the mechanical warships, which required constant replenishments of fuel and equally constant repairs, not of battle damage alone but also to intricate machinery. These repairs could be accomplished only in the security of a dock and with the assistance of facilities which a dock implies. The extent of the necessity for bases is reflected in the fact that at the Washington Conference of 1922 Japan was willing to accept a ratio of 3 ships to the American 5 to provide Japan with adequate security in the Western Pacific, with the understanding that the United States build no more bases. Japan thought that 5 United States ships in the Eastern Pacific or at Pearl Harbor would be worth 3 or less off the coast of Japan because so many of the "5-fleet" would be under repair at a distance or in transit to the repair shops.

By the production of new types of floating equipment, the United States Navy rendered the concept completely falacious. In the fall of 1944, the American Fleet occupied the atoll of Ulithi in the Southwest Pacific. Within less than a week it had become a major United States base, capable of repairing any type of battle or operational damage to ships, adequately stocked with supplies to support the campaign of the largest group of ships the world had seen. The overall result was that fleets were set free from the limitations that engineering had imposed upon them.

The effect of World War II on strategy was not to change but to confirm; not to impose new limits but to erase those limits that had appeared to exist; to dispose of localizations; and to assert once more that the proper objective of strategy is control of the surface of the sea. The weapons by which such a result is attained may be employed above, below, or upon that surface, but that is a matter of tactics. Above all, the effect of the war was to demonstrate that, although the enemy's lines of communication and supply carriers may be the ultimate objective in sea warfare, the first objective must be, and always is, the elimination of the fighting forces contesting control of the sea. WORLD WAR II PEACE CONFERENCE. The full conference of the 21 Allied nations which participated in the defeat of the Axis powers convened at the Luxembourg Palace (q.v.) in Paris on July 29, 1946, to draft treaties of peace, based on earlier drafts made by the Council of Foreign Ministers, with the following enemy nations: Italy, Rumania, Hungary, Bulgaria, and Finland. (See also PACTS AND CONFERENCES—*Council of Foreign Ministers.*) The nations represented in the conference and their leading delegates were as follows:

France: Georges Bidault, Premier and Foreign Minister; Pierre Schneiter, Undersecretary for Foreign Affairs; René Massigli, Ambassador in London; Henri Bonnet, Ambassador in Washington; Gen. Georges Catroux, Ambassador in Moscow; Couve de Murville and Hervé Alphand, of the Quai d'Orsay.

United States: James F. Byrnes, Secretary of State; James Dunn and William L. Clayton, Assistant Secretaries of State; Benjamin V. Cohen and H. Freeman Matthews, of the State Department.

Great Britain: Clement R. Attlee, Prime Minister; A. V. Alexander, First Lord of the Admiralty; Hector McNeil, Under-Secretary for Foreign Affairs; Glenvil Hall, Financial Secretary to the Treasury.

Soviet Union: Vyacheslav Molotov, Foreign Minister; Andrei Vyshinsky, Deputy Foreign Minister; M. Gusev, Ambassador in London; M. Novikov, Ambassador in Washington; M. Bogomolov, Ambassador in Paris. The Soviet delegation also included the foreign ministers of the Lithuanian, Latvian, and Estonian Soviet republics, respectively MM. Rotomskis, Kruss, and Valeskalm.

Australia: Dr. Herbert V. Evatt, Minister for External Affairs; James Beasley, Minister Resident in London.

Belgium: Paul-Henri Spaak, Foreign Minister; F. van Langenhove, Secretary-General of the Belgian Foreign Office.

Brazil: João Neves de Fontoura, Foreign Minister; Luis de Souza Dantas, formerly Foreign Minister.

Belorussia: A Kisseley, Foreign Minister.

Canada: Mackenzie King, Prime Minister and Minister for External Affairs; Brooke Claxton, Minister of Health and Welfare.

China: Dr. Wang Shih-chieh, Foreign Minister; Pao Yi.

Czechoslovakia: Dr. Jan Masaryk, Foreign Minister; Dr. Vladimir Clementis, Under-Secretary for Foreign Affairs.

Ethiopia: Ato Aklilou Abte-Wold, Vice-Minister for Foreign Affairs; Blatta Ephrem Tewolde Medhen, Minister in London.

Greece: Constantin Tsaldaris, Premier and Foreign

Minister; Philip Dragoumis, Under-Secretary for Foreign Affairs.

India: Sir Samuel Runganadhan, High Commissioner in London; Sir Joseph Bhore, formerly of the Viceroy's Executive Council.

Netherlands: Baron van Boetzelaar van Oosterhout, Foreign Minister; Tjarda van Starkenborgh Stachouwer, Ambassador in Paris.

Norway: Halvard Lange, Foreign Minister; Ludwig Aubert, Ambassador in Paris; Judge Terje Wold, of the Supreme Court; Carl Hambro, former president of the *Storting*.

New Zealand: H. G. R. Mason, Attorney-General; W. J. Jordan, High Commissioner in London.

Poland: Wincenty Rzymowski, Foreign Minister; Zygmunt Modzelewski, Deputy Foreign Minister; M. Skrzeszewski, Ambassador in Paris.

South Africa: Major-Gen. Frank Theron, Minister to Italy; Leif Egeland, Minister to Belgium and the Netherlands. Field Marshal Smuts was expected to arrive in Paris later.

Ukraine: Dmitri Manuilsky, Foreign Minister.

Yugoslavia: Edvard Kardelj, Deputy Premier; Stanoje Simitch, Foreign Minister.

It was announced that the official languages of the conference would be English, French and Russian. By prior agreement of the Council of Foreign Ministers, Norway alone of the 21 nations was excluded from signing any of the five treaties, and France would sign only the treaty with Italy. The United States would be a signatory of all the treaties except that with Finland. Of the Big Five powers only Great Britain and the USSR would sign all five treaties. The principle upon which these exclusions of signatories was based was that only those governments which had declared war against the Axis satellites should be privileged to sign the relative peace treaties. Thus, the United States, not having declared war against Finland, was denied the right to sign the Finnish treaty, which was limited to 10 signatories. The Italian treaty, it was agreed, would be signed by 20 of the 21 nations, only Norway abstaining. The signatories of the other four treaties would be as follows:

Hungary
1. United States
2. Great Britain
3. USSR
4. Australia
5. White Russia
6. Canada
7. Czechoslovakia
8. India
9. New Zealand
10. South Africa
11. Yugoslavia
12. Ukraine

Rumania
1. United States
2. Great Britain
3. USSR
4. Australia
5. White Russia
6. Canada
7. Czechoslovakia
8. India
9. New Zealand
10. South Africa
11. Ukraine

Bulgaria
1. United States
2. Great Britain
3. USSR
4. Australia
5. White Russia
6. Czechoslovakia
7. Greece
8. India
9. New Zealand
10. South Africa
11. Yugoslavia
12. Ukraine

Finland
1. Great Britain
2. USSR
3. Australia
4. White Russia
5. Canada
6. Czechoslovakia
7. India
8. New Zealand
9. South Africa
10. Ukraine

Premier and Foreign Minister of France Georges Bidault formally opened the conference with a speech of welcome to the delegates in which he declared:

> For the second time in less than 30 years France is the seat of the international convocation where the nations that have emerged victorious from terrible wars are striving to establish peace. The conference which met after the war of 1914–18 laid before the world solutions which did not prevent the outbreak, less than 25 years afterwards, of a new, longer, and more terrible war. It is only too easy to call to account the men or the policies which were responsible for these solutions. The right of passing judgment belongs to history. But whatever the mistakes and weaknesses of the time, the underlying cause of failure lay in the fact that two great powers whose arms had been brought to bear with decisive weight in the struggle had no part in the peace settlement.

The next day United States Secretary of State James F. Byrnes addressing the conference acknowledged the validity of Premier Bidault's assertion that the failure to preserve peace after World War I had been due to nonparticipation of the United States and Russia in 1919 peace settlements. He declared that the United States would not again commit the mistake of returning to a policy of isolationism. He also defended the course of the Council of Foreign Ministers in preparing preliminary draft treaties, while conceding that they were not such as the United States would have advocated had it been the sole arbiter. One of the most significant points in his speech was a declaration that the conference was free to adopt its own rules of procedure, ignoring the recommendations of the Council of Foreign Ministers. His address included the following remarks:

> After World War I, differences among the Allies were allowed to weaken and destroy their will to cooperate in the maintenance of peace. The United States unwisely decided to return to a policy of isolation rather than to cooperate and to improve a peace which fell short of its expectation. Other governments also drifted into a policy of isolation or appeasement. That must not happen again. However difficult may be the paths of international cooperation, the United States is determined not to return to a policy of isolation.
>
> We must try to understand one another even when we cannot agree with one another. We must never accept any disagreement as final. We must work together until we can find solutions which, while not perfect, are solutions which can be defended . . .

Prime Minister of Great Britain Clement R. Attlee addressed the conference after Mr. Byrnes, saying, among other things:

> The greater part of the drafts before you have been agreed by the four powers. They are put forward as embodying the greatest measures of agreement. Having agreed to them ourselves we shall naturally support them at the conference, but we are anxious to hear the opinions of the 17 other states to whose judgment they are now submitted. Criticisms, suggestions, and recommendations made here must be given full consideration when the final drafts are framed. The remaining articles which have not been agreed will come before you, and I have no doubt that the discussions here will be powerful factors in resolving difficulties and promoting agreement. The four powers should not, and indeed cannot, be unresponsive to the desire of the wider community of nations, and equally to those nations who have made such significant contributions to victory . . .

Foreign Minister of China Dr. Wang Shih-chieh spoke after Mr. Attlee, pleading for "a peace of the common people and not merely a peace of government delegates." He gave special emphasis in his speech to two points: (1) that the victors should abide by the principles and pledges proclaimed during the war; (2) that care should be taken not to impose peace terms on the defeated countries that would favor the resurgence of "reactionary elements" and prevent the emergence of democratic forces.

On July 31, Soviet Foreign Minister Vyacheslav Molotov addressed the conference, his speech including the following observations:

> It is justly said that big states should not impose their will upon small countries. The Council of Foreign Ministers was set up just so that question might be settled not by imposing upon some states the will of others, but by arriving at joint decisions and arrangements. The example of the drafting of the treaties proved to us that positive results have been achieved by the Council of For-

eign Ministers. We can claim this, though we by no means feel that the just aspirations of the Allied peoples have found an adequate reflection in those drafts. But we cannot overlook the fact that at present the decisions of the Council of Foreign Ministers are assailed by all sorts of reactionary elements, who are stuffed with absurd anti-Soviet prejudices and who base their calculations on the frustration of the cooperation among the great powers.

On July 28, the day before the conference opened, Gen. Charles de Gaulle, while on a visit in Lorraine, made a speech at Bar-le-Duc, near Verdun, which was regarded as epitomizing the French point of view on the treaties. Germany's position in postwar Europe was his first concern. He stated the historical reasons "why France must oppose a unified and centralized Germany, a Reich such as that used as an instrument by Bismarck, Wilhelm II, and Hitler." France's solution, he said, was the simple one of allowing the diverse and traditional German entities—Prussia, Bavaria, Saxony, Wurttemberg, Baden, Hesse, the Palatinate, the Rhine Province—to administer themselves.

General de Gaulle recalled the great changes that had supervened in the recent past. "A third of a century ago we lived in a world containing 6 or 8 Great Powers, with which were associated less powerful states and creating a sort of equilibrium . . . In view of the collapse of Germany and Japan and the weakening of Europe, only the United States and Soviet Russia now hold front-rank positions." Quoting the prophetic comparison between Russia and the United States enunciated by de Tocqueville in 1835, de Gaulle said that the destinies of all other countries depended on the future relations of these two, implying that there was small likelihood of such relations becoming amicable. "Who, then," he asked, "can restore the balance between these two new worlds? Only the old world of Europe, which is alone able to provide the necessary element of balance and understanding in a world which is tending to split in two." In order to preserve the balance between the "two new masses" he considered it essential to establish "in the first place an entente between London and Paris." The speech was received with enthusiasm in England where de Gaulle's treaty with Soviet Russia and coolness toward the proposal of a permanent alliance with Great Britain, due to his anger over British intrigues against France in Syria, had caused considerable anxiety.

WORLD WAR II, WAR CRIMES TRIALS.—Trial and punishment of war criminals has been customary during and after wars. The instructions for the government of the armies issued by the United States War Department in 1863 recognized that war crimes could be punished only after trial, and distinguished the jurisdiction of courts martial over statutory offenses from that of military commissions over offenses, under the common law of war. There were a number of war crimes trials during and after the Civil War including that of Capt. Henry Wirz, the Confederate commander of the prison camp at Andersonville, Ga. War crimes have been defined by customary international law, and more precisely in national instructions such as the United States War Department instructions referred to, and in, the Hague Conventions of 1899 and 1907 based upon them and ratified by most countries.

Especial interest has attached to war crime trials of World War I and II. The Treaty of Versailles provided for the trial of Kaiser Wilhelm II "for a supreme offense against international morality and the sanctity of treaties" by a special tribunal composed of judges of the five principal Allied and associated powers (Art. 227). Because of the refusal of the Netherlands (to which he had fled) to surrender him, this trial was never held. Germany also agreed in the Versailles Treaty to the trial of "persons accused of having committed acts in violation of the laws and customs of war," such trials to be before military tribunals of one or more of the Allied and associated powers whose nationals had been injured (Arts. 228–230). Germany declined to surrender the 900 persons accused by the Allies, and agreement was reached for Germany to try them. The tribunal set up at Leipzig for this purpose tried 12 of the 45 initially indicted and convicted 6 mainly for brutality in prison camps and illegal submarine warfare. In the case of Dithmar and Boldt, officers on a German submarine which had sunk a British hospital ship and some of the lifeboats occupied by survivors, the Leipzig tribunal found that certain brutal acts were offenses against the law of nations and that individuals who participated were criminally liable in spite of superior orders, if they knew the order was in violation of law. This opinion established an important precedent, but because of the failure of the tribunal to convict in most of the cases and the short sentences meted out in the few convictions, the Allies declined to indict further persons before this body.

The memory of these inadequate trials influenced public opinion in the Allied countries during World War II to insist that war criminals be tried under Allied auspices. This determination was also motivated by the widespread feeling that Axis aggressions were illegal and that the behavior of the Nazis toward minorities in occupied territories and the Nazi conduct of hostilities on land and sea was not only illegal but atrocious. This opinion, expressed in public by President Franklin D. Roosevelt and Prime Minister Winston Churchill in the autumn of 1941, was also manifested in the declaration of 9 governments in exile in London on Jan. 13, 1942 who "placed amongst their principal war aims the punishment, through the channel of organized justice, of those guilty and responsible for these crimes, whether they have ordered them, perpetrated them or in any way participated in them."

The Moscow Declaration of German atrocities, signed Nov. 1, 1943 by Roosevelt, Churchill, and Stalin, declared that "those German officers and members of the Nazi Party who have been responsible for, or have taken a consenting part in" the described "atrocities, massacres, and executions" will be sent back for trial "in the countries where their abominable deeds were done" without prejudice to the case of the major criminals, whose offenses have no particular geographical localization and who will be punished by the joint decision of the governments of the Allies.

In accordance with the Moscow Declaration and with customary international law, each of the Allied powers has tried many enemy persons accused of crimes against their nationals or armed forces in military commissions or other tribunals. Thus a United States military commission found eight German soldiers, who had landed in the United States during the war and abandoned their uniforms, guilty of attempted

sabotage contrary to the customary law of war. This proceeding was sustained by the United States Supreme Court (Ex parte Quirin, 1942, 317 U.S. 1), and the death sentences were carried out. The Supreme Court also sustained the sentencing by a military commission of Gen. Tomoyuki Yamashita for failure to prevent atrocities by forces under his command during Japanese occupation of the Philippines (In re: Yamashita, 1946, 66 Sup. Ct. 340). After the occupation of Germany, national military commissions sentenced many persons for wholesale murder and other acts in concentration camps such as Büchenwald and Dachau, for killing Allied airmen who had landed in Germany, and for other offenses.

Most interest, however, has been attracted by the trials of major war criminals whose offenses had no particular geographic localization. The procedure for these trials resulted from the report on June 7, 1945, by Supreme Court Justice Robert H. Jackson, who had been appointed chief of counsel for the United States in prosecuting the principal Axis war criminals. Following this report, Justice Jackson was authorized to negotiate with the other principal powers, with the result that the London Agreement for the establishment of an International Military Tribunal was signed by him in behalf of the United States, and by representatives of the USSR, Great Britain, and France on Aug. 8, 1945. The other United Nations were invited to adhere, and 19 did so.

Attached to this agreement was the charter of the International Military Tribunal. This document provided for a tribunal composed of one judge and two alternates from each of the four powers; for a procedure designed to assure the defendants a fair trial and adequate opportunity for defense; for jurisdiction "to try and punish persons who, acting in the interests of the European Axis countries, whether as individuals or as members of organizations," committed any of the crimes defined in the charter. The charter authorized a committee consisting of the chief prosecutors of each country to prepare the indictment and present the evidence on the basis of the law set forth in the charter as follows:

Article 6.—The following acts, or any of them, are crimes coming within the jurisdiction of the Tribunal for which there shall be individual responsibility:

(a) Crimes against peace: Namely, planning, preparation, initiation or waging of a war of aggression, or a war in violation of international treaties, agreements or assurances, or participation in a common plan or conspiracy for the accomplishment of any of the foregoing:

(b) War Crimes: Namely, violations of the laws or customs of war. Such violations shall include, but not be limited to, murder, ill-treatment or deportation to slave labor or for any other purpose of civilian population of or in occupied territory, murder or ill-treatment of prisoners of war or persons on the seas, killing of hostages, plunder of public or private property, wanton destruction of cities, towns or villages, or devastation not justified by military necessity;

(c) Crimes against humanity: Namely, murder, extermination, enslavement, deportation, and other inhumane acts committed against any civilian population, before or during the war, or persecutions on political, racial or religious grounds in execution of or in connection with any crime within the jurisdiction of the Tribunal, whether or not in violation of the domestic law of the country where perpetrated.

Leaders, organizers, instigators and accomplices participating in the formulation or execution of a common plan or conspiracy to commit any of the foregoing crimes are responsible for all acts performed by any persons in execution of such plan.

Article 7.—The official position of defendants, whether as heads of state or responsible officials in government departments, shall not be considered as freeing them from responsibility or mitigating punishment.

Article 8.—The fact that the defendant acted pursuant to order of his government or of a superior shall not free him from responsibility, but may be considered in mitigation of punishment if the Tribunal determines that justice so requires.

Article 9.—At the trial of any individual member of any group or organization the Tribunal may declare (in connection with any act of which the individual may be convicted) that the group or organization of which the individual was a member was a criminal organization. . . .

Article 10.—In cases where a group or organization is declared criminal by the Tribunal, the competent national authority of any signatory shall have the right to bring individuals to trial for membership therein before national, military or occupation courts. In any such case the criminal nature of the group or organization is considered proved and shall not be questioned.

Article 11.—Any person convicted by the Tribunal may be charged before a national, military or occupation court, referred to in article 10 of this Charter, with a crime other than of membership in a criminal group or organization and such court may, after convicting him, impose upon him punishment independent of and additional to the punishment imposed by the Tribunal for participation in the criminal activities of such group or organization.

The tribunal was promptly established with Lord Justice Geoffrey Lawrence of the British Court of Appeals as president; and Francis Biddle, former attorney general of the United States; Maj. Gen. I. T. Nikitchenko, vice chairman of the Soviet Supreme Court; and Donnedieu de Vabres, professor of law at the University of Paris, as judges. The alternates were Sir Norman Birkett, judge of the High Court of England; John J. Parker, judge of the United States Circuit Court of Appeals; Major A. F. Volchkov, judge of the Moscow District Court; and Robert Falco, judge of the Court of Cassation of France. The tribunal held its first public meeting in Berlin on Oct. 18, 1945, and received the indictment from the Committee of the Chief Prosecutors consisting of Justice Robert H. Jackson for the United States, Sir Hartley Shawcross and Sir David Maxwell Fyfe for Great Britain, François de Menthon for France, and General R. A. Rudenko for the Soviet Union.

The indictment, comprising approximately 25,000 words, outlined four counts and three annexes concerning the responsibility of individual defendants and organizations, and the state's violation of international agreements. The four counts, on two or more of which each of 24 Nazi leaders was indicted, were as follows:

(1) "the common plan," or conspiracy to commit war crimes;
(2) crimes against peace—the planning, preparing, initiating, or waging of aggressive war;
(3) war crimes—violation of the laws and customs of war; and
(4) crimes against humanity.

The tribunal established itself in the Palace of Justice at Nürnberg where it decided upon its rules and assisted the defendants to find the counsel of their choice and to obtain the witnesses necessary for their defense. It also decided that Gustav Krupp von Bohlen, who had been indicted, was too sick to be tried and that Martin Bormann, who had not been found, should be tried in absentia. It also found that Rudolf Hess, who was alleged to be suffering from loss of memory, was not in such a condition as to prevent his trial. One defendant, Robert Ley, committed suicide while in custody. Thus only 21 defendants were present in person during the trial.

The trial, begun on Nov. 20, 1945, and continued until Oct. 1, 1946, was conducted in four languages, facilitated by a simultaneous interpretation device. The case of the prosecution was opened by the Americans who dealt with the first count, on which all had been indicted. The British prosecution followed with the second count, on which 16 had been indicted. The French prosecution then dealt with counts three and four, as applied to the west, and the Soviet prosecution followed with the same counts in the east. Nineteen were indicted under each of these counts. The prosecution's case consumed three months, that of the defense—represented by able German lawyers and having many witnesses—five months. In August 1946, the prosecution summed up its case, and each of the defendants made a final statement. After a few weeks' adjournment, the court read its opinion on September 30 and sentenced the defendants the following day. Three of the defendants (Hjalmar Schacht, Franz von Papen, and Hans Fritzsche) were found not guilty on any counts. Seven (Rudolf Hess, Walther Funk, Karl Doenitz, Erich Raeder, Baldur von Schirach, Albert Speer, and Konstantin von Neurath) were sentenced to prison terms varying from 10 years to life. The remaining 12 (Hermann Göring, Joachim von Ribbentrop, Wilhelm Keitel, Ernst Kaltenbrunner, Alfred Rosenberg, Hans Frank, Wilhelm Frick, Julius Streicher, Fritz Sauckel, Alfred Jodl, Martin Bormann, and Artur von Seyss-Inquart) were sentenced to hang.

The Allied Control Council for Germany considered applications for clemency as provided in the charter but did not grant them and carried out the executions of those sentenced to death on October 16, with the exception of Bormann who had not been found and Göring who succeeded in committing suicide a few hours before.

Of the 76 counts on the indictment against the 22 defendants, the court sustained 52. All those sentenced to hang were found guilty of crimes against humanity and in most cases of other crimes also. Four defendants, Funk, Neurath, Schirach, and Speer, though found guilty of crimes against humanity, were given prison sentences because of extenuating circumstances. Defendants found guilty of aggressive war or conspiracy were given life sentences (Hess, Raeder, and Funk) unless there were extenuating circumstances as in the case of Neurath and Doenitz. The Soviet judge dissented from that part of the verdict acquitting three of the defendants.

The tribunal also declared that three of the six accused organizations, the SS (Black Shirts) and its subsidiary the SD, the Gestapo, and the Leadership Corps of the Nazi Party were criminal. The SA (Brown Shirts), the Reich Cabinet, and the General Staff were acquitted without prejudice to the individual liability of members.

In its opinion, the tribunal recognized that it was bound to apply the law provided by the charter, but it considered this law declaratory of customary and conventional international law in existence at the time the offenses were committed. The summary of the opinion contained the following points.

It was said by defendants' lawyers that to punish defendants for the crime of aggressive war was to indulge in ex post facto legislation abhorrent to the law of all civilized nations. In the judgment of the tribunal these contentions ignore the true nature of international law which is continually developing, adapting itself to the needs of a changing world as the wisdom and experience of the succeeding generations dictate. The General Treaty for the Renunciation of War of Aug. 27, 1928, generally known as the Pact of Paris or the Kellogg-Briand Pact, was binding upon 63 nations, including Germany, Italy, and Japan. After 1928, war was an illegal thing. The solemn renunciation of war as an instrument of national policy necessarily involves the proposition that such a war is illegal in international law and that those who plan and wage such a war, with its inevitable and terrible consequences, are committing a crime in so doing.

The contention was made that the official position of defendants as heads of state should free them from responsibility and that international law did not apply to individuals. The tribunal declared that the doctrine of the immunity of heads of state had no application where a state had violated international law and that for many years past military tribunals had tried and punished individuals guilty of violating the rules of land warfare laid down by the Hague conventions. The defense of "superior orders" has never been recognized as a defense to a crime but is considered in mitigation as the charter here provides.

In spite of this opinion, the tribunal was criticized on the ground that it was constituted from one side in the war, that it had jurisdiction only over enemy persons, and that it applied a principle of collective criminal responsibility. In respect to one-sidedness, the tribunal was no different from all military commissions of the past. This was not a trial of Germany but of individual offenders, and it is recognized that international law permits states to assume jurisdiction over offenses against the law of nations, endangering their security, committed by individuals outside their territory. While the tribunal had jurisdiction only over Nazi offenders, the principles of law it applied, as Justice Jackson pointed out, "impose liability upon war-making statesmen of all countries alike."

The ex post facto criticism has been applied particularly to the crime of "aggressive war." Its cogency depends upon the precision with which it is thought crime and penalty must be defined by law before the act. The prosecution pointed out that acts of warlike character not under lawful state authority have long been considered offenses against the law of nations. Piracy and the setting on foot of military expeditions were defined by the United States Congress as such offenses in the 1790's, and a United States district court supported indictments under customary international law for the latter offense prior to any congressional enactment (Henfield's Case, 11 Fed. Cas. 1099). After aggressive war had been outlawed by treaties binding substantially all states, a person who committed warlike acts under the alleged authority of such a state could not claim to be acting in pursuance of a lawful act of state. Thus while there was no precise international legislation defining aggressive war as a crime and affixing a penalty, international practice and custom had established that crime and indicated penalties commensurate with its gravity long before the charter was made or the acts committed. The tribunal, therefore, considered that the Allied powers in making the charter had not made new law but had declared

with greater precision pre-existing rules of customary international law.

As to the question of collective criminal responsibility, the tribunal made it clear that an organization could be found criminal only if its membership constituted a conspiracy to commit crime, that is, if the organization had criminal purposes voluntarily supported by the members. "Persons who had no knowledge of the criminal purposes or acts of the organization and those who were drafted by the state for membership" could not be regarded as members. The presumed members of the organizations found to be criminal, of which there were several hundred thousand, were to have individual opportunity to prove before national military commissions that they were not members in the sense defined by the tribunal.

The trial gave publicity to thousands of documents discovered by the prosecution and to over 16,000 pages of evidence, of great historic and educational value in establishing the activities of the Nazis and the origin of the war. It manifested the practicability of a fair trial of war crimes in an international tribunal, and may encourage the establishment of a permanent tribunal with a wider jurisdiction for the trial of such crimes and other offenses against the law of nations not dealt with by national tribunals. It established important precedents for the development of international law, particularly the principal of responsibility of individuals for war crimes irrespective of official position or superior orders; the inclusion among such crimes of the planning, preparing, initiating, or waging of aggressive war, and the distinction between the aggressor and the defender in hostilities. These principles, if established, will add important sanctions to the numerous international agreements, including the Kellogg-Briand Pact and the charter of the United Nations, outlawing war as an instrument of national policy.

The trial of Japanese major war criminals proceeded along lines similar to the Nürnberg trial. Gen. Douglas MacArthur, supreme commander for the Allied Powers in Japan, proclaimed the charter for the International Military Tribunal for the Far East on Jan. 19, 1946. The charter provided for a tribunal of 6 to 11 judges appointed by the supreme commander on nominations by the signatories of the Japanese surrender instrument and for a chief of counsel designated by the supreme commander. Otherwise it closely resembled the charter under which the Nürnberg trial was held.

The Far Eastern trial began in Tokyo on April 29, 1946. Joseph B. Keenan, chief of counsel for the prosecution, presented a 55-count indictment against 28 defendants, including the major military, naval, and political officers of Japan at the time of the Pearl Harbor attack. The tribunal included judges from Australia (Sir William Webb, chief justice of the Supreme Court of Queensland, presiding), Canada, China, France, Great Britain, the Netherlands, New Zealand, USSR, and the United States.

The experience of the war crimes trials in World War II has contributed much to the definition of war crimes and to the development of procedures for punishing them.

QUINCY WRIGHT,
Professor of International Law, University of Chicago.

Bibliography.—Of the many books published about World War II, the following have been helpful in verifying facts for the preceding articles and can be consulted for additional information: Modley, Rudolf, *A History of the War* (New York 1943); Kafka, Roger, and Pepperburg, Roy L., eds., *Warships of the World* (New York 1944); *General Marshall's Report: The Winning of the War in Europe and the Pacific,* biennial report, 1943–1945 (New York 1945); U.S. Dept. of State Documents, *Trial of War Criminals* (Washington 1945); Eisenhower, Dwight D., *Report by the Supreme Commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force 6 June 1944 to 8 May 1945* (Washington 1946); Glueck, Sheldon, *The Nuremberg Trial and Aggressive War* (New York 1946); Jackson, Robert H., *The Case Against the Nazi War Criminals* (New York 1946); King, Ernest J., *Our Navy at War,* 1st official report, 1941–1944 (Washington 1944); *United States Navy at War,* 2d official report, March 1944–March 1945 (Washington 1945); *United States Navy at War,* final official report, March 1945–October 1945 (Washington 1946); McInnis, Edgar, *The War,* 6 vols. (New York 1945–1946); Wright, Quincy, "Due Process and International Law," *American Journal of International Law,* p. 398, April 1946.

WORLD'S COLUMBIAN EXPOSITION, an international exposition held in Chicago, Ill., in 1893, to celebrate the 400th anniversary of the discovery of America by Christopher Columbus.

History.—The fitness of some special celebration of the discovery of America had been recognized and the question agitated several years before the bill providing for a Columbian Exposition was introduced in Congress in 1889. Several cities urged their claims for the site of the exposition; chief among them were New York, Chicago, Washington and St. Louis; Chicago was finally chosen as the site and the bill passed and approved April 25, 1890. The organization of the fair was placed under the charge of an Illinois corporation previously organized, and the World's Columbian Commission, a national commission consisting of delegates appointed two from each state and territory, two from the District of Columbia, and eight at large. The work of construction was placed under the charge of a bureau of construction, of which Daniel H. Burnham was chief; work was begun on the first building in July 1891. On Oct. 23, 1892, the buildings were formally dedicated by the vice-president of the United States; the dedication ceremony, which was attended by 130,000 people, was held in the Manufactures and Liberal Arts Building. The exposition was formally opened May 1, 1893 by President Cleveland; at the moment which he declared the fair open, the flags of the various nations were unfurled, the electric fountains turned on, and the statue of *The Republic* unveiled. The attendance at the fair was 27,539,041, of which 21,479,661 were paid admissions; the days showing the largest attendance were October 9, Chicago Day, and July 4, the United States' Independence Day; the average daily attendance was 172,712. The exposition was formally closed October 30.

Financial.—The bill providing for the exposition required the city of Chicago to raise

$10,000,000 toward the expenses; later, Congress provided for the gift of a special mintage of $2,500,000 in souvenir half dollars, the exposition authorities also issued $5,000,000 worth of debenture bonds; about $3,000,000 additional were received from other miscellaneous sources, so that about $20,000,000 was available before the opening. The total expenditures for the fair were over $31,000,000, and the profits, about $1,850,000. The United States government appropriated $2,250,000 to its exhibits, the states $6,060,350, the foreign governments $5,830,000, and over $350,000 was invested in the Midway Plaisance.

Buildings and Principal Exhibits.—The site chosen for the exposition was Jackson Park, a portion of the South Park system of Chicago; it covered 666 acres and extended about two miles along the shore of Lake Michigan. There were about 150 buildings erected; the more important were built of the material called "staff," a composition of plaster of paris and jute fiber, which produced the general effect of white marble, hence the exposition grounds became generally known as the White City. The Manufactures and Liberal Arts Building faced the lake near the eastern end of the basin; this was the largest building yet constructed for an exposition; it covered nearly 31 acres; the main roof was of iron and glass. At the head of the basin was the Administration Building, with its gilded dome; near this were the Agricultural Building, Machinery Hall, and the Electrical and Mining Building. On the west of the lagoon were the Transportation Building and Horticultural Hall, and on the east the Government Building, with a large dome 150 feet high; at the northwestern end of the lagoon was the Womans' Building, and at the northeastern end, the Fisheries Building. Still further to the north were the state buildings, many of the foreign nations' exhibits, and the Fine Arts Building. The Fine Arts Building was an example of purely classical architecture; it was entered by four richly ornamented portals. The state and foreign nations buildings were in many cases copies of some characteristic historic building or type; as, for example, Virginia's building was modeled on Washington's Mount Vernon home; Massachusetts' was a copy of John Hancock's house; England's represented a manor house of the time of Henry VIII, and Spain's, the Convent of La Rabida. In the southern part of the grounds was the Forestry Building, built in the rustic style, the columns supporting the roof being made of tree trunks furnished by the different nations and the states and territories of the United States. Near the Forestry Building were a number of the small exhibits, the Krupp exhibit, dairy, etc. The Manufactures and Liberal Arts Building included in its exhibits everything related to engineering, architecture, publishing, technical and domestic arts, together with education, the professions, music, and the drama. The fine arts exhibit included many masterpieces of painting and sculpture, the Womans' Building containing a collection representing womans' work in all lines of activity; the Transportation Building's collection represented all modes of transportation from the most primitive to the most complete, modern inventions of ocean steamers and locomotives; and the exhibits of the other special departments of human industry showed excellently the progress of the race in each special industry.

Special Features.—Among the special features of the exposition the Midway Plaisance was perhaps most interesting; on this were represented the villages of different nations and peoples, including the Irish village, the Javanese village, the Japanese bazaar, the Samoan and Dohomey villages, etc.; here also were the "Street of Cairo," and the various amusement features; and the Ferris wheel, 250 feet in diameter, carrying 36 coaches. Other special exhibitions of interest outside the main buildings were the reproduction of the cliff dwellers' buildings at Battle Rock Mountain, Colo.; the models of Columbus' three caravels, of the Viking ship, and of a modern United States battleship. Another interesting feature of the exposition was the numerous world's congresses held on the grounds under the auspices of the World's Congress Auxiliary. These congresses discussed the leading phases of professional, scientific, economic, educational and religious thought; the World's Parliament of Religions probably attracted the most general attention.

WORM, or **SCREW GEARING** are gears connecting shafts that are not parallel and do not meet, and the elements of whose teeth are helical or screw-like. The worm is a screw, sometimes termed an endless screw, made to mesh with the teeth of a wheel called the worm-wheel. The axis of the worm is usually at right angles to the axis of the worm-wheel. Worms are usually made for single curve gear-teeth, because the sides of involute rack teeth being straight, the tool for cutting worm-teeth is easily made. Special gear-cutting machines are used to cut worm-gears. See GEARS.

WORMS, vōrms, Hesse-Darmstadt, town on the Rhine, nine miles northwest of Mannheim. The town is irregularly built and has remains of its mediaeval walls and ramparts. Its principal building is the cathedral, completed and consecrated in 1101, a noble Romanesque structure with four elegant towers, two domes, a double choir and a flamboyant 15th century Gothic portal. The interior is 357 feet long, 87 feet wide, across the transepts 117 feet and is very imposing from its grand simplicity. On the north side of the cathedral is the site of the Bischofshof or episcopal palace, the seat of the celebrated Diet of Worms in April 1521. It was destroyed by the French in 1689, and again in 1794. On its massive red sandstone substructure the Heil'sche Haus has been erected in the rich Renaissance style. The restored church of Saint Martin, and the church of Saint Paul secularized as a museum, are also of notable ecclesiastical architecture. Outside the town stands the Liebfrauenkirche (dating from the 15th century), which gives its name to the Liebfrauenmilch, a much-esteemed wine grown in the vicinity. The finest monument in Worms is that to Luther, erected from Rietschel's designs in 1868 at a cost of $85,000. Worms is a considerable river port with a good harbor and an active shipping trade. The principal industries of Worms are the manufacture of patent leather, machinery, worsteds, chicory, slate, tobacco, beer, soap and amber wares. Worms is one of the most historical towns of Germany. It was known to the Romans as *Borbetomagus,* and later as *Augusta Vangionum*,

the capital of the Vangiones. It was destroyed by Attila and rebuilt by Chlodwig in 486. After the partition of the empire among the sons of Ludwig the Pious, Worms became a German free town under the protection of the Elector of the Palatinate. Already in 1255 it belonged to the Confederation of Rhenish towns, and it contained in the time of Frederick Barbarossa 70,000 inhabitants. It was the seat of many Imperial Diets, most famous that under Karl V, at which Luther made his defense. In 1632 the suburbs of the town were leveled by the Swedish Colonel Haubold, and in 1689 the town itself was ruthlessly destroyed by Melac and the young Duc de Créqui under the orders of Louis XIV. In September 1792 part of it was leveled by the French under Custine; at the peace of Lunéville in 1801 it was given to France. The peace of Paris in 1814 gave it back to Germany, and the Vienna Congress in 1815 to Hesse-Darmstadt. Pop. 47,015. Consult Fuchs, 'Geschichte der Stadt Worms' (Worms 1868); 'Beiträge zur Geschichte der Stadt Worms' (Worms 1896); Nover, 'Das alte und neue Worms' (Worms 1895).

WORMS, vorms, island in the Baltic, east of Dagö, belonging to Esthonia, about 36 square miles in area. It is flat and generally well wooded in the interior and throws out numerous steep promontories, round which strong currents run, so that, often for months together, it is cut off from all intercourse with the neighboring islands of Oesel, Dagö, Runö, etc., as well as with the mainland, and thus the inhabitants who are of Swedish origin have remained unmixed with foreign elements. A stranger is a surprising rarity on this island, and he, in turn, is not less surprised at the peculiar old Swedish dialect, the architecture and the manners and customs of this small, poor, but happy insular people.

WORMS, any of many elongated jointed animals; the term has no more definite signification or limits than has Vermes (q.v.). Examples of what may most properly be called worms are earthworms, leeches, marine annelids and the parasitic flatworms, roundworms, etc., especially such as infest the intestinal tract. These are described elsewhere, under their names. See also Parasites.

WORMWOOD, a perennial herb (*Artemisia absinthium*) of the composite family. It is a native of Europe and northern Asia, whence it has been introduced into other countries by way of gardens in which it was formerly cultivated for domestic medicine. The plant grows about three feet tall, is spreading, bears silky, pinnatifid leaves and yellow flowers in heads arranged in racemes. All parts of the plant are intensely bitter on which account they, the leaves especially, have been used for flavoring drinks. Wormwood is cultivated to some extent for the manufacture of absinthe (q.v.), of which it forms one of the most important ingredients and which is named from it. See Artemisia.

WORSHIP, the act of paying divine honors to the Supreme Being; or the reverence or homage paid to Him in religious exercises, consisting in adoration, confession, prayer, thanksgiving and the like. The Christian Church distinguishes between the worship due to God alone (*latria*), the respect paid to the saints (*dulia*) and the worship due to the Virgin Mother of Christ (*Hyperdulia*). The homage paid to idols or false gods by pagans is idolatry. "Worship" is also a title used in Great Britain and some British colonies in addressing certain magistrates. See Liturgy; Prayer; Religion; Ritual.

WORSHIP, Freedom of. (The word *worship* is derived from A. S. *weorthscipe* = *weorth,* worthy, + *scipe,* ship; it meant *worthiness* in O. E., and is now used to designate *reverence* for a person or a thing). Reverence is the honor due to another because of some excellence which he has and we have not. That excellence is either natural or supernatural. If we reverence another because of some natural excellence, which we have not, our worship is natural. By such natural reverence we honor our parents, because of a superior excellence in them. They gave us life itself. For that gift we can never sufficiently pay them back. By the excellence of parenthood they will ever be superior to us, and an object of natural reverence. Of natural worship and reverence this article does not treat.

1. Supernatural and External Worship.— If we reverence another because of some supernatural excellence, which we have not, our worship is supernatural. Now this supernatural excellence may be finite or infinite, created or uncreated. Supernatural reverence of another, because of infinite and uncreated excellence, is called *adoration.* Supernatural reverence of another, because of finite and created excellence, has among Catholics the technical, figurative name of *dulia* — from *δουλεία,* "slavery." Just as the subscription "Your obedient servant" means servitude only in a figurative sense, so the supernatural reverence of the saints is slavery only by a figure of speech. Moreover, among Catholics the reverence for the Blessed Virgin Mary is called *hyperdulia,* "more than *dulia,*" to indicate that the homage paid to her is in a class by itself. It is not adoration, because the motive, objectively considered, is not infinite and uncreated. It is *dulia;* because the motive is finite and created. It is "more than *dulia*"; because divine motherhood, the motive of our reverence for Mary, though a finite and created excellence, is unique and in a class by itself. There is only one mother of the divine Person, Jesus Christ. Supernatural reverence — be it *adoration, hyperdulia,* or *dulia* — is either internal or external worship. Quite naturally one is free from State interference with one's internal worship; the State is not concerned with the acts of reverence, which one in no wise expresses by outward signs. The subject of this article is freedom, not of internal, but of external, supernatural worship.

2. Obligatory Worship.— This freedom of worship does not preclude man's obligation to religion, which flows from natural law. External, supernatural worship is not a matter of choice to man. Apart from the duty of religion, consequent upon his knowledge of God's supernatural revelation of Himself to the human race, man is by the very law of nature obliged to both internal and external supernatural worship. For man was created to praise, reverence and serve God. But man is

made up of both body and soul. Hence the faculties of his animated body, as well as the powers of his spiritual soul, should join in this praise, reverence and service of the Creator. That is to say, there should be an external manifestation of the reverence, which the mind conceives and the will elicits. «Ever since the creation of the world, the unseen truths about God,— that is, His everlasting power and divinity,— are to be seen by being reasoned out by means of His works. So that men have no excuse.» (Romans i, 20). The religious freedom, whereof our article treats, is man's right to follow the dictate of his reason and the mandate of his will as to the manner of external worship. This right should be respected and protected by the State as it now is constituted. It is fundamental to our government. For the First Amendment to the Constitution ordains that «Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof.»

Freedom of external worship, guaranteed to the individual by the Constitution of the United States, does not preclude the duty of civil society as such to give reverence to God. For God is the author and stay of civil society. Without Him and His gifts there would be no social organism. Hence is society bound to acknowledge His dominion and beneficence. The State recognizes its indebtedness to particular persons and to other States. America is not unmindful of the services of Lafayette and Rochambeau, nor of France that sent them to our aid. Much less should our State be oblivious of the infinite Being, on whom we depend for our existence and well-being. Nor are the United States forgetful of God. Witness the appeal of the signers of the Declaration of Independence to «the laws of nature and of nature's God,» to the rights wherewith men «are endowed by their Creator,» and «to the Supreme Judge of the world, for the rectitude of their intentions,» when they pledged themselves to the support of the independence of the United States «with a firm reliance on the protection of divine Providence.» Witness likewise the annual proclamation of Thanksgiving Day by the President of the United States.

The Church, as established by Christ, is a true and perfect society; it has its own inalienable rights, which the State should protect. Such protection is quite feasible, when society is entirely Catholic; but in a State such as ours, would be fraught with many and varied difficulties. Hence Catholics of the United States have always stood for justice to the consciences of each and all. Their principle of action in matters religious has been: Live and let live. Whereas at times Protestants seem to have called upon civil authority to impose on others their own religious tenets. In colonial days, the only real freedom of worship to be found was that of Maryland during the brief control of the colony by Catholics, 1634–89. As Bancroft says, in his 'History of the United States,' the Maryland Act of Toleration, 1649, was «the first in the annals of mankind to make religious freedom the basis of the State.»

3. Free Worship.— In civil society constituted as is ours, the only feasible attitude of the State toward external worship is that of the First Amendment to the Constitution. Thereby is safeguarded by the United States the inalienable right, which her every citizen has to liberty of conscience. That right should be respected by civil authority. For authority, the unitive principle of the State, is from God. Therefore it may not validly impose an obligation to violate God's law. But to go against one's conscience is to violate God's law. For it is the function of conscience to dictate to us what is God's law in each particular case. Were the State so to legislate as to atrophy this function of conscience, it would seriously interfere with the observance of God's law. For it is the certain dictate of conscience that testifies just what particular form of worship is willed by God.

From this inalienable right, which each one has to worship God according to the certain dictate of conscience, we may conclude that, in a State such as ours, it would be ethically wrong to force one to practice even the true revealed religion. And this conclusion we draw, despite the fact that Christianity was established as a world-religion, which Jesus wished all to embrace. Just before the Ascension, He appeared to the eleven apostles in Galilee and said to them: «All power hath been given me in heaven and upon earth. Therefore go ye; make disciples of all nations; baptize them in the name of the Father and of the Son and of the Holy Ghost; teach them to observe all things whatsoever I have commanded you. And, lo, I am with you all days, even to the end of the world.» (Matthew xxviii, 18–20). And on the very point of ascending into heaven from Mount Olivet, Jesus once again gave this solemn message to the same body of teachers: «Go ye to all the world; preach the Gospel to all creation. He that believeth and is baptized, shall be saved. He that believeth not, shall be damned.» (Mark xvi, 15–16). The will of Jesus Christ, the divine Ambassador, is clear. He wishes all to belong to His Church. And yet no one is subject to the authority of the Church, unless he has entered it. And he enters the Church by faith; since faith is the root and foundation of justification. But true faith may not be forced. It must flow from the reason at the mandate of the unhampered, unshackled, free will.

Likewise, as our Constitution decrees, the State may not «prohibit the free exercise» of religion according to one's conscience; nor impose any obligation which runs counter to one's religious duty. It goes without saying that the rights of others must be protected. And the State may prevent such religious practices as interfere with these rights, and hinder the well-being of the community. This juridical status of the modern, constitutional State, as the protector of the religious rights of all, is the logical consequence of two fundamental facts in the science of sociology.

First, the State is not a divinely constituted depository of God's revelation to man. Hence it has neither the duty nor the right to dictate what its members shall believe, nor how they shall externally manifest their belief. Christ established a spiritual, and not a material society. He gave His doctrines to the Church, and not to the State, to hand down to men.

Pilate asked Him, «Art thou a king?» Jesus made reply: «My kingdom is not of this world.» (John xviii, 33–36).

Secondly, the social organism or State is from God. Because man is by nature a social being. It is by the law of nature that men form themselves into an organic social unit. But whatsoever is by the law of nature, is from God the Author of nature. Therefore the social organism is from God. Therefore the unifying and vitalizing principle of that social organism is from God. But authority is the principle which unifies and vitalizes society. Hence the authority of the State is from God. Therefore civil authority is bound to protect God's rights in society. And one of those divine rights is to the reasonable manifestation, by the members of society, of their relations to the Supreme Author of the social organism.

No State has the right to be so godless and atheistic as utterly to rule God out. To rule God out of society were to do away with the very Author of society; to substitute the authority of might for the might of authority; to destroy the vitalizing principle of the State, and to devitalize, disintegrate and destroy the social organism.

4. Freedom of Worship, Guaranteed by Treaties.— Since the State, as to-day constituted, has the right and the duty to guarantee to its subjects that freedom of worship which is dictated by the certain conscience of each individual and does not clash with the rights of others, this same freedom may be the legitimate content of international treaties. The exigencies of diplomatic, business or other relations may render it necessary that the subjects of one State reside in another. They still have the natural right to worship God according to the dictate of a certain conscience. And their own State may protect that right. The treaty, whereby a State protects the religious freedom of its subjects abroad, is an agreement between two sovereign States; and essentially differs from a concordat. A concordat is a treaty between the Apostolic See of Rome and a State in diplomatic relations therewith; it has to do with the relations of the Catholic Church to the State. Before the Protestant reformation there was only one ecclesiastical authority in Christendom; and the religious rights of subjects were amply protected by the canonical relations between that supreme papal power and Christian states. Now such protection can no longer be guaranteed. Hence the necessity of treaties between sovereign states, which have as their object the guarantee of a freedom of divine worship. We instance some such treaties between the United States and other countries, which were generally made for the protection of Protestant missionaries. By a treaty of 1805, with the sultan of Tripoli, the American consul, his family and household, were guaranteed freedom of worship in the consulate. By the Treaty of Guadalupe, 1848, Mexico permitted Americans to practise and spread their religion within that republic. In 1856, Siam signed a treaty with the United States, whereby Americans were allowed to build churches and practise their faith in that kingdom. China, by the treaties of 1858 and 1868, yielded to Americans the right to build churches, maintain cemeteries and practise their religion in those parts where foreigners were permitted to reside. In 1858, Japan ceded to Americans freedom of worship and the right to build churches; and the United States in turn assured Japan against molestation of her subjects in their worship. The year following, 1859, our government secured by treaty the religious freedom of Americans, residing in Paraguay. In Turkey, American missionaries have been active since 1818. At first they shared in the religious freedom, which the Edict of Toleration has allowed to all Christians in the Ottoman empire since the 15th century. The treaties of 1830 and 1874 guaranteed to Americans the right to build churches, conduct mission schools and spread their religion throughout the Turkish empire.

WALTER DRUM, S.J.,

Late Professor of Scripture, Woodstock College, Maryland.

WORSTEDS, wûst'ĕd or wûr'stĕd, are varieties of woolen yarn or thread, spun from long staple wool which has been combed, and which in the spinning is twisted harder than ordinary. It is knit or woven into stockings, carpets, etc. The name is derived from Worsted, a village in Norfolk, where it is supposed to have been first manufactured.

WORT, the saccharine liquid obtained by the action of malt on a mixture of water and crushed barley, corn or other grain, the whole being known as «mash.» The water extracts

the maltose and dextrine from the malt and allows the diastase to act on the starch of the grain, changing it also to maltose and dextrine. The pectase of the malt at the same time changes the grain proteids to soluble peptones. Care must be taken of the temperature and the dilution of the mash in order to obtain the best results. Worts are of various kinds, depending on the grain used and the temperature given it. Some are fermented to beer, ale, porter and like beverages, while other forms are fermented to a mash that is distilled for alcohol or whisky.

WORTH, wûrth, **William Jenkins,** American general: b. Hudson, Columbia County, N. Y., March 1, 1794; d. San Antonio, Tex., May 7, 1849. He received an ordinary education, and when the War of 1812 broke out enlisted as a private soldier, rising to the rank of captain in 1815. He was instructor of infantry tactics and commander of cadets at West Point 1820–1828 and in 1838 became colonel of the 8th Infantry.

In 1840 he was sent to serve in the war against the Florida Indians, and in 1841 took the chief command. He was successful in repeated and severe conflicts with the aborigines, whereby the war was brought to a close, and in August 1842 was brevetted a brigadier general for gallantry and distinguished services.

In the war with Mexico, at the Battle of Monterey, Sept. 23, 1846, he bore a very important part. As it was impossible to communicate with Zachary Taylor, Worth was obliged to act independently throughout the battle. He carried the forts commanding his line of approach, stormed the bishop's palace, and had fought his way through the streets nearly to the great plaza, when the town capitulated to Taylor, approaching from the other side. For these achievements Worth was brevetted a major general, and received a sword from Congress.

Later under Winfield Scott he further distinguished himself at Cerro Gordo, Puebla, Cherubusco, Molino del Rey, and at the storming of the city of Mexico, which surrendered to him. A monument was erected to his memory by the city of New York, at Broadway and 25th Street in 1858. Fort Worth, Texas, was named for him.

WORTH, William Scott, American general: b. Albany, N. Y., Jan. 6, 1840; d. Clifton, S. I., Oct. 16, 1904. Entering the Union army as 2d lieutenant in 1861, he became captain in 1866; lieutenant colonel of the 13th Infantry in 1894, and colonel in September 1898. He accompanied the army to Cuba, and during the assault on San Juan Hill, July 1, 1898, was severely wounded. He was promoted brigadier general, United States Army, in the following November, and was retired a week later.

WORTH, vûrt, village in Alsace, France, at the confluence of the Sauerbach and Sulzbach rivers, 10 miles southwest of Weissenburg. Here the French under Marshal MacMahon on Aug. 6, 1870 met their first great defeat in the Franco-German War. Pop. (1946) 1,165.

WORTHEN, wėr'thĕn, **William Ezra,** American civil engineer: b. Amesbury, Mass., March 14, 1819; d. New York, April 2, 1897. After graduation from Harvard in 1838, he began the practice of civil engineering, and until 1848 was employed chiefly with surveys connected with the Boston water supply, and in other hydraulic works. He became chief engineer of the New York and New Haven Railway, and in 1854 its vice president. After 1854 he was busily employed as a practising and consulting engineer, being frequently retained as an expert in matters relating to the planning, construction or improvement of sewage and water systems. He was chief engineer of the first rapid transit commission of New York, and in 1890–1891 chief engineer of the Chicago main drainage canal.

WORTHING, wėr'thĭng, borough, England, a watering place in Sussex, 47 miles south of London, with good streets, handsome terraces, crescents, and villas, splendid hotels, baths, smooth sands and a beautiful esplanade. Industries include metalworking and pharmaceutical products. Fruit and flower growing under glass is an important industry of the town. Pop. (1951) 69,375.

WORTHINGTON, wûr'thĭng-tŭn, **Henry Rossiter,** American inventor: b. New York, Dec. 17, 1817; d. Tarrytown, N. Y., Dec. 17, 1880. In 1840 he began a series of experiments with steam for the propulsion of canal boats, soon afterward devised a small steam pump to be used in the maintenance of the water supply in the engine boiler, and in 1841 patented an independent feed pump which developed into the direct-acting steam pump which he patented in 1849. Subsequently he built in Savannah, Ga., the first direct-acting compound-engine ever used in waterworks; invented the duplex steam feed pump, and devised various improvements in steam and hydraulic machinery.

WORTHINGTON, Thomas, American public official: b. Charleston, Va. (now W. Va.), July 16, 1773; d. New York, N. Y., June 20, 1827. A member of Ohio's territorial House (1799–1803) and the state's General Assembly (1803; 1807–1808), he was one of Ohio's first United States senators. Resigning his Senate seat in 1814, he assumed the governorship, and was re-elected in 1816. He was responsible for founding the state library, served two terms in Ohio's House of Representatives, and was a strong advocate of a state-supported school system.

WORTHINGTON, city, Minnesota, Nobles County seat; altitude 1,593 feet; 186 miles southwest of Minneapolis, on the Chicago, Rock Island and Pacific, and the Chicago and North Western railroads, and on two federal and one state highways. It has a public library, radio station, municipal hospital, airport and municipally owned electric and water utilities, and a mayor and council. Worthington Junior College is here. The city was established in 1871 as a prohibition colony and was first known as Okabena. Pop. (1950) 7,923.

WOTHERSPOON, William Wallace, American military officer: b. Washington, Nov. 16, 1850; d. there, Oct. 21, 1921. He was commissioned in the army in 1873, and saw campaign service in the Indian wars and the Philippine Insurrection. Returning to the United States in 1903, he was made assistant commandant of the service schools at Fort Leavenworth, Kansas. Appointed chief of staff of the army in April 1914, he retired with rank of major general in November 1914.

WOTTON, wŏt"n, Sir **Henry,** English diplomat and poet: b. Boughton Malherbe, Kent, March 30, 1568; d. Eton, December 1639. He was educated at Oxford, and having studied civil law under an eminent Italian professor, became proficient in the Italian language. He visited all the principal countries of the Continent 1589–1597, and on his return was secretary to the earl of Essex. On the fall of that nobleman he went to Florence, where he composed a treatise, printed after his death, entitled *The State of Christendom.* The grand duke of Tuscany having intercepted some letters disclosing a plot to take away the life of James, king of Scotland, engaged Wotton to carry secret intelligence of it to that prince. This service he ably performed in the character of an Italian, and when James came to the English crown he sent for Wotton, knighted him and in 1604 employed him as an ambassador to the Republic of Venice. As Wotton passed through Augsburg, being desired to write in an album, he wrote in Latin that "an ambassador is a good man, sent to lie abroad for the good of his country." This innocent sally was represented as a state maxim sanctioned by the religion of the king of England. James I, who thought nothing relative either to kingcraft or state-craft a subject for wit, was highly displeased; and on his return Wotton had to make humble apology. At length he recovered the royal favor, and was restored to his former post at Venice (1616–1619). Other missions followed, and in 1624 he was made provost of Eton College. The first fruits of his leisure were his *Elements of Architecture.* A collection of miscellanies was published after his death entitled *Reliquiae Wottonianae.* This collection includes several poems by Wotton, of which two, *The Character of a Happy Life* and *On His Mistress, the Queen of Bohemia,* are among the finest lyrics in the English language.

Consult *Lives* by Izaak Walton (1651) and A. W. Ward (1899), and More, P. E., *Shelburne Essays* (Fifth Series, New York 1908).

WOTTON, William, English scholar: b. Wrentham, Suffolk, Aug. 13, 1666; d. Buxted, Essex, Feb. 13, 1726. He had acquired a remarkable knowledge of Latin, Greek and Hebrew at the age of 10, was graduated at St. John's College, Cambridge, in 1679, and was elected a Fellow there. He was later ordained, held various livings, and was a prebend of Salisbury Cathedral from 1705 until his death. He was prominent in the controversy concerning the respective merits of ancient and modern languages, taking the side of the moderns. He ably defended his views in *Reflections Upon Ancient and Modern Learning* (1694, 1697), which was subjected to an attack by Swift in *The Battle of the Books.* He was also author of *History of Rome* (1701); *Traditions and Usages of the Scribes and Pharisees* (1718), and he left an unpublished translation from the Celtic of the laws of Hywel Dda (1730).

WOUND, a disruption of continuity of an external or internal surface of the body caused by an instrument. Wounds are classed as to character under many heads such as *cutting,* when due to a sharp instrument, *contused* when produced by a blunt one, *incised* when caused by a sharp pointed weapon, *penetrating* when due to the piercing of the wall of a cavity and entering an organ, *lacerated* when the tissues are torn. Other types have received their names from the weapons used such as *gunshot,* made by the projectile of any small arm (pistol or rifle), *shell wounds,* usually lacerated and the result of artillery fire. In general wounds fall into two main classes as to causation, those that are accidental, homicidal, or suicidal and resulting from violence, and those that are intentional and incident to surgical operative procedures.

Healing and Management of Wounds.—In practice every wound is regarded in the light of how best to effect its healing. Wound repair is dependent upon the activity of growth of living cells. When healing is complete cell growth ceases. The presence of necrotic tissue, debris, and foreign bodies retards healing. Likewise undue motion of the parts about a wound, especially joint motion, disturbs the young cells, inviting minute hemorrhages, this in turn rendering infection likely, with consequent death of immature cells. An adequate blood supply is essential for wound repair and an absolute requisite in wound closure following operative procedure. Continued bleeding in the depth of a wound may be disastrous for it separates tissue planes and increases the cellular repair necessary to bridge the gap. It also provides a medium of blood plasma and clot in which bacteria will multiply. All wounds require a certain amount of granulation tissue for healing. In a clean wound with well approximated edges the amount of granulation tissue necessary to cover the gap with epithelium will be small, while in one with widely separated edges it will be considerable (second intention). The greatest menace to wound healing is the presence of bacteria. All wounds, including many of those made by the surgeon under the best aseptic conditions, will harbor some bacteria on their surfaces and no wound can be guaranteed aseptic. The objection to using antiseptics in wounds is that such agents, if capable of killing bacteria, will also be certain to damage or destroy young tissue cells. The sulfonamides, penicillin, and other antibiotics are not regarded as antiseptics in the generally accepted sense. The extent to which they may be used locally as preventives of infection is often a matter of individual opinion, but their use systemically is not open to question. In a planned operative wound, closure should be made and a dressing applied when bacterial infection is at a minimum and bleeding is at a standstill. If the wound is traumatic and newly made, all devitalized tissue is removed together with surface bacteria. In a wound presumably infected care should be observed to avoid opening up channels to widespread infection through unnecessary cutting operations. In such a wound, drainage is often indicated and, if no more than a few hours have elapsed, healing without serious infection may be expected. After 12 hours all wounds are presumably infected and should be so treated. Large areas denuded of epithelium may be impossible to close and may require skin grafting later. In some cases, a skin graft may be avoided by secondary suture which cuts short an unnecessarily protracted period of healing.

Treatment of Specific Varieties of Wounds.—The ordinary wound, which on examination appears superficial and without any important blood vessel or nerve being severed, may be

sutured at once after surgical cleansing. If a large artery or vein has been cut it must be tied before closure and if the wound edges are damaged they will have to be trimmed. If a nerve trunk has been divided, as occurs fairly often in stab wounds, the original wound must be enlarged and the nerve ends sought for in order to suture them (nerve suture). The nerves most often involved are the cranial, brachial plexus, median, ulnar, sciatic, and peroneal. If a cut nerve is not sutured a permanent paralysis of the muscles supplied will result. A deep stab wound is not necessarily serious unless it involves a vital organ or one of the great blood vessels but any wound penetrating the abdominal cavity demands immediate exploration with repair of the damage done to intra-abdominal organs. Stab wounds of the chest may cause alarming hemorrhage from divided intercostal arteries. Wounds of the heart are not infrequent, both in civil and military practice; in a large percentage of these wounds suture is possible, with a surprising recovery rate, about half of those operated on. A contused wound may present a special problem. If the skin is viable it may be wise not to open the wound. If damage is so great that a slough is inevitable it is best to proceed as with any open lacerated wound, that is, the skin edges are excised along with any dead tissue and the wound washed with salt solution before closing. In all scalp wounds it is essential to save as much tissue as possible so as to permit closure without tension. In extensive lacerated wounds of the extremities, tendons are often severed which will require painstaking repair. Bullet wounds in civil practice are produced mostly from rifles, revolvers and shotguns. Wadding and pieces of clothing may be carried deep into the wound. Bullet wounds should not be probed. Where the abdominal cavity is involved immediate operation is mandatory. In most wounds antitetanus vaccine is advisable if the individual is unprotected. Antibiotics such as penicillin have a wide use in combating infection.

Battle Wounds.—These include almost every type of injury. Most have been already defined, being similar to those encountered in civilian life and differing only in distribution and causation. The causative agents are small arms, grenades, explosive shells, bayonets, and incendiary material. Their care and treatment involves no departure from accepted surgical methods and standards maintained in civil practice. Military surgery is the surgery of trauma encountered on the battlefield, in what might be called epidemic proportions. Battle statistics reveal that out of every 100 casualties about 15 are wounded men. See also SURGERY.

HAROLD WELLINGTON JONES, M.D.

WOUWERMAN, vou'vĕr-män, **Philips,** a Dutch painter: b. Haarlem, May 1620; d. there, May 19, 1668. He was instructed by his father, an indifferent artist and by Wynants of Haarlem, in which city his life was passed. According to the commonly received account, his reputation as a painter during his life was small. After his death his pictures rose immensely in value, and he is now one of the most esteemed painters of the Dutch school. In consequence, it is said, of the disgust with which this neglect inspired him, he destroyed before his death all the studies he had made during his life, from fear that his son might be induced by the possession of them to become a painter. His subjects consist for the most part of roadside scenes and hunting or battle pieces, and it is commonly believed that he never painted a picture without a white or gray horse as a conspicuous object. His technical qualities are of a high order and his skies, foregrounds and foliage are executed in the best style of his school. He left upward of 800 carefully finished pictures. Those offered for sale always bring high prices, and in 1892 his *Halt of a Sporting Party* was sold for $18,375. The best collection of his works is in the Royal Gallery of Dresden. There are also fine examples in the Louvre, and in Munich, Vienna, Petrograd, Amsterdam, The Hague, Rotterdam, etc.

Consult De Groot, C. Hofstede, *Catalogue Raisonné of the Works of the Most Eminent Dutch and Flemish Painters of the 17th Century* (new ed., 1909).

WOVEN FURNITURE. See WICKER WEAVING AND PRODUCTS.

WOVOKA, wō-vō'kà (English name, JACK WILSON), Piute Indian mystic: b. Mason Valley, Nev., about 1856; d. 1932. He was left an orphan at the age of 14, and became a member of the family of David Wilson, a white man, from whom he received his English name. In 1888 or 1889, while in delirium from an illness he had what he described as a revelation to the Indians from the Great Spirit. He established himself as a prophet, foretelling the time when the old Indian life would be restored as it had been before the coming of the whites. Among the principles he put forth in his preaching were the equality of women in ceremonial affairs, the abolition of tribal warfare and the war dance, property distribution, and undue grief at funerals. He became most widely known among the various tribes by the institution of the Ghost Dance which the Indians generally adopted. The dance reached its greatest popularity in about a year's time after which, largely because of the Sioux outbreak (1890–1891), and the action of the United States government, the excitement quickly subsided. Wovoka's influence waned to negligibility upon the failure of his prophecies.

WRANGEL or **WRANGELL,** vrän'gyĕl, Angl. răng'gĕl, BARON **Ferdinand Petrovich von,** Russian explorer: born St. Petersburg (now Leningrad), Russia, of Swedish parents; d. Dorpat, Estonia, June 6, 1870. He studied at the Naval Academy of St. Petersburg and in 1820–1824 directed a Polar expedition to explore eastern Siberia and the region north of Asiastic Russia. By sledge journeys undertaken in 1822 and 1823 he reached latitude 72° 2′ north, but he found no trace of the reported land for which he was searching after being first reported by native Siberians. This was discovered later by G. W. De Long in 1867, and is now known as Wrangel Island. In 1829–1834 Wrangel was governor general of Russian-America and in 1840–1849 director of the Russian-American Company. He attained vice admiral's rank in the navy. In 1855–1858 he was acting minister of marine, and subsequently a councillor of state. He opposed the sale of Russian-America to the United States. His account of his Polar expedition appeared in Russian in 1844. An account in German was prepared from Wrangel's journals (1839), and an English translation was made by Sabine,

'Wrangell's Expedition to the Polar Sea' (1840). Consult Von Engelhardt, 'Ferdinand von Wrangel und seine Reise' (1885) and Sabine (ed.) 'Narrative of an Expedition to the Polar Sea in 1820–23' (London 1840).

WRANGEL, Karl Gustaf von, Count, Swedish general: b. Skokloster, on Lake Maelar, 13 Dec. 1613; d. Isle of Rugen, 24 June 1676. He accompanied Gustavus Adolphus in his expedition to Germany, and at the battle of Lützen, in 1632, rendered great services after the fall of the king. In 1641 he was one of the major-generals who commanded the Swedish forces until the arrival of Torstenson, and under him participated in the campaign in Germany, and the famous march of Holstein. After the death of Flemming in 1644 he received the supreme command of the Swedish fleet, and obtained over the Danish fleet a great naval victory on 13 October, between the islands of Femern and Laaland. In 1646 he succeeded Torstenson as commander-in-chief of the Swedish army, effected a junction at Geissen with the French forces under Turenne, with whom he crossed the Main and besieged Augsburg, which, however, was relieved by the Austrian army. In 1648 the Swedes and French defeated the Austrians and Bavarians near Zusmarshen, but retired before the army of Piccolomini. Wrangel commanded under Charles X in the campaigns in Poland (1655) and Denmark (1657–59), and in 1674 led an army of 16,000 men into the electorate of Brandenburg. Ill health obliged him to relinquish this command before the conclusion of the campaign.

WRANGEL (răng'gĕl) **LAND,** or **NEW COLUMBIA,** an island in lat. 71° 32" N., and long. 178° W.; in the Arctic Ocean, about 100 miles off the coast of Siberia and 300 miles from the coast of Alaska. It is about 75 miles long and 20 miles wide. It consists chiefly of bare rocks which rise to a height of 2 000 feet. At the base and in places near the shore line there is some vegetation. The first mention of an island in this locality was made about 1810, and in 1821 Ferdinand, Baron Wrangell, the Russian explorer, commanded an expedition in search of this land. Long, the American explorer, sighted the island in 1867, and Hooper, also an American, visited it in 1881, and took possession of it for the United States. He named the island New Columbia. Consult Hooper, Rosse, Muir and Nelson, 'Cruise of the Corwin' (Washington 1893).

WRANGELL, Alaska, town, on Wrangell Island, near the mouth of the Stikine River, 160 miles south of Juneau. A Russian settlement here in 1833 was named for Baron Ferdinand von Wrangell, Arctic explorer. There is fine hunting and fishing for sport, but commercial fishing is more important, with a cold storage plant and canneries of salmon, shrimp, and crab. It has airplane and steamer transportation. There is mining and fur farming near by. Bishop Rowe Hospital and Wrangell Institute (U. S.) are here. Pop. (1930) 948; (1939) 1,162.

WRANGLER, Senior, a term applied previous to 1909 in the University of Cambridge, England, to the undergraduate who passed the best public mathematical examination for the bachelor's degree. The candidates for honors were arranged in order of merit in three lists or classes, of which the highest was called that of wranglers, the next that of senior optimés, and the lowest that of junior optimes — the whole constituting what was known as the mathematical tripos. Hence the senior wrangler or the highest in the list of wranglers was the most distinguished mathematician of the year. Since 1909 the results of the examination have been published with the names in alphabetical order.

WRASSE, a fish of the family *Labridæ* (q.v.), of which the best known representatives in America are cunners, doncellas, ladyfishes, tautogs, etc.

WRATTISLAW, răt'ĭs-lâ, **Arthur Henry,** English scholar: b. England, of Bohemian parentage, about 1822; d. 1892. He was graduated from Cambridge in 1844, was headmaster of Felstead Grammar School 1849–57, and of that at Bury Saint Edmonds 1857–79, and was vicar of Manorbier, Pembrokeshire, Wales, 1879–87. He was the leading Slavonic scholar of his day in England, and among his important publications are 'Lyro Czecho-Slavonska' (1849); 'The Queen's Court MSS. with Other Ancient Bohemian Poems' (1852); 'Life, Legend and Canonization of Saint John Nepomuk' (1873); 'Native Literature of Bohemia in the 14th Century' (1878); 'Sixty Folk Tales from Exclusively Slavonic Sources' (1889).

WRAXALL, răk'sąl, Sir **Nathaniel William,** English historian: b. Bristol, 8 April 1751; d. Dover, Kent, 7 Nov. 1831. He was in the East Indian Civil Service, 1769–72, and during the course of some seven years of foreign travel was a confidential agent of Queen Caroline Matilda of Denmark to her brother, George III (1774–75). He published 'Cursory Remarks Made in a Tour' (1775); 'Memoirs of the Valois Kings' (1777); 'History of France from Henry III to Louis XIV' (1795); 'Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna' (1799), and the famous 'Historical Memoirs of My Own Time, from 1772 to 1784' (1815). For a libel in the last on Count Woronzov, Russian envoy to England, Wraxall was fined $2 500 and sentenced to six months' imprisonment. He is an amusing writer, but his veracity has been many times questioned. He sat in Parliament for 14 years from 1780 and was knighted in 1813. Consult his 'Posthumous Memoirs,' continued from 1784 to 1790 (1836).

WRAY, John. See Ray, John.

WRECK, that which is cast or driven ashore by the waves, the goods, broken timbers, plates, etc., cast ashore from a ship that has been broken up, destroyed or rendered helpless at sea, as by collision, tempest, etc. In maritime law the term means the goods cast ashore by the waves after shipwreck, and left there within the jurisdiction of some country, and subject to common law. A ship also is a wreck when she is rendered unable to pursue her voyages without repairs exceeding half her value. A sunken vessel is not a wreck, but a derelict. In the United States laws have been enacted by the several States bordering on the sea and on the Great Lakes for the safe-keep-

ing and proper disposition of wreck. Goods found at low-water mark, or between high- and low-water mark, whether resting or partly resting on the ground, are wrecks, and, if not reclaimed, belong to the owner of the shore. See SALVAGE; MARINE INSURANCE.

WRECKAGE, *in navigation,* is usually understood to mean any ship or goods driven ashore or found floating at sea in a deserted or unmanageable condition. *In law,* wreckage is defined as such articles of value as are cast upon land by the sea, and includes jetsam, flotsam, ligan and derelict. In most countries any person found stealing or destroying any wreck is chargeable with felony; and a person proved to be in possession of shipwrecked goods, or who offers such goods for sale, may be fined or imprisoned. See WRECK.

WREN, rĕn, SIR **Christopher,** English architect: b. East Knoyle, Wiltshire, 20 Oct. 1632; d. Hampton Court, Berkshire, 25 Feb. 1723. He entered as a student at Wadham College, Oxford, in 1646, having previously given proofs of genius by the invention of astronomical and pneumatic instruments. In 1647 he wrote a treatise on spherical trigonometry upon a new plan, and the following year composed an algebraical tract on the Julian period. He was one of the earliest members of the Philosophical Society at Oxford, which was the origin of the Royal Society, after the institution of which, in 1663, he was elected a Fellow and distinguished himself by his activity in promoting the objects of that institution. In 1657 he was appointed professor of astronomy at Gresham College, but, being nominated to the Savilian professorship of astronomy at Oxford, resigned the former office, and in 1661 returned to the university. He received a commission in 1663 to prepare designs for the restoration of Saint Paul's Cathedral, then the largest Gothic edifice in the kingdom. While his designs were under consideration the cathedral was destroyed by the fire of 1666, and Wren had now an opportunity for signalizing his talents by the erection of an entirely new structure. In 1668 he succeeded to the office of surveyor of works, resigned his Savilian professorship in 1673, in 1674 received the honor of knighthood; and in the following year the foundation of the new cathedral was laid. In 1680 he was chosen president of the Royal Society. In 1683 he was appointed architect and one of the commissioners of Chelsea College; and the following year controller of the works at Windsor Castle. He was elected member of Parliament for Plympton in 1685, and to his public trusts were added in 1698 that of commissioner for the repair of Westminster Abbey, and in 1699 that of architect of Greenwich Hospital. In 1700 he represented in Parliament the boroughs of Weymouth and Melcombe Regis. In 1708 he was made one of the commissioners for the erection of 50 new churches in and near the city of London. After having long been the highest ornament of his profession he was, in 1714, deprived of the surveyorship of the royal works from political motives. He was then in the 85th year of his life, the remainder of which was devoted to scientific pursuits and the study of the Scriptures. His remains were interred under the choir of Saint Paul's Cathedral, and over the choir entrance was placed the following inscription (since removed to another part of the church):

Subtus conditur
Hujus Ecclesiæ et Urbis Conditor,
Christ. Wren;
Qui vixit Annos ultra nonaginta,
Non sibi sed Bono publico.
Lector, si Monumentum quæris,
Circumspice.

(Beneath is laid the builder of the church and city, who lived above ninety years, not for himself but for the public good. Reader, if thou seekest his monument, look around).

The edifices constructed by Wren were principally public, including a royal hunting seat at Winchester and the modern part of the palace at Hampton Court. Some of the most remarkable of his buildings, besides Saint Paul's, are the monument on Fish Street Hill, the theatre at Oxford, the library at Trinity College, Cambridge; the hospitals of Chelsea and Greenwich; the church of Saint Stephen's, Walbrook; those of Saint Mary-le-Bow, Saint Michael, Cornhill and Saint Bridge, Fleet street; and the great campanile of Christ Church, Oxford. The Royal Exchange and Custom-house, since destroyed by fire and re-erected, were among his works. As an architect he possessed an inexhaustible fertility of invention combined with good natural taste and profound knowledge of the principles of his art. His talents were particularly adapted to ecclesiastical architecture but in his palaces and private houses he sometimes achieved monotonous results, as at Hampton Court. The interior of the church of Saint Stephen's, Walbrook, which has been considered as his *chefd'œuvre,* exhibits a deviation from common forms equally ingenious and beautiful, and Saint Paul's Cathedral may be fairly reckoned among the most magnificent productions of architectural genius. Yet the works of Wren have not passed without censure. Even in Saint Paul's, while the grandeur of the whole work is admitted, many faults, and especially waste of interior space, are charged against him. Consult 'Parentalia, or Memoirs of the Family of the Wrens' (1750); Elmes, 'Sir Christopher Wren and His Times' (London 1823); Clayton, 'Churches of Sir Christopher Wren' (London 1848); Milman, 'Annals of Saint Paul's Cathedral' (1868); 'Life,' by Phillimore (1883); Loftie, 'Inigo Jones and Wren' (New York 1893); Marshall, 'Under the Dome of Saint Paul's' (1899); Dimock, 'Handbook of Saint Paul's Cathedral' (1900).

WREN, a family (*Troglodytidæ*) of passerine birds, having a slender, slightly curved and pointed bill, with the exposed nostrils partly concealed by a scale, the wings very short and rounded, with nine well developed and the first short primaries, the tail short and often carried erect; the legs are robust and rather long. They are abundant in the neotropical region, less common in the nearctic, and only a few occur in the Old World in Europe, Asia and Sumatra, those of the latter region being more or less aberrant. The known species exceed 100 and are arranged in about 15 genera, several of which are confined to tropical America. North America has six genera and 14 species. Closely related to the wrens are the mocking thrushes, which some ornithologists place in the same family, and the creepers (*Certhiidæ*). The wrens are plain little birds

usually clothed in modest browns and seldom exhibiting bright colors of very conspicuous markings. They are insectivorous and mostly migratory, though particular species may inhabit either warm or cold regions. Their haunts are mostly brush piles, tangled roots, stone walls and similar places, where they pry into every nook and cranny; they enter holes and reappear in another place in very mouselike fashion; and are altogether very sprightly little creatures. Their songs are wonderfully loud and vehement for such small birds, but differ characteristically for each species. Although the nests vary greatly in their location, which is most often a hole of some sort, they are always more or less spherical in construction. Few passerine birds are more prolific, the eggs numbering from five to 10, and many of the species producing several broods.

Few birds are more familiar in the United States than the house-wren (*Troglodytes aëdon*). It is about five inches long. The color is very uniform, reddish brown above, barred with dusky, and pale fulvous white below. It often builds its nest near houses and in boxes prepared for it or in any convenient hole. The nests are made to fill the boxes; and to effect this a large mass of heterogeneous materials is sometimes collected. From six to eight eggs constitute a brood and two or three broods are produced in a summer. The eggs are so thickly spotted with brown that they appear to be almost uniformly colored. The song is extremely rapid and vivacious as though the performer were overflowing with good spirits. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the bluebird and swallows, and taking possession of the boxes which they have appropriated for their nests. It even attacks cats when they approach its nests and vigorously scolds all intruders.

The winter wren (*T. hiemalis*) is our smallest species of wren, only about four inches long, and the ridiculous little tail is usually cocked straight up into the air. Above, the color is a rich dark brown; below it is much lighter, both regions prettily barred. The typical form inhabits most of eastern North America, the Canadas, and northernmost United States during the summer and the rest during the winter.

Of the genus *Cistothorus,* or marsh-wrens, we have three species, of which one (*C. marianae*) is a Florida form. See MARSH-WREN.

Thryothorus comprises the mocking wrens, of which *T. ludovicianus,* the great Carolina wren, is the best known Eastern species and the largest of the wrens of this region. It is six inches long, of which the tail is two and one-third inches, about equaling the wings. It is nearly uniform bright reddish brown above with yellowish white under parts, a conspicuous white superciliary streak and the wings and tail cross-barred with black. Bewick's wren (*T. bewickii*) is a related species very abundant in the interior southward, while a number of other species and subspecies of the same genus are found in the West and Southwest. In the latter region also, as well as in Mexico, and southward, occur several large wrens which have broad spreading tails composed of somewhat cuneate feathers. Among these are the cactus wrens (q.v.), which build purse-shaped nests in bushes in the desert regions of Texas, California, etc., and the rock-wrens and cañon-wrens (qq.v.), which live and nest in rocky places. They have loud ringing songs. In Europe are several species of *Troglodytes,* of which the beloved common or jenny wren (*T. parvulus*) is found in all parts of Europe, and in Morocco and Algeria, and in Asia Minor and northern Persia. In central Asia it is represented by *T. pallidus,* in Iceland and the Faroes by *T. borealis* and in Norway by *T. bergensis.*

H., *Useful Birds and their Protection* (Boston 1913); and *Bulletin 30, United States Biological Survey.*

WRESTLING. Greek legend ascribes the invention of wrestling to Theseus. Homer sang of it in the *Iliad,* and it has been estimated that ancient Egyptian monuments contain figures showing over 1,000 holds. About 708 B.C. wrestling was introduced into the Olympic Games as part of the pentathlon, the wrestler attempting to throw his opponent to the ground while remaining on his feet himself. The pancration, introduced in 648 B.C., was a rough and tumble fight with only biting forbidden and lasted until one contestant acknowledged defeat.

One of the earliest English sports records concerns matches held in 1222, but probably wrestling's pinnacle was reached in 1520, when King Henry VIII challenged Francis I of France to a bout and was thrown by him. The rules governing the original Loose style are obscure, but apparently it resembled the Cumberland and Westmoreland style, in which the hands were clasped around the body and a wrestler was defeated when any part of his body other than his feet touched the ground. Under the Devonshire and Cornwall rules contestants wore jackets on which holds were taken, the object being to throw an opponent to the ground so that he lit on two shoulders and a hip or both hips and a shoulder. The Lancashire style was the direct ancestor of the present catch-as-catch-can wrestling. This is by far the most popular in the United States and the British Commonwealth, the earlier forms now being of historic interest only.

Under Intercollegiate rules the objective is to gain a fall, and a fall is gained by pinning the opponent's shoulders to the mat for two seconds. When no fall is gained the wrestler showing the most aggressiveness and wrestling skill is awarded the decision. A bout lasts nine minutes, but in case of a draw two additional two-minute periods are wrestled. Strangling, butting, holds for punishment alone and grips considered dangerous to life and limb, such as the full nelson, toe hold, etc., are forbidden. It is illegal to slam an opponent to the mat unless the slammer has one knee on the mat. The Free style rules used in the Olympic Games require only a momentary touch of the shoulders to gain a fall, a match may last fifteen minutes, and a point scoring system is employed. Illegal holds are essentially the same as those prohibited by the Intercollegiate code, with the addition that use of scissors holds is forbidden. Other more minor differences also exist. To train American wrestlers for Olympic competition, the A.A.U. rules have been drawn quite similar

to the Free style, differing principally in that a one second fall is required.

Professional wrestling unfortunately has largely degenerated into a prearranged display of rough and tumble acting. In 1945 at least five different «World's Heavyweight Champions» were recognized in various sections of the country.

On Continental Europe the Graeco-Roman style (which has no connection with the Greeks and Romans and is primarily a codification by the French) is the most popular. All holds must be taken above the waist, and the use of the legs for tripping or holding is forbidden. A fall is gained when both of the opponent's shoulders touch the mat at the same time. The emphasis on the use of the upper body requires that successful wrestlers be men of great strength above the waist, and this style has never been popular in English speaking countries.

Hindu wrestling resembles Free style, but in Japan two distinct styles developed. The first sumo match reputedly took place 7 July 22 B.C. Originally the object was to kill the opponent or force his surrender, but the more dangerous holds were eliminated in the 8th century. Every detail of sumo is surrounded with elaborate ritual. Matches are held in a ring slightly over fifteen feet in diameter. A wrestler is defeated when any part of his body except his feet touches the ground, or when he is forced out of the ring. While matchings are by skill alone, weight is extremely advantageous, and the professionals are usually huge, occasionally exceeding six feet in height and 300 lbs. in weight.

Japanese tradition relates that jiu jitsu was introduced by the gods Kajima and Kadori; Occidental scholars incline to the more prosaic opinion that its elements were imported from China during the Ming dynasty (1368–1644). Forbidden to defile their swords on commoners, the samurai developed it as a means of defense against their inferiors or when unarmed. So efficient did this deadly art become that a contestant could never be sure of returning home alive. The resultant effect on its popularity was so serious that by the 19th century it had fallen into disrepute.

In 1882 Professor Jigoro Kano founded his Kodokan School of Jiudo, so refining or eliminating the objectional features that it became a popular sport. He has defined jiu jitsu as «the art or practice of gentleness or of first giving way in order to gain final victory» and jiudo as «the principle of the same.» Great stress is placed on the emotional, intellectual and moral development attributed to the sport.

Reflecting its self-defense origin, contestants wear the kimono, short trousers and belt of the early Japanese costume. Grips are taken on the clothing, and a good deal of the effectiveness of the art is lost against one not so clad. The wrestlers are divided into several grades according to ability and are matched by skill, not by weight as in Western wrestling. The proficiency of the participant is indicated by the color of his belt. A fall may be gained by throwing an opponent once cleanly, twice in a slovenly manner, by forcing him to give up, or by pinning him in one of certain positions for a given time. Only wrestlers of the fifth grade and above are permitted to use dangerous grips and then only against each other. Scissors holds are not permitted, but choking is allowed. Although bouts between wrestlers and jiu jitsuns have not been conclusive, the Japanese found their original expectation that judo would enable their wrestlers to win Olympic competitions was not fulfilled, and prior to World War II, imported westerners to teach Free style in preparation for these events.

PHILIP J. RASCH,
Lieutenant Commander, U.S.N.R.

WREXHAM, rĕks'ăm, North Wales, a market town in the county of Denbigh, 12 miles south of Chester, in a district containing coal, lead, and iron. It is a station on the Great Western and Great Central railways, 201 miles from London, and has several churches and other places of worship, schools, a guildhall, infirmary, barracks, market-halls, public baths, electrical works, and a free library. The restored parish church, dedicated to St. Giles, was erected between the 14th and 16th centuries. It is the seat of a Roman Catholic bishopric. In St. Giles' churchyard is the tomb of Elihu Yale, founder of Yale College, New Haven, Conn., U.S.A. Pop. (1940) 25,740.

WRIGHT, SIR **Almroth Edward,** British physician and pathologist: b. Middleton Tyas, Yorkshire, Aug. 10, 1861; d. Farnham Common, Buckinghamshire, April 30, 1947. Educated at Dublin University and the universities of Leipzig, Strasbourg, and Marburg, he developed a method of preparing the serum for antityphoid inoculation in 1896. This method gained international acceptance after he had arranged for its use among British troops during World War I. He was knighted in 1906, and served as principal of the Institute of Pathology and Research at St. Mary's Hospital, London, from 1902 to 1946.

WRIGHT, Carroll Davidson, American statistician and sociologist: b. Dunbarton, N. H., July 25, 1840; d. Worcester, Mass., Feb. 20, 1909. After studying law, he enlisted in the 14th New Hampshire Volunteers at the outbreak of the Civil War, and in 1864 became its colonel. In 1865 he was admitted to the bar at Keene. He was appointed first commissioner of the U.S. Bureau of Labor in 1885, and president of Clark College. (Worcester, Mass.) in 1902. He was president of the American Statistical Association (1897–1909) and recorder of the commission appointed to arbitrate in connection with the anthracite coal strike in the fall of 1902. Besides numerous contributions to periodicals, he published *The Industrial Evolution of the United States* (1895) and *Outlines of Practical Sociology* (1899).

WRIGHT, Elizur, American abolitionist; b. South Canaan, Conn., Feb. 12, 1804; d. Medford, Mass., Nov. 21, 1885. He was graduated at Yale in 1826, was professor of mathematics in Western Reserve College (1829–1833), and became identified with the antislavery movement in 1832. He then removed to New York, where he edited the *Quarterly Anti-Slavery Magazine* (1835–1837), and was at the same time secretary of the American Anti-Slavery Society. Removing to Boston in 1838 he there edited the

Massachusetts Abolitionist, the *Daily Chronotype* (1845), and *The Commonwealth,* its successor (1850). He published *Savings Banks Life Insurance* (1872); *The Politics and Mysteries of Life Insurance* (1873), etc., and was (1858–66) insurance commissioner of Massachusetts. He wrote an introduction to Whittier's poems (1844), and published a translation of *La Fontaine's Fables* (1859).

WRIGHT, Fanny. See D'ARUSMONT, FRANCES.

WRIGHT, Frank Lloyd, American architect: b. Richland Center, Wis., 8 June 1869. In America, the architectural work of Frank Lloyd Wright has been characterized as «The New School of the Middle West,» and in Europe it has been described as «The American Expression in Architecture.» After studying civil engineering at the University of Wisconsin in 1884–88, he began practice at Chicago, Ill., in 1893, and thereafter won international distinction as architect of the Imperial Hotel in Tokyo, Japan, and many notable buildings in Europe and America. He was awarded honorary membership in architectural societies in the United States, France, Germany, and Brazil. He founded the group for cultural experiment in the arts, «The Taliesin Fellowship,» which meets annually at «Taliesin» in Wisconsin and Arizona. His books include: *An Interpretation of Japanese Prints, In the Cause of Architecture* (essays), *Modern Architecture, The Nature of Materials, An Autobiography—Frank Lloyd Wright, The Disappearing City, Architecture and Modern Life* (with Baker Brownell), and three volumes published in Europe.

WRIGHT, Harold Bell, American novelist: b. Rome, N.Y., 4 May 1872. He was engaged in the decorating business in 1887–92; was a landscape painter in 1892–97; and in 1897–1908 he was a pastor in the Christian (Disciples) Church. He later devoted himself wholly to the writing of fiction of great popular appeal. These include *That Printer of Udells* (1903); *The Shepherd of the Hills* (1907); *The Calling of Dan Matthews* (1909); *The Winning of Barbara Worth* (1911); *Their Yesterdays* (1912); *When a Man's a Man* (1916); *The Recreation of Brian Kent* (1919); *Helen of the Old House* (1921); *The Mine with the Iron Door* (1923); *A Son of His Father* (1925); *God and the Groceryman* (1927); *Long Ago Told* (1929); *Exit* (1930); and *To My Sons* (1934). D. La Jolla, Calif., 24 May 1944.

WRIGHT, Horatio Gouverneur, American military officer: b. Clinton, Conn., 6 March 1820; d. Washington, D.C., 2 July 1899. He was graduated at West Point in 1841, was superintending engineer of the building of Fort Jackson at Tortugas, Fla. (1846–56); lighthouse engineer in Florida (1852–53); and assistant to the chief of engineers in Washington (1856–61). He was active throughout the Civil War, became brigadier general of volunteers in September 1861, and took command of the Department of Ohio in August 1862. He commanded a division at the battle of the Wilderness, a corps at Spottsylvania Court House and Cold Harbor, 3 June; served as major general at the battle of Opequon Creek, 19 Sept. 1864, and contributed to the decisive victory at Cedar Creek, 19 Oct. 1864. He was brevetted major general in the United States Army for his services at the capture of Petersburg, 13 March 1865, and was mustered out of the volunteer service, 1 Sept. 1866. He returned to regular army duty as lieutenant colonel of engineers becoming brigadier general and chief of engineers, 30 June 1879, retiring 6 March 1884.

WRIGHT, John Calvin, American vocational educator: b. Elkhart Co., Ind., 24 June 1876. Educated at the Kansas State Normal School and at the University of Missouri. In 1895 he began teaching, first in Kansas rural schools and then in city high schools. In 1913 he became director of vocational education at Kansas City, Mo., and in 1917 he joined the Federal Board of Vocational Education, of which he was a director, 1922–33, and then assistant commissioner. He has published *Automotive Repair* (4 vols.), and was co-author of several volumes on vocational education. He served during the Spanish-American War with the rank of corporal.

WRIGHT, Joseph, American artist: b. Bordentown, N.J., 16 July 1756; d. New York, 1793. He obtained his art education in England and Paris, in 1783 returned to America, and in that year painted a portrait of Washington. Subsequently he executed another for the Comte de Solms, and still later a miniature profile. Among his other portraits were those of Jay and Madison. In 1792 he was made first draughtsman and die-sinker in the mint newly established at Philadelphia. He was the designer of the first coins and medals struck by the government.

WRIGHT, Joseph, English philologist: b. 31 Oct. 1855. From 1891 to 1901 he was deputy-professor of comparative philology, Oxford University, professor until 1925, and then emeritus. His numerous publications include *Primer of the Gothic Language* (1899); *Middle High German Primer* (1888, rev. 1917); *Old High German Primer* (1888, rev. 1906); *English Dialect Dictionary* (1896–1905); *Old English Grammar* (1908, rev. 1925); *Grammar of the Gothic Language* (1910); *Elementary Old English Grammar* (1923); *Elementary Middle English Grammar* (1923); *Historical New English Grammar* (1924). Died, 27 Feb. 1930.

WRIGHT, Luke E., statesman, diplomat: b. Tennessee, 1846; d. Memphis, Tenn., 17 Nov. 1922. He took a prominent and active part in the affairs of his state, especially in Memphis, where he practiced law. For eight years he was attorney general of Tennessee, and during the epidemic of yellow fever in 1878 he did much to relieve the suffering. From 1900 to 1904 he served on the United States Philippine Commission, of which he was president in 1903–04. In the latter year he became civil governor of the Philippine Islands, and was appointed governor-general soon after. This position he held until 1906, when he became Ambassador to Japan, but resigned soon after to become Secretary of War (1908–09).

WRIGHT, Mabel Osgood, American writer on nature, daughter of Samuel Osgood (1812–80) (q.v.): b. New York 26 Jan. 1859; d. Fairfield, Conn., 21 July 1934. She was married in 1884 to J. O. Wright, and made her home in Fairfield, Conn. She was contributing editor to *Bird Lore,* and published *The Friendship of Nature* (1894); *Birdcraft*

(1895); *Dogtown* (1902); *The Garden, You and I* (1906); *The Stranger at the Gate* (1913); *My New York* (1926); *Captains of the Watch* (1927); *Eudor's Men* (1931).

WRIGHT, Marcus Joseph, American soldier: b. Purdy, Tenn., June 5, 1831; d. Washington, D. C., Dec. 27, 1922. He studied law, was admitted to the bar, and practiced his profession in Memphis until the outbreak of the Civil War when he entered the Confederate Army as lieutenant colonel of the 154th Tennessee Regiment. Promoted brigadier general in 1862, he was wounded at Shiloh. In 1878 he was selected by the Department of War as agent for the collection of Confederate records for the United States government. He wrote lives of Gen. Winfield Scott, Governor William Blount, Col. David Crockett, and Gen. John Peter Muhlenberg. With Gen. A. L. Long he was coeditor of *Memoirs of Robert E. Lee* (1886). He also prepared the sketches of Confederate generals in Appleton's *Cyclopedia of American Biography.*

WRIGHT, Orville, American aviator and inventor: b. Dayton, Ohio, Aug. 19, 1871; d. there, Jan. 30, 1948. Like his older brother and lifelong associate Wilbur (q.v.), his formal education ended with a high school course. It was Orville's prowess as a prize-winning amateur cyclist that suggested the brothers' second business venture in 1892, a bicycle sales and repair shop which was even more prosperous than their earlier printing house. So closely were the brothers associated in developing the airplane that in most cases it is impossible to give individual credit for the many details of invention; however, it was Orville's suggestion that an aviator could restore his machine's balance by varying the angles of the wing tips which became the basic claim of the original Wright patent, now incorporated in the aileron controls of every plane. The brothers' gliding experiments at Kitty Hawk, N.C., starting in September of 1900, were encouraged by Octave Chanute, the noted engineer, glider experimenter, and author of *Progress in Flying Machines* (1891). In 1901, Orville constructed the first wind tunnel, with which the brothers began testing more than 200 types of wing surfaces. On Dec. 17, 1903 at Kitty Hawk, Orville made the first self-powered airplane flight in history, against a 27-mile wind. In February 1908 the Wrights' bid of $25,000 to construct a biplane for the United States Army Signal Corps was accepted, and the following September, while his brother was in France, Orville began the official army tests of the new machine. All went well until the 13th flight when the machine crashed, fatally injuring Lieut. Thomas E. Selfridge and causing Orville a broken leg and several ribs. After a short convalescence he joined Wilbur in Europe where both received the highest honors. After closing a contract with the German Wright Company they returned home to receive more honors including medals presented by President Taft at the White House. Wilbur died in 1912. When the United States entered World War I, Orville was commissioned a major in the Signal Corps Aviation Service. In 1920–1921 he developed the split wing flap, much used by dive bombers in World War II. Not until 1942 did the Smithsonian Institution make tardy amends in conceding that the Wright brothers had designed the first practical airplane. The Kitty Hawk plane, loaned to the South Kensington Science Museum in 1928, was returned to the Smithsonian after Orville's death.

WRIGHT, Robert Ramsay, British biologist and educator: b. Alloa, Scotland, Sept. 23, 1852; d. Droitwich, England, Sept. 5, 1933. He was graduated at the University of Edinburgh in 1873 and the following year accepted an appointment as professor of natural history at University College, Toronto. Professor of biology at the University of Toronto from 1887 to 1912, for the last 11 years of this term he served also as vice president of the university and dean of the faculty of arts. He was a past president of the Canadian Institute, the American Association of Anatomists, and the Royal Society of Canada. He contributed many papers on the comparative anatomy of invertebrates to scientific journals. As professor emeritus he made his home at Oxford, England.

WRIGHT, Silas, United States senator and governor of New York: b. Amherst, Mass., May 24, 1795; d. Canton, N.Y., Aug. 27, 1847. In his early childhood his family moved to Weybridge, Vt., where he grew up on his father's farm and in due course entered Middlebury College, graduating in 1815. Admitted to the bar in 1819, he began practicing at Canton, N.Y. During the next decade he held several local offices and attained the rank of brigadier general in the militia. Elected state senator in 1823, he served until 1827. A staunch nationalist and Democrat, he voted for manhood suffrage and direct election of justices, yet held that boss leadership and the spoils system were necessary in the battle against special privilege. Taking his seat in Congress in 1827, he favored high protection and helped frame the 1828 "tariff of abominations," but in 1842 frankly admitted he had taken the wrong side of that issue. Though re-elected, he resigned (1829) to become comptroller of New York, which office he also resigned in 1833 to complete the senatorial term of William L. Marcy who had been elected New York's governor. Re-elected in 1837 and 1843, Wright was held in high esteem by his colleagues. Always master of his subject, a logical and powerful reasoner, and of unflinching integrity, Thomas Hart Benton called him the "Cato of the Senate." He opposed rechartering of the Bank of the United States, urged an independent treasury system and saw the bill passed in 1840. Refusing President Tyler's offer of a Supreme Court appointment in 1844, he resigned his seat to run for the New York governorship, carrying that state for Polk. As governor he alienated powerful banking and landlord interests by advocacy of liberal reform, and also lost popular support by his suppression of the antirent disturbances. Renominated in 1846, he was defeated by the Whig candidate. An antislavery man, though not an abolitionist, he supported the Wilmot Proviso. At his death he was being talked of for the presidency. Consult Gillet, R. H., *The Life and Times of Silas Wright* (2 vols., 1874).

WRIGHT, Thomas, English antiquary: b. Tenbury, Shropshire, April 23, 1810; d. Chelsea, London, Dec. 23, 1877. He was graduated at Trinity College, Cambridge, settled in London,

and devoted himself to the study of English history, literature and antiquities. He was one of the founders of the Camden Society, and of the British Archaeological Association, and was an active member of the Percy and Shakespeare societies. He edited numerous rare works connected with early English history and literature, and was author of many others including *The History of Ireland* (1857) and *Essays on Archaeological Subjects* (1861).

WRIGHT, Thomas, English biographer: b. Olney, Buckinghamshire, England, May 16, 1859; d. there, April 3, 1936. Educated at Buxton College, Forest Gate, he was for several years principal of the Cowper School at Olney. He founded the Cowper Society (1900) and wrote lives of such literary men as Cowper, Defoe, William Blake, and Charles Dickens.

WRIGHT, Wilbur, American pioneer aviator: b. Millville, Ind., April 16, 1867; d. Dayton, Ohio, May 30, 1912. Descendant in the paternal line of an old Massachusetts family and son of a bishop of the United Brethren Church, he grew up in Dayton, Ohio. His father, keenly interested in scientific developments, evinced mechanical talent as inventor of a crude typewriter. His mother, the Virginia born daughter of a German wagonmaker, was a college graduate, an excellent mathematician, and shared her husband's scientific bent; she encouraged their four sons to use her kitchen as a laboratory for experiments. With his younger brother Orville (q.v.), Wilbur in 1889 began publication of a four-page weekly, the *West Side News,* printed on a large press which they had constructed. Wilbur edited the paper; but though it soon became fairly profitable they discontinued publication a year later to concentrate on the more lucrative work of job printing. In 1892 the brothers, who continued partners in all their enterprises, opened a bicycle salesroom and repair shop; three years later they began manufacturing original bicycle models, making their own tools to save expense. The accidental death in 1896 of Otto Lilienthal (q.v.), whose gliding experiments they had followed with rapt interest, stimulated their efforts to solve the problems of aerodynamics. From the Smithsonian Institution they obtained a brief bibliography of flying and studied the few books and pamphlets then available, including works of L. P. Mouillard, Octave Chanute, and S. P. Langley. In 1899, Wilbur built a model biplane with a five-foot wing spread which he flew as a kite. In 1900, the inventors, advised by the Weather Bureau, established a camp on the sand bar between Albemarle Sound and the Atlantic Ocean at Kitty Hawk, N.C., where Kill Devil Hill, over a hundred feet high with a ten degree slope, proved ideal for their purpose of glider experimentation. Soon they were able to make 300-foot glides under perfect control in winds of 27 miles per hour. On Dec. 17, 1903 they made their first flight in a powered airplane, the first in history, with only five witnesses. At noon that day, Wilbur made the fourth and longest flight, covering 852 feet and remaining in the air 59 seconds. In 1905 at Huffman Field, Dayton, in a circular flight, they solved the problem of equilibrium in turning, and next year took out their first patent for a flying machine. Despite the praise of *l'Aerophile* and the Aero Club of America, the United States government ignored them until late in 1907 when, after they had made successful negotiations with foreign governments, the War Department finally contracted for construction of one biplane. In 1908, Wilbur, leaving his brother to complete their War Department contract, visited France. His flights over the race course at Hunandrières, near Le Mans, roused tremendous enthusiasm. The French regarded this gaunt and taciturn ascetic, who would neither smoke nor drink, with his weather-beaten face and piercing eyes, as the apostle of a new religion. After making satisfactory arrangements with a French syndicate, Wilbur returned home. His demonstration flights up the Hudson River from Governor's Island during the Hudson-Fulton celebration in the fall of 1909 resulted in formation of the American Wright Company. He took the lead in the brothers' subsequent dealings for airplane construction in England, France, Germany, Italy, and the United States. Though they received substantial rewards, both brothers lacked the streak of avarice which would have assured them the great wealth they might have amassed. Wilbur never married, and died of typhoid fever just as the airplane was approaching its more modern development. See also AERONAUTICS. Consult Kelly, F. C., *Wright Brothers; A Biography Authorized by Orville Wright* (New York 1943).

WRIGHT, William Aldis, English scholar: b. 1836; d. 1914. He was a contributor to Smith's *Dictionary of the Bible* (1860–1863), secretary to the Old Testament Revision Company in 1870–1885, and from 1868, the year of its establishment, editor of the *Journal of Philology.* In 1888 he became vice master of Trinity College, Cambridge. With William George Clarke he collaborated on the *Cambridge Shakespeare* (1863–1866) and the *Globe* Edition of Shakespeare's complete works (1864). Among his other publications are the *Letters and Literary Remains of Edward Fitz-Gerald* (1889); *Facsimile MSS. of Milton's Minor Poems* (1899); *Fitz-Gerald's Miscellanies* (1900); *More Letters of Edward Fitz-Gerald* (1901); *Literary Remains of Edward Fitz-Gerald* (1902–03), and *Milton's Poetical Works* (1903); *English Works of Roger Ascham* (1904); *The Hexaplar Psalter* (1911).

WRIGHTSVILLE, borough, Pennsylvania, in York County, 11 miles northeast of York on the west bank of the Susquehanna River, opposite Columbia and on the Pennsylvania Railroad. Located at an altitude of 256 feet in a fertile farming region, midway between York and Lancaster, the borough is chiefly industrial. There are dress and hosiery mills, and foundries making castings, especially of gray iron. Near the borough are quarries. Wrightsville was settled in 1730, and named for John Wright who operated the ferry at this point. The town marked the farthest east of the Confederate Army in the Civil War. Government is by borough council. Pop. (1950) 2,104.

WRIGHTSVILLE, Pa., Military Operations At. In June 1863, Gen. Jubal A. Early (q.v.) was ordered to seize the bridge over the Susquehanna River between Wrightsville (q.v.) and Columbia. On the 28th a Union force, has-

tily assembled and intrenched about half a mile west of Wrightsville, was attacked by Gen. John B. Gordon's brigade, together with a battery of field guns and a battalion of cavalry. The Confederate forces, coming from York, attacked the Union defenders, under Col. J. G. Frick of the Pennsylvania militia, late in the day. The Confederate infantry attempted to cut Frick off from the bridge by a flank movement, but were thwarted. The artillery, Capt. W. Tanner's battery, then opened fire, and Frick, being without guns, retreated across the bridge, which he destroyed by fire. The burning of the bridge caused destruction of several houses in the town, but Gordon's men prevented spread of the flames. Early had to abandon his plans for an advance upon Harrisburg. The day after the battle Gordon's force marched to York, and later took part in the battle of Gettysburg. The invasion of Pennsylvania was checked here.

WRIT. In general understanding a writ is a mandatory precept issued by the authority of and in the name of the executive branch of the State for the purpose of compelling the defendant to do some particular thing mentioned in the instrument. Writs are generally classified as mandamus, habeas corpus, summons, error, quo warranto, certiorari or review. Writs are further distinguished as original and judicial. Original issued without any order of the court in the particular case, judicial issued in pursuance of a decree or order or judgment of the court. A writ of mandamus is a command issuing from a court of law of competent jurisdiction, in the name of the State, directed to some inferior court, officer, corporation or person, requiring them to do some particular thing therein specified, and which appertains to their office or duty. In order to secure a writ of mandamus it is necessary to show (1) that the petitioner has a legal right to have the thing done which it is sought to be done; (2) that it is the duty of the respondent to perform it; (3) that the writ is the only plain, speedy and adequate remedy. A writ has a purely personal effect. An injunction — either mandatory or prohibitory — is a writ framed according to the circumstances of the case commanding an act which the court regards as essential to justice or restraining an act which it esteems contrary to equity and good conscience. Quo warranto is an order to show by what authority a given act is done or office held. A writ of error is a commission to a superior court by which they are authorized to examine the record in a case on which judgment has been given in an inferior court. Habeas corpus is an order issued by a magistrate to an officer in charge of the person of the defendant and designed to give summary relief against illegal restraint of personal liberty. Summons is a demand made to a person to appear at a given time before a court or officer. Certiorari or review is an order to a superior court to review the evidence presented before an inferior court. Consult Blackstone, 'Commentaries on the Laws of England'; Hallam, 'Constitutional History' (New York 1872); Hurd, 'On the Right of Personal Liberty' and 'On the Writ of Habeas Corpus' (1876); Mather on 'Sheriff and Execution Law' (1935 ed.); Wait, W., 'Manual of Supplementary Proceedings' (1936).

WRITERS' CRAMP, or SCRIVENERS' CRAMP, or PALSY, an occupation-neurosis to which those who do much writing, especially with the hand too tightly contracted, are very liable. A person with this trouble has no complete control over the muscles of the thumb and middle and forefingers, brought into use in writing, although other manual operations are performed without difficulty. The affection seldom manifests itself until toward middle age. The various methods of treatment that have been proposed have not been very successful. Small surgical operations have been performed with occasional but far from general good results. The application of electricity to the adductor of the thumb, and the kneading of the muscles of the ball of the thumb and the lower part of the forearm, so as to promote the circulation in those parts, are said to be beneficial, but the only way to obtain perfect relief is for the patient to abstain from writing altogether. If he is obliged to write he will do so with more ease if he uses a pen with a very thick handle. For extreme cases several contrivances have been devised for assisting the patient to write by altering the movements of the fingers in writing, and giving support to the ball of the hand. The typewriter has proved the best resource of those who suffer from the ailment. See NEUROSIS.

WRITERS TO THE SIGNET, in Scotland, where lawyers generally are called writers, an incorporated legal society dating from an early period of Scottish history. Originally, the name probably applied to clerks in the office of the Secretary of State, where was deposited the seal by which the king's letters and writs for the purposes of justice were authenticated. This duty was monopolized by this close society of practitioners, members being appointed, not by public officials, but by the organization. Thus the Writers to the Signet came to control admissions to the bar, like the English Inns of Court. They still retain a certain prestige at the bar, but their former monopoly has been taken away by recent statutes.

WRITING, the art of recording ideas by means of characters or figures of some sort impressed upon some kind of material substance. History, though it does not throw complete light on the origin of writing, suffices to show certain stages in its progress, and upon these a classification has been founded, which is, however, incomplete and unsatisfactory. The simplest classification and perhaps at an initiatory stage the best, is that which divides all writing into ideographic and phonographic, or signs representing the things symbolized by words and signs representing sounds, that is, words themselves. Less satisfactory is the classification of writing into three historical stages, the figurative, the transitional or conventional, and the alphabetic. In the first of these, to which hieroglyphic writing belongs, writing is supposed to be pictorial or immediately representative of objects. After this, in the transitional period comes symbolical writing, in which abbreviated pictures are transformed into arbitrary symbols, first of things and afterward of sounds and words. Lastly, with the prevalence of phonetic writing sounds are represented first in syllables and afterward in

letters. The course of writing is generally in the direction thus indicated. but it is inaccurate and misleading to represent these stages as epochs in its progress. As the most modern writing contains traces of the first of these methods, so the earliest contains traces of the last. The majority of the letters in modern alphabets can be traced to symbols or abbreviated pictures representative of things, but as the thing originally represented is usually an object whose name begins with the sound represented by the letter, there is no evidence that the sign was not originally intended in a double sense and used as a phonograph. In Egyptian hieroglyphics we have ideographs and phonographs mixed together. This, however, does not prove the absolute precedence of ideographs, but only the imperfection of the phonographic elements in that system. The same thing occurs in the Mexican picture writing, which was long supposed to be purely ideographic. Its phonetic signs are syllabic, not alphabetic. In our own system we use figures and other symbols when phonographic signs are too slow for our purpose, and with a less perfect phonographic system this would naturally occur much more frequently. It does not appear, moreover, that any transition from pictorial to phonetic writing is necessary through arbitrary non-phonetical symbols. Both of these modifications would no doubt proceed simultaneously from independent causes. Pictorial signs not phonetized would be abbreviated as well as phonetized signs, and when the phonetized abbreviations came to prevail the non-phonetized abbreviations would be phonetized also, thus producing the appearance of a transition from arbitrary symbols to phonetic signs.

The reason why writing has had to pass through various stages of pictorial and more or less arbitrary symbolical representation before reaching the more perfect development of the alphabetic form is not very difficult to discover, and it has an important bearing on the order of development. It is not because the representation of words is in itself more difficult to conceive than the representation of things, or because when the desire for writing as a medium of communication is excited the human intellect is inadequate to the task of forming at once an entire phonetic system. Had phonetic or even alphabetic representation been the only possible means of constructing a written symbol all difficulties would doubtless have been overcome by one sustained effort, as they have actually been by many partial ones; but as an easier process was to be found and would directly suggest itself as a means of meeting the immediate demand, the more elaborate process was excluded and prevented by this process from being performed. Nothing is easier than to make a rude pictorial representation of certain objects. To draw something resembling a man would be easier than to agree on a sign to represent the word man, hence ideographs would naturally precede phonetic symbols. But for the same reason the earliest systems of writing would not be purely ideographic but mixed. There are many things which form the subject of the least sophisticated human communications which cannot be represented pictorially. When writing was first practised these things were already represented by words, and the idea would naturally occur to form a sign to represent the word, that is, a phonetic sign. These signs could not be directly pictorial, but they might be allegorical or symbolic, and in the absence of analysis of sound they probably would take that form, although the direct intention was to suggest conventionally a specific word by the symbol. This sort of symbol might be called a mnemonic. From such symbols to merely arbitrary syllabic and alphabetic symbols the transition would be easy.

It is generally agreed that writing was introduced to the western nations by the Phœnicians, and it is commonly believed that the Phœnician system was based on the Egyptian but the comparative antiquity of the Egyptian and Assyrian or Akkadian, the hieroglyphic and cuneiform systems, cannot be definitely determined. The Egyptians attributed their writing to Thoth, and the first characters are said to have consisted of portraits of the gods. The cuneiform writing, which is cumbrous and exceedingly difficult to read, has been adapted to several languages, the Akkadian, the Assyrian, the Persian, etc., in a variety of ways, ideographic, syllabic and alphabetic. The Egyptians had three distinct kinds of writing, the hieroglyphic, the hieratic and the enchorial or demotic. The first is a mixed system, containing large numbers of signs of various characters, ideographic and phonetic. It is used chiefly for inscriptions on monuments and public buildings. The hieratic is a cursive hand abridged from the hieroglyphic for use on papyri. Both these forms were sacred, and the priestly caste only were initiated in them. The demotic was introduced much later than the other forms. It was used for trading and common purposes, and in civil documents. The hieratic writing was more phonetic than the hieroglyphic, and the alphabetic character prevailed in the demotic. The first was written in any direction according to the form of the surface; the hieratic was at first written in columns, but afterward always in horizontal lines. The hieratic and demotic are read from right to left, but the individual letters are formed from left to right. The connection between the Egyptian and the Semitic writings, to which the Phœnician belongs, is by no means unanimously admitted, many scholars holding that the resemblances between them may be explained by the independent adoption of common principles. The leading Semitic forms are the Samaritan or ancient Hebrew, the Chaldee or East Aramaic, the Syriac or West Aramaic, and the Kufic or early Arabic, which continued to be used in manuscript for several centuries after the Mohammedan conquest, after which it was replaced by the Neshki or modern Arabic, which, with some slight modifications, is the same with the modern Persian. The Hebrew alphabet now in use, the Babylonian or East Aramaic, is entirely consonantal, the vowel points being of modern origin. The Phœnician which forms the basis of the western languages was of a similar character. Phœnician writing was anciently represented to have been brought by a Cadmean colony to Boeotia about the 16th century B.C. (see CADMUS); and a certain number of the Greek letters are undoubtedly of Phoenician origin. (See the section on language and writing in the article GREECE). The

Greeks at first wrote from right to left, and afterward adopted the method called *boustrophēdon,* from the motion of the ox in plowing, that is, alternately from right to left, and from left to right. Writing from left to right was said to have been introduced in the time of Homer by Pronapides of Athens. The various modifications which the Phoenician or Pelasgian forms underwent in Italy are to be found by comparison of the Oscan, Etruscan, Umbrian and early Latin inscriptions. In the ancient Greek and Roman writing, and even for a time in the mediaeval writing of Europe, the words were not separated by spaces, and no punctuation marks were used. The present cursive characters with modifications occur in Greek inscriptions of the the age of Augustus. In mediaeval manuscripts a variety of styles were adopted in different epochs and countries and for different uses, to describe which in detail would require a separate treatise. In France the various styles were called after the dynasties under which they prevailed: Merovingian, Carlovingian, Capetian, Valesian and Bourbon. There was also a variety of styles used for different purposes distinguished by such names as *majuscule* and *minuscule* (great and small letters), diplomatic minuscule and many others. Capitals were not then used as now to distinguish prominent words, but whole manuscripts were written in large or small capitals. There was also a variety of mixed styles. From the 8th to the 11th century writing with *tremblements* was affected in France. The diplomatic minuscule was a mixture of minuscule and cursive characters distinguished by an unusual prolongation of the long letters. Uncial letters, which prevailed from the 7th to the 10th century were rounded capitals with few hairstrokes. The practice of ornamenting pages began in the 8th century, and the earliest manuscripts are also without title pages. The so-called Gothic characters, in reality of scholastic origin, are merely fanciful deviations from the Roman types, such as the rounding of straight limbs, the substitution of angular facets for rounded forms, with hair-lined projections from the extremities contrasting with massive body-strokes. They became common in inscriptions from the 13th to the 15th century, and were employed in church-books from the time of Saint Louis. The Gothic cursive was introduced about the middle of the 13th century. The modern German alphabet was also introduced in the 13th century. In England a variety of styles called Saxon prevailed in the early Middle Ages. An elegant mixed style was formed of a combination of Roman Lombardic and Saxon characters. The Norman style of writing came in with William the Conqueror. The Old English form of Gothic dates from the middle of the 14th century. The English "court hand," an adaptation of Saxon, prevailed from the 16th century to the reign of George II. In regard to the antiquity of writing in other parts of Europe, it was known to the Gauls before the time of Caesar; but no traces of the ancient writing remain, and whether it was derived from the Greeks or the Phoenicians is doubtful. There are slight traces of writing in Britain previous to the Roman period, but if it were employed by the Druids, as Caesar says, it may have existed without leaving remains. The Germans claim the knowledge of writing previous to their contact with the Romans; but in their case also we are without early remains. The Runic alphabet used for many centuries in Denmark, Norway, etc., may have been employed long before the Christian era.

In the East we find one of the most striking contrasts in the history of language. The Chinese, who have an ancient system of writing which they attribute to Fou-hi, have never reached the alphabetic system. Their characters are syllabic, and as Chinese words are monosyllables, they are strictly ideographic. They have been adopted in this way by peoples speaking not only different dialects, but different languages, who apply the signs to words of different sound but of the same signification as the original. The Chinese system is said to contain 40,000 characters. They were originally hieroglyphic, but from difficulty of interpretation have become conventional. There are, of course, certain general principles of combination and construction, but to master the whole system is said to be the work of a lifetime. Only a limited portion of it can, therefore, have any real existence as a medium of communication. Sanskrit, on the other hand, possesses the most perfect known alphabet. The Hindus claim to have derived it from the gods, and call one form of it *devanâgari* (divine city). It is wholly different from the Semitic, and is founded on a much more complete and subtle analysis of sound. Its consonant signs number 33, its vowel signs 14. They are applied with an analytical method which gives a power of distinction vastly superior to that of European alphabets, and which is greatly admired by scholars. Sanskrit is written from left to right. By means of its derivatives it is widely diffused in the East. The Pali, which forms the sacred language of the Buddhists, has carried it far beyond India. The Burmese Pali character is square, the Siamese round. To complete the vagaries which have prevailed in the direction of writing, the Mexican picture writing was written from bottom to top. See Alphabet; Cuneiform Writing; Etymology; Hieroglyphics; Language, Science of; Paleography; Speech.

WROCLAW, vrô'tsläf, name given by the Poles in 1945 to the German city of Breslau (q.v.).

WRONG, George Mackinnon, Canadian historian: b. Ontario, June 25, 1860. He was educated at University and Wycliffe colleges, Toronto, and in 1883 was ordained in the Church of England. Throughout his career he engaged in academical work; he served as professor of history at the University of Toronto from 1894 until his retirement in 1927. His numerous works on Canadian history included *The Fall of Canada* (1914); *The Conquest of New France* (1918); *The Rise and Fall of New France* (1928); *Canada and the American Revolution* (1935); *The Canadians: the Story of a People* (1938).

WROUGHT IRON. See Iron—*Wrought Iron.*

WROXETER, England, a village of Shropshire, on the Severn River 6 miles east-southeast of Shrewsbury. Before the Roman conquest of Britain the site was the market center of the Cornovii, a Celtic tribe. The Romans built a city there (on the road later known as Watling

Street), naming it *Viroconium* or *Uriconium;* Roman baths, the forum, basilica, and several houses have been excavated within the limits of the city wall, which enclosed an area of 170 acres.

WRYBILL, an extraordinary plover (*Anarhynchus frontalis*) of New Zealand, which is unique in having a bill bent sideways near the tip—always toward the right. By this peculiarly adapted instrument it seems to be able to reach and obtain many small crustaceans, which are able to creep under stones out of reach of all the other shore-birds of the region, these latter having only the ordinary straight kind of beak. See PLOVER, and consult Buller, Sir W. L., *Birds of New Zealand* (London 1888), and for general discussions of variation see Robson, G. C. and Richards, O. W., *The Variations of Animals in Nature* (London 1936); and Thomson, Sir J. A., *Concerning Evolution* (New Haven 1925).

WRYNECK, a European bird (*Iynx* or *Yunx torquilla*), related to the woodpeckers, which has a habit of twisting its head in a curious manner. This bird visits Great Britain in summer, arrving in April, usually with or just before the cuckoo, and hence is named the cuckoo's mate. The food consists of insects, and chiefly of ants and their pupae. It is also said to eat elderberries. The tongue is long and extensile, like that of the woodpeckers. The nest is formed in the holes of trees, and the eggs vary from six to 10.

WU TING-FANG, wōō'tĭng'fāng', Chinese statesman and diplomat: b. Singapore, 1842; d. Canton, June 23, 1922. Following his early education in Saint Paul's College, Hong Kong, he studied law at Lincoln's Inn, London. Entering the colonial government service in 1862, he served as interpreter in the law courts until 1874; and when he returned to the East in 1877, engaged in law practice in Hong Kong. In 1882 he was appointed to the official staff of Li Hung-chang, at that time governor general of Chihli and grand chancellor of China, and in 1895 was one of the peace commissioners who negotiated the Treaty of Shimonoseki, following the Chinese-Japanese War. He later occupied high government offices at Peking. He was twice minister to the United States—1897–1902 and 1908–1909. In 1902 he aided in the negotiation of various commerical treaties, and in 1903 became vice president of the board of commerce. He was minister of the board of punishment in 1905–1906, and reorganized the penal code. Supporting the revolution in 1911, between 1916 and 1921 he occupied various posts in the Canton government. He became a member of the Permanent Court of Arbitration (The Hague). He published *America Through the Spectacles of an Oriental Diplomat* (New York 1914).

WUCHOUSEN, the great wind eagle, a mythological character, universally believed in by the numerous tribes of Algonquin Indians. Of him many fabulous stories are told. According to the Passamaquoddy legend, in which he is called The-Bird-who-Blows-the-Winds, Wuchousen lives far in the north, on a huge rock whose top reaches up into the region of the cloudland, at the very end of the sky. When he flaps his wings the winds blow over all the earth and all the cloudland. In the olden days Wuchousen was so fond of blowing, of flapping the wind with his monster wings, that men could not live in peace, for the fear of the tempest was ever upon them. So terrible were these tempests that even Kulóskap, the Master of Men and Beasts, was often afraid to venture out upon the sea to fish, as was his pleasure. At last he made up his mind to bring the wind eagle to time and make the earth safer for all. So he made a long journey into the far northland, on the very outer border of the world. There he found Wuchousen flapping his mighty wings and screeching louder than the howling tempest he was winging up.

Kulóskap protested against this, representing to the wind eagle that he had already made the world uninhabitable and requested him to modify his tempest-making. To this Wuchousen replied that since time began he had blown always in this way, that his wings needed exercise and that he proposed to go on flapping them no matter what happened to the rest of creation. In a rage, Kulóskap, changing himself into a monstrous giant, higher than the clouds, seized the wind eagle and, tying his wings together, cast him down from his high cliff into the sea thousands of feet below. Unable to move, the eagle exercised all his magic power and made the water so putrid that they poisoned all the streams and the rain that fell from the clouds, so that Kulóskap was forced to release him, for being a spirit, he could not kill him. But that he might not again incommode and endanger the world, he left one of his wings tied, when he replaced him on top of his high cliff. Since that time, in the long past, Wuchousen has been able to raise a wind only half so strong as he used to; and though he often raises a tempest, yet, flapping only one wing, he soon grows tired and then the tempest subsides.

WUCHOW, wōō-chō', China, a city and river port of Kwangsi Province, on the left bank of the Si-kiang 200 miles west of Canton. Situated in the extreme western end of Kwangsi, most export products of the province are shipped from Wuchow. The city was opened to foreign trade in 1897. Pop. 90,000.

WUHU, wōō-hōō, China, city of Anhwei Province, on the right bank of the Yangtze Kiang 185 miles west of Shanghai and 75 miles upriver from Nanking. It is served by the Chekiang-Kiangsi Railway. The principal industry is the manufacture of cotton textiles; besides cotton goods, wheat, rice, and tea are shipped through the river port. Wuhu suffered severely about 1865 in the aftermath of the Taiping Rebellion (q.v.). The city was opened to foreign trade in the year 1877. Commerce was at a standstill between 1938 and 1945, when Wuhu was in Japanese occupation. Pop. (1937 est.), 50,000.

WULFENITE, native lead molybdate. It is generally admitted that the best specimens of this mineral are among the most beautiful minerals known. It crystallizes in hemimorphic tetragonal crystals. They are usually in square tabular plates, sometimes very thin and transparent, but occasionally in elongated pyramidal forms and nearly opaque. The mineral also occurs in crystalline masses. It is very brittle, has a hardness of about 3 and is very heavy, its specific gravity ranging from 6.7 to 7.0. Its luster is resinous to adamantine, and colors are various shades of yellow, orange, red, grayish, or greenish. It is associated with other lead ores at many localities, as in Austria and New South Wales, but the United States localities are far more important. Magnificent specimens occur in the Red Cloud and Mammoth mines of Arizona, in the Organ Mountains.

New Mexico, at Eureka, Nev., and Tecoma, Utah. It was named in honor of the Austrian mineralogist, Franz Xaver von Wulfen.

WULFSTAN, wo͝olf'stăn, name of several Anglo-Saxon prelates.

Wulfstan or Wolstan, Saint, b. Long Itchington, Warwickshire, about 1012; d. Worcester, Jan. 18, 1095. Educated at Evesham and Peterborough, he became a monk in the monastery of Worcester and in 1062 was consecrated bishop of Worcester. He was one of those who submitted to William the Conqueror at Berkhampstead in 1066, and was allowed to retain his see. The crypt of the present Worcester Cathedral represents the church which Wulfstan caused to be erected between 1084 and 1089. He was a man of saintly character and loyal devotion to his work, and he is credited with having induced the merchants of Bristol to stop their traffic in British slaves. He assisted in the Domesday survey and led the defense of Worcester against the rebellious nobles, commanded by William Fitzosbern, earl of Hereford He was buried in Worcester Cathedral, and was canonized in 1203, his day being January 19.

Wulfstan, d. York, England, May 28, 1023. He was archbishop of York from 1003 and bishop of Worcester (1003–1016), and is known for his many homilies, the most famous of which is *Lupi Sermo ad Anglos,* first printed in 1703–1705 in a translation by George Hickes.

Wulfstan of Winchester, fl. 1000, a monk of St. Swithun's, Winchester. He is remembered for his metrical lives of St. Swithun and St. Ethelwold.

WULLNER, vül'nĕr, **Franz,** German pianist, conductor, and composer: b. Münster, Germany, Jan. 28, 1832; d. Braunfels, Sept. 7, 1902. He studied at Münster, Frankfurt, Berlin, and Cologne, and in 1861, after holding various musical positions throughout Germany, was named *musikdirektor* to the king of Prussia. From 1864 to 1877 he was *kapellmeister* in Munich, and later in Dresden (1877–1882). He directed the Philharmonic Orchestra of Berlin in 1883–1884, and from the latter year until his death was director of the conservatory at Cologne. He was noted as a teacher and as a composer of choral works, among them a cantata *Heinrich der Finkler; Miserere; Psalm 125; Stabat Mater.*

WUNDT, vo͝ont, **Wilhelm,** German physiologist, psychologist, and philosopher: b. Neckarau, Germany, Aug. 16, 1832; d. near Leipzig, Aug. 31, 1920. He studied at Tübingen, Heidelberg, and Berlin, became privatdocent and in 1864 assistant professor of physiology at Heidelberg where he remained until 1874. Here he wrote his first important books which pointed the way to a new psychology, one defined not by a differentiation of objects but by point of view, one that is experimental in its method, and one capable of including much of the psychology of Johann F. Herbart and Rudolf H. Lotze, the psychophysics of Ernst H. Weber and Gustav T. Fechner, and the sense-physiology of Johannes P. Müller and Hermann L. F. von Helmholtz.

In 1875 Wundt was called to the chair of philosophy at Leipzig where he remained until his death. He established the first laboratory of experimental psychology here in 1879 and in 1883 established the *Philosophische Studien,* devoted chiefly to the contributions of the Leipzig school. This ceased publication with the 20th volume in 1902, but a new series, the *Psychologische Studien* was begun in 1905.

Meanwhile, Wundt found time also for philosophy. His system of philosophy has often been characterized as the science of the sciences, for he was one of the greatest comparative philosophers of his age, integrating works of other fields to form a solid theory of his own. He attempted to "unite into a consistent system the general knowledge contained in the various sciences, and to trace back to their principles the general methods and presuppositions of science in general." Among his more important works may be listed: *Vorlesungen über die Menschen- und Tierseele* (1863); *Lehrbuch der Physiologie des Menschen* (1865); *Logik, eine Untersuchung der Principien der Erkenntnis und der Methode vissenschaftlicher Forschung* (1880–1883); *Ethik, eine Untersuchung der Thatsachen und Gesetze des sittlichens Leben* (1886); *System der Philosophie* (1889); and *Völkerpsychologie,* 10 vols. (1900–1920).

Bibliography.—König, Edmund, *W. Wundt, seine Philosophie und Psychologie* (Stuttgart 1901); Eisler, Rudolf, *W. Wundts Philosophie und Psychologie in ihren Grundlehren dargestellt* (Leipzig 1902); Høffding, Harald, *Modern Philosophers,* Eng. tr. by A. C. Mason (London 1915).

WUOTAN. See Odin.

WUPPER, vo͝op'pĕr, river, Germany, rising in the *land* of North Rhine-Westphalia. It rises on the Westphalian frontier, and flows first northwest and then southwest, joining the Rhine between Cologne and Düsseldorf after a tortuous course of about 65 miles. It is not navigable for vessels of any size, but it provides considerable power for manufacturing purposes. Its valley is the most populous in Germany, and contains the important industrial cities of Wuppertal, Remscheid, and Solingen. In its upper course, it is called the Wipper.

WUPPERTAL, vo͝op'ĕr-täl, city, Germany, since 1945 in the *land* of North Rhine-Westphalia, formerly in the Prussian Rhine Province, situated on both sides of the Wupper River, 16 miles east-northeast of Düsseldorf, and well served by railroads and highways. The city, or *stadt,* was formed in 1929 by a coalition of the cities of Barmen, Elberfeld, Ronsdorf, Beyenburg, Cronenberg, and Vohwinkel. The city extends eight miles along the course of the river and covers an area of 57 square miles.

Before World War II, it was the German center of the textile industry, and also had manufactures of chemicals, leather, carpets, metal goods, furniture, roller and ball bearings, rubber goods, machinery, paper, firearms, organs, and pianos. Because of its industrial importance, it was heavily bombed by the Allies during World War II, nearly 50 per cent of the city being destroyed. At the end of the war it was situated in the British Zone of occupation. Pop. (1950) 363,224.

WURDHA, India. See Wardha.

WURMSER, vo͝orm'zĕr, Count **Dagobert Siegmund von,** Austrian general: b. Strasbourg, Germany, May 7, 1724; d. Vienna, Austria, Aug. 21, 1797. He served in the French Army, but

left it for the Austrian service, where he commanded a hussar regiment during the Seven Years' War, attaining the rank of major-general. During the Bavarian war of succession he commanded a special corps of the army in Bohemia, and after the peace was made commanding general in Galicia, and in 1787 general of cavalry. By the outbreak of the French Revolution his family lost their estates in Alsace. In May 1796 the critical condition of affairs in Italy after the defeat of Beaulieu led to the appointment of Wurmser to the command of the second Austrian army destined to act against Bonaparte. At the head of 60,000 men he obliged the French to raise the siege of Mantua; but the defeat of his main body at Castiglione, Roveredo and Bassano, rendered his situation extremely critical. He finally forced his way into Mantua, of which the blockade was resumed. A third Austrian army was sent into Italy, but the defeat of Arcole prevented it from relieving him; and at length, in February 1797, seeing the impossibility of any longer maintaining the defense, Wurmser surrendered Mantua to Napoleon who had previously routed two divisions of his army. Wurmser was allowed his freedom.

WURTS, John, American educator and legal writer: b. Carbondale, Pa., 10 July 1855. He was educated at Yale and after traveling in Polynesia as a newspaper correspondent (1876–77) was graduated from the Yale Law School in 1884 and practised his profession in Jacksonville, Fla., 1884–96. He was professor of the law of real property and equity at Yale 1897–1920, and then professor emeritus. In 1914–15 he was exchange professor at the University of California. He is joint author of 'Minor and Wurts on Real Property' (1910); 'Complete Revision to Date of Florida Index Digest' (1910); and author of 'The Anti-Slavery Movement with its Relation to the Federal Constitution' (1883); 'Washburn on Real Property' (1902); 'Cases in Federal Practice' (1905); 'A Bit of Judicial History' (1911); 'Jury System Under Changing Conditions' (1912); 'Law of Habeas Corpus.' D. 5 Aug. 1936.

WÜRTTEMBERG, vürt'tĕm-bĕrg, **or WURTEMBERG,** until 1918 a kingdom, now a component state, of Germany, between Bavaria, Baden, Hohenzollern, and the Lake of Constance, which separates it from Switzerland; area, 7,534 square miles. It was formerly included in the territory of Swabia (q.v.). Except a few tracts in the south, the surface is hilly and even mountainous. In the west the Schwarzwald, or Black Forest, forms part of the boundary, and the Alb or Rauhe Alp, forming part of the Franconian Jura, covers an extensive tract. The country belongs in large part to the basin of the Rhine, being drained northward into that river by the Neckar, while the Danube flows across the southern districts. A part of the Lake of Constance is also included in Württemberg. The climate is temperate. In the lower and more favorable districts the fig and melon ripen in the open air, and the vine, cultivated on an extensive scale, produces several first-class wines; maize, wheat, hops, tobacco and fruit, which is employed in cider making, are chiefly cultivated. About a third of the country is under forests, which consist mainly of oaks, beeches and pines. Of minerals, the most valuable are iron and salt, both of which are worked by the government; the others are limestone, gypsum, alabaster, slate, mill-stones and potter's-clay. The manufactures consist chiefly of cotton, woolen and linen goods, paper, wooden clocks, toys, musical instruments and chemical products. The government until November 1918 was a hereditary constitutional monarchy, the executive power being lodged in the sovereign, and the legislative jointly in the sovereign and a parliament, composed of an upper and a lower chamber. The yearly revenue (estimated) for the year ending 31 March, 1930, was 151,404,947 marks, and the expenditure was 161,003,289 marks. The public floating debt as of 1 April 1930, is 1,350,000 reichsmarks. Under the monarchy the king was invested with the supreme direction and guardianship of the Evangelican Protestant Church, though there was no established religion. Education is generally diffused and the centre of the educational system is the University of Tübingen. Besides Stuttgart (the capital), the chief towns are Ulm, Heilbronn and Esslingen The history of the state is of little general interest. Previous to the Napoleonic era the rulers had the title of duke, but in 1806, by the favor of Napoleon, the then duke gained a great accession of territory, as well as the title of king. In the subsequent arrangement of the European states by the Congress of Vienna the territorial accessions were confirmed and the kingly title formally recognized. In the war of 1866 Württemberg sided with Austria against Prussia. It became a member of the German empire on its foundation in 1871. After the collapse of the German imperial armies on the western front in November 1918 and the establishment of a republic in Berlin, the Württemberg monarch abdicated the throne and Württemberg became a constituent state of the Republic. Pop. 2,579,453. Consult Gaupp, 'Das Staatsrecht des Königsreichs Württemberg' (Freiberg 1895); Hirschfeld, 'Württembergs Grossindustrie und Handel' (Leipzig 1889); Belschner, 'Geschichte von Württemberg' (Stuttgart 1902); Heyd, W., 'Bibliographie der Württ.' (6 vols., 1895–1929).

WURTZ, vürts, **Charles Adolphe,** French chemist: b. Strassburg, 26 Nov. 1817; d. Paris, 12 May 1884. He went to Paris in 1845, in 1851 became professor at the Agronomic Institute, Versailles, in 1853 was made professor of organic chemistry at the Sorbonne and professor of toxicology at the Ecole de Médecin. From 1866 to 1876 he was dean of the Sorbonne faculty of medicine. He made important discoveries in connection with compound ammonias, glycol and adol; and rendered a valuable contribution to theoretical chemistry in distinguishing the atomic relations of organic compounds. Among his numerous works on chemistry are 'La théorie atomique' (1878); 'Leçons élémentaires de chimie moderne' (1868); 'Traité de chimie biologique' (1885). Consult Friedel, 'Notice sur la vie et les travaux de C. A. Wurtz' (1884).

WURTZ, Henry, American chemist: b. Easton, Pa., 5 June 1828; d. 10 Nov. 1910. He was graduated from Princeton in 1848, studied

further at the Lawrence Scientific School of Harvard, was State chemist of New Jersey 1854–56, chemical examiner in the United States Patent Office 1859–61, and from 1871 to 1875 edited the *American Gas Light Journal.* He was closely identified with the earlier investigations of natural and artificial gas and the use of petroleum as fuel. He proved the existence of gold in sea water. In 1888 he entered the employ of T. A. Edison (q.v.), as chemist, and afterwards made several important chemical discoveries, chief of which is that of the geometrical laws of the condensation of chemical modules. Other important investigations are described in his scientific monographs. Author of 'Obtaining Potash Compounds from Greensand Marl' (1850); 'Geometrical Chemistry' (1876); 'Discovery of Lake Superior Silver Minerals, Huntilite and Animikite' (1878), etc.

WURTZILITE, an asphalt (elaterite) mined extensively in Wasatch County, Utah, and used for roofing material, waterproof felts, building paper, rubber substitutes and paving materials. Color black, but deep red in thin plates. Practically insoluble in gasoline (76°) and only partly soluble in ether, carbon disulphide, turpentine and carbon tetrachloride.

WURTZITE (named for C. A. Wurtz, q.v.), *in mineralogy,* a dimorphous form of zinc blende. Crystallization, hexagonal; hardness 3.5 to 4; specific gravity, 3.98; lustre, resinous; color, brownish black; streak, brown; composition, a sulphide of zinc, ZnS; occurrence, in a silver mine near Oruro, Bolivia, in Portugal, Peru, and near Butte City, Mont. Its artificial manufacture is accomplished by fusing equal parts of zinc sulphate with calcium fluoride and barium sulphide.

WÜRZBURG, Bavaria, city and capital of Lower Franconia, on the river Main, 62 miles southeast of Frankfort and at the junction of the main railway lines to Nuremberg and Bamberg. The river is crossed here by three bridges, of which the first is a stone structure built in 1474–1607; while the modern bridges were built in 1887 and in 1894. The town is built on both sides of the river, but the main portion of it is on the north bank. The older portion of the city is of quaint and irregular pattern, but the modern suburbs are handsomely laid out, with broad promenades. There are many mediæval buildings in a good state of preservation and several ancient churches. Among the churches are the Romanesque cathedral dating from 1042–1189, with additions of later date; the Marienkapelle, a Gothic structure built in 1377–1441; the Haugerstiffs Church, in Italian Renaissance style, 1670–91; the Neumünster Church, dating from the 11th century, and the church of Saint Burkhard, built in 1033–44. A notable structure is the palace, built in 1720–44 as a residence for the bishops and grand dukes of Würzburg. The bishopric dates from 741, but the town existed earlier. From the 12th century the bishops had ducal authority. The bishopric was secularized by the Peace of Lunéville in 1803, and Würzburg came under Bavarian control. By the Peace of Pressburg in 1805 it became an electorate under Ferdinand III, former grand duke of Tuscany, who took the title of Grand Duke of Würzburg and joined the confederation of the Rhine. It was restored to Bavaria in 1815. A new bishopric, without ducal authority, was established in 1817. The city was bombarded and captured by the Prussians in 1866.

The University of Würzburg (q.v.) adds considerably to the importance of the town, and there are also schools of agriculture and horticulture, a royal music school and other educational institutions. The city is surrounded by vineyards which produce excellent wine. Manufactures include furniture, machinery, scientific instruments, railway carriages, brick, chocolate, beer, malt and vinegar. It is an important commercial centre. Pop. 95,113.

WURZBURG, University of, a German educational institution founded at Würzburg, Bavaria, by Bishop Julius in 1582. An earlier university of the same name existed at Würzburg for a short time after 1403, but passed out of existence. The university was founded as a Roman Catholic institution and its chairs of theology and philosophy were held by Jesuits until the suppression of the order in 1774, but theological instruction remains in Roman Catholic hands. The faculty of medicine early became famous and has remained the most important in the university; taking, with its kindred departments of dentistry and pharmacy, more than half the students enrolled. The university was reorganized after Würzburg passed under Bavarian control in 1803. The library contains over 600,000 volumes. Law, political science, and theology faculties flourish. Here W. K. Röntgen conducted the experiments which led to his discovery of the Röntgen rays in 1896.

WUSHKUM (from the name of their chief village), meaning a species of louse or flea, a tribe of the Chinookan stock of North American Indians. They call themselves *Tlaqluit,* and are the Echeloot of Lewis and Clark and the Wisham, Wishram, etc., of other writers. They occupy the north bank of Columbia River, Washington, from Tenino to the neighborhood of White Salmon River. They subsist largely on salmon, and are not reservation Indians, although they took part in the Yakima treaty of 1855. As they are given to wandering up and down the coast and as they have mixed, to some considerable extent, with neighboring tribes, it is very difficult to estimate their population.

WUTHERING HEIGHTS, Emily Brontë's one novel, was published in 1847 under the pseudonym "Ellis Bell." Though an almost complete failure with both the public and the critics it was reissued in 1849 with an introduction by Emily's more famous sister, Charlotte, the author of 'Jane Eyre.' The work is a belated and unconventional specimen of the so-called Gothic Romance or novel of terror, inaugurated by Horace Walpole's 'Castle of Otranto.' Its scene is a bleak mansion on the Yorkshire moors, the home of the Earnshaw family, into which is introduced the foundling Heathcliff, picked up by Mr. Earnshaw on the high road. The story deals with the fiercely revengeful life of Heathcliff, who develops under ill usage and neglect an appalling cruelty, coupled with an inflexible will and a strange power of fascination. He gains control of the Earnshaw property and brings up Hareton, son

of the besotted Hindley Earnshaw, whom he hates, in brutal ignorance. The one redeeming trait in his distorted and Satanic nature is his wild love for Hindley's sister, Catherine, which outlives both her marriage to Edgar Linton and her death. Thwarted by Catherine's daughter in his endeavor utterly to debase Hareton Earnshaw, Heathcliff starves himself to death, haunted and exhilarated by the spectral presence of the woman who, despite his cruelty, of which she herself felt the effect during her life, has always belonged to him in spirit.

The story is a wild and passionate one, far remote from real life, which Emily Brontë knew scarcely at all. Scenes of domestic violence succeed each other in a way which is almost too much for the reader's nerves. The characters are the creation of a lawless but extraordinarily vivid imagination, and the whole novel is written with an energy which triumphs over the obvious limitations of its author's art. The best edition, with introduction, etc., is that by Clement K. Shorter, *The Complete Works of Emily Brontë,* vol. 2.

Consult also, Shorter, C. K., *Charlotte Brontë and Her Circle;* and the essay on Emily Brontë in *Swinburne's Miscellanies.*

JAMES H. HANFORD.

WYANDOT, wī'ăn-dŏt, or **HURON** (English adaptation of the French *Ouendat,* or *Hoüandate,* later written *Guyandotte,* from the native name *Gendat,* signifying, "They are islanders"). A tribe composed of the remnants of several politically independent Iroquoian tribes and confederacies whose political integrity was destroyed by the Iroquois during the middle of the 17th century. Among these peoples may be mentioned the ancient Wendat (or Houandate), or Huron confederacy, which was composed of four tribes, namely, the Attigneenongnahac, the Attignawantan, the Arendahronons and the Tohontaenrat (for Tohontakenrat), and also, later, the affiliated tribes known as the Ataronchronons, the Wenrohronons, and the Tinnontatehronnons, and lastly the Eries.

The first known habitat of these several peoples was south and east of Lakes Huron and Erie, in the present states of Ohio and Pennsylvania and western New York, in Ontario, Canada, and the northern shore of the St. Lawrence River as far down as the site of Quebec. Today the Wyandots so-called live in Oklahoma and at Lorette, Quebec, Canada, where some Hurons, who are in fact Wyandots, dwell. All these tribes when first encountered by Europeans were organized into well-governed communities. The social and political organizations were based strictly on bloodkinship, real or fictitious. Fictitious kinship was obtained through the rites of adoption. These peoples dwelt in lodges constructed of bark, which were long in figure, sometimes having as many as 10 or 12 fires with a family on two sides of each fire. The lodges were usually collocated into villages, many of which were quite strongly palisaded. For their sustenance they depended chiefly on agriculture, raising corn and beans of several varieties, squashes and sunflowers for oil. They tanned and dressed the hides of the animals which they killed. The prepared skins they neatly and skilfully utilized in the preparation of their raiment and their bedding. Reeds and barks of various kinds were useful in making mattresses and other needed articles. The title to their lands was vested solely in the mothers of the people. The choice of a candidate for chief for either of the two grades of this office was solely a prerogative of the mothers of the clan to which the chiefship belonged. The chief held his office during his good behavior.

WYANDOTTE, wī'ăn-dŏt, city, Michigan, in Wayne County, on the Detroit River, eight miles south by west of Detroit. It is served by the Michigan Central, the Detroit and Toledo Shoreline, and the Detroit, Toledo and Ironton railways. It is the home of more than 30 industries several of them the largest of their kind. The city is noted especially for its chemical products which are derived from the vast salt beds underlying the city. Its manufactured products are widely diversified. In addition to chemicals they include: metal toys and novelties, trunks, compression gaskets, spark plugs, metal wheel rims, soda, dairy products, beverages, and brass pipe fittings. A number of the large steel freight boats and steel passenger boats plying the Great Lakes were constructed at the Wyandotte shipyards. Wyandotte had a blast furnace and rolling mill in 1853 and a steel analysis laboratory as early as 1862.

The religious and educational advantages of the city compare favorably with much larger communities, there being nine churches, three public schools, five parochial schools and one private school. There is a well-equipped public library.

The community was settled in 1820, incorporated as a village in 1854, and as a city in 1866. It has a mayor and council form of government. Pop. (1950) 36,846.

WYANDOTTE CAVE, Crawford County, Indiana, a natural formation, west of Corydon and smaller than Carlsbad Caverns and Mammoth Cave, but having a greater number and variety of stalactites and stalagmites perhaps than any except the first mentioned in the United States. It has been explored for a distance of 23 miles. The chambers and galleries are numerous, some about 350 feet long and 180 feet high. Some of the remarkable features are Monument Mountain, about 175 feet high, and 75 feet above its crests is the grand dome. The Pillared Place contains several clusters of stalactites, and the Pillar of the Constitution, a large stalagmite 30 feet high and 75 feet in circumference. There are 144 places of unusual interest named.

Consult Hovey, H. C., *Celebrated American Caverns* (1896); and Indiana State Geological Reports.

WYANT, wī'ant, **Alexander Helwig,** American artist: b. Port Washington, Ohio, Jan. 11, 1836; d. New York City, Nov. 29, 1892. After trying the saddlery business, he turned to art, became a painter of landscapes at Cincinnati, exhibited in the National Academy of Design in 1865, was elected associate of the academy in 1868, and academician in 1869. In 1865 he went to Europe, becoming a pupil of Hans Gude at Carlsruhe. He attained high rank in landscape art, painting almost exclusively American scenes, and being particularly successful in views from the Adirondack wilderness. His chief characteristics are subtle tones, the evanescent moods of nature that he was quick and able to catch, and a delicate

quality of workmanship. His work is well represented in the Metropolitan Museum, New York. He was a founder of the American Water-Color Society. Among his works are 'Scene on the Upper Susquehanna' (1869); 'Pool on the Ausable' (1871); 'In the Adirondacks' (Metropolitan Museum); 'A North Woods' Brook'; 'An Old Clearing'; 'Pool in the North Woods'; 'New Jersey Meadows' (1872); 'Sunset on the Prairie' (1876); 'Reminiscence of the Connecticut' (1878); 'Evening' (1885); 'Sunset near Killarney' (1886); 'October Day' (1892).

WYATT, wī'at, **James,** English architect: b. Burton Constable, Staffordshire, 3 Aug. 1746; d. Marlborough, Wiltshire, 5 Sept. 1813. He was taken to Rome in 1760 by Sir William Bagot, and during the next six years studied architecture in that city and in Venice. Returning to London, he brought himself into notice by his designs for the Pantheon, in Oxford street, a building for many years famous as the rendezvous of the fashionable world. He received innumerable commissions for private residences in all parts of the kingdom; but his designs, for the most part in a sort of Græco-Italian style, have little at the present day to recommend them. About 1782 he turned his attention to Gothic architecture, being one of the first to attempt its revival; and for many years was employed as a restorer of cathedrals and parish churches, in the course of these labors making sad havoc, at Salisbury, Hereford, Durham and elsewhere. It must be said, however, that his imperfect conceptions of Gothic art were shared by his contemporaries and approved by the taste of his time, in large measure. His most famous work in this style was Fonthill abbey, erected for Beckford in 1795. He held the position of surveyor-general subsequent to 1796, and in 1802–03 was president of the Royal Academy. George III employed him at Windsor. Wyatt is often referred to as «The Destroyer.»

WYATT, Sir **Matthew Digby,** English architect and art writer: b. Rowde, near Devizes, Wiltshire, 1820; d. London, 21 May 1877. He made a diligent study of the architecture of Italy, France and Germany, returning to England in 1846 to publish his 'Geometrical Mosaics of the Middle Ages' (1848). In 1856 he was appointed architect to the East India Company, and made many important designs for public works in Great Britain and India; in 1866 was awarded the royal gold medal of the Royal Institute of British Architects; and in 1869 was knighted and made Slade professor of fine arts at Cambridge. His chief books are 'Metal Work and its Artistic Design' (1852); 'Industrial Arts of the 19th Century' (1853); 'Art Treasures of the United Kingdom' (1857); 'Fine Art' (1870); 'Architect's Handbook in Spain' (1872).

WYATT, Sir **Thomas,** English poet: b. Kent, about 1503; d. Sherborne, Dorsetshire, 11 Oct. 1542. He was graduated from Cambridge in 1518, may have studied at Oxford, and subsequently went on his travels to the Continent. After his return to England he appeared at court, where the reputation he had already acquired as a wit and a poet introduced him to the notice of Henry VIII, who retained him about his person and knighted him in 1537. He was employed on several diplomatic missions to different powers, and was a friend of Thomas Cromwell (q.v.), in whose fall he ran some risk of being involved. In 1542 he was returned to Parliament as knight of the shire for Kent. A close student of foreign literature, Wyatt introduced the sonnet into England from Italy. In this he is commonly associated with Henry Howard, Earl of Surrey, but is more correctly to be regarded as the pioneer. None of Wyatt's verse, sacred or secular, appeared in his lifetime. Some of the secular poems were printed (96 are assigned to Wyatt) in the 'Songes and Sonnettes' (1557) of Richard Tottel, commonly known as 'Tottel's Miscellany.' There are among the extant works 31 sonnets, and satires in heroic couplets, imitated from Persius and Horace. Wyatt's poems evince more elegance of thought than imagination, while his mode of expression is far more artificial and labored than that of Surrey. Consult Nott's edition of Wyatt and Surrey with the elaborate memoir prefixed thereto (1816); also the article by Churton Collins in T. H. Ward's 'English Poets' (1883), and Simond's 'Sir Thomas Wyatt and his Poems' (1889). Consult also Foxwell, A. K., 'Study of Sir Thomas Wyatt's Poems' (New York 1912) and Padelford, F. M., 'Early XVIth Century Lyrics' (London 1907).

WYCHERLEY, wich'ėr-li, **William,** English wit and dramatist: b. Clive, Shropshire, about 1640; d. London, 1 Jan. 1716. About 1655 he went to France for his education, but he returned to England a short time before the Restoration, and was entered a gentleman commoner of Queen's College, Oxford, which he left without a degree, and took chambers in the Middle Temple. He paid, however, little attention to the law, but became a man of fashion in the town, and made himself known as author of 'Love in a Wood, or Saint James's Park,' a comedy, published about the end of 1671. This piece brought him into much notice, and his popularity was increased by comedies that soon afterward followed: 'The Gentleman Dancing-master,' published in 1673; 'The Country Wife,' produced in 1672 or 1673, and 'The Plain Dealer,' 1674. He became a favorite of the meretricious Duchess of Cleveland, and was much regarded by Villiers, the witty and profligate Duke of Buckingham. About 1680 he improved his circumstances by marrying the Countess of Drogheda, a young, rich and beautiful widow. At her death soon afterward she settled her fortune upon him; but, his title being disputed, the costs of law and other encumbrances produced embarrassment, which ended in arrest. He remained in confinement seven years, until released by James II, who, it is said, was so pleased with his comedy of 'The Plain Dealer' that he ordered his debts to be paid, and added a pension of £200 per annum, which he lost at the revolution. The succession to his father's estate, which was strictly entailed, does not appear to have relieved him from the embarrassments into which he had again fallen, and from which he found a deliverance only a few days before his death in marrying a young woman with a fortune of £1,500. Besides the plays already mentioned he wrote poems of no value or

interest. His plays are excessively licentious. He was a friend of Dryden, and in his later years of Pope, but Pope's statements regarding their connection are not much to be depended on. Among latest editions of his plays is that by W. C. Ward (London 1893); Hazlitt, William, 'Lectures on the English Comic Writers' (ib. 1819; new ed., New York 1910); Lansdowne, Lord, 'Memoirs of the Life of William Wycherly, Esq.; with a character of His Writings' (London 1718).

WYCKOFF, wī'kŏf, **Walter Augustus,** American sociologist: b. Mainpuri, India, 12 April 1865; d. 15 May 1908. He was graduated at Princeton in 1888, and after further study in Europe began in July 1891, the life of a day laborer, working his way from Connecticut to California and spending 18 months in this manner. His aim was to study from the inside the economic conditions surrounding American wage-earners, and the immediate outcome of his experiment was his three sociological works: 'The Workers — the East' (1897); 'The Workers — the West' (1898); 'A Day with a Tramp and Other Days' (1901). In 1893–94 he went around the world twice as a private tutor, in 1895 was made a lecturer on political science at Princeton, and in 1898 became an assistant professor of political economy there. His works were widely read and aroused considerable discussion.

WYCLIFFE, wĭk'lĭf. See WICLIF, JOHN.

WYE, wī, a river partly in Wales, partly in England, with its source in Plynlimmon, Montgomeryshire. After a circuitous and winding course of about 130 miles, having passed through Radnorshire, Herefordshire and separated Monmouth from Gloucestershire, it falls into the Severn below Chepstow. It is distinguished for the beauty and variety of its scenery, especially in the neighborhood of Tintern Abbey. The tide at Chepstow sometimes rises 46 feet. Large vessels cannot ascend beyond Chepstow Bridge, but barges of from 18 to 30 tons reach Hereford. A canal from Hereford connects the Wye with the Severn at Gloucester. Other towns on the river are Monmouth, Ross and Builth. Tintern Abbey, one of the noblest ruins of England, is on the banks of the Wye.

WYETH, John Allan, American physician: b. Marshall County, Ala., 26 May 1845; d. New York, N. Y., 28 May 1922. He received his education at the University of Louisville, and at Bellevue Hospital Medical College. During the Civil War he served as a private in Company I of the Fourth Alabamian Cavalry. After practising as attending surgeon to Mount Sinai and Saint Elizabeth hospitals, he founded the New York Polyclinic Medical School and Hospital, the pioneer organization for post-graduate medical study in the United States. For a number of years he was president of the faculty, and surgeon-in-chief of that institution. He was president of the American Medical Association the New York Academy of Medicine, the New York State Medical Association and the New York Pathological Society. In 1878 he was awarded the first and second prizes of the American Medical Association, and the Bellevue Alumni Association Prize in 1876. He published 'A Text-Book on General Surgery' (1888); 'Osteo-Plastic Operation for Correction of Deformities of the Nose and Palate' (1892); 'Life of Lieutenant-General Nathan Bedford Forrest' (1899); 'With Sabre and Scalpel' (an autobiography, 1915).

WYKEHAM, wĭk'ạm, William of. See WILLIAM OF WYKEHAM.

WYLIE, wī'lĭ, **Robert,** American artist: b. Isle of Man, 1839; d. Pont Aven, Brittany, France, 4 Feb. 1877. He was brought to this country when a child, and after some study in the Pennsylvania Academy was sent by his trustees to study in France in 1863. Settling at the village of Pont Aven he was presently surrounded by a colony of artists. In the Paris Salon of 1872 he obtained a second-class medal, but not till after his death did his paintings attract much attention. His 'Death of a Vendean Chief' (1876) hangs in the Metropolitan Museum, New York.

WYMAN, wī'mạn, **Jeffries,** American anatomist: b. Chelmsford, Mass., 11 Aug. 1814; d. Bethlehem, N. H., 4 Sept. 1874. He was graduated from the Harvard Medical School in 1833, was professor of anatomy and physiology at Hampden-Sidney Medical College, Richmond, Va., 1843–47, and Hersey professor of anatomy at Harvard from 1847 until his death. He established there the Museum of Comparative Anatomy and for many years was indefatigable in efforts for its increase, was president of the Boston Society of Natural History 1856–70, became curator of the Peabody Museum, Cambridge, in 1866, and published over 175 scientific papers, including 'On the External Habits, Characters and Osteology of the Gorilla' (1847); 'On the Nervous System of the Bull-Frog' (1853); 'Observations on the Development of the Skate' (1865); 'Observations and Experiments on Living Organisms in Heated Water' (1867); and 'Fresh-water Shell-Mounds of the Saint Johns River, Florida' (1875). He was one of the earliest American supporters of the theory of evolution. Consult biographical sketches by Asa Gray, O. W. Holmes, S. Weir Mitchell, F. W. Putnam, and Burt G. Wilder.

WYMAN, Robert Harris, American naval officer: b. Portsmouth, N. H., 12 July 1822; d. Washington, D. C., 2 Dec. 1882. He entered the navy in 1837, and while attached to the Gulf Squadron during the Mexican War, took part in the siege and capture of Vera Cruz and the expeditions that captured Tuspan and Tampico. He was stationed at the naval observatory in Washington in 1848–50 and 1853–54, and in the Civil War commanded the *Yankee* and *Pownee* and the Potomac flotilla in 1861; and the *Santiago de Cuba* on blockading duty in 1862–64. He became commodore in 1872, and rear-admiral in 1878; and was commander-in-chief of the North Atlantic Station in 1879–82.

WYMAN, Walter, American surgeon: b. Saint Louis, Mo., 17 Aug. 1848; d. 1911. He was graduated at Amherst in 1870, and at the Saint Louis Medical College in 1873; served in city hospitals 1873–75, and after 1876 was in the Marine Hospital service, being made assistant surgeon in 1876, chief medical purveyor of the quarantine division in 1888, and supervising surgeon-general in 1891. He was an earnest

advocate of the sanitation of ports not only in the United States, but in the West Indies and South America, holding that if this were enforced yellow fever would be entirely eradicated from the Western hemisphere. On his recommendation the government set apart a large tract of land at Fort Stanton, New Mexico, for a hospital whither all consumptive patients in the United States marine hospitals could be transferred.

WYMORE, city, Nebraska, in Gage County; alt. 1,222 feet; on the Big Blue River, 54 miles south of Lincoln; on the Chicago, Burlington and Quincy Railroad. There are railroad machine shops and a flour mill. It is a shipping center for grain and livestock. Pop. (1950) 2,258.

WYNANTS, wī'nănts, or **WIJNANTS, Jan,** Dutch painter: b. Haarlem, between 1615 and 1620; d. about 1680. Very little is known of his life except that he was master of Adrian Vandevelde, Wouwerman and other eminent painters, and that he was naturally indolent and given to pleasure. His works are consequently few, but are highly valued for their technical merits. They consist of landscapes of small size, the figures and cattle in which were often executed by other hands. He is represented in the galleries of Amsterdam, The Hague, Munich and in the National Gallery, London.

WYNDHAM, Sir **Charles,** English actor: b. Liverpool, March 23, 1837; d. London, Jan. 12, 1919. He was the son of a physician, studied medicine and surgery in Germany and passed all his examinations brilliantly. During the Civil War he enlisted with the Union forces in the United States and served continuously until the close of the war, being present at the battles of Chancellorsville, Fredericksburg and Gettysburg and through the Red River campaign with General Banks. On quitting the army he made his initial American stage appearance in *Brothers and Sister* and two years later returned to England, where he supported Henry Irving and Ellen Terry in many plays. When he reappeared at the Wallack Theatre, New York, in 1869 he made an excellent impression as a light comedian, and organized a touring company of his own, which went to all of the larger cities of the United States. His repertory was extensive. *The School for Scandal,* in which he appeared as Charles Surface, was one of his greatest successes, and *Pink Dominoes* which he produced in 1877, ran for 500 nights. For 20 years Sir Charles successfully managed the Criterion, New and Wyndham's theatres in London. He was knighted by King Edward in 1902. Consult Scott, *The Drama of Yesterday and Today* (1899).

WYNDHAM, George, English cabinet officer: b. London, Aug. 29, 1863; d. 1913. He was educated at Eton and Sandhurst Royal Military College. He served through the Suakim campaign and at Cyprus in 1885, and was private secretary to A. J. Balfour (q.v.) 1887–1892. He also sat in Parliament for Dover from 1889, was Parliamentary Under-Secretary of State for War 1898–1900, became chief secretary for Ireland in 1900 and entered the Cabinet in 1902. In March 1903 he introduced the Irish land purchase bill subsequently passed. His resignation as chief secretary was brought about by the Orange Unionists. He published an edition of *North's Plutarch* in the *Tudor Classics* (1894); *Shakespeare's Poems* (1898); *Ronsarde and La Pléiade* (1906).

WYNDHAM, Sir **William,** English statesman: b. Orchard-Wyndham, Somerset, 1687; d. Wells, Somerset, June 17, 1740. He was educated at Oxford and entering the House of Commons for his native county, identified himself with the Tories, became secretary of war in 1711, and in August 1713 was transferred to the office of Chancellor of the Exchequer. He was suspected of treasonable relations with the Pretender, and lost his office on the death of Queen Anne. On the outbreak of the rebellion in Scotland under the Earl of Mar in 1715, an order for Wyndham's confinement was issued, and he was arrested at his house in Somerset, but escaped. A reward of $5,000 was offered for his apprehension. After lurking for some time in disguise he surrendered himself and was committed to the Tower. Released without a trial, he remained until his death a leader of the Parliamentary opposition to the ministry of Sir Robert Walpole. He was a very graceful, clear, forcible and spirited orator. One of his sons, Percy, took the name of O'Brien and in 1756 was made Earl of Thomond.

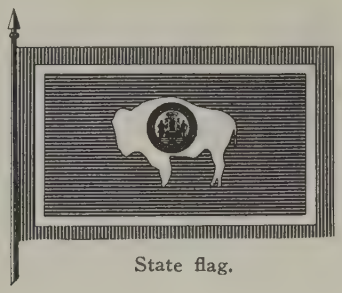
WYNNE, wĭn, **Charles Whitworth.** See Cayzer, Sir Charles William.

WYNNE, city, Arkansas, and Cross County seat; alt. 257 feet; 48 miles west of Memphis, Tenn.; on the Missouri Pacific Railroad. Located in productive farming country, Wynne is the trading center of a district including a number of small municipalities. Besides local and county roads, one state and one federal highway serve it. There are wholesale groceries, and the customary assortment of retail establishments. Making handles, ginning cotton, rice drying, and bottling are the principal industrial occupations. Wynne is a shipping point for fruits, especially grapes, apples, and peaches. Pop. (1950) 4,142.

WYNTOUN, wĭn'tŏn, **Andrew of,** Scottish rhyming chronicler: b. about 1350; d. after 1420. He was a canon regular of the priory of Saint Andrews, and was in 1395 prior of Saint Serf's Inch, in Lochleven, probably holding this office until his death. Wyntoun's *Orygynale Cronykil of Scotland* is the first historical record in the Scottish vernacular. It received little attention until 1795; when David McPherson published an annotated edition of a part of it. David Laing edited a complete edition of this work (3 vols., Edinburgh 1872–1879) and an edition from the Wemyss Manuscript was prepared for the Scottish Text Society (1906). Wyntoun's Chronicle bears the usual character of the historical writings of the age in the indiscriminate mixture of tradition with history, but he appears to have been faithful to his authorities, whom he sometimes literally transcribes. Wyntoun's scholarship appears to have been considerable and the candor and generosity with which he speaks of the enemies of his country are commendable.

WYOMING, wī-ō'mĭng, one of the Rocky Mountain states. It is bordered on the east by Nebraska and South Dakota, on the north by Montana, on the west by Montana, Idaho and

Utah, and on the south by Utah and Colorado. The word *wyoming* is thought to be derived from the Indian word *mecheweami-ing,* meaning "at the big plains."



State flag.

Land area	97,506 square miles
Water area	408 square miles
Total area	97,914 square miles
Latitude	41°—45° N.
Longitude	104° 03'—111° 03' W.
Altitude (average)	6,700 feet
Population (1950)	290,529
Capital city—Cheyenne; Pop. (1950)	31,935
Admitted as a state	July 10, 1890
Bird	Meadowlark
Flower	Indian Paint Brush
Motto	*Cedant Arma Togae* (Let Arms Yield to the Toga)
Nicknames	Equality State; Sagebrush State; Wonderland of America
Song (adopted 1955)	*Wyoming*
Tree	Cottonwood

State seal.

Physical Characteristics.—Wyoming is a state of high plains and mountains. The Continental Divide crosses the state from the northwestern corner to the southern border east of center. The great plains in the eastern part of the state gradually rise to the foothills of the Rocky Mountains. The topography is diversified with plains, low and high mountains, and occasional badlands. The largest mountain masses are in the southern, north central, and northwestern parts of the state. There are many high plateaus with elevations between 4,500 and 7,500 feet.

Wyoming's climate is dry and cool. The dryness serves to temper the coldness of the winters. Cheyenne, for which extensive records are available, may be taken as having typical Wyoming climate. Cheyenne has a mean temperature of 44.6°, an average daily maximum temperature of 56.8°, an average daily minimum temperature of 32.3°; highest temperature of record, 100°; lowest temperature of record,—38°; average precipitation, 14.99 inches. Local variations in climate are considerable, however, since altitudes vary from 3,125 feet in the northeastern corner of the state to over 13,000 feet in the western mountains. The state's average precipitation is 15.8 inches. The growing season varies from 30 days to 156 days.

Wyoming's rivers flow out of the state in all directions, but most of the drainage is to the north and east into the Missouri. The North Platte, Belle Fourche, and Cheyenne rivers flow east; the Wind, Big Horn, and Powder flow north; the Snake and Bear flow west; and the Green flows south. The state supplies water for the Missouri-Mississippi system, the Columbia system, the Colorado system and the Great Salt Lake. Wyoming's lakes are generally small, its principal ones being Yellowstone and Jackson. Reclamation projects provide many smaller areas of water surface, and there are innumerable small lakes in the mountains.

The state has about 1.5 million acres of irrigated land, about one fortieth of its area. The irrigated areas are mainly near the Laramie and Platte rivers in eastern Wyoming, in various parts of the Big Horn Basin, and just east of the Big Horn Mountains. Federal irrigation projects put into operation within the state include the Riverton, Shoshone, and Kendrick projects, which also provide hydroelectric power. If completely exploited, Wyoming's water resources would allow for irrigation of approximately three million acres, or one 20th of the state's area.

Political Divisions.—*Cities.*—Chief cities with their 1950 populations in parentheses are: Cheyenne (31,935), the capital and oil refining center; Casper (23,673), oil and wool production center; Laramie (15,581), transportation and industrial center; and Sheridan (11,500) and Rock Springs (10,857), coal mining centers. (For populations of other cities and towns, see back of state map.)

Counties.—The counties and their county seats are as follows:

County	County Seat	County	County Seat
Albany	Laramie	Natrona	Casper
Big Horn	Basin	Niobrara	Lusk
Campbell	Gillette	Park	Cody
Carbon	Rawlins	Platte	Wheatland
Converse	Douglas	Sheridan	Sheridan
Crook	Sundance	Sublette	Pinedale
Fremont	Lander	Sweetwater	Green River
Goshen	Torrington	Teton	Jackson
Hot Springs	Thermopolis	Uinta	Evanston
Johnson	Buffalo	Washakie	Worland
Laramie	Cheyenne	Weston	Newcastle
Lincoln	Kemmerer		

The People.—Of Wyoming's 1950 population of 290,529, 284,009 were whites and 6,520, nonwhites. Males numbered 154,853 and females, 135,676. The 1940 population of 250,742 included 246,597 whites, 2,349 Indians, 956 Negroes, 643 Japanese, and 102 Chinese. Of the whites, 16,779 were foreign-born, most of whom had come from England (1,490), Germany (1,392), Sweden (1,353), Russia (1,325), Italy (1,215), Mexico (1,198), and Scotland (1,086). Although approximately 93 per cent of the people were American-born, almost two thirds were migrants from other states.

Wyoming's 1950 rural population of 145,911 approximated 50.2 per cent of the total. Most of those classed as rural, however, lived in villages and towns, communities of less than 2,500 being classified as rural. About 19.5 per cent of the people actually lived in rural farm or ranch areas.

Natural Resources.—*Fauna and Flora.*—Wyoming's animals and plants vary with the elevation. At lower elevations are found coyotes, prairie dogs, ground squirrels, pocket gophers and cottontail rabbits. At middle elevations are found coyotes, jack rabbits, cottontail rabbits,

antelope, mule deer and a few moose. At higher elevations there are snowshoe rabbits, black bear, elk, and an occasional grizzly bear and mountain lion.

At lower elevations there are broad-leaved cottonwood and box elder. At middle elevations one finds trembling aspen, yellow pine, narrow-leaved cottonwood, saltbush, yucca and sage-brush; at higher elevations there are spruce, fir and lodgepole pine. The highest parts of the state, above timber line, are characterized by arctic flora. The mountains are wooded up to timber line, and this forest area comprises 13 per cent, or 12,500 square miles, of the state.

Minerals.—Wyoming's known coal reserves are the greatest of any of the states. More than half of the state is underlaid with bituminous coal. Reserves are estimated at six hundred billion tons. Seventeen of the 23 counties produce coal, but the five main fields are at Rock Springs, Hanna, Kemmerer, Sheridan and Gillette.

Wyoming has known petroleum reserves of 800,000,000 barrels. This compares with a cumulative production of 751,000,000 barrels up to January 1, 1948. Many important discoveries were made in the oil boom which began in 1942. These discoveries involved both the finding of entirely new fields, and the discovery of new producing horizons in old fields. From 1942 to 1947 41 new fields were found in 15 counties. During the same period new producing horizons were developed in 23 old fields in eight counties. The exploration seismograph has been widely used to locate buried structures. Wyoming's first production below 10,000 feet was discovered in 1946 in the Church Buttes Field in Uinta County. In 1947 six wells were drilled below 10,000 feet.

There are large iron reserves near Hartville in Platte County, which have been worked by the Colorado Fuel and Iron Company at its Sunrise Mine since 1900. There are also vast deposits of titaniferous magnetite (iron) ore in the Laramie Mountains and extensive reserves of low-grade vanadium ore in the western part of the state. Nonmetallic minerals of which there are considerable reserves are bentonite, vermiculite, sodium sulphate, trona, feldspar, phosphate, potash, gypsum and anorthosite.

Gold and silver have been found in only small quantities, although the search for them has continued for more than a century. Copper has been produced in comparatively small quantities from time to time. The greatest production was at Encampment, 1902–1908, valued at two million dollars.

Soils.—Wyoming's soil is generally fertile, but rather thin. Lack of water makes it impossible to use most of the land except for grazing. Along the eastern border the soil is brown with calcareous subsoil; in east central Wyoming there is grayish-brown soil with calcareous subsoil. In most of southern Wyoming and in the Big Horn Basin there are gray or brown arid-region soils.

Water Power.—The Bureau of Reclamation had 45,800 kilowatts of installed capacity in five hydroelectric plants, and 800 miles of high voltage transmission lines connecting the plants, in 1948. In general, reclamation projects in the state are multiple-purpose. The Kortes Project, begun in 1946, is primarily for power, and when completed will have a capacity of 30,000 kilowatts. The Boysen Project, begun in 1947, is for flood control, irrigation, silt control and power. It will have a power capacity of about 10,000 kilowatts.

Natural resources of growing importance in Wyoming are the state's scenic attractions, its pleasantly cool summer climate, and its fishing, hunting and skiing opportunities which bring many tourists.

Parks, Reservations and Preserves.—One seventh of Wyoming (8,658,185 acres) is in national forests; and 2,540,000 acres are in national parks and monuments. Five forests lie entirely within the state; and four others are partly in the state. The national parks are Yellowstone, 2,222,000 acres and Grand Teton, 96,000 acres. The national monuments are Devil's Tower, Shoshone Cavern, Fort Laramie and Jackson Hole—the last named having 221,621 acres.

There is one Indian reservation, the Wind River, 808,500 acres, in Fremont County, where there were located 1,351 Shoshoni and 1,346 Arapaho, as of 1945.

Birds and game animals are protected in the national parks. The State Game and Fish Commission regulates hunting and fishing elsewhere, changing rules as needed to maintain proper balances.

Production.—*Agriculture.*—The most important agricultural activity is livestock production. Ninety-five per cent of the farm and ranch area of the state is used for cattle and sheep range. Normally there are about one million cattle in the state and three million sheep. The sheep population, however, declined in the 1940's until there were only about 2,070,000 in 1949. Wyoming fleeces are the heaviest in the United States, averaging ten pounds. Wyoming ranks second to Texas in the number of sheep and lambs produced and in total wool production.

The United States Agricultural Censuses of 1940 and 1945 showed that Wyoming's farm and ranch units were becoming fewer and larger. In 1940 the 15,018 farms and ranches averaged 1,866.2 acres; in 1945 the 13,076 farms and ranches averaged 2,532.6 acres.

Five per cent of Wyoming's farm and ranch area is crop-producing. More than half of the crop area is devoted to native hay, much of which is irrigated. The remaining crop area is partly irrigated and partly dry-land. Crop production for 1947 was: hay, 1,115,000 tons, wheat 296,000 bushels, oats 153,000 bushels, barley, 152,000 bushels, sugar beets 454,000 tons. These figures were considerably above the 1935–1944 averages.

Wyoming's forest lands produced 54,000,000 board feet in 1945.

Minerals.—Wyoming's assessed coal production reached 8,038,648 tons in 1947. Its assessed petroleum production reached 40,662,627 barrels in 1947, an all-time high for the state. Wyoming experienced an oil boom in the early 1920's; and a second boom in production began in 1942. Other extractive industries have been developed on only a comparatively small scale.

Wyoming's only important manufacturing industry is oil refining. Not all of the state's production of oil, however, is refined within its borders; much of the crude production going by pipeline to Salt Lake City, Denver, and to points in Missouri.

Transportation and Communications.—Although the Continental Divide traverses Wyoming in a northwesterly direction, this backbone of the continent is quite low at several places in southern Wyoming, making it possible for railways and highways to pass through without the necessity of

solving the problems of extremely high altitudes. The main line of the Union Pacific Railway and Highway 30, the Lincoln Highway, consequently cross southern Wyoming. The Chicago and Northwestern, and Burlington railroads serve central and northern Wyoming, with connections to the north, east and south. North-south transportation facilities are generally poor. The state's line mileage of railways is 1,877.61. In early 1954 there were 27,172 miles of highways and roads, of which 5,548 miles were surfaced, and 33 commercial and municipal airfields, with three regularly scheduled airlines in service. Communications media included 92,100 telephones, 16 radio stations, two television stations, 10 daily newspapers, and 35 other newspapers.

Economic and Financial Factors.—As of June 30, 1954, the state's 25 national banks held $231,433,000 in assets and $214,914,000 in deposits; 28 state banks had $93,102,000 in assets and $84,987,000 in deposits.

Wyoming has only a small industrial population. The railroad workers are organized in the railroad brotherhoods and the American Federation of Labor. The miners, teamsters, building trades and other crafts belong to the American Federation of Labor. Oil workers belong to the Congress of Industrial Organizations. The three different labor organizations are generally together on political issues in Wyoming. The two principal groups of workers, the miners and the railroad employees, have regularly followed their national organizations in the matter of strikes.

Government.—*Executive.*—Wyoming has a multiple executive elected by popular vote. The executive officers provided for by the state constitution are the governor, secretary of state, treasurer, auditor, and superintendent of public instruction. Except for the governor, each has a department of government under his immediate control. Basic administrative authority is vested in various boards and commissions. A number of the more important boards and commissions are made up of the five constitutional executive officers serving in an ex-officio capacity. The governor's term runs for four years.

GOVERNORS OF WYOMING

TERRITORIAL

John A. Campbell		1869–1875
John M. Thayer		1875–1878
John W. Hoyt		1878–1882

C. J. Rogers (acting)	"	1953–1955
Milward L. Simpson	"	1955–

Legislature.—The state legislature is bicameral, with 27 senators elected for four years, and 56 representatives elected for two years. Elections are from the counties at large. Four of the 23 counties return two senators. The number of representatives varies, with two counties returning six. The legislature meets the second Tuesday in January of odd-numbered years. The length of the session is limited to forty days, but special sessions may be called. In the regular session of 1947, for the first time, an Interim Committee was provided for, to study various problems and to submit recommendations to the 1949 session.

Courts.—Wyoming has a state supreme court of three justices elected for overlapping eight-year terms. Its jurisdiction is primarily appellate. There are also seven district courts with single judges elected for six-year terms. The district courts have general original jurisdiction and limited appellate jurisdiction from inferior local courts.

Public Welfare.—The five elective executive officers constitute the Board of Public Welfare with supervision over the Department of Public Welfare. Likewise, these five officers comprise the Board of Charities and Reform, with supervision over the Tuberculosis Sanitarium at Basin, the Training School at Lander, the State Hospital for the Insane at Evanston, the Soldiers' and Sailors' Home at Buffalo, the Penitentiary at Rawlins, the Boys' Industrial Institute at Worland, the Girls' School at Sheridan, the Children's Home at Casper, and over the Saratoga Hot Springs Reserve at Saratoga, and the Hot Springs State Park at Thermopolis.

Local Government.—This is organized in the usual pattern of western states. Each county has a board of three county commissioners with general administrative and legislative authority. The commissioners are elected, as are the county clerk, surveyor, sheriff, treasurer, attorney, superintendent of schools, coroner, justice of the peace, and constables. Cities and towns vary in their governmental organization. The cities of Laramie and Sheridan operate under special charters granted by the territorial government. Others operate under general state laws. Most Wyoming communities have the mayor-council form of government, but Cheyenne and Sheridan have the commission form, and Laramie uses the manager form. The constitution provides that the legislature shall provide for a system of township organization and government which may be adopted by any county, but this section of the constitution has not been implemented.

Educational System.—Wyoming had only one institution of higher learning until 1947 when two junior colleges were established, one at Casper and one at Powell. In 1948 two other junior colleges were established, one at Sheridan and one at Torrington. All four junior colleges are supported by the local school districts. Three of them, however, those at Powell, Sheridan and Torrington are named University of Wyoming Centers, and are closely coordinated with the state-supported University of Wyoming.

The University of Wyoming was established in 1887, as a land-grant institution. It grew slowly, attaining an enrollment of 1,000 for the first time in 1925. The enrollment in 1947–1948 was 3,300. In 1948 the university included colleges of agriculture, commerce and industry, education, engineering, law, and liberal arts. There

is also a school of pharmacy. The university offers work to the master's degree in almost all fields, and work to the doctor of education degree and to the degree, doctor of philosophy, in the four fields of agriculture, chemistry, education and geology. The university is managed by a board of trustees composed of nine members appointed by the governor with the consent of the senate for overlapping six-year terms. The governor, the president of the university, and the state superintendent of public instruction are ex-officio members of the board.

The state superintendent of public instruction has supervision of the elementary and secondary schools of the state. A state board of education was established in 1919 and is appointed by the superintendent with the consent of the governor. The board oversees vocational and other schools receiving state aid, prescribes standards for elementary and secondary schools, and supervises the examination of superintendents and teachers for the public schools. The state board of education appoints a commissioner of education who acts as secretary to the board, and executes the educational policies of the board under the general direction of the superintendent.

The Wyoming Education Association employs a full-time secretary who publishes the *Wyoming Education News.*

In 1947–1948 the public school enrollment totalled about 55,000; there were 2,600 teachers. The average public school teacher was paid $2,370 in 1947–1948. There are several parochial elementary schools, but only one parochial high school, St. Mary's in Cheyenne.

An Equalization Fund was established by the legislature in 1935. The purpose of the fund is to equalize educational opportunity by providing assistance needed by school districts to maintain the program established by law.

Wyoming's educational level is relatively high. The 1940 census reports reveal that the median of school years attained by Wyoming's population is 9.2 while that for the United States is 8.4. Only six per cent of Wyoming's people above 25 years of age in 1940 had less than five years of schooling as compared with 13.5 per cent in the United States.

History.—Before the arrival of the white man, various Indian tribes roamed over the region now known as Wyoming. Among these tribes were the Sioux, Cheyennes, Arapaho, Crow and Shoshoni.

The first white men to reach Wyoming were probably the Vérendrye brothers, Frenchmen who traveled west-southwest from the Mandan villages late in 1742, and finally on New Year's Day, 1743, came to a place from which they could see to the west a mountain range—perhaps Wyoming's Big Horn Mountains. Towards the end of the 18th century, other Frenchmen penetrated to the Wyoming country via the North Platte River. Spanish trade goods reached the region, but they were probably brought by Indians, rather than by the Spaniards themselves. No Spanish expedition is known to have gone as far north as Wyoming.

Meriwether Lewis and William Clark did not enter Wyoming, but one of their men, John Colter, is usually credited with being the first white man to view the wonders of Yellowstone Park. Colter left the returning expedition to trap the tributaries of the upper Missouri. Employed by Manuel Lisa, the St. Louis fur trader, Colter spent part of the winter of 1807–1808 in northwestern Wyoming. He presumably crossed from the Big Horn Basin into Jackson Hole and into Teton Basin in Idaho, and then returned through Yellowstone Park. In 1810 he told William Clark of his experiences, and Clark included Colter's route on his 1814 map of the Lewis and Clark Expedition. Colter's stories of Yellowstone were first received with skepticism and incredulity. The name "Colter's Hell" was applied to the region that the intrepid trapper had visited.

John Jacob Astor, who was interested in the Oregon fur trade, sent an overland expedition, led by Wilson Price Hunt, which crossed northern Wyoming on its way west in 1811. In the following year Robert Stuart, another Astor employee, led a small party from Oregon through Wyoming, suffering great hardships. They lost their horses to Indians, wandered northward through Star Valley, crossed to the Green River valley, passed over the Continental Divide in the vicinity of South Pass (probably south of the pass) and made their way eastward along the North Platte River.

Early in 1824 a party representing the Rocky Mountain Fur Company entered Wyoming from Montana, traversed the Big Horn Basin, and crossed through South Pass. Jedediah Smith, Thomas Fitzpatrick and James Clyman were in the party. They are generally credited with being the first white men to go through South Pass, gateway to the west.

Increasing numbers of trappers penetrated the Wyoming country in the 1820's and 1830's. Hundreds of fur men ransacked the region for the precious beaver pelts. They lived not unlike Indians, and often died at the hands of the red men. William H. Ashley in 1825 gathered many of the trappers together on the Green River near Pinedale in the first fur trappers' rendezvous. In the next fifteen years the rendezvous was an annual affair. Trappers, white and red, assembled in early summer at a prearranged place to dispose of their winter's catch, to get fresh supplies, and to enjoy the conviviality they had missed during the long winter. Twelve of the 16 rendezvous were held in western Wyoming. Rivalry developed between various fur companies, but with the decimation of the beaver by 1840, Wyoming's "beaver gold" disappeared.

Other motives sent people along the trapper's trails. Sportsmen, scientists and missionaries had accompanied the fur trade caravans bound for the rendezvous. Among these were the Methodist missionaries, Jason and Daniel Lee, Thomas Nuttall, botanist, John K. Townsend, ornithologist, all in 1834; the Reverend Samuel Parker and Dr. Marcus Whitman in 1835; and notably Mrs. Whitman and Mrs. Spalding, who came with their husbands in 1836. They were the first white women to enter Wyoming. Father Pierre Jean de Smet, Roman Catholic missionary, came with the supply train of 1840.

The 1840's saw a crescendo of westward migration along the well-marked trails to Oregon, California and Utah. Wyoming was looked upon as part of the "Great American Desert," which had to be crossed as quickly as possible to reach more promising lands beyond.

Two small Wyoming communities offered the weary travellers opportunities to secure supplies, repairs for their wagons, and replacements for their worn out draft animals. Fort Laramie, near

Wool production is an important industry in Wyoming where exceptionally heavy fleeces are produced. Here, on a large sheep ranch, ewes are shown ready for shearing.

Ewing Galloway, N.Y.

the junction of the Laramie and North Platte rivers in eastern Wyoming was for many years the best known settlement in the Rocky Mountain region. Fort Laramie was established as a private trading post in 1834. In 1849 it was sold to the United States government. The other Wyoming port of call for the overland travelers was Fort Bridger on Blacks Fork of the Green River in southwestern Wyoming. The famous storyteller, scout and guide, Jim Bridger, opened the post in 1843. Both of these forts were busy places in summer, and very quiet in winter.

Second Lieut. John C. Frémont of the Corps of Topographical Engineers visited Fort Laramie in 1842. He followed the Oregon Trail to western Wyoming and returned by the same route. In 1843 Frémont again visited southern Wyoming, and moved on to the west coast. The first United States troops visited Wyoming in 1845 when Col. Stephen W. Kearny led five companies of the First Dragoons over the Oregon Trail to South Pass.

In the dozen years beginning in 1841 more than 150,000 persons crossed South Pass on the way to the Pacific Slope. Perhaps 50,000 crossed in the single year of 1850. By August 14 of that year the register at Fort Laramie recorded 39,506 men, 2,421 women, and 609 children. Brigham Young led the main party of Mormons across Wyoming in 1847.

The Indians understandably were alarmed at the number of whites who were moving along the Oregon Trail. Wild game disappeared for many miles on either side of the broad highway. Various misunderstandings arose, and occasionally white travellers suffered from Indian depredations. A great treaty council was held below Fort Laramie in 1851. Perhaps 10,000 Indians, Sioux, Cheyennes, Arapaho, Shoshoni and Crows, were present to hear Col. Thomas Fitzpatrick and Superintendent D. D. Mitchell, the government commissioners. The Indians were promised an annuity of $50,000 in goods for 50 years in return for promises that they would allow unmolested passage to the west and a treaty of peace was made. The Fort Laramie Treaty no doubt mitigated hostilities for a number of years. In 1854, however, just below Fort Laramie occurred the Grattan Massacre. Lieut. John L. Grattan, a corporal, 27 privates and an interpreter were killed. Although relations between Indians and whites were strained thereafter, there was little violence in Wyoming until the 1860's. An effort to open the Bozeman Road from Fort Laramie to the Montana gold fields culminated in open war in northern Wyoming. The road led through a favorite Sioux hunting ground east of the Big Horn Mountains. Near Fort Phil Kearny, which was established in 1866 a few miles south of present Sheridan, occurred the Fetterman Massacre, December 21, 1866. Eighty-two men, including Lieut. Col. William J. Fetterman, were ambushed and slain. War continued until another Fort Laramie Treaty in 1868 provided for withdrawal of garrisons from the Bozeman Road. In the same year a treaty made at Fort Bridger established the Wind River Reservation in Central Wyoming for the Shoshoni. The Arapaho were moved to the same reservation in 1878; and the two tribes, about 1,000 persons in each, have remained there. Northern Wyoming was not made safe for whites until after the Custer Massacre which took place in Montana near Wyoming's northern border in 1876.

In the meantime many prospectors, beginning in the 1840's, had searched the Wyoming country for gold without much success. Perhaps $2,000,000 was taken from the South Pass region in the late 1860's and early 1870's, but otherwise the search for precious metals in Wyoming was, and has remained, disappointing.

Stage lines operated along the Oregon Trail in the 1850's. Ben Holladay moved his line south to the Overland Trail in 1862. The Pony Express provided fast communication in 1860–1861, and the telegraph, faster still in 1861 and thereafter.

The Union Pacific Railway entered Wyoming in 1867 and had crossed into Utah by 1869. Cities sprang up along the route in southern Wyoming, Cheyenne, Laramie, Carbon, Rawlins, Rock Springs, Green River and Evanston. This influx of population gave strength to a movement to organize Wyoming Territory. The Wyoming region had been from time to time a part of various territories, and was a part of Dakota Territory in 1868 when Congress passed an act, July 25, creating Wyoming Territory. The territory was actually organized in 1869 with four counties, Laramie, Albany, Carbon and Carter (Sweetwater), each extending the length of the territory from north to south.

One of the first acts of the territorial government was to give women the right to vote. The measure was signed by the governor, December 10, 1869. Wyoming's priority in extending general suffrage to women has given rise to the nickname "Equality State"; and the date that the measure was approved, December 10, is celebrated as Wyoming Day.

The 1870 census showed 9,118 people. Rapid growth thereafter brought demands for statehood, which led to the admission of Wyoming as the 44th state, July 10, 1890. The state was given the same boundaries as the territory had had.

Cattle had wintered at Forts Laramie and Bridger in the 1840's with the aid of supplemental feed and water. Later—according to one story, in 1854—it was discovered that cattle could survive the northern winter if left to roam unattended on the open range. After the Civil War, Texas longhorns were trailed into the region and turned loose to forage for themselves until roundup time. Later, particularly in the early 1880's, improved breeds were trailed from Oregon. For a number of years the open range cattle industry flourished. The Laramie County Stock Growers Association of 1873 became the Wyoming Stock Growers Association of 1879. Profits were surprisingly good, since grazing on government land cost nothing. The cattlemen dominated territory politics. The term "Cattlemen's Commonwealth" was no misnomer. The terrible winter of 1886–1887, however, dispelled the dream. The summer of 1886 had been unusually hot and dry. Too many cattle were competing for the available grass. When the abnormally hot and dry summer was followed by an unusually severe winter, hundreds of thousands of cattle died. Those cattlemen who were fortunate enough to avoid bankruptcy reorganized their industry thereafter. In particular they made provision for supplementary winter feed and water.

Sheep had been trailed into Wyoming from Oregon before the winter of 1886–1887. They had been received with hostility by the cattlemen. Although the comparatively few sheep also suffered in the winter of 1886–1887, there was rapid

expansion of the sheep industry thereafter. In the 1890's, the Wyoming range was divided about equally between cattle and sheep; and that status of balance has endured. Wyoming sheep and sheepmen continued to suffer at the hands of cattlemen until after a cattlemen's party killed two prominent sheepmen and a herder at Bonanza in the Big Horn Basin in 1909. The arrest, trial and conviction of the guilty cattlemen terminated the use of extralegal methods in settling range disputes. The Wyoming Wool Growers Association and the National Wool Growers Association had become strong enough to secure the rule of law.

In an earlier period cattlemen had found it desirable to take the law into their own hands in dealing with cattle thieves—rustlers. Range detectives were not very successful, partly because juries often would not convict on the evidence presented. When prosecution in the courts failed, individuals believed to be rustlers were shot or hanged without benefit of trial. Cattlemen, however, continued to lose cattle and settlers with small herds in Johnson County in northern Wyoming were particularly suspect. These settlers in turn believed that their rights were not respected in the official roundups of the Stock Growers Association. The settlers determined to hold their own roundup, whereupon the association laid plans to make a surprise raid into Johnson County. A list of alleged rustlers who were to be killed on sight was prepared. Twenty-five Texans were brought to Cheyenne and joined to a similar number of Wyoming cattlemen. Taking every precaution to keep their movements secret, the raiders left Cheyenne by special train, April 4, 1892. They mounted their horses at Casper on April 6 and proceeded across country. They killed two of the men on their list when they surrounded them on the KC ranch, but word of their activities reached Buffalo, county seat of Johnson County. The sheriff organized a posse considerably outnumbering the cattlemen's party. Informed of this development the cattlemen fortified the TA ranch 12 miles from Buffalo, and soon were besieged by the enraged posse. Word went quickly to the governor, and from him to the president of the United States. Cavalry were dispatched from Fort McKinney to arrest the cattlemen. They surrendered and were taken to Cheyenne for trial. The case against the cattlemen was eventually dismissed, much to the chagrin of the people of Johnson County.

A few individual cattlemen later returned to the practice of hiring gunmen to frighten or kill rustlers. The notorious Tom Horn was active in this business. Horn was finally arrested for killing a boy, whom he apparently had mistaken for the father, was convicted and hanged for the crime in 1903.

As the 20th century progressed, Wyoming citizens conformed more and more to the ways of people farther east. The state's population growth in the 1920's, 1930's, and 1940's corresponded very closely to the nation's population increase, evidence of the state's maturity. Most of the state remained a great pasture for cattle and sheep. Scattered reclamation projects made possible intensive agriculture on 1,500,000 of the state's 62 million acres. Great coal reserves were drawn on for eight or nine million tons annually. Numerous oil pools were tapped, with peaks of production in the early 1920's and the late 1940's. The tourist business became of great importance in the state's economy. The spirit of territorial days, however, was revived every summer in almost every community with rodeos, stampedes, chuck wagon days, or similar celebrations.

During World War II, and after, efforts were made with small success to bring manufacturing industries to the state. There was a feeling that, with oil refining the only major manufacturing industry, the state was sorely in need of more industry to balance its economy.

Fifty-one per cent of the state's area had remained public domain, and there was much controversy regarding the use and ultimate disposal of the public property. Often sportsmen and dude ranchers were aligned with the government against the cattlemen and sheepmen. President Franklin D. Roosevelt's creation of the Jackson Hole Monument in 1943 aroused a storm of disapproval from private interests in the community and state. The cry of state's rights which had been heard in Wyoming since 1890 was loud as ever after half a century.

T. A. LARSON,
Professor of History and Head of Department, University of Wyoming.

WYOMING, Pa., borough in Luzerne County; on the Susquehanna River; about 5 miles northeast of Wilkes-Barre; on the Delaware, Lackawanna, and Western, and the Lehigh Valley railroads. It is in the heart of the anthracite mining region, has silk and metal industries, and is noted as the scene of the Battle of Wyoming of 1778. (See PENNAMITE WARS; WYOMING VALLEY.) Pop. (1940) 4,728; (1950) 4,511.

WYOMING, University of, located at Laramie, Wyo. It was charted by the territorial legislature in 1886 and opened to students in 1887. The first state legislature in 1890 enlarged the scope of the university and made the state agricultural college, provided by federal grants, a part of the university organization. The institution, which is coeducational, includes colleges of law, liberal arts, education, engineering, commerce and industry, and agriculture. There is also an extension division which conducts extension lectures throughout the state, and a department for teaching by correspondence. See also WYOMING—*Educational System.*

WYOMING VALLEY, a crescent shaped valley, 21 miles long, in Luzerne County, Pa., traversed by the northern branch of the Susquehanna River. It is a fertile alluvial plain, with rich deposits of anthracite coal, and is noted for its beautiful scenery. The valley was claimed by Connecticut under its charter of 1662 and settled in the 1750's and 1760's by people from that colony. The ensuing dispute between Pennsylvania and Connecticut was not settled until after the American Revolution (see PENNAMITE WARS).

During the revolution a large proportion of the men of the Wyoming Valley joined the Continental Army; but a number of Tories remained in the valley and in 1778, when they were joined by British troops and Indian allies, an attack

was made upon the settlers who had taken refuge in Forty Fort, near Wilkes-Barre. The settlers did not number over 400, chiefly boys and old men; the British force, including the 700 Indians, was about 1,100. After a desperate battle fought on the 3d of July 1778 the settlers were completely defeated, about two thirds being killed. They were forced to capitulate, and after the surrender many of the prisoners were tortured and killed by the Indians. The greater part of the inhabitants of the valley were compelled to flee to other settlements and endured great hardships.

WYOMINGITE, a rock consisting almost entirely of leucite and phlogopite, abundant in the Leucite Hills in Sweetwater County, Wyoming. Contains so much potash that it may become a source of that material.

WYON, wī'ŭn, **William,** English engraver and designer of coins and medals: b. Birmingham, 1795; d. Brighton, Sussex, Oct. 29, 1851. Having won several prizes for medals offered by the Society of Arts, he went in 1816 to London and was appointed second engraver at the mint, a post which he filled until the close of his life. In 1831 he was elected an associate of the Royal Academy, and in 1838 an academician, being the first of his department who had ever obtained these honors. His works, comprising coins, pattern pieces of coins not used, medals and seals are numerous. His coins cover a period of nearly 30 years, including the latter part of the reign of George IV, the reign of William IV, and the first 13 years of the reign of Victoria. Far more numerous than these are his war, scientific, artistic and testimonial medals, executed from his own or John Flaxman's designs, and in the highest style of art.

WYSPIANSKI, vĭs-pyän'y'-skē, **Stanislaw,** Polish painter, poet and dramatist: b. Cracow, 1869; d. there, 1907. A pupil of the historical painter Jan Matejko, he continued his studies in France and Italy. Of his 16 plays, some were of classic Greek but most of Polish inspiration. The latter include *The Legion* (1900), *The Wedding* (1901), *Deliverance* (1903), *November Night* (1904).

WYSS, vēs, **Johann Rudolf,** Swiss author: b. Bern, March 4, 1782; d. there, March 31, 1830. He was educated at various German universities, became professor of philosophy at Bern in 1806, and later also chief librarian. His *Der Schweizerische Robinson* (1812–1827), an imitation of Defoe, was translated into various languages, the first series appearing in English (*The Swiss Family Robinson*) in 1820, the second in 1849. Wyss also wrote *Vorlesungen über das höchste Gut* (1811), and *Idyllen und Erzählungen aus der Schweiz* (1815–1822); *Reise im Berner Oberland* (1808); and edited the collection *Die Alpenrosen* (1811–1830). Wyss is the author of the Swiss national anthem, *Rufst du, mein Vaterland?* (1811).

WYTHE, with, **George,** American patriot: b. 1726 in the county of Elizabeth City, Va., a short distance from Yorktown; d. Richmond, June 8, 1806. From his mother Wythe received a life-long bent toward scholarship, and from a Quaker ancestor, George Keith (q.v.), his opposition to slavery. Wythe was trained in the law by an uncle. His connection with the Virginia House of Burgesses began on Feb. 27, 1752. Hence he knew in a practical way the steps which led to the revolution, whose course he was destined to influence. He was a member of the Continental Congress and a signer of the Declaration of Independence. He sat in the Philadelphia Convention of 1787 and exerted himself to secure the ratification of the Constitution by Virginia the following year. For 10 years he was a member of the Virginia Supreme Court of Appeals, and for more than 20 years sole chancellor of the state. However, George Wythe is not to be judged chiefly as a statesman or jurist. He was greatest in his role as teacher. Either in his law office or as professor in William and Mary College, he was the teacher of Thomas Jefferson, John Marshall, James Monroe, Henry Clay and scores of other men only less prominent than these. With Jefferson, in particular, Wythe maintained a friendship and interchange of thought which had a bearing upon national concerns. So highly did Jefferson prize the work of Wythe as a teacher, that he exerted himself to establish, in 1779, in the College of William and Mary a chair of law, expressly for the occupancy of his "master and friend," as he delighted to call Wythe. Wythe was the first professor of law in the United States. William and Mary College was the second in the English-speaking world to have a chair of Municipal Law, George Wythe coming to such a professorship a few years after Sir William Blackstone. In three signal instances Wythe was a forerunner. As early as 1764 he wrote Virginia's first remonstrance to the House of Commons against the Stamp Act, taking so advanced a position in regard to that ominous act as to alarm his fellow burgesses. He was perhaps the first judge to lay down, in 1782, the cardinal principal that a court can annul a statute deemed repugnant to the Constitution, thus anticipating by a score of years the classic decision of his great pupil, John Marshall, in the case of *Marbury* v. *Madison*. He was an ardent advocate for the emancipation of the slaves, not only infusing his students with his abolition sentiment, but actually freeing his own slaves and making provision for them in his will. His death occurred in Richmond, Va., in 1806, from poison administered by his great-nephew, who hoped to come thus into the inheritance of his estate. "No man," says Jefferson, "ever left behind him a character more venerated than George Wythe. His virtue was of the purest kind; his integrity inflexible, and his justice exact; of warm patriotism, and devoted as he was to liberty and the natural and equal rights of men, he might truly be called the Cato of his country, without the avarice of the Roman; for a more disinterested person never lived. Temperance and regularity in all his habits gave him general good health, and his unaffected modesty and suavity of manners endeared him to every one. He was of easy elocution, his language chaste, methodical in the arrangement of his matter, learned and logical in the use of it, and of great urbanity in debate. Not quick of apprehension, but with a little time profound in penetration, and sound in conclusion. His stature was of middle size, well formed and proportioned, and the features of his face manly, comely, and engaging. Such was George Wythe, the honor of his own and

the model of future times." Wythe was the author of *Decisions in Virginia by the High Court of Chancery* (1795); 2d ed., with *Memoir* (1852).

SAMUEL C. MITCHELL,
Professor of History, University of Richmond.

WYTHEVILLE, wĭth'vĭl, town, Virginia, Wythe County seat; altitude 2,350 feet; 65 miles southwest of Roanoke; on the Norfolk and Western Railroad. Livestock is raised in the county. The town's industries include meat packing, flour and lumber milling, and the manufacture of hosiery, shirts, underwear, and furniture. There is a public library and a number of interesting old houses. The town, settled in 1790, was named in honor of George Wythe, Virginia patriot and jurist. It was incorporated in 1839 and has the city manager form of government. Pop. (1950) 5,513.

WYTHEVILLE, Military Operations at. During the Civil War the lead mines and works near Wytheville assumed much importance. On July 13, 1863, Col. John T. Toland, with the 2d West Virginia cavalry and 34th Ohio mounted infantry, about 800 men, started from Fayetteville, W. Va., to damage the lead works and destroy the railroad near Wytheville. On the evening of the 18th Toland arrived within five miles of the town and detached two companies to destroy a railroad depot and track 10 miles west. He marched his remaining force into the town, which was defended by less than 200 men, under Major Bowyer. Most of these were distributed in houses and some in the streets supporting two guns. There was an obstinate fight in the streets, lasting an hour, when the town was taken and eight or ten of the best houses burned. The two guns and many small arms were captured and some prisoners taken, but all were abandoned when the return march was taken up next morning.

The command reached Fayetteville on the 23d after a march of about 300 miles. The expedition had failed of its object, with the loss of 78 killed, wounded and missing, of whom 17 were killed, including Colonel Toland and two other officers. Colonel Powell, commanding the 2d West Virginia cavalry, was severely wounded and captured. The Confederates reported a loss of six killed and 12 wounded.

On May 2, 1864, General Crook started from Charleston on the Kanawha to destroy the Virginia and Tennessee Railroad and join General Sigel in the Shenandoah Valley. One of his columns of 2,600 cavalry, under General Averell, was directed upon Saltville to destroy the salt works, and then rejoin the main column under Crook at Dublin Station. After a very difficult march through the mountains and some sharp skirmishing Averell reached Tazewell Court House on the afternoon of the 8th. Here he learned that Saltville was defended by earthworks and artillery, and was held in strength by Gen. W. E. Jones. Averell abandoned the idea of attack and turned toward Wytheville, near which he arrived on the afternoon of the 10th.

Here he encountered Col. John H. Morgan, who had followed him from Saltville and by a detour first gained the town with a brigade and two battalions. A detachment of Morgan's command had been pushed out to a small gap in the mountain, through which alone Averell could approach the town from the road on which he was marching. The detachment was immediately attacked and Morgan marched to its assistance with all his command, and Averell fell back to a commanding ridge 800 yards from the gap. The contest continued four hours, or until nightfall, in a succession of attacks on the one side and retreats on the other. Morgan fell back a short distance and Averell withdrew and next morning marched for Dublin, where he arrived in the evening and, resuming his march, joined Crook at Union on the 15th. Averell had 114 killed and wounded, and lost nearly 100 in prisoners. Morgan lost 50 or 60 killed and wounded.

When General Stoneman made his raid into southwestern Virginia in December 1864, he captured Wytheville on the 16th, partially burned it and next day sent a detachment to destroy the lead mines, which was done without loss. On Stoneman's second raid in southwest Virginia and western North Carolina in March 1865, Col. J. K. Miller, with 500 picked men of his cavalry brigade, captured Wytheville April 6th and destroyed the depot of supplies at that point and the bridges over Reedy Creek and at Max Meadows. At Wytheville, Miller was attacked by Confederate infantry and cavalry, but after hard fighting repulsed them, and withdrew with a loss of 35 killed, wounded and missing, and rejoined the main column on its march for Salisbury, N. C.

WYTTENBACH, vĭt'ĕn-bäĸ, **Daniel Albert,** Dutch scholar: b. Bern, Switzerland, Aug. 7, 1746; d. Osgeest, Holland, Jan. 17, 1820. He studied at Marburg, Göttingen and Leiden; became professor of Greek at the Remonstrant Gymnasium at Amsterdam in 1771, of philosophy at the Athenaeum in 1779, and succeeded in 1799 to Ruhnken's chair of rhetoric at Leiden.

His greatest work is the edition of Plutarch's *Morals,* with copious annotations, and an admirable *Greek Index to Plutarch's Works* (1795–1830). Other works are *Epistola Critica* (1769); *Praecepta Philosophiae Logicae* (1782); *Eclogaesen Selecta Principum Historicorum Capita* (1793; 1829); Plato's *Phaedo* (1825). He retired in 1816, and died after some years of blindness.

WYTTENBACH, Johanna Gallien, Dutch author: b. Hanau, c.1770; d. Leiden, April 27, 1830. Daughter of a sister of the eminent scholar D. A. Wyttenbach (q.v.), in 1816 she married her aged uncle to whom she had given 20 years of devoted service as housekeeper, secretary, and literary assistant. This unusual marriage, for which the king of Holland granted a special license, was arranged to ensure her the pension of a professor's widow. After her husband's death she lived for some years in Paris. At Marburg University's tercentenary celebration (1827) she was awarded a doctorate. Among her works are *Théagène* (1815); *Das Gastmahl der Leontis* (1821); and the novel *Alexis* (1823).

WYZEWA, Teodor de (real last name WYZEWSKI), French author of Polish origin: b. Zvanec, Russian Poland, Aug. 30, 1863; d. Paris, April 8, 1917. Brought to France as a child, in 1881 he was appointed professor of philosophy at the college of Châtellerault. With E. Dujardin he founded the *Revue Wagnérienne* (1884), and subsequently was foreign literature critic of the *Revue des Deux Mondes.* A prolific author, he also translated into French many Russian classics.

X The twenty-fourth letter of the English alphabet (see article on letter A), corresponding to the twenty-first of the Latin, from which both its position and shape are derived (the increase in number being due merely to the differentiation of *i* and *j*, and of *u*, *v*, and *w* in the English alphabet). Its name *ix* or *ex* is also of Latin origin. The combination of consonants written *x*, namely *ks*, does not exist initially in English; those words which show it are all foreign and, with hardly an exception, Greek (for example, *xylophone*). *Xavier* is a Spanish local name, and *Xerxes* simply the Greek rendering of the Persian word *ḫšāyathiya* (king). The Romans could not pronounce the Greek name (*xei*) of the letter, but substituted *ix* for it, not so much by inverting the order of the sounds in the name as by prefixing a vowel and then dropping the final vowel. The symbol appears in the Etruscan alphabet also, but only in *abecedaria* (which nevertheless have ⊞ , *samech*, in addition). Etruscan inscriptions also have *X* with the numerical value of 10, and it is possible that this use in Latin was taken over from the Etruscans, the upper part (*V*) indicating one half the amount—perhaps suggested by a rude sketch of the hand with fingers and thumb outstretched. On the other hand, the *V*-symbol (5) may have been the older, and the use of *X* for 10 inspired by the apparently doubled *V*.

In modern times in algebra *x* is used to designate an unknown quantity, and hence also in the sciences (as in *X-rays*), though the concept is far from modern. For example, in Diophantus, an Alexandrian mathematician (fl. about 350 A.D.), a symbol ς is used, which may have been of Egyptian origin, though it has been regarded as a compendium of αϱ , that is, ἀριθμός (number). Its similarity to ϛ′ *hex* (six) is, then, entirely fortuitous. As an abbreviation *X* is used sometimes in the sense of "extra"; for example, it is used for the additional (or extra) decretals of Gregory IX. It is also used for the older Christus-symbol (☧) as an abbreviation of *Christ-* in *Xmas*, and in Greek inscriptions for *chilio-*, "thousand(s)."

The use of *X* with the phonetic value *ks* is proper to the western subdivision of the ancient Greek alphabet that came to be adopted in Italy. Hence its appearance in modern western European alphabets with the same value, whereas in the Attic (eastern) Greek alphabet X (χ) has the value of an aspirated *k* (*kh* or *ch*), for which the western had 𐌚 . In Attic *x* is written Ξ (ξ), and this is represented by the variant ⊞ of the Chalcidian *abecedaria*, which is also the Palestinian ⋕ , the Moabite ⋕ , Cretan and Phoenician ⋕ , square Hebrew ס . Its name is *sāmekh*, "fish," and in the proto-Sinaitic texts a drawing of a fish has been identified with the Canaanitish ⋕ . Another view interprets *sāmekh* as "prop"(?), which is closer to the hieroglyphic ⊸ (subsequently ⋕). In any event, the Semitic value is *s*, and in early Greek inscriptions not only does Ξ appear beside I (ζ) for *sd* (or *zd*), just as in early Latin *z* means *s* or *ss*, but also κσ and χσ appear for *x*, a fact which shows that *sāmekh* was felt to be inadequate. A few early Ionic inscriptions have a symbol ⊟ or ⊡ (*h*) used in combination with *s* to signify *x*. If this had been confused with *sāmekh*, it is easy to see how the latter, used alone, might come to have the value *x*. However, evidence is lacking to prove this intermediate stage, and X (in some Greek alphabets +) has been held to be derived from ⊞ (see above); in the Messapic alphabet X or + actually has the value *s*, not *x*. It is, nevertheless, noteworthy (1) that the combination *-ks-* often becomes *-khs-* and *-hs-* (Gothic *wahsjan* has *-hs-* from an older *-ks-*; compare *ahsa* beside Latin *axis*), and this becomes *ch* or *h* (Welsh *achel*, "axis"; *chwech*, "six"); (2) that another development of the same combination is *-ss-* or *s*, as in Irish *dess* beside Latin *dexter*, "right-handed"; *mos* beside Latin *mox*, "soon," like Vulgar Latin *dester* (Italian *destro*, French *destrier*), and Provençal *eis(s)ir* from Latin *exire*. In the later Greek numerical use of alphabetic symbols ξ′ means "sixty," and this appears also in the Cyrillic Old Church Slavonic. The Greek name *xei* was modeled on *pei* (π), taken from the Semitic *pē*. In Old English runes ᛉ , later Ψ , appears instead of the older Latin *x*; its name was *eolhs*, but the meaning, "elk"(?), and derivation (perhaps from ᛉ , *z*) are dubious.

Nearly all modern English words containing the prefix *ex-* were borrowed from French, and show a curious variation of pronunciation; thus *x* is *gz* before accented vowels (as in *examine, exert*), but *ks* after accented vowels (as *execute, exit*). In Latin *x* was always *ks*, but this became *gz* in early French and the French pronunciation was borrowed into English. Subsequently the influence of the normal English pronunciation of *ex-* in Latin words influenced that of most words in which the accent was thrown back onto the first syllable, though the old pronunciation still survives beside the new in a few words (*exile, exigence*), and some have both pronunciations even before accented vowels (*exhale, exhilarate, exude*). In Old English, especially in late West Saxon, metathesis of *sx* to *cs*, written *x*, is not uncommon (e.g., *axe*, "ashes," *axian*, "ask." The final combination *-ks* is stable (*vex, wax, axe*). For bibliography see the article on the letter A.

JOSHUA WHATMOUGH.

X-RAYS, Medical Use of. With the advent of X-ray mankind gained one of the most powerful tools in the long course of medicine. For the first time it became possible to peer into the innermost recesses of the body without the aid of the surgeon's scalpel. It was possible to carry medical diagnostic methods to hitherto completely inaccessible areas of the human body by painless efficient techniques. When Prof. Wilhelm Konrad Roentgen made his epochal discovery in 1895 he realized the vast possibilities of the door he had opened and sought to advance the X-ray method right from its inception toward its present advanced status. From that late evening when he first observed the glimmer of a fluorescent screen and grasped the significance of this new illumination until he published his historic paper entitled "On a New Kind of Ray," Roentgen acted with great comprehension of what this discovery meant in the fields of medicine, research, industry, physics, and all the other areas which X-ray has so vitally affected.

From its inception the diagnostic uses of X-ray have been chiefly divided into fluoroscopic and radiographic techniques. Frequently fluoroscopic examination of portions of the human body precedes other X-ray methods and constitutes a way of examining the body in motion. It is accomplished by placing the patient between the X-ray tube and a special fluorescent screen. When the rays strike the screen they cause the particles in the screen to glow strongly enough to be well seen in a completely darkened room. When the patient is placed between the X-ray tube and the screen, the difference in density of various parts of the body casts a varying shadow on the screen, enabling the observer to distinguish between different parts of the body. This effect is further enhanced by the observer having accommodated the pupils of his eyes by wearing special goggles before going into the darkroom. In addition, various techniques are adopted to accentuate contrast in this method such as the use of radio-opaque solutions which cast a dense shadow on the screen.

One of the most frequent uses of fluoroscopy lies in the investigation of the alimentary canal or digestive system. This method was pioneered by Dr. Walter B. Cannon of Harvard University. In order, for example, to diagnose disease of the esophagus or swallowing tube the patient is given a solution to drink which is dense enough to cast a clear-cut shadow on the fluorescent screen. The opaque media usually employed here and for other parts of the digestive system is barium sulphate. The patient stands behind the screen in the darkroom holding a glass of barium sulphate and the observer takes a position in front of the screen with special controls of the X-ray unit at hand. The patient is then told to drink from the glass, and on the screen one is able to see the entire swallowing mechanism and follow the barium into the stomach. Of course if there is any disease affecting the esophagus such as inflammation, a swallowed bone, or a tumor, the drink of barium sulphate will outline the effect of the disease on the structure of the esophagus. For example if the patient had swallowed, whole, a chunk of meat which had lodged midway down the esophagus the barium sulphate would then stop at that point and indicate just where the meat was located. If it became necessary to do surgery the exact location of the obstruction would be of extreme value to the surgeon.

A similar technique is employed for investigation of the stomach. The stomach is filled with barium sulphate and outlined on the fluorescent screen. The motion and action of the stomach is clearly seen and abnormalities of function as well as structure may be identified. Examination of the large colon or intestine is also carried out with this method in which case the barium is administered as an enema from the rectum and the observer is enabled to visualize the rectum and the colon. Many persons have been saved from cancer and other catastrophic diseases by discovering the curable conditions that precede cancer in the colon, and by having them corrected in time.

Examination of the heart as a moving organ is best done under the fluoroscopic screen. Where previously doctors labored with listening and tapping aids to draw a mental picture of their patients' hearts it now became possible to see the heart in its functioning state and to watch it expand and contract. At the present time this method has become so well accepted that it is a rare heart specialist who does not have a fluoroscopic device in his office for this purpose. At the same time that the heart is examined the lungs are inspected and the movement of the diaphragm is observed.

The fluoroscopic screen has different meanings for the various specialties in medicine. The orthopedic or bone surgeon checks his fractures with it. The industrial or military surgeon uses it to locate metallic fragments caused by either industrial accident or military gunshot. The pediatrician or baby doctor looks for an inhaled candy ball or toy. The chest physician searches for early evidence of lung tumor. This partial list of present uses of fluoroscopy is always being expanded.

Radiographic techniques for the purpose of obtaining a picture of some part of the interior of the body are a standard of medical practice all over the world. These methods differ from fluoroscopy in that a still picture is obtained with no projection of the motion of the part X-rayed except by taking enough separate films to simulate a cycle of motion. These stills, however, play a most important role in medical diagnosis and generally show a finer detail throughout than is possible to obtain on the fluoroscopic screen.

The enumeration of all the various aspects of taking X-ray films would be far too lengthy for our purposes. Suffice it to say that there is no part of the body which is exempt from the probing of the X-ray eye and that medical diagnosis has become markedly dependent upon X-ray findings; so much so that a complete medical specialty has grown up around Roentgen's discovery and doctors devote years to training in the various aspects of X-ray or radiology, as it is more properly designated.

The uses of special substances to show organs in the body reach into many branches of medicine. The kidney specialist may wish to investigate the location and effect of a kidney stone. There is available to him several medications which, when injected intravenously, will opacify the internal kidney structures as well as the tubes leading to the urinary bladder and the bladder itself. X-rays taken at this time show these structures in considerable detail enabling the doctor to locate the site of disease. In some cases he will inject the contrast media through

an instrument inserted from below into the bladder.

The gall bladder is a relatively frequent offender and a contrast medium has been perfected which, when taken by mouth, will render the gall bladder dense enough to be seen on an X-ray film. In this way gall bladder function and the possibility of stones are determined. Even after the gall bladder is removed there are ways of studying the remaining bile passages with contrast media and X-ray films.

The problem of sterility or inability to bear children has come under X-ray observation. The specialist may inject opaque material which will render the female reproductive tract opaque and demonstrate the structures on X-ray film. In this way the exact cause of sterility may be found and its correction attempted.

X-ray studies have been of great assistance to the neurologist and neuro-surgeon. Plain films of the skull and spine may point the way to the diagnosis. Specialized techniques are also available. For example in the diagnosis of spinal column disease one may inject an opaque solution and watch its passage up and down the spinal canal with the fluoroscope. One may also inject air for special brain studies, especially to diagnose and locate brain tumors.

Preventive medicine has vastly benefited by the employment of X-ray. We are all familiar with chest surveys for the early diagnosis of tuberculosis with its result on decreased time of treatment and diminished risk to contacts. This screening technique has been applied in government, industry, armed services, and community life.

In more recent years there have been many advances made in refining techniques for the purpose of early diagnosis, especially in the heart and cancer fields. Keeping pace with the newer methods of heart surgery there have been ways developed of showing the inner structures of the heart. This is of particular importance in children born with defective hearts who had previously been condemned to ever-constricting activity and ultimate death. These cases include the so-called blue babies with a faulty circulation of the blood giving them a bluish cast. Diagnostic methods now make possible an early diagnosis of just where the heart defect may be and enable the surgeon to bring to bear his new surgical techniques.

Another development of note enables the radiologist to take films at designated levels in the body in an attempt to show more precisely the site of disease. This technique is known as laminography and is particularly important in the chest where tuberculous cavities must be located precisely for the chest surgeon.

The X-ray apparatus is undergoing constant change and there is a steady flow of specialized accessories designed to facilitate more modern procedures. Perhaps the most promising at present is an electronic device which greatly enhances the fluoroscopic image.

X-rays are also employed as a method of treatment and have a wide application ranging from the acne or pimples of the adolescent to the widely prevalent bursitis or shoulder pain and the treatment of deep seated cancers in remote areas of the body.

The hazards of X-rays are being re-emphasized in this age of atomic radiations. Improper use may result in damage being done to all personnel concerned and the history of radiology is replete with its martyrs. At present, in the hands of trained radiologists, X-ray radiations are safely controlled.

Few discoveries have had as far-reaching effects and universal application as that of Professor Roentgen. His X-rays are employed all over the world and have made an immeasurable contribution to the early diagnosis, control and treatment of disease. It is equally true that the full possibilities of the X-ray method are not yet understood and that we may anticipate increasing usefulness of this tool in the future.

ALAN R. BLEICH, M.D.,
Assistant Clinical Professor of Radiology, New York Medical College.

X-RAYS, Physical Nature of. X-rays or Roentgen rays were discovered by a professor of physics, Wilhelm Konrad Roentgen, on Nov. 8, 1895, at the Royal University of Würzburg in the German town of that name. Roentgen was experimenting with a primitive vacuum tube, then known variously as a Hittorf, a Crookes or a Lenard tube, which was essentially a pear-shaped glass bulb provided with two metallic electrical-conducting terminals, called a cathode and an anode, hermetically sealed through the walls of the bulb. The cathode inside the bulb usually took the form of a small concave metal disc on the inner end of a metal stem passing through the neck of the pear-shaped bulb in a way not unlike the actual stem in the fruit. The other terminal, the anode, was usually sealed through the glass on one side of the pear at a point where a small teat-shaped projection for this purpose was blown into the glass wall.

The air pressure in such a bulb was reduced to the order of one millionth of normal atmospheric pressure by means of a vacuum pump. If the terminals of the tube were then connected to a source of high-voltage electrical current, the cathode being connected to the negative terminal, the glass walls of the tube, particularly at the opposite end of the bulb from the cathode, would be seen in the dark to emit an "apple green" fluorescent glow.

W. K. Roentgen's Experiments.—Roentgen was experimenting with such a tube completely enclosed in an opaque black cardboard box when he happened to notice that a fluorescent screen lying on the bench nearby and consisting of a piece of paper coated with the chemical substance barium platino-cyanide, emitted light when and only when the tube inside the cardboard box was being supplied with the high-voltage electrical current.

After interposing various objects between the tube and the fluorescent screen, he concluded that its fluorescence must be produced by an invisible radiation traveling in straight paths from the tube to the screen. He showed that shadows could be cast in the fluorescent illumination of the screen by many objects, particularly heavy metals such as lead, which clearly absorbed the invisible rays much more completely than some lighter substances such as wood, cardboard, paper, or aluminum. He reported that "behind a bound book of about one thousand pages I saw the fluorescent screen light up brightly, the printer's ink offering scarcely a noticeable hindrance." The bones in his own hand cast shadows on the screen while the rays passed easily through the flesh. In the short space of scarcely more

than two weeks, with very rudimentary equipment and with astonishing ingenuity, Roentgen performed a series of brilliant experiments which established, in broad outline at least, a large fraction of all the basic qualitative phenomena connected with X-rays.

Scientific Importance of X-Rays.—News of the discovery spread through the world like wildfire, and applications were made almost immediately, especially in the realm of medical diagnosis. In retrospect it is clear, however, that the discovery had far greater significance in the realm of physical research than in any of these immediate applications. It marked the opening of the era of what came to be loosely called "modern physics," a period during which man's understanding, control, and use of the submicroscopic features of the world of nature—molecules, atoms, electrons, nuclei and their constituents—were developed to an astonishing degree. In this development of our physical knowledge of the world through research, the rays discovered by Roentgen have played one of the central roles.

"Cathode rays," which are rapidly moving electrons, were already known to be produced in vacuum tubes such as Roentgen used, and in fact in Lenard's form of the tube a sufficiently thin window was provided to allow the cathode rays to stream out into the air. But Roentgen established that X-rays were also generated on the inner surfaces of the glass walls of the Hittorf or Crookes vacuum tube wherever these surfaces were bombarded with the cathode rays, the stream of rapidly moving electrons.

Provisionally we may conceive an electron as a small particle with a single unit of negative electrical charge ($e = 4.803 \times 10^{-10}$ absolute electrostatic units) and with a mass of 9.1×10^{-28} grams. Electrons exist in huge numbers in all forms of matter. Swarms of them form the outer cloaks surrounding the nuclei of all atoms, where their characteristic motions, configurations, and energies of attachment account for most of the characteristic chemical and physical properties possessed by the approximately 92 well-known stable elements of chemistry.

The electrons which bombarded the walls of Roentgen's tube are not to be confused with the X-rays which they produced at their point of impact. The electrons came chiefly from the cathode terminal of the Crookes tube. Most of the electrical energy supplied from the high-voltage generator to the terminals of the tube resulted in imparting high velocities (kinetic energy) to these electrons, and this energy was chiefly released as heat to the glass walls wherever they received the electron bombardment. Such heat could and frequently did melt the glass envelope. (Only a fraction of one per cent of the energy input is converted into X-rays ordinarily.)

The source of supply of electrons in the earliest tubes was maintained by literally splashing them out of the cathode through bombardment of the latter by positive ions created in the residual gas of the tube by the electrical discharge itself. The operation of such "gas filled" tubes was, in consequence, quite sensitive to small changes in the low residual gas pressure and therefore undesirably erratic.

The X-ray tube in consequence passed through an evolution. At an early stage a refractory metal "target" was provided inside the vacuum envelope. The bulk of the cathode rays could strike against the surface of this target in a small, rather concentrated "focal spot" which had various provisions to remove the heat generated there by the bombardment. This focal spot then became the source from which the X-rays came. At another stage William David Coolidge found a way to dispense with the gas as a means of obtaining electrons from the cathode and provide a "pure electron discharge" supplied by a "thermally emitting" cathode filament kept hot by a source of electrical current.

X-Ray Spectra.—When the rapidly moving electrons are suddenly stopped by the metal target, the impact produces a mixture of X-rays of two distinct categories: (1) a line spectrum of X-rays characteristic of the material of which the target is composed, superposed upon (2) a continuous spectrum of X-rays in which all wavelengths or frequencies are present. The latter range from wavelengths so long that they are absorbed completely in the glass walls or the exit window of the tube, to wavelengths having a well-defined upper limiting frequency (and lower limiting wavelength) beyond which there are no X-rays whatever at shorter wavelengths or higher frequencies. This upper frequency limit is called the "quantum limit of the continuous X-ray spectrum."

As the preceding statements imply, X-rays exhibit all the characteristics of a transverse undulatory electromagnetic wave phenomenon and indeed constitute a region of the general spectrum of electromagnetic radiations to which also belong the regions of radio waves, infrared radiation, visible light, ultraviolet light, and nuclear gamma rays. These various regions merge indistinguishably into one another, differing only in regard to one quality which may, however, be described in several different ways, as the wavelength, λ, the frequency, ν, or the quantum energy, $h\nu$, of the radiation; for it has been found that whenever radiation interacts with matter it always does so in discrete amounts or bundles of energy called quanta. In all phenomena of wave propagation the product of the frequency, ν, by the wavelength, λ, gives the phase velocity of the radiation. The phase velocity of all electromagnetic radiation in free space (vacuum) is $c =$ 299,792 kilometers per second. The quantum energy of the radiation is proportional to the frequency, and the ratio between quantum energy and frequency is Max Planck's famous universal constant, h. The convenient conversion rule follows from this that if we divide the constant number, $12{,}398 \times 10^{-8}$ by either one of the following two quantities, (1) quantum energy expressed in electron-volts * or (2) wavelength, λ, expressed in centimeters, we obtain the other of these two quantities.

It soon became apparent that the continuous spectrum from X-ray tubes running under higher applied voltages exhibited superior power of penetrating material screens. Such penetrating X-rays were called in the beginning "hard X-rays." Less penetrating radiation was said to be "softer." These names have been retained in use, but it later came to be understood that "hard" radiation is more penetrating because it is shorter in wavelength (or higher in frequency

* A convenient unit of energy in physics is the electron-volt. This is the energy acquired by an electron when it is accelerated through a potential difference of one volt. It is equivalent to 1.6021×10^{-12} ergs or 1.6021×10^{-19} watt-seconds.

or in quantum energy). It has been found that save for certain important abrupt deviations (called "absorption discontinuities"), each atom of a given atomic number Z (a term we shall presently explain) absorbs X-rays to an extent approximately as the cube of the wavelength and as the fourth power of the atomic number.

Generation of the Continuous Spectrum.—To form a clearer picture of how the continuous X-ray spectrum is generated in the target, let us imagine the structure of this metal target on a scale of linear dimensions ten billion times natural size. Each atom would then be about the size of a moderately large room and the nucleus of the atom in the middle of that room would be about the size of a pinhead. In spite of its relatively tiny size, almost the entire mass ("weight") of the atom is nevertheless concentrated in the nucleus. With the increase in size we have envisioned, if our pinhead had the same matter density as actual nuclei possess, it would have the fantastic mass of two tons, even if it were the lightest of all nuclei (a proton). If it were a tungsten atom (tungsten is a refractory heavy metal very frequently used for X-ray tube targets), the pinhead nucleus would weigh about 370 tons.

The rest of the atom, the great bulk of the space in our room, would be occupied only by the atomic electrons. For each tungsten atom there would be seventy-four of these electrons, which we might picture as darting rapidly about in the room with terrific velocity like a cloud of extremely agile gnats or other insects, so that all parts of the room would be continuously explored by them with great rapidity.

We must be careful not to push the analogy too far. Although the electrons, like the gnats, have little mass compared to the nucleus, unlike the gnats they are bound to the nucleus by, and they repel each other with, gigantic forces. They also have other far less familiar wavelike properties which profoundly affect and condition the behavior of a given electron in terms of the behaviors of neighboring electrons. Thus, although most of the (370 tons) mass of our tungsten atom is in the little pinhead nucleus and the rest of the room (atom) is in a sense almost empty space, that space is highly forbidden ground for encroachment by the similar parts of any neighboring tungsten atoms.

One of the important duties which the electrons accomplish in their ceaseless flying about is, through their force fields, to insure the rigidity of the three-dimensional atomic lattice work which constitutes the structure of any solid (in our present case, tungsten). Fast electrons accelerated by X-ray tube voltages of tens or hundreds of kilovolts can, however, be driven at high speed through such a structure although the energy transferred from the fast electron to the atomic electrons is very high (of the order of one to ten million electron volts per centimeter of its path).

We may picture one of these fast electrons from the X-ray tube cathode driven into the heart of the tungsten target by the high voltage with which it has been impelled against it and weaving its way through the cloud of electronic gnats. At the center of each atom (our "room") through which this dashing visitor passes is the tiny pinhead 370-ton nucleus which (in the case of tungsten) has a positive charge some 74 times as great as an electron and of course of opposite sign. If the fast electron passes this positively charged nucleus at some distance from it, there will be so many negatively charged electrons between the two as to "shield" the fast electron very considerably from the strong attraction of the nucleus; but occasionally, by chance, the fast electron may pass close enough to the nucleus to be very strongly deflected by its attraction. When such an event occurs, the impulsive kick or acceleration which the fast electron experiences will cause some (perhaps a substantial fraction) of its kinetic energy to be converted into a quantum of electromagnetic radiation in accord with principles, familiar to the radio engineer, according to which any charged body which experiences an acceleration can be expected to emit electromagnetic radiation.

In the case of a "head-on" collision between a fast electron from the X-ray tube cathode and a tungsten nucleus, the maximum possible energy available to be converted into a "photon" of radiation is the entire kinetic energy of the bombarding electron; an energy which, if expressed in electron volts, is essentially equal numerically to the voltage applied to the terminals of the X-ray tube. The photons of radiation which constitute that part of the continuous spectrum of X-rays which appears at its quantum limit (the highest frequency, or shortest wavelength of the spectrum) are formed by such head-on collisions with nuclei at the very surface of the target. In these collisions the entire kinetic energy of the fast electron, before it has had an opportunity to be dissipated in any other way, is converted completely in a single elementary process into a quantum of radiation. Between this most favorable (but rare) case of 100 per cent conversion of electron kinetic energy into a quantum of X-radiation and the cases of more distant interactions between electrons and nuclei in which only a small fraction of the kinetic energy is so converted, all gradations are possible. This explains the presence of an entire continuum of wavelengths, frequencies, or quantum energies in the continuous X-ray spectrum.

The line spectrum, which is also emitted by X-ray tubes, is found to consist of several series of distinct, well-defined lines whose wavelengths, frequencies, or quantum energies depend on the particular atoms of which the target is made. They are in fact the characteristic response made by the electron "gnats" surrounding the atoms of the target to the disturbance created among them by the passage of the bombarding cathode-ray electrons.

Laue Spots.—An advance of tremendous importance was made in 1912 when at the suggestion of Professor Max von Laue in Munich the two physicists W. Friedrich and P. Knipping tried directing a fine pencil of X-rays at a crystal of zinc blende (zinc sulphide). They found that the X-rays were "reflected" in a large number of well-defined directions by the crystal so as to form a regular pattern of spots (now known as Laue spots) on a photographic emulsion placed in the vicinity. It rapidly became evident that a similar phenomenon could be expected for any crystal, the pattern of spots being closely related to the atomic lattice-work structure of the crystal. The analytically correct but somewhat intricate explanation of these spots given by von Laue became much easier to understand intuitively after the work of William Henry and William Lawrence Bragg (father and son) in England in the following year.

To understand this we need to explain briefly what has been revealed, chiefly by studies with X-rays, about the so-called atomic lattice structure of crystals. It is found that the atoms in a crystal arrange themselves in three-dimensional lattice-work patterns of which one of the simplest, the only one we shall attempt to describe, is that of rock salt (consisting of sodium and chlorine atoms in equal numbers). We picture a plane surface dotted with sodium and chlorine atoms in an alternate square array such as one would obtain if the center of each black square of a checkerboard were occupied by a sodium atom and the center of each white square by a chlorine atom. Next we picture a three-dimensional array consisting of such checkerboards piled upon each other in layers so adjusted that each sodium atom has a chlorine atom just above and below it and each chlorine a sodium just above and below it. In the case of sodium chloride the vertical separation between adjacent layers is the same as the horizontal separation between adjacent atoms in each square array. (In the actual crystal the atoms support each other in this rigid array through the force fields set up by their respective electronic structures, and there is of course no question of tangible surfaces or checkerboards other than as a help to the imagination of the reader.)

Anyone who has looked from a railway train at a grape vineyard or an orchard of fruit trees laid out in regular square array will recall how the vines or trees not only align themselves in two mutually rectangular directions but also form straight rows in a great number of other directions as well. With a little imagination it will be easy to see that, in the three-dimensional atomic crystal lattices, there will in a similar way be a great number of differently directed plane surfaces which can be passed through the lattice work in uniformly and densely studded patterns of atoms; and that, for every plane so tilted, there will in fact be an infinite number of other planes parallel to the one in question for which the same will be true. Each such set of parallel planes will constitute a layered array in which all adjacent pairs of planes have the same common interplanar spacing, although the spacing may be different for differently tilted arrays.

In Laue, Friedrich, and Knipping's experiment, each of these differently titled arrays of planes accounted for each of the differently directed Laue spot reflections of the primary beam. It is important, however, to understand that not any X-ray wavelength would be so reflected if it fell at an arbitrary angle upon a set of planes of arbitrary spacing. The reflection is strong only when a certain condition obtains between the wavelength, λ, the angle of glancing incidence on the planes, θ, and the interplanar spacing, d, known as the Bragg condition, namely $n\lambda = 2d\sin\theta$ where n is a small whole number, the "order" of the reflection. This Bragg condition is the analytical statement of the requirement that the X-ray wavelets emitted from a specified distant source point, after reflection by the planes (as though each were a mirror), must recombine at another distant observation point in exact phase coincidence. This occurs because the path traversed by an X-ray wavelet reflected by any one plane differs from that of a wavelet reflected by a neighboring plane by exactly a whole number of X-ray wavelengths. Any wavelength, λ, incident on a specified array of planes of spacing, d, at a specified angle, θ, for which the above Bragg condition is not fulfilled, will pass on into (and perhaps through) the crystal until it has been absorbed, but it will not be appreciably reflected. What we have described, therefore, is frequently referred to as "selective reflection." It is easy to see how this principle can be used to analyze the radiation from an X-ray tube into its component wavelengths by studying the X-ray intensities selectively reflected from systems of crystal planes at different reflection angles.

Moseley's Atomic Numbers.—The next important step followed rapidly when in 1914 Henry Gwyn-Jeffreys Moseley, in two classic papers applying the principle of selective crystal reflection, presented a systematic study of the characteristic line spectra emitted by targets of various metals when "excited" by cathode-ray bombardment in an X-ray tube of special construction which permitted rapid and convenient substitution of several different target materials. He found that, unlike optical spectra, the characteristic X-ray spectra of atoms are relatively simple, consisting, for a given target element, of widely spaced groups of but a few lines. The groups were recognizable in all the elements examined by Moseley (some seventeen elements in his first work). The simple pattern of lines was very much the same in each spectral group over this wide range of elements, save for the actual wavelength position in the spectrum at which a given line occurred; and it was of extreme significance that as Moseley passed from element to element in the "periodic table" of increasing atomic weights, the wavelength of a given line in the pattern, as observed successively in the spectrum of each element, varied in a regular and quite uniform way with only one or two exceptions when plotted as a function of the ordinal number of the element in the series.

Furthermore, Moseley found that, even in the few exceptional cases, a completely uniform behavior of line wavelength as a function of ordinal number could be obtained by exchanging the order of one or two adjacent pairs of elements from the original order of increasing atomic weight. Moseley showed that if ordinal numbers, Z (since come to be called the "atomic numbers") are assigned to the elements as follows H-1, He-2, Li-3, Be-4, B-5, C-6, N-7, O-8, F-9, Ne-10, Na-11, Mg-12, Al-13, Si-14, P-15, S-16, Cl-17, A-18, K-19, Ca-20, and so on to Zn-30, then the square root of the frequency of a given X-ray line in any element is a linear function of the atomic number (nearly proportional to it in fact). Although Moseley's assignment of atomic numbers required in some cases reversal of the generally prevalent order of increasing atomic weights, it turned out to be actually of much more fundamental significance than the weight; it represents the number of positive unit charges possessed by the nucleus of each atom and therefore is an index of the number of electrons that nucleus can bind to itself in its outer cloak.

Only the year before, in 1913, Niels Bohr had proposed a quantitative model of the hydrogen atom based in part on a general earlier proposal of Lord Ernest Rutherford, who conceived the atom (correctly) as a heavy positively charged nucleus surrounded by a swarm of electrons equal in number and in charge (but of opposite, that is negative, sign) to the nuclear charge. It seemed

a safe guess at the time that the swarm of electrons must be in rapid motion because of a mathematical theorem due to Earnshaw which gave convincing proof that no system of point charges could ever be in static equilibrium under the action of their own fields. On the other hand, according to the electromagnetic theory of radiation propounded by James Clerk Maxwell, any such system of moving charges must radiate electromagnetic waves and hence must lose energy. As a result, the cloud of electrons would be expected to "fall" inward closer and closer to the nucleus, and it became difficult to see what would place the final limitation upon this catastrophic shrinkage unless some new principle of stability were injected into the picture. Bohr conceived the electrons as executing orbits about the central nucleus, but added the revolutionary new concept that out of the infinitude of classically possible orbits and energies that such electrons could possess, only certain orbits possessing well-defined energies had the special property of not dissipating their energy into radiation.

According to Bohr's proposal, spectral lines were emitted when and only when the electronic orbits executed a transition from one of these nonradiating states to another such state of lower energy, the frequency emitted being given by the energy set free in the transition divided by Planck's quantum of action, h. Bohr's theory, which has turned out to be one of the major steps of progress in the quantum theory (originated by Max Planck), predicted a formula for the wavelengths of the lines to be expected from atoms of atomic number, Z, and this formula successfully explained the wavelengths of the lines observed in the spectrum of hydrogen, the simplest of all atoms. Bohr's theory had indeed been constructed precisely for the purpose of explaining these hydrogen lines.

It was a matter of great significance, however, when Moseley showed that Bohr's formula also succeeded in predicting with quantitative success the wavelength of the K X-ray lines in the entire series from aluminum ($Z = 13$) to Zn ($Z = 30$) which he had just measured. This was the first strong evidence of any family relationship between the atoms of chemistry, and it was an important opening wedge in the conquest of our understanding of the atomic world.

Compton Effect.—The next extremely important fundamental contribution which came from the field of X-ray research was made by Arthur Holly Compton in 1923. It had already been observed by Joseph Alexander Gray (1920) that short wavelength X-radiation, after scattering from carbon and other low atomic number atoms, was somewhat more absorbable than the primary radiation, but still of a "hardness" so clearly related to the primary radiation as to exclude its being a characteristic fluorescent radiation from the scatterer. Compton gave the following daring explanation of this effect. He supposed the bundles of radiation energy, $h\gamma$, instead of being associated with spreading waves, to be propagated through space from the source in the form of projectiles. When one of these projectiles (or "photons"), each with momentum $h\gamma/c$, was scattered by a loosely bound electron in some low atomic number scattering material such as carbon, the electron would recoil under the impact, the more so the larger the angle of scattering and the higher the quantum energy (and hence the momentum) of the projectile. The kinetic energy thus given to the electron at the expense of the photon explained the "softening" of the scattered radiation in a completely and quantitatively correct way. Using characteristic line radiation from a molybdenum target tube, Compton showed that in the spectrum of the scattered radiation there appeared lines each of which was shifted toward longer wavelengths than its corresponding line in the primary radiation by an amount in complete accord with his theoretical explanation. The recoil electrons were also detected and shown by Compton and Simon to have the requisite speeds and directions of recoil. Even more than this was ascertained, for Jesse W. M. DuMond and Harry A. Kirkpatrick succeeded in showing that the shifted line above referred to was notably broader than the unshifted line and this was satisfactorily explained by them (with complete quantitative verification in all respects), to be due to the randomly directed velocities possessed initially by the atomic electrons which were the agents that scattered the photons. The presumptively dynamic character of the electronic clouds in atoms both for gases and for solid metallic bodies was thus experimentally verified.

De Broglie's Wave Theory.—In the same year (1923) Louis Victor de Broglie made a very bold suggestion regarding electrons, namely that besides their aspect as particles they might also possess undulatory properties. He came to the conclusion that a stationary electron, which Albert Einstein had predicted must possess a "rest energy" m_0c^2, must therefore have associated with it a frequency m_0c^2/h. He concluded further that a moving electron would behave in many respects like a train or small bundle of plane waves of wavelength, h/p, where p was its kinetic momentum. Both Einstein's and de Broglie's superlative insights were regarded as fantasies at first. The energy m_0c^2 has since then become only too familiar as a commonplace closely associated with its military application in atomic bombs. De Broglie's electron waves were actually verified, with quantitative corroboration of his formula, four years later by Clinton Joseph Davisson and Lester Halbert Germer, who showed that electrons were selectively reflected from a monocrystal of nickel in just the same manner as we have explained above for the reflection of X-rays. Erwin Schrödinger had, almost immediately, seized upon de Broglie's idea of the electron as a "matter wave" and with rare skill and insight had refined it in the form of a differential equation which in a sense fused the wave-like properties with the character of the electron as a mass particle obeying the laws of mechanics. From this point of view the stationary states of the electrons in atoms, which Bohr had been obliged to postulate *ad hoc*, appeared as permanent modes of vibration (standing waves) of a complex quantity, Ψ, the probability amplitude with distinct improvements and clarifications of several puzzling difficulties that had afflicted the simpler Bohr theory. In 1927 Schrödinger proposed an alternate theory of the Compton effect based entirely on the wave picture of both electrons and photons, in which the initial and final states of the initially free recoiling electron interfere with each other to form a space grating of standing matter waves which reflect undulatory X-radiation like the atomic layers in a crystal. The change in wavelength in this picture of the modified scattering process is to be

ascribed to a Doppler effect caused by the velocity of recoil of the reflecting space grating. No basis for preferring either Compton's or Schrödinger's viewpoint can be found, and indeed we have here one of the striking examples of the famous "wave-particle duality" which, thanks to the work of Schrödinger, Werner Heisenberg, Bohr, and others is now recognized to be a common property of all forms of energy, be it matter or radiation.

The discovery of the Compton effect with its two complementary interpretations, together with the quantum theory of optical and X-ray spectra and the wave-like properties of electrons, led directly to Heisenberg's famous "principle of indetermination" and to Bohr's principles of "complementarity" and "renunciation," a discussion of which is outside the scope of this article. These important ideas form the groundwork of quantum theory upon which repose most of the advances made in theoretical atomic and nuclear physics during the first half of the 20th century by Nils Bohr, Erwin Schrödinger, Werner Heisenberg, Arnold Sommerfeld, Wolfgang Pauli, Paul Adrien Maurice Dirac, Enrico Fermi, and many others. The insight thus gained into the weird subatomic world has obliged us to revise completely our intuitive notions of space, time, and causality, and has certainly brought about one of the most drastic and deep-rooted revolutions in human thinking that have occurred in the entire history of the race. See also ATOMIC THEORY; ELECTRON THEORY; QUANTUM THEORY.

X-RAYS APPLIED. X-rays have become a most important tool for the analysis and study of matter in the solid state. X-ray powder diffraction is a unique technique for the identification of crystalline substances and has been applied to a large variety of analyses with spectacular results. It is also used to reveal other characteristics, such as crystallite size, orientation, and strain. X-ray fluorescence spectroscopy has now been developed into a practical tool for qualitative and quantitative analysis of substances, whether crystalline or amorphous, solid or liquid. Two important advantages of these X-ray methods are that they are nondestructive and that the results can be obtained in a fraction of the time required for routine chemical analysis. Commercially available X-ray equipment for analytical purposes has been developed to the point where X-rays are obtained with the mere flick of a switch; and related apparatus for recording the X-ray pattern has been improved to a degree which permits far greater precision and convenience than was formerly possible. A few simple, easy-to-follow precautions are necessary for the safe use of the equipment.

The methods of single-crystal structure analysis are given in the article on CRYSTALLOGRAPHY, which should be read in conjunction with this article.

X-ray Diffraction.—X-rays, like visible light, have the properties of electromagnetic radiation but have much shorter wavelengths. The spectrum produced by an X-ray tube consists of a few intense lines superimposed upon a broad continuous ("white") band of wavelengths, as shown in Fig. 1. The wavelengths of the lines are determined solely by the atomic number of the element composing the target of the X-ray tube. Each element produces a few characteristic lines. Wavelengths decrease as the atomic numbers of the elements increase. The intense Kα lines (actually composed of two lines with nearly the same wavelengths)* are used for diffraction. The Kα lines from a copper target have an average wavelength of 1.54 Å (Å $= 10^{-8}$ cm.). The Kβ line, 1.39 Å, may be selectively removed by a filter of thin nickel foil (see Fig. 1). For a molybdenum target, Kα = 0.71 Å, while Kβ = 0.63 Å, and the latter may be removed by a zirconium foil.

The atoms in crystalline substances are arranged in a symmetrical, repeating three-dimensional pattern, and the distances between planes of atoms are of the magnitude of X-ray wavelengths. Hence, crystals act as three-dimensional gratings for X-rays in a manner analogous to the diffraction of ultraviolet or visible light by a ruled one-dimensional grating. Under appropriate conditions the electrons associated with each atom

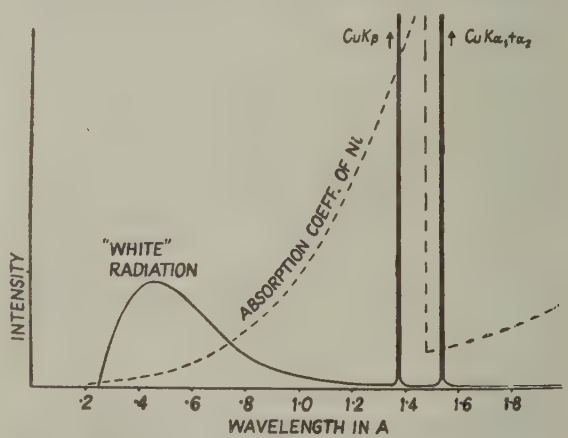

Fig. 1. Spectrum from copper target X-ray tube operated at 50,000 volts. (From C. W. Bunn, *Chemical Crystallography,* Clarendon Press, Oxford 1945.)

scatter the incident X-ray beam in a coherent manner, so that in certain specific directions the scattering from millions of atoms will be in phase at the same time. William Lawrence Bragg reduced this complex phenomenon to the simple equation

$$n\lambda = 2d \sin \theta \qquad (1)$$

where n is a small integer giving the order of reflection analogous to the ruled grating; λ, the wavelength of incident X-rays; d, the distance between planes of atoms; and θ, the angle between the incident X-ray beam and the atomic planes. There is only one θ angle at which the reflected rays are in phase for a given value of d and λ.* At other angular positions of the crystal there is destructive interference and no reflections occur.

Consider, for example, the case of reflection of CuKα X-rays, λ = 1.54 Å, from one set of atomic planes of a flat, single-crystal plate of quartz in which $d = 3.34$ Å. When this set of planes makes an angle of 13.3° (θ) with the incident X-rays, a reflection occurs at an angle of 26.6° (2θ) with respect to the incident beam. A second-order reflection, $n = 2$, occurs at $2\theta = 54.9°$

* The diffraction phenomena may be visualized as reflections, and this term is frequently used in this article.

X-ray powder photographs (top to bottom): aluminum with unfiltered Cu radiation; quartz with nickel filtered copper radiation; quartz with nickel filter on bottom of film; lead nitrate (compare with diffractometer chart), brass wire, montmorillonite—a clay mineral; natural chrysotile asbestos fibers.

X-ray powder photographs (top to bottom): tungsten wire showing preferred orientation; tungsten wire coated with rhenium and fired; same but unfired showing amorphous pattern.

There are no other reflections between these two angles. A crystal oriented for reflection from another set of atomic planes, say $d = 4.25$ Å, will cause the first-order reflection of CuKα X-rays at 20.9° (2θ). If a polychromatic X-ray beam is used, then each d-spacing will reflect each wavelength at different angles and the pattern will become very complicated. Hence monochromatic X-rays are generally used for diffraction.

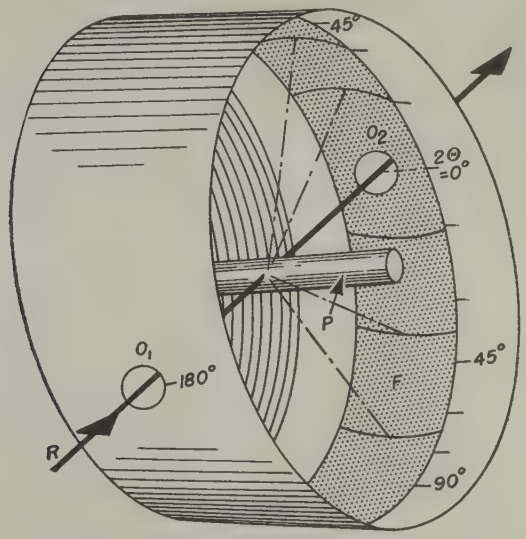

Fig. 2. Principle of the powder camera.

If the crystal is crushed to form a fine-grained powder, there will be many crystallites with the correct θ orientation for each of the d-spacings, and consequently all possible reflections from the various sets of atomic planes can occur simultaneously. This is the so-called powder method, the most widely used of all X-ray techniques. A small amount of powder may be glued onto a thin (0.005″ to 0.010″ diameter) glass fiber which is rotated continuously in the X-ray beam. The probability of having crystallites in all possible orientations is large. The recording instrument used, called a powder camera, is shown schematically in Fig. 2, and consists of a light-tight cylindrical chamber for mounting the film concentric with the axis of the specimen, and a collimator tube to give a fine pencil-like beam of X-rays. Each crystallite may produce a reflection which will appear as a spot on the processed film. For any given value of d there will be a large number of crystallites in various orientations, each producing its own spot. The reflected rays will form the surface of a cone, with its apex at the specimen and subtending the angle 4θ. Each d-spacing produces a separate concentric cone, and these appear on the film as a series of arcs whose curvature depends upon the particular reflection angle. The d-spacings are determined by measuring the linear distances on the film from the direct beam to each of the arc lines, converting these quantities into angular values (2θ), and substituting in the Bragg equation, since λ is known. The intensities of the lines will vary over wide limits. Usually each substance has a few strong lines and a number of weaker lines. The exposure times for the accompanying powder photographs range from one to four hours.

Powder patterns can be automatically recorded with high precision and resolution with the X-ray diffractometer, shown schematically in Fig. 3. The specimen is prepared in the form of a flat surface about 10 x 20 millimeters. The divergent primary beam of X-rays converges after reflection from the specimen, passes through a narrow slit, and enters the X-ray detector. The detector is driven at twice the speed of the specimen, so that the specimen surface is always at θ when the detector is at 2θ. The detector is coupled by means of electronic circuits to a strip chart recorder which plots the pattern, line by line. This technique is made possible by the use of highly sensitive X-ray detectors of the type shown in Fig. 4. An advantage of these detectors

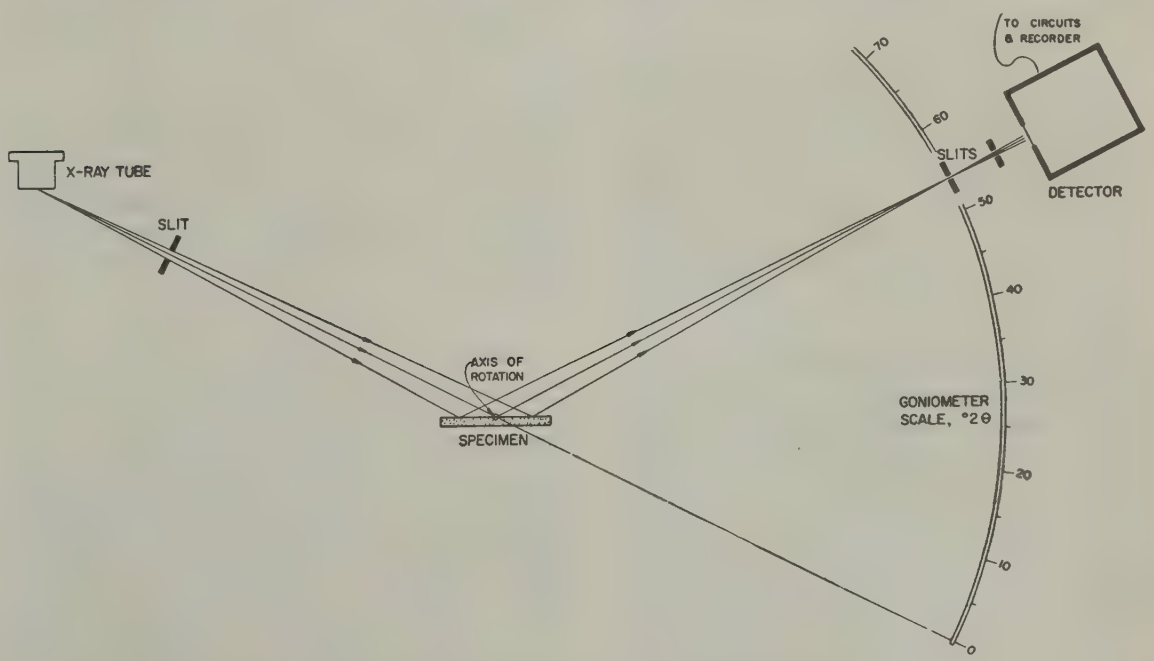

Fig. 3. Principle of the X-ray diffractometer.

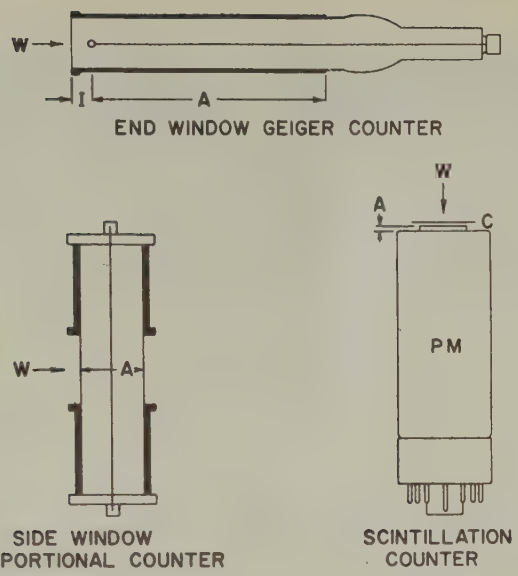

Fig. 4. X-ray detectors. W indicates direction of X-ray beam and window of counter; A, the path in which the X-rays are absorbed; I, inactive path; C is the scintillation crystal; and PM the photomultiplier tube.

is that the X-ray reflections can be measured instantly and quantitatively.

Identification of Crystalline Solids.—One of the most useful and important applications of the X-ray powder-diffraction method is in the identification of solid crystalline substances. The basis of the method is the fact that each substance gives a characteristic X-ray pattern, and no two chemically distinct substances give identical patterns. The positions of the lines and their relative intensities do not vary for a given set of experimental conditions. Hence, if the unknown substance gives the same X-ray pattern as a known substance, the identification is complete. The powder pattern establishes the identity of a substance with the same certainty that fingerprints identify a person. The method is rapid and inexpensive (aside from the initial cost of the equipment), and it requires only a small amount of the sample. The pattern results from the crystal structure (arrangement of the atoms) rather than from the constituent elements of the substance, and if the specimen contains a mixture of several crystalline substances, each produces its own characteristic pattern. The X-ray analysis is made on the substance in its original solid form and is nondestructive with respect to the sample, whereas in chemical or optical spectrographic analysis the substance is dissolved, vaporized, or altered in some manner to determine the constituent elements.

Identification of unknown substances is made by comparing the pattern of the unknown sample with that of a known substance. A file of reference substances is necessary. For this purpose the American Society for Testing Materials, Philadelphia, Pa., publishes a catalogue of X-ray data obtained from the literature. The file now contains data on many thousands of substances including minerals, metals and alloys, inorganic and organic compounds, and is continually being expanded. The data cards are arranged according to the *d*-spacings of the three most intense lines of the pattern to facilitate identification.

An X-ray analysis of a mixture of the ore minerals chalcopyrite ($CuFeS_2$), bornite (Cu_5FeS_4), and pyrite (FeS_2) would identify each of the three minerals, and their relative amounts could be determined. The chemical analysis would give the weight per cent of copper, iron, and sulphur, but could not explain how these elements had been chemically combined; hence the minerals could not be identified. Such a limitation is also encountered in X-ray fluorescence spectroscopy. To cite another example, the chemical analysis of a quartz sand used for making glass might show, in addition to silicon dioxide, impurities of a few per cent of iron and titanium. In order to determine the best method of purification, it is necessary to know if the impurities are present as a thin coating on the quartz grains or as separate admixed crystals of rutile, ilmenite, magnetite, or some other mineral. Microscopic examination combined with X-ray analysis will reveal how these impurities are present and their relative amounts, whereas chemical analysis would show only the bulk composition.

X-ray diffraction studies are used in a great variety of applications. These include analysis and control of raw and finished products as well as research in the fields of ceramics, metallurgy, chemistry, mineralogy, biology, pharmacy, engineering, and electronics. Paint pigments, petroleum products, engine deposits, soils, metals and alloys, pharmaceuticals, catalysts, clays, boiler deposits, minerals and soaps, are but a few of the materials analyzed with X-rays. The X-ray method was used to determine the chemistry of the transuranic elements and their compounds. Many of these substances are highly radioactive with a short half-life so that speed and safety were essential. These facts and the very small amounts of samples available made chemical methods very difficult to apply. Several laboratories use X-rays for the routine analysis of quartz in industrial dusts. A procedure for the quantitative analysis of the minerals in bauxite exploration-samples has been developed in which the X-ray analysis gives results within 1 to 2 per cent of chemical analysis in about 10 man-minutes, thus permitting an enormous saving of time.

Substances with the same crystal structures give similar X-ray patterns with small changes in the spacings and intensities of the lines. The similarities are usually clear enough to be revealed by visual comparison of the patterns. Such information is useful in relating substances which have markedly different chemical compositions. Fig. 5 shows the X-ray patterns of diamond (carbon), silicon, and sphalerite (ZnS).* Each atom in all three substances is surrounded by four other atoms which may be represented as follows:

```
   C          Si          S
 C C C      Si Si Si    S Zn S
   C          Si          S
```

These are said to have a diamond-type structure. Many other basic structure types have been revealed by X-ray analysis. Some substances of the same chemical composition may occur in two or more different atomic arrangements, called polymorphic forms. Since the atomic arrangement is different, the X-ray patterns will be different even though the chemical composition is the same. This is shown by a comparison of the patterns

* Figs. 5 and 6 are schematic drawings. The positions of the lines are those obtained with CuKα X-rays, and the relative intensities are indicated by the heights of the lines.

of sphalerite (the cubic form of ZnS) with wurtzite (the hexagonal form). See Fig. 5. There are many well-known cases of polymorphism: for instance, diamond and graphite, both carbon; glass and quartz, both silicon dioxide. Different heat treatments or slight changes in chemical constitution may cause different forms to occur and their physical properties may be quite different. X-rays are most useful in distinguishing between these forms.

Solid Solutions and Mixtures.—In addition to the gross features discussed above, small changes may occur in the X-ray pattern which reveal important facts, useful for the analysis of matter in the solid state. Consider the simple X-ray patterns of the metals, nickel and copper (Fig. 6). Since both have the same structure, they give similar X-ray patterns which differ only in the spacings of the lines. The radius of the nickel atom is somewhat smaller than that of the copper atom (1.25 Å and 1.28 Å, respectively). The atomic planes of nickel are closer together and the d-spacings are smaller. The X-ray patterns show the nickel lines occurring at larger 2θ angles corresponding to smaller d values. Note that the lines occurring at high 2θ angles are shifted by relatively larger amounts than the lines at small 2θ angles. The reason for this is predicted by the Bragg equation which, after differentiation, may be written

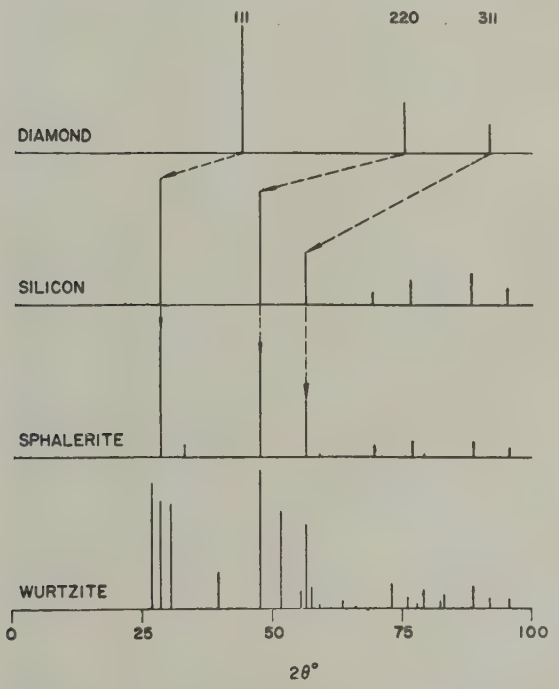

Fig. 5. Powder patterns of isostructural and polymorphic substances.

$$\Delta\theta/\Delta d = -\tan\theta/d. \qquad (2)$$

This equation shows that the shift in line position, $\Delta\theta$, due to a change of lattice spacing, Δd, increases as the tangent of the angle and reaches a maximum at $\theta = 90°$ and $2\theta = 180°$ where $\tan\theta = \infty$. The high-angle lines occurring in the so-called back-reflection region of the pattern are most useful in determining changes in the lattice spacings.

Between the patterns of the pure metals presented in Fig. 6 is a pattern labelled $Ni_{50}Cu_{50}$

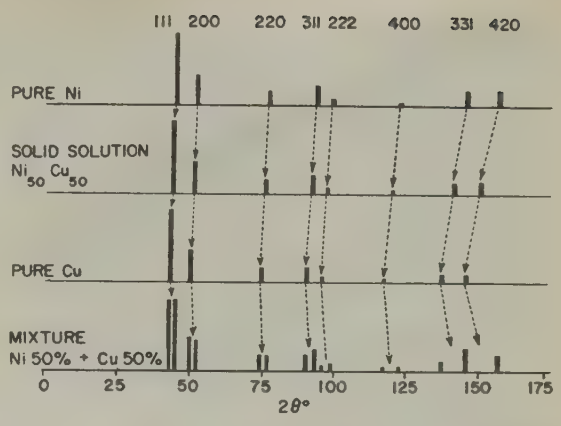

Fig. 6. Powder patterns illustrating the difference between a solid solution and a mixture.

which represents a solid solution of 50 atomic per cent of both nickel and copper. If the atomic arrangements of the pure metals in two dimensions are indicated as

Ni Ni Ni Ni	Cu Cu Cu Cu
Ni Ni Ni	Cu Cu Cu
Ni Ni Ni Ni	Cu Cu Cu Cu
Ni Ni Ni	Cu Cu Cu

the solid solution could be represented as

Ni Cu Ni Ni
Ni Cu Ni
Ni Cu Cu Cu
Cu Ni Cu

This is called a substitutional solid solution because the nickel and copper atoms may substitute one for the other and occupy the same relative positions as in the pure metals, although they are randomly mixed. The d-spacings, therefore, are between those of the two pure metals. The lines are shifted in the X-ray pattern by an amount which is dependent upon the composition of the solid solution. A smooth, nearly linear relation exists between the dimensions of the lattice and the chemical composition. The X-ray patterns of simple cases of the type illustrated here permit easy and rapid calculation of the intermediate members.

A single basic structure, called a phase, may extend over wide ranges of chemical composition. In the case described above, the same phase exists for pure nickel, pure copper, and all intermediate compositions. The atomic arrangement is the same for the entire series. Usually, however, only a limited solid solution can take place because the substituting atoms are very different in size or for other reasons, and the phase will have a limited range of chemical composition. The X-ray method has great practical importance in the determination of phase-composition-temperature diagrams. Such diagrams form the basis for the production of many complicated metals and alloys. If a phase change occurs through heating or change of composition, it is revealed by the X-ray pattern. When the composition of a given phase is altered, the lattice dimensions also change and hence the boundaries in the phase diagram may be determined. This application of X-rays is widely used in the study of binary and ternary alloys, systems of oxides, carbonates, and the like. The application has also been used to detect small amounts of solid solution, for example in the manufacture of the fluo-

rescent material zinc orthosilicate, in which 1 per cent manganese substitutes for zinc.

Interstitial solid solutions occur when very small atoms fit into unoccupied interstices of the lattice instead of substituting for atoms in the lattice. Obviously the lattice parameter remains nearly the same. A good example is the addition of carbon to iron to produce steel. Accurate measurements of the density, in addition to X-ray data, are used to study the process. Density increases with the addition of interstitial atoms, and X-ray data show if specific compounds are formed at certain critical compositions.

X-rays often afford the only practical means of following the course of a chemical reaction. For example, if an alloy of copper and nickel is desired, the required amounts of each element will be weighed, mixed, and heated. If the heat is insufficient for the elements to alloy, the X-ray pattern will be a mixture of the two patterns, as shown on the bottom of Fig. 6. Heating at a temperature sufficient to allow a complete reaction will give the X-ray pattern depicting a solid solution. No other method has proven as useful in following complicated reactions. For example, in the manufacture of ceramic magnetic materials, various substances such as the oxides of iron, zinc, and manganese are mixed together in their proper proportions and fired. A reaction occurs forming a useful magnetic spinel phase which has a totally different structure than the original individual oxides. If some of the oxides remain unreacted, the properties of the magnetic material will be altered. X-rays are used to study the course of the reactions and to work out the proper firing conditions. Chemical analyses are of little aid in such reaction studies since the end product has the same chemical composition as the original materials.

The X-ray patterns of amorphous materials, such as glasses, resins, and liquids, are distinctly different from those of crystalline substances. The atoms in an amorphous material do not have the symmetrical repeating arrangement so characteristic of crystalline materials. The X-ray patterns of amorphous materials appear as one or two weak broad bands at small 2θ angles superimposed upon a continuous background. X-rays are therefore not useful in distinguishing between amorphous substances but are ideally suited to show if a substance is crystalline or amorphous. This test is useful in many practical applications. The X-ray diffractometer patterns of Fig. 7 show the progress of the devitrification (crystallization) of a silica glass. At the left is the broad diffuse band characteristic of glasses. The middle pattern shows the beginning of crystallization by the appearance of lines of cristobalite, a high temperature form of silicon dioxide, superimposed upon the amorphous band. The final pattern shows an increase in the intensity of the lines and further reduction of the band as the devitrification continues.

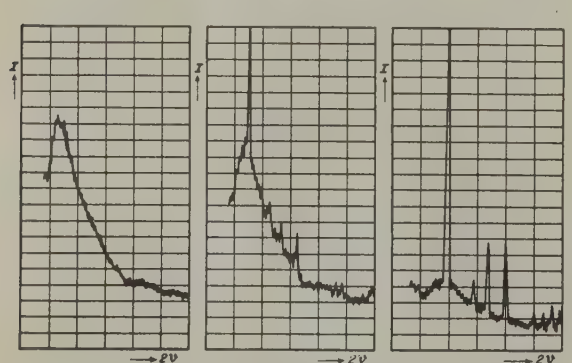

Fig. 7. Diffractometer patterns showing devitrification of silica glass to cristobalite.

Diffraction Applications.—The discussion in the previous section has been confined to substances in their ideal crystalline state. If the substance is ground to colloidal-crystal size, strained beyond its elastic limit, cold- or hot-worked, rolled, or the like, the resultant lattice deformation has a marked effect on the X-ray pattern. X-rays are of great practical importance in studying these phenomena and a few examples will be presented to show the general nature of these applications.

When a crystalline substance is ground into particles a few microns in size (the beginning of the colloidal range), the resultant X-ray powder lines broaden, the amount of broadening increasing with decreasing size. Although such X-ray patterns will not reveal absolute particle sizes, the technique is most useful for determining relative sizes and for distinguishing between clusters of particles and true crystallite sizes. The equation

$$t = k\lambda/(b - b_o)\cos\theta \qquad (3)$$

gives the basis for the measurement. The crystallite thickness, t, is the dimension perpendicular to the reflecting atomic planes; k is a constant usually taken as 1; b is the measured width of the diffraction line of the small particle specimen; and b_o is the width of the line obtained with particles large enough not to cause line broadening, both b and b_o being measured under exactly the same experimental conditions. If the powder consists of small particles whose sizes embrace a large range, the X-ray measurement represents an average value since it is not possible to separate the overlapping broadenings. One application of the method has been the testing of the quality of catalysts. A good catalyst has a large surface area and hence small particle size. If the X-ray pattern is sharp, it is good evidence the particles are too large.

When a substance is strained, the X-ray lines, particularly those at high angles, become broad and poorly defined. When the strain is removed by appropriate heat treatment (annealing), the lines return to their original sharpness. This is a simple procedure to determine the correct annealing temperature. The method is also used to determine the effect of various types of mechanical treatment on the material.

In the previous discussion the assumption has been that the crystallites used for the X-ray specimen are randomly arranged so that all possible sets of atomic planes have an equal probability of reflecting. If this is not the case and if the crystallites assume certain special orientations, then the relative intensities of the lines of the X-ray pattern will be changed from their correct values; or, in extreme cases, some reflections may disappear. The ability of X-ray patterns to elucidate such behavior provides a powerful tool for the study of many practical problems dealing with the orientation of crystallites in fibers, wires, sheets, and foils.

Many electrodeposited metals tend to orient themselves in a preferred manner. For example, when selenium is plated on steel under certain conditions, it shows a marked preference for

growing with its *c*-axis, the axis along the selenium chain of atoms, perpendicular to the steel surface; but the *a*-axes, perpendicular to the chain, are more or less randomly oriented. X-ray diffractometer patterns show a large increase in intensities of reflections from the atomic planes perpendicular to the *c*-axis relative to those of planes parallel to the *c*-axis. The latter are less likely to be in a position to reflect X-rays and may even disappear from the pattern. Electrical conductivity is much larger in the direction along the chain than perpendicular to the chain. The X-ray method affords an ideal way of following the plating conditions required to develop the best selenium electrical elements. Similarly, the magnetic properties of certain ceramic materials are enhanced by placing the powder in a magnetic field prior to firing so that the crystallites are oriented, resulting in the greatest magnetic susceptibility for the material. X-rays are used to study this process, which can not be followed with a microscope.

In the manufacture of drawn wire the metal crystals tend to become oriented with respect to the drawing direction but are randomly oriented around the wire axis. An X-ray powder photograph of a wire, therefore, shows discontinuities and marked variations of intensity around the circumference of the X-ray reflection, as shown in the accompanying illustrations. X-rays are also used to follow the effect of various treatments on the molecular orientation of natural and synthetic fibers such as ramie and nylon. The improved mechanical strength of the fibers and their physical properties can be correlated with the particular alignment of the molecules caused by extrusion and drawing.

The preferred orientation of crystals in rolled metal sheets may be influenced by the manufacturing method. The crystals tend to align with a certain rolling axis and in a particular orientation with respect to the rolling plane. The preferred orientation has a marked effect on deep drawing and similar operations. Careful control of the rolling process by X-ray analysis can produce special orientations, for example, in iron-silicon sheets used in transformer cores. The direction of easiest magnetization of iron-silicon crystals is parallel to the cube axes, and when these crystals coincide with the rolling direction, the sheet has a high permeability.

During World War II it was necessary to manufacture millions of quartz oscillator plates for use in frequency control of military communications. These crystals had been made in small quantities, but the sudden unprecedented requirements made it necessary to develop mass production methods. The desired crystals required precision cut angles with respect to the crystallographic axes. After an approximate orientation of the raw quartz crystal, a test slice was cut with a diamond saw, its precise orientation measured with X-rays, and the sawing angle corrected accordingly. Special X-ray machines with counter tube detectors were developed which permitted unskilled personnel to make accurate measurements in about 15 seconds. This process was the first use of X-rays as an integral part of a manufacturing process.

X-Ray Spectroscopy.—This field has its origin in the work of Henry Gwyn-Jeffreys Moseley, who, in 1913, published the basis of X-ray spectroscopy. He measured the X-ray spectra of a number of elements and found that the square root of the frequency of the various X-ray lines and the atomic number of the element emitting these lines exhibited a linear relationship. This fundamental law showed that each element had a characteristic X-ray spectrum and that the wavelengths varied in a regular fashion from one element to another. In addition to pure metals, he obtained the spectrum of a piece of brass which showed strong copper and weaker zinc lines, and this was the first X-ray chemical analysis. Moseley's work also played a most important role in the early conception of atomic structure and the acceptance of Niels Bohr's model of the atom.

It was stated in the section on X-ray diffraction that each element produced a simple, characteristic X-ray line spectrum when that element was made the target of an X-ray tube. Therefore, the element can be identified by measuring the X-ray wavelengths. Obviously, the practical difficulties of preparing specimens as X-ray targets would be a serious disadvantage in routine chemical analysis. Instead, the specimen may be irradiated by an X-ray beam which causes the specimen to produce secondary or fluorescence X-rays. These fluorescence X-rays have the same characteristic line spectrum, wavelengths, and relative intensities as the X-rays produced by direct electron excitation in an X-ray tube. The total intensities of the secondary X-rays are much lower than the X-rays produced directly in an X-ray tube; nevertheless, the fluorescence is sufficiently strong to be of practical value. The specimen is mounted outside and close to the X-ray tube window since the primary X-ray intensity diminishes as the square of the distance between the target and specimen. For instance, at a distance of one inch the intensity is 25 times greater per unit area than at a five-inch distance. Each element exhibits a sharp change in its X-ray absorption properties at a wavelength slightly less than the shortest emission wavelength characteristic of the element as indicated by the dotted line of Fig. 1. This is called the absorption edge of the element. An element produces the strongest fluorescence when irradiated by primary X-rays of wavelengths slightly shorter than its absorption edge. Thus, the copper lines, $\lambda = 1.54$ Å and 1.39 Å, produce strong secondary X-rays in cobalt, whose absorption edge is at 1.61 Å, but no fluorescence in zinc, whose edge is at 1.28 Å. Instead of using the characteristic lines of the X-ray target material, which would excite strong fluorescence in only a few elements, the continuous "white" radiation may be used to cause a whole series of elements to fluoresce. A tungsten-target X-ray tube operating at 50,000 volts or more produces a large amount of continuous radiation and is generally used for this purpose.

A schematic diagram of the arrangement used in a modern X-ray spectrograph is shown in Fig. 8. Here a relatively large X-ray source is used since no focusing is involved in this particular instrument and a high total intensity is desirable. Radiation from the X-ray tube causes the specimen to fluoresce in all directions, as indicated by the dotted lines. Only those rays traveling in a certain direction pass through the parallel-slit assembly whose thin, highly-absorbing metal foils collimate the X-rays. The single-crystal plate, oriented to reflect from only a single *d*-spacing, reflects one wavelength at a given angle in accordance with Bragg's law

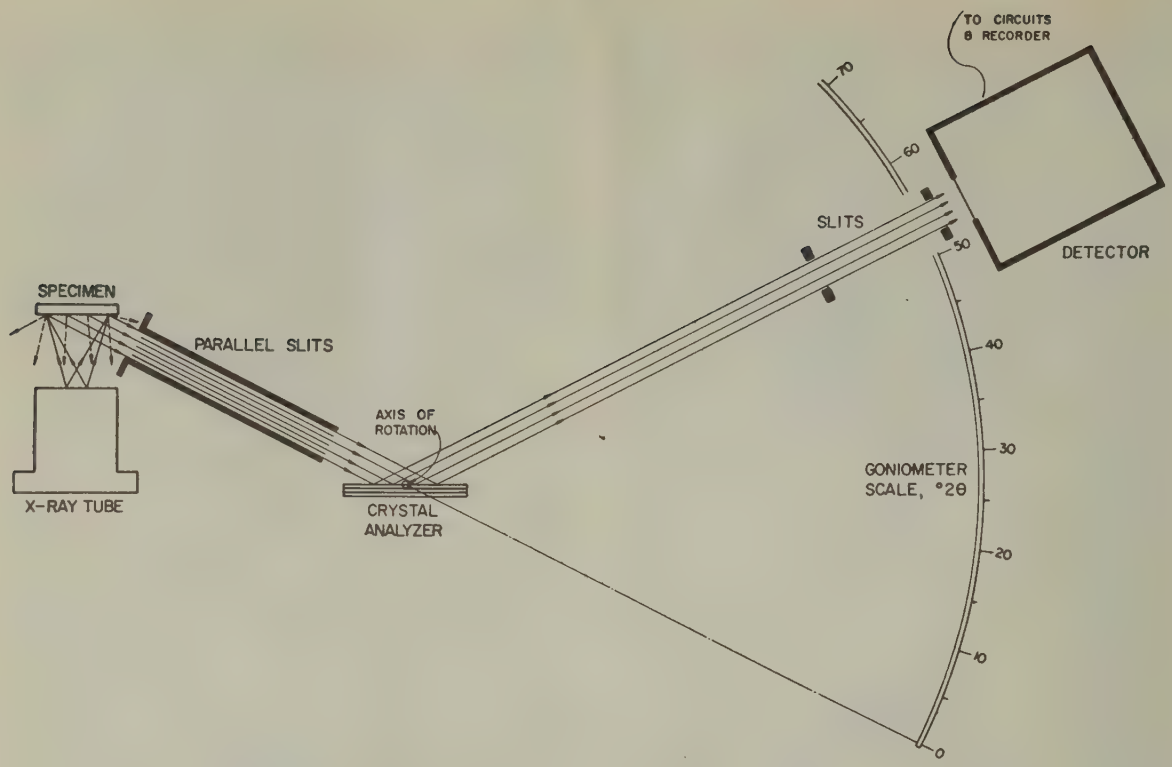

Fig. 8. Principle of the X-ray spectrograph.

(equation 1 above). By slowly rotating the crystal at one half of the angular speed of the detector, the various wavelengths from the parallel beam of X-rays are reflected one by one as the crystal makes the proper θ-angle for each wavelength. The intensity of each wavelength is then measured with a high-sensitivity scintillation counter or similar detector and automatically recorded. Calibration curves relating concentration to intensity are established for each element of interest. The angle at which the various wavelengths are reflected, and the angular separation (dispersion) of the wavelengths, are dependent upon the d-spacing of the reflecting atomic planes of the crystal analyzer, as shown in Fig. 9. Three

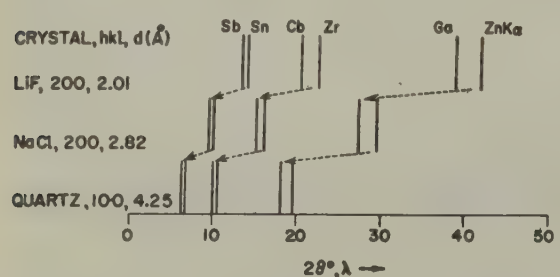

Fig. 9. Effect of crystal analyzer on positions of lines.

common crystals are depicted as analyzing the Kα reflections of three sets of adjacent pairs of elements. When the value of d decreases, the reflections occur at larger angles and have a greater separation. The crystal analyzer cannot reflect a wavelength larger than $2d$ as shown by the Bragg equation.

An interesting comparison can be made between X-ray fluorescence and optical emission spectroscopy. In the latter method the specimen is burned in an electric arc, a lens is used as a collimator, and a prism or diffraction grating disperses the spectrum, while a film is commonly used to record it. The optical spectrum is a complexity consisting of hundreds of closely spaced lines for each element, whereas the X-ray spectrum has only a few lines. Hence the X-ray method is comparatively simple and more direct.

The specimen used for X-ray spectroscopy may be an amorphous or crystalline powder, a polished and etched metallographic specimen, or even a liquid. There is a simple relationship between the fluorescent X-ray intensity as measured and the amount of element in the sample. The increase in intensity with concentration is seldom linear, however, because of the absorption of the fluorescent X-rays by the specimen itself. Since the composition of the specimen may vary over wide ranges, the measured intensities show a marked dependence upon the absorption. As a consequence, empirical calibration curves made with a small number of standard specimens are required when a quantitative analysis is to be made.

In many cases the X-ray method is more rapid than the optical method and the calibrations required for quantitative analysis are usually simpler. The X-ray method is superior for analyses involving amounts from 5 to 100 per cent, wherein an accuracy of about 1 per cent can be achieved; the procedure requires about one minute of actual measurement. In general the optical method is more reliable for trace-element analyses. Good results have been reported for the X-ray method for concentrations as small as 0.1 to 0.01 per cent, but the accuracy is lower and the time required is longer. The X-ray method is usually as accurate as a quantitative chemical analysis and has the important advantages of requiring far less time and of being a nondestructive, recording method. The analyses can be performed equally as well on the rare earth elements as on the transition elements: However, experimental difficulties are encountered with ele-

ments of low atomic number. With increasing wavelengths (decreasing atomic number) air absorption of the X-rays also increases. Vacuum techniques are required for elements of atomic number below 22, starting with titanium, for which $K\alpha = 2.75$ Å. About 90 per cent of X-rays of this wavelength are absorbed in an air path 13 inches long.

The results of a fluorescence analysis of nickel and copper with a rock salt crystal analyzer are shown in Fig. 10. The upper two charts show the simple spectrum of pure nickel and pure copper. The third chart shows the spectrum of a mixture of equal parts of nickel and copper. Unlike X-ray diffraction, a solid solution and a mixture give the same spectrum. The CuKβ line is relatively lower than it was in the case of pure copper because of the self-absorption of the nickel. The bottom chart for 10 per cent nickel and 90 per cent copper shows how the relative intensities are dependent upon the concentration of the elements in the specimen.

This method has been used in many types of analyses, such as the determination of nickel, chromium, and other elements in high-temperature steels; the measurement of lead and bromine in gasoline, sulphur in oil, and uranium in aqueous solutions; and the analysis of ores, minerals, alloys, and the hemoglobin (iron) content

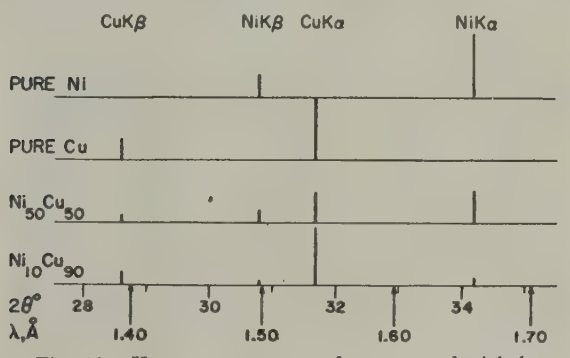

Fig. 10. X-ray spectrogram of copper and nickel.

of blood. Another unique application has been in the measurement of the thickness of tin plating on steel. The iron in the steel is irradiated to produce fluorescence, and the reduction of this fluorescent intensity as it passes through the tin plate is a measure of the thickness of the plate.

Summary.—X-ray techniques are being widely used in a great variety of applications. X-ray methods are fast, reliable, nondestructive, and direct-recording. Information that cannot be obtained by other methods of analysis can often be obtained by the X-ray method. There are many applications of chemical analysis by X-ray methods, the powder diffraction method being used to identify compounds and the X-ray spectrograph to identify the constituent elements. Since no two chemically distinct crystalline substances give the same X-ray powder diffraction pattern, the identification made by comparison with a known standard is unique. X-rays are used to follow the course of chemical reaction, to distinguish between mechanical mixtures of substances, solid solutions, and polymorphic forms. They are used in the study of phase-composition-temperature diagrams, and similar problems. Other applications of the diffraction technique are in the determination of particle sizes, proper annealing temperatures, the special orientation of crystals, stress and strain of materials, and the like. The modern X-ray spectrograph, using the secondary or fluorescence X-rays, has become an important tool in quantitative chemical analysis of the elements. It has been applied in many chemical problems and gives promise of becoming an invaluable analytical instrument.

Chief, X-Ray and Crystal Sections, Philips Laboratories, Irvington-on-Hudson, New York.

XY COMPANY, the popular name of the New North West Company formed in 1798 by a union of Montreal, Canada, fur firms and discontented North West Company men. The new company marked its goods with the letters XY. After a keen competitive struggle the XY Company was absorbed by the North West Company in 1805.

X Y Z CORRESPONDENCE, in United States history, the name given to the reports made to President John Adams by a United States commission sent to France to negotiate a treaty of commerce and amity in 1797–1798. War between France and England had begun in 1793; and when in the following year the United States settled its outstanding differences with England in Jay's Treaty (q.v.), the French regarded it as a breach of the commitments made to them by the United States during the American Revolution. As a result, they began to harass United States shipping, and in October 1797 Adams sent Charles Cotesworth Pinckney, John Marshall, and Elbridge Gerry to Paris to try to reach an understanding. The Directory refused to recognize them, but Talleyrand, the French foreign minister, delegated three agents to conduct negotiations unofficially. As the price of agreement, the French agents demanded a sizable personal bribe and a large official loan to the French government. These terms were promptly rejected, and the United States commission left France. To justify his action, Adams submitted the commission's reports to Congress in April 1798 and distributed thousands of copies to the public, substituting X, Y, and Z for the names of the French agents. One of the products of the ensuing excitement was the patriotic hymn *Hail Columbia,* written by Joseph Hopkinson to the tune of the *President's March.* Another was the popular slogan, "Millions for defense but not one cent for tribute," attributed to Pinckney, who always, however, denied coining it. For the next two years, an undeclared naval war between France and the United States was waged in the Caribbean Sea.

Consult *American State Papers, Foreign Relations,* vol. 2 (Washington 1832) for the text of the correspondence.

XANTHIAN MARBLES, zăn'thĭ-ăn, a large collection of marble sculptures of various ages (from 545 B.C. onward) discovered in 1838 near the site of the ancient Lycian city of Xanthus (now Günük, Turkey).

XANTHINE, an organic base, $C_5H_4N_4O_2$, occurring in small amounts in many animal secretions, in the blood, urine, liver, in some urinary calculi, and in tea extract. It may be readily made by the action of nitrous acid on guanine. A white amorphous powder slightly soluble in water, and forming crystalline compounds with both acids and bases. It is closely related to theobromine and caffeine, the alkaloids found in cocoa and coffee respectively. Caffeine may be considered as xanthine in which three hydrogen atoms have been replaced by three methyl (CH_3) groups.

XANTHIPPE, zăn-tĭp′ē, 5th century B.C., wife of the Greek philosopher Socrates. Her name has become proverbial for a nagging wife, (*v.* Shakespeare, *Taming of the Shrew,* i. 2). Speaking of her, Socrates said: "My aim in life is to get on well with people; I chose Xanthippe because I knew if I could get on with her I could with anyone."

XANTHIPPUS, zăn-tĭp′ŭs, early 5th century B.C., father of Pericles. A prominent figure in Athenian public life. He was one of the commanders of the Greek fleet which defeated the remnant of Xerxes' navy at Mycale in 479 B.C.

XANTHOCONITE. A silver ore $3Ag_2S.As_2S_5$, containing 61.4 per cent of silver. Formerly mined in Santa Fé County, N. Mex.

XANTHUS, zănth′ŭs (Gr. "golden yellow"), (1) Chief city of ancient Lycia in Asia Minor, located on the west bank of the Xanthus River. Destroyed in 545 B.C. by the inhabitants who refused to surrender it to the besieging Persians. Again so destroyed in 42 B.C. when the Romans invested it. Many of the ruins are well preserved. The better marbles were transported to the British Museum by the archaeologist Sir C. Fellows in the mid-19th century. (2) The Xanthus River (modern Kucuk Menderes River) also called Scamander. According to Homer, during the fighting between the Trojans and Achilles, the Xanthus, choked with bodies, rose to drown Achilles who escaped through the intervention of Apollo. (3) Achilles' famous horse. When rebuked by his master for abandoning Patroclus on the field, Xanthus turned his head and told Achilles that he too would soon be dead, not by his horse's fault but by the inexorable decree of fate. (*Iliad,* xix.)

XAVIER, Saint Francis. See FRANCIS XAVIER, SAINT.

XEBEC, zē-bĕk, a small three-masted vessel, employed in the Mediterranean, distinguished from other European vessels by the great projection of the prow and stern beyond the cutwater and stern-post. In this respect it resembles the felucca, from which it differs only in having the fore-mast square-rigged.

XENIA, zē′nĭ-a, city, Ohio, Greene County seat; altitude 925 feet; 14 miles east-southeast of Dayton; on the Pennsylvania, and the Baltimore and Ohio railroads. It is in the valley of the Little Miami River, on a broad elevated area. A trading center for stock raising and farm products of the surrounding agricultural area, its chief manufactures are rope and twine, furniture, shoes, electrical equipment, and foundry products. It is the seat of the Ohio Soldiers' and Sailors' Orphans' Home, a federal government institution founded in 1869. Three miles distant is Wilberforce University (q.v.). Laid out in 1803, many of its early settlers were Germans. Government is by commission and city manager. Pop. (1950) 12,877.

XENOCLES, zĕn′ō-klēz, Greek tragedian, b. Athens 4th century B.C. He won a prize for four plays: *Oedipus, Lycaon, The Bacchanarian Women* and *Athamas.*

XENOCRATES, zē-nŏk′rå-tēz, Greek philosopher: b. Calchedon, 396 B.C.; d. 314 B.C. He went to Athens in early youth; became a pupil of Aeschines, studied Socratic philosophy, joined Plato in 361 and accompanied him to Syracuse where he remained until Plato's death in 347. In 339 B.C. he succeeded Speusippus in the Platonic School, presiding over the Academy until his death. An exponent of Plato's philosophy, he further developed the Pythagorean theories of the master, but Xenocrates was a brilliant teacher rather than an original thinker. His integrity won him the respect of his contemporaries. Epicurus was one of his pupils.

XENOLITHS, inclusions of the wall rock caught in an intrusion, as in a dyke or batholith (qq.v.); and there frozen into the igneous mass as it cools. See MAGMATIC STOPING.

XENON, zē′nŏn, a heavy noble gas and element (atomic number 54; atomic weight 131.3) named by Ramsay and Travers, its discoverers (1898), from the Greek ξενος, strange. Consisting of nine isotopes, traces occur in the atmosphere (5/100,000%). Colorless, it is insoluble in water. The symbol is X or Xe.

XENOPHANES, zē-nŏf′å-nēz, Greek philosopher and satirical poet; founder of the Eleatic school of philosophy; b. Colophon, Asia Minor, c.570; d. about 480 B.C. Banished from his native city he settled, c.536 B.C., at Elea in southern Italy. He believed all things to be made of earth and water, and in one God, unlike men in form and thought, who "swayeth all things by the force of his mind." He wrote with scorn of the Homeric Gods and their human vices, and ridiculed the Pythagorean doctrine of transmigration: "Pythagoras was passing by when a dog was being ill-treated. 'Don't beat it!' he cried. 'It is the soul of a friend; I recognize his voice.'" In matters of theology Xenophanes held that "there is nowhere anything but guessing." He was a critical thinker rather than a creative philosopher.

XENOPHON, zĕn′ō-fŭn, Greek historian and general: b. Athens, c.430 B.C.; d. Corinth, c.355 B.C. The first three decades of Xenophon's life were spent in an atmosphere of war. The struggle for world supremacy between Athens and Sparta ended in the destruction of the Athenian Empire and the overthrow of democracy in 404, when Xenophon was about 26. It seems evident that to Xenophon, aristocratic by birth, handsome in appearance, reserved, unimaginative and a little smug in temperament, the

confusion of Athenian politics, which he did not understand, was less congenial than Spartan discipline and order. There was little future for a young man of Xenophon's attainments in Athens at the end of the 5th century, and all over Greece many disillusioned young men were turning to a career of military adventure as an escape. Thus he willingly accepted the offer of his friend Proxenus, a commander of Greek auxiliaries in the army of the Persian prince Cyrus, to join those forces about to launch on a campaign to wrest the throne of Persia from Cyrus' elder brother Artaxerxes (401 B.C.). A pupil of Socrates, Xenophon was deeply religious, and on his master's advice consulted the Delphic oracle before leaving Athens to which he was never to return. A full and vivid record of the campaign in Asia Minor is contained in Xenophon's most famous work, the *Anabasis* (q.v.).

On joining, Xenophon served as a subordinate officer, but with his capacity for observation and love of discipline, he soon distinguished himself as a soldier and acquired a reputation for reliability. After Cyrus fell in battle, and the Greek commanders were treacherously murdered by Artaxerxes' lieutenant, Tissaphernes, Xenophon was selected to cammand the retreat of some 13,000 Greeks, through 1,500 miles of mountainous country inhabited by hostile tribes. This prodigious feat he accomplished by a combination of physical courage, tenacity, cheerfulness, firmness and diplomacy, all qualities of leadership. He developed the greatest tactical ability in extricating his troops from the perils of a retreat through rugged territory. Military historians such as Theodore Ayrault Dodge and George Fielding Eliot mention Xenophon as the inventor of retreat tactics still valid in modern mountain warfare.

At the end of the campaign, Xenophon joined the forces of Sparta, then waging war on the Persian satraps Pharnabazus and Tissaphernes, after which he returned to Greece with Agesilaus, king of Sparta, and in 394 fought in the Spartan army against the Athenians at Coronea. The latter, not unnaturally, found him guilty of treason and condemned him to exile. Though this sentence was later rescinded he seems never to have returned to his native city with which he was completely out of sympathy. Agesilaus made him a gift of an estate in the beautiful hunting country near Scillus in Elea—a good place for retirement, since it was very close to Olympia which every one of consequence visited sooner or later, and where the whole of Greece gathered every four years for the Olympic Games. Here he could indulge his natural inclinations, which were those of a country squire with literary tastes. Politics he loathed and despised. In fact he had all the characteristics of an 18th century English gentleman of leisure, including the love of foreign adventure which he had already satisfied on his campaigns.

With the spoils won in Asia Minor, Xenophon built a small but magnificent replica of the temple of Artemis at Ephesus, on his estate, and settled down to a life of farming, hunting and writing. At Scillus he probably wrote most of his books. Next to the *Anabasis,* the *Memorabilia Socratis* (*Reminiscences of Socrates*) is his most interesting work, in that it gives us an interpretation of the great philosopher by a contemporary writer other than Plato. While we cannot accept what Xenophon says about Socrates if it involves any difficult point in philosophy which he was not qualified to understand, many of his reminiscences are very convincing. He is accurate and interesting when he gives an anecdotal, discursive account of Socrates' activities, showing him to be a teacher of pithy common sense giving his young followers practical advice on how to manage their affairs, or telling how Socrates was continually occupied with the problem of getting competent men into power. In his *Symposium,* or *Table Talk,* Xenophon does not make Socrates and his companions indulge in deep philosophical argument, but presents a very human and humorous Socrates amusing the company by arguing that a snub nose is far better than a straight one, and telling them he danced every morning in order to reduce. This presentation of Socrates does not conflict with the more serious and profound philosophical presentation by Plato; rather, it complements it. The Socrates whom Xenophon shows his readers is the familiar figure known to his contemporaries at large, the Socrates Xenophon himself was qualified to understand and admire. The Socrates interpreted by Plato was beyond Xenophon's comprehension.

The *Hellenica* by Xenophon is a valuable history of contemporary Greek affairs from 411 B.C. through the first forty years of the 4th century; it is written with political bias but without distortion of facts. His *Cyropaedia,* or *Education of Cyrus* (the Elder), is a pleasant and fanciful account of Persian life, and his *Oeconomica,* or *Home Management,* is a delightful account in dialogue form of a Greek country gentleman's idea of the good life. He describes the place of the wife in the home, the duties of the servants, the duties of the master to the servants, the best arrangement of the house with forethought and without extravagance: the innermost room, being the most secure, to contain the most valuable furniture and rugs; the coolest cellar to be used for storing wine; the driest room for storing wheat; the best lit room for displaying works of art. Xenophon insists at length upon tidiness. Clothes, shoes, even saucepans look beautiful when they are arranged neatly. He was inclined to be fussy in the home.

Xenophon's style is clear, limpid, straightforward and elegant. It was greatly admired by the Greeks who called him the "Attic Bee." After seventeen years at Scillus Xenophon removed to Corinth where he died. He was reputed to have been extremely handsome even in old age.

ANDRÉ MICHALOPOULOS.

XENOPHON OF EPHESUS (Xenophon the Younger), Greek writer who flourished in the 2nd century A.D. One work of his has been preserved, a story in five books called *Ephesiaca; or the Loves of Abrocomas and Anthia.* It is written in a simple and elegant style. There is an English translation by Rooke.

ANDRÉ MICHALOPOULOS.

XENOS, zē'nŏs, **Stefanos Theodoros,** Greek author. From 1855 he was a merchant and general broker in London, and in 1858 was naturalized as a British citizen. He published *The Devil in Turkey* (1850), a three-volume English translation from the author's unpublished Greek manuscript; in Greek, *The Heroine of the Greek Revolution* (1861), trans-

lated as 'Andronike' (1897); 'East and West: A Diplomatic History of the Annexation of the Ionian Islands to the Kingdom of Greece' (1865); and 'Depredations: or Overend, Gurney and CoC. and the Greek and Oriental Steam Navigation Company' (1869).

XENOTIME, a tetragonal mineral occurring in crystals of the same forms as zircon. It is essentially an yttrium phosphate, YPO_4, but much erbium is frequently present, and also sometimes the cerium metals, and small quantities of thorium and silicon. It is usually found in minute crystals of resinous or vitreous lustre, yellow or brown color and having a hardness of 4 to 5 and specific gravity of about 4.5. It occurs as an accessory constituent in many granites (see Derby in *American Journal of Science* 41, 308, 1891), in large crystals in the granitic rocks of Norway, in the auriferous gravels of North Carolina and Georgia, and in choice crystals in the gneiss of New York City. When obtainable in sufficient quantities it will be an important ore of yttria and erbia.

XERES, hā'rās, or **XEREZ,** or **JERES, Francisco de,** Spanish historian: b. Seville, about 1500; date of death unknown. He accompanied Pizarro, as his secretary, to Peru, about 1530, returned to Spain with the first shipment of gold taken from Atahualpa. At the direction of Pizarro he wrote a detailed history of the expedition and the conquest down to the death of Atahualpa, entitled 'A True Account of the Conquest of Peru' (1547). The work was translated into Italian by Ramusio, and into French by Ternaux-Compans and is still valued as a source of information.

XERES DE LA FRONTERA. See JEREZ DE LA FRONTERA.

XEROPHYTES, zĕr'ō-fīts, plants which have guarded themselves by structural means against excessive transpiration. The term was originally applied to plants living in dry and sandy soil, or on rocks, and to those inhabiting deserts; but it is now extended to plants existing in localities where, for one reason or another, they cannot readily obtain water, as in the case of the vegetation in salt marshes, arid bogs and moors and of cold regions where water is present but not available for the use of the plants, which have consequently adapted themselves to prevent the waste of the moisture which they have. This result is obtained in various ways. In some, the transpiring surface is greatly reduced, and the foliage is nearly or wholly dispensed with, the stems themselves taking its place, as in switch plants and cacti; and this habit is frequently combined with the storage of water in succulent tissues. Other plants, like the eucalyptus trees predominating in the dry forests of Australia, by a vertical arrangement of their foliage, or a similar disposition of the branches themselves, when foliage is wanting, as it is in the casuarinas, avoid presenting broad surfaces to the sun and hot winds. Some erophytic plants close their leaves just before the dry season; the whole existence of others begins and ends during the continuance of a rainy season; and in the bulbous and tuberous plants we see still another common arrangement for passing the dreaded dry months, the plants growing vigorously and completing their above-ground existence, while the weather is still favorable, and storing up food in their roots or rootstocks, so that they may rest uninjured in the ground during the heated term, and be ready to spring into activity as soon as the rains begin. An extensive development of ligneous tissue is characteristic of xerophytes and so also are such modifications of tissue as the matted hairs, mineral, waxy and varnish-like encrustations on the epidermis, the closing or concealing of stomata, etc.

XERXES I, zĕrk'sēz, king of Persia: b. about 519 B.C.; d. 465 B.C. He was a younger son of Darius, the son of Hystaspes, and began to reign in 485. He was preferred to his elder half-brothers, born before his father was raised to the throne; Xerxes was born after that event, and was the son of Atossa, daughter of Cyrus. After having suppressed a revolt in Egypt in a single campaign, he thought himself able to execute the plan of conquering Greece, already conceived by his father, and collected for this purpose an immense army, estimated by the historians as containing 1,000,000 men. In all probability the Greeks greatly exaggerated the number of their enemies; and the train of women and slaves who followed the army made at least half of its numerical amount; still the numbers of the Persians were beyond all comparison superior to those of the Greeks. By means of a bridge of boats Xerxes crossed the Hellespont (480) while the Greeks awaited him on the frontier of their country, in the pass of Thermopylæ. After the heroic Leonidas had fallen with his Spartans (see LEONIDAS), Xerxes burned Athens, which had been forsaken by its inhabitants. The first naval battle between the two powers at Artemisium had been indecisive; but it inspired the Greeks with new confidence; and the second naval action at Salamis, in which, if we believe the Greek historians, 2,000 Persian vessels were engaged against 380 Greek, terminated in the defeat of the Persians (28 Sept. 480). Xerxes now quitted Greece, leaving behind him his best general, Mardonius, who, not long after, was routed at Platæa. Xerxes now gave himself up to debauchery; his conduct offended his subjects and Artabanus, the captain of his guards, conspired against him, and murdered him in his bed. The personal accomplishments of Xerxes have been commended by ancient authors; and Herodotus observes that there was not one man among the millions of his army that was equal to the monarch in comeliness or stature, or as worthy to preside over great and extensive empire. He was succeeded by his son Artaxerxes I.

XIMENA, hē-mā'nä, in Spanish legendary history, the wife of the Cid (q.v.).

XIMENA, or The Heroic Daughter, an English adaptation of Corneille's 'Cid,' by Colley Cibber, first played in London in 1712 and printed in 1718.

XIMENEZ DE CISNEROS, Francisco. See JIMÉNEZ DE CISNEROS, FRANCISCO.

XIMENEZ DE QUESADA, Gonzalo. See JIMÉNEZ DE QUESADA, GONZALO.

XIMENEZ DE RADA, Rodrigo. See JIMÉNEZ DE RADA, RODRIGO.

XIMENIA, zī-mē'nĭ-ȧ, a genus of plants of the family Olacaceae, represented by large shrubs or small trees, often spiny. Leaves entire, leathery; calyx very small, petals four, hairy inside; stamens eight; ovary with four one-seeded cells. *X. americana,* the false sandalwood, is a straggling shrub, or low spreading tree producing dull-white fragrant flowers, smelling like cloves, succeeded by small, oval, red or yellow pulpy fruits, an inch long, aromatic, but somewhat astringent. They contain a white globose nut with a kernel which tastes like a filbert. Its wood is very tough and heavy. This shrub is known in Florida as the hog plum or wild lime, and in the West Indies as mountain or seaside plum.

XINGU shĕNng-gōō', river, Brazil, one of the chief tributaries of the Amazon. It is formed by the junction of several headstreams which rise near latitude 15° S., longitude 55° W. Chief of these is the Tamitatoaba, which flows from a small lake about 75 miles in circumference. After flowing north for 1,200 miles through a densely forested and little explored region, the Xingú forms a large lake which is connected with the Amazon estuary by a number of deltaic channels 240 miles west of Belem (Pará). Steamers ascend the river to the Cataract and Fall of Itamaracá. The river was unexplored until 1884–1887, when it was descended from Cuyabá by Karl von den Steinen; but much of its course, interrupted by falls and rapids, is still unexplored.

XIPHODONTIDAE, zĭf-ō-dŏn'tĭ-dē, a family of primitive forerunners of the ruminants, whose remains occur in the Upper Eocene rocks of western Europe. Some of them are the largest and most slender artiodactyls of their age, and the only feet hitherto discovered are two-toed, with mere rudiments of the lateral digits.

XIPHOSURA. See MEROSTOMATA.

XOCHIMILCO, sō-chē-mēl'kō, town, Mexico; in the Federal District; 10 miles south of Mexico City. It is situated on the western shore of Lake Xochimilco and is a picturesque suburb of the capital. Pop. (1940) 14,370.

Floating Gardens.—Before the Spanish conquest the Indians here raised flowers, vegetables, and fruits on rafts (chinampas) made of interwoven twigs and reeds and covered with mud. Their produce was marketed in the Aztec capital of Tenochtitlán, now Mexico City. In the course of time the roots of the plants became attached to the bottom of the shallow lake and fixed the rafts to the bottom. The modern appearance of the "floating gardens," therefore, is that of a raised meadow intersected by canals lined with poplars, flowers, and other plants. Boating on the canals is a popular diversion, especially on Sundays, when they are crowded with flower-decorated boats propelled by boatmen with long staves. Other boats are manned by those selling food and beverages to the holiday-makers; still others by small bands which serenade for a fee.

XUARES, hōō-ä'rās, **Gaspar,** Paraguayan botanist, historian and biographer: b. Santiago del Estero, Paraguay, 1731; d. Rome, Italy, 1804. Entering the order of Jesuits, he devoted himself to teaching philosophy and theology; and after the suppression of his order he moved to Italy, where he occupied himself with botanical researches.

He wrote *History of Buenos Ayres,* and *Dissertations,* which remain in manuscript; and a *Life of Saint Francis Xavier.*

XUREL. See JUREL.

XYLANDER, ksü-län'dĕr, **Wilhelm** (real surname HOLTZMANN, hôlts'män), German scholar: b. Augsburg, Aug. 20, 1532; d. Heidelberg, Feb. 10, 1576. Educated at Tubingen and Basel, in 1558 he was appointed professor of Greek at Heidelberg. His numerous Latin translations from the Greek have been of much service to later students. Xylander is noted as having been the first to translate Euclid into German, in 1562. An introduction to Aristotelian philosophy was one of his many original works.

XYLENE, zī'lēn, or **DIMETHYL BENZENE,** in chemistry. Three isomeric hydrocarbons are known by this general name, orthoxylene, metaxylene, and paraxylene. They all have the composition $C_6H_4(CH_3)_2$ and are dimethyl derivatives of benzene. Commercial xylene or xylol, found in coal tar, is a mixture of the above three. It is a colorless, oily liquid, boiling above 140°C., not soluble in water, and used as a solvent in various chemical operations.

XYLOGRAPHY. See WOOD ENGRAVING.

XYLOIDIN, zī-loi'dĭn, or **XYLIDINE,** in chemistry, an explosive probably of the composition $C_8H_9NO_2O_5$, known also as pyroxylin and nitrostarch. Discovered by Henri Braconnot in 1833 and prepared by dissolving one part of potato starch in eight parts of fuming nitric acid and then pouring this solution, well cooled, into 16 parts of concentrated sulphuric acid. It is a white hydroscopic powder, insoluble in water and alcohol, but soluble in ether. It is not used to any considerable extent.

XYLOPHONE, zī'lō-fōn, a musical instrument of percussion consisting of bars of wood or glass graduated in length and resting on belts. The notes are produced by striking on the bars with small hammers and have a range of two or three octaves.

XYLOPIA, zī-lō'pĭ-ȧ, a genus of anonaceous trees or shrubs, natives of tropical regions, with coriaceous leaves, commonly two-ranked, and flowers in axillary clusters or solitary. The corollas have six petals, the outer three elongated, boat-shaped, curving over and partially enclosing the other three. The receptacle is conical, with the stamens outside and the carpels in its excavated interior. The fruits are elongated berries. *X. sericea,* the pindaïba of Rio Janeiro, bears a highly aromatic fruit, which may be used as pepper, with which it agrees in flavor. Good cordage is made from the fibers of its bark. The wood, bark and berries of *X. glabra,* the "bitter

wood" of the West Indies, taste like orange seeds, and impart a similar flavor to the wild pigeons which feed on them. It is said to be useful in colic and for creating an appetite. Martius believes the fruit of *X. grandiflora* to constitute a valuable febrifuge used by the South American Indians. The dry, black and quill-like fruits of *X. aromatica* form the *Piper aethiopicum* of commerce, used as pepper by the West African Negroes. They are sold in the native market as a stimulant and condiment. *X. polycarpa* is the yellow dye tree of tropical Africa, with a bitter bark, that contains berberine and which yields a yellow dye, of extensive use.

Y the 25th letter of the English alphabet, derived from the Greek through the Latin, is both vowel and consonant. It came into Latin in Cicero's time in spelling words borrowed from the Greek; for the Latin language has no sound like that of the Greek Υ (upsilon); the *y* found in some Latin words, as *lacryma, satyra, sylva,* is due to an error of modern editors; those words were in ancient Latin always written *lacrima, satira, silva.* The modern Italian alphabet has no *y,* and the *y* of Greek words adapted into Italian is changed to *i: sinfonia, symphony, sindico, syndic.* In Dutch, *y* stands for *ij,* and represents the diphthongal long *i* of English as in *time.* In English, *y* is a superfluous letter, so far as it stands for a vowel sound; as such, it can always be represented by the vowel *i.* The sound of Υ, *v,* in Greek, was that of French *u* and German *ü.* This sound does not exist in English: it is heard when, with lips and tongue in the positions for pronouncing the vowel sound *oo,* one tries to give the English vowel sound of *e* in *he.* In early English or Anglo-Saxon, *y* represented this peculiar vowel sound; but it has so far dropped out of English speech that a person whose only speech is English cannot pronounce it untaught. At the time of the Norman Conquest *i* had taken the place of this *y,* and soon both the sound and the letter went out of English use. But when Norman words came to be used by the English the French *u* sound was retained in many words, as *muse, lute, duke,* and they were pronounced with the French *u;* this sound gradually developed into *iu,* but the spelling remained unchanged: this *iu* represents the sound of *u* in *muse, duke* as now pronounced. In the beginning of syllables and when followed by a vowel, *y* is a palatal consonant formed by bringing the middle of the tongue in contact with the palate, nearly in the position for *g* hard; hence Old-English *g* hard has often been softened into *y,* as in *day* from Old-English *dag. Y* also often stands for the sound pronounced in the same manner but written *j* in the other Germanic tongues. Until comparatively recent times it was customary to write *the* y^{e} and *that* y^{t}, and those forms were repeated in typography. In those cases the character resembling *y* or identical with it, stood, not for *y* but for the Old-English letter þ; it is a mere ignorantism to read "y^{e} year," *ye year* as though *y* here stood for the consonant *y,* and not for the digraph *th.* As an abbreviation *Y* stands for yttrium. *Y* is used in mathematics for the second of two unknown quantities or the ordinate of a point in Cartesian co-ordinates. See ALPHABET.

YACHTS AND YACHTING. Broadly speaking, a yacht is any boat, vessel or ship privately owned and used for pleasure, although small, undecked sailing, motor and rowing boats are seldom referred to by the term. The term "yacht" covers an infinite range of sizes and types of craft, from the small open boats through half-decked day-sailing and racing boats; small cabin cruisers propelled by sail, power, or both; larger seagoing power and sailing vessels; up to the lofty America's Cup class racing sloops and great luxury ships 200 or more feet in length and costing many hundred thousand dollars, which were common up to World War II but which have been little in evidence since then. Sailing yachts may be of various rigs—the single-sailed catboat; the single-masted sloop or cutter with from two to five sails; the two-masted yawl or ketch with three or more sails; and the schooner, with two or more masts and three to a dozen or more sails. There are various less widely-used rigs, but the square-rigged yacht, once common, is practically extinct. "Yachting," likewise, is a term that includes a multitude of activities—afternoon sailing, small-boat racing, leisurely coastwise cruising in sail and power craft, round-the-world voyages, international racing on a formal and expensive scale, and entertaining aboard some palatial Diesel yacht, to mention but a few.

Early History of Yachting.—Yachting may be traced back into the dawn of history, in the state vessels and pleasure barges of the Egyptians, Greeks and Romans. In English-speaking countries, it was introduced by King Charles II, who had become a devotee of the sport during his exile in the Channel Islands and Holland, and brought it home with him in the Restoration in 1660. Indeed the word "yacht" stems from the Dutch *jaght* or *jaght schip,* with connotations of hunting, sport and speed. Races were held and pleasure sailing was popular on the Thames and elsewhere in British waters intermittently from that time on. The earliest recorded yacht club was the Water Club of Cork Harbor, in existence in 1720. In 1775 the Cumberland Fleet, which became the present Royal Thames Yacht Club, was formed in London and in 1815 The Yacht Club, later to become the Royal Yacht Squadron, at Cowes, England, was formed in London.

In America the sport goes far back into colonial times. An engraving of New York Harbor in 1717 identifies "Col. Morris's yacht *Fancy,*" and histories of that time indicate that there were many craft in use for pleasure though "racing was not much in fashion." While there was no organized yachting, as such, the use of craft for pleasure continued through colonial and federalist times. A noted early American yacht was the lavishly equipped and decorated 83-foot hermaphrodite-brig-rigged *Cleopatra's Barge* built in Salem, Mass., in 1816, for George Crowninshield, wealthy merchant-ship owner, who cruised to the Mediterranean in her. Early attempts at starting yacht clubs were the Knickerbocker Boat Club in New York in 1811 and the

Boston Yacht Club in 1835, but neither lasted more than a couple of years. The first permanent yacht club in America was the New York Yacht Club, founded in 1844. It held its first annual cruise that year and its first annual regatta in 1845, events which, save for interruptions by wars, have been annual fixtures ever since. The Royal Bermuda Yacht Club was also formed in 1844. Other early yacht clubs in America were the Southern (New Orleans), 1859; Carolina, 1854; Hoboken, 1856; and Brooklyn, 1857. In the New England area the Boston Y. C. was formed in 1865 and the Eastern in 1870. Other old clubs in different parts of the country are Oshkosh (Wisconsin) 1870; San Francisco, 1867; Savannah (Ga.) 1867; Portland (Maine) 1869; and St. Augustine (Fla.), 1872. Today there are many hundreds of clubs in the United States devoted to the sport of yachting, many of them on inland rivers and artificial lakes where yachting was never thought of until a few years before World War II. Some are elaborate, socially important and expensive institutions; many are simple and unpretentious clubs with dues of a few dollars a year, filling the needs of the small-boat owners of modest means.

International Yacht Racing.—The America's Cup has always been regarded as the blue ribbon of international yacht racing. The schooner yacht *America* was built by George Steers, in New York, in 1851 for a group of members of the New York Yacht Club headed by Commodore John C. Stevens. She was 101 feet long on deck, a typical American schooner of the fast, seaworthy type then used by the New York pilots. She was sailed to England, where she proved much faster than any of the British yachts, and while there won a trophy of the Royal Yacht Squadron called the Hundred-Guinea Cup, in a race around the Isle of Wight against 17 British yachts. The *America* was sold in England; subsequently was a Confederate blockade runner and then a federal naval dispatch boat during the American Civil War; later she became a yacht again, and in 1921 was presented by a group of yachtsmen to the United States Naval Academy, at Annapolis, where she finally succumbed to neglect and was broken up in 1946.

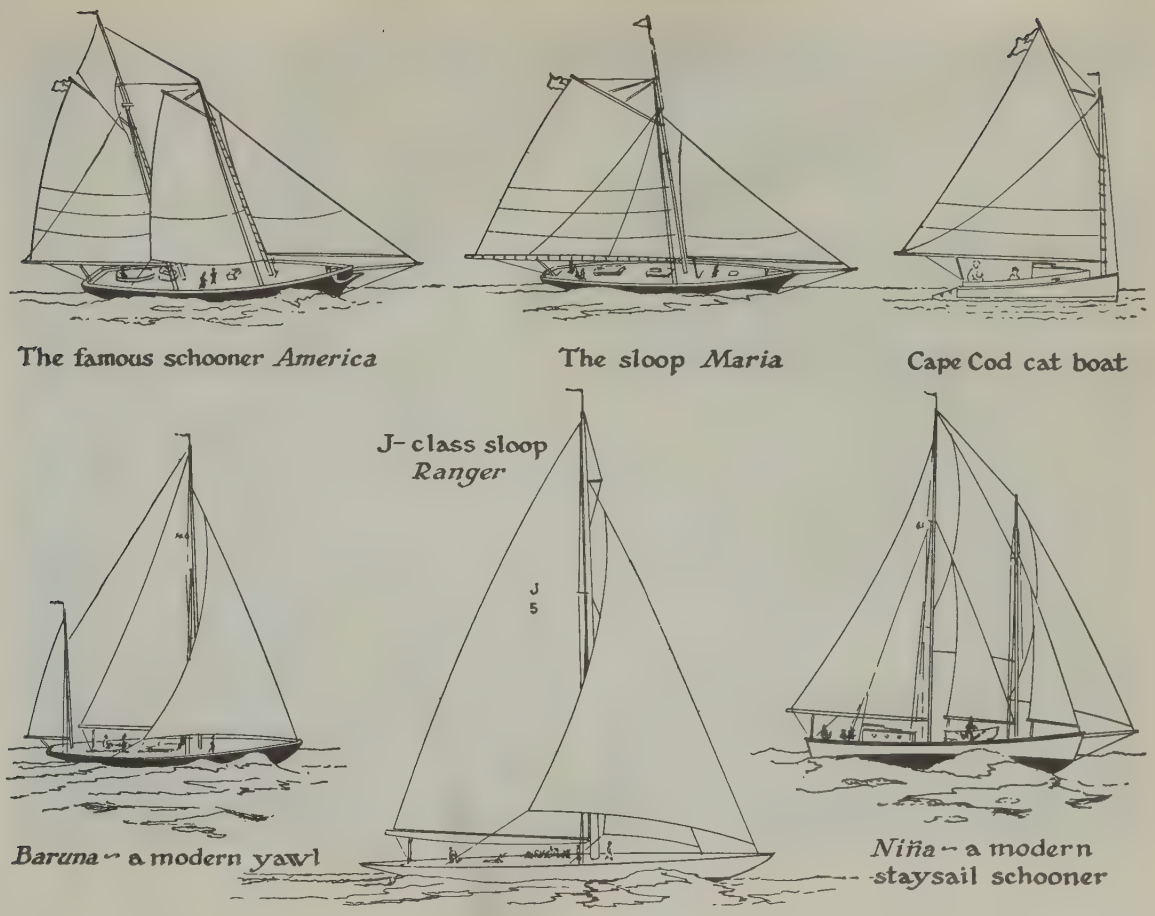
The trophy became known as the America's Cup after it was deeded to the New York Yacht Club by the yacht's original owners in 1857, to be an international challenge trophy. A requirement of the deed of gift, inserted to insure that only really seaworthy yachts would compete for the cup, requires a challenger to cross the ocean under sail on her own bottom. The cup has always been raced for in yachts of the largest active racing classes in point of size. From 1870 through 1937, sixteen attempts to take this cup have been made, two by Canadian and the others by British challengers, but the New York Yacht Club has always managed to make good the defense. In 1870 and 1871 the British schooners *Cambria* and *Livonia* were beaten by several American yachts. Since then all contests have been true match races, one boat to a side. The Canadian *Countess of Dufferin* and *Atalanta* were beaten by *Madeleine* and *Mischief* (the first sloop to defend the cup) in 1876 and 1881. General Charles J. Paine's *Puritan, Mayflower,* and *Volunteer,* all designed by Edward Burgess, defeated the British *Genesta, Galatea,* and *Thistle* in 1885, 1886, 1887.

The era of Herreshoff-designed and -built defenders started with *Vigilant* and *Defender,* club syndicate-owned sloops that beat Lord Dunraven's *Valkyries II* and *III* in 1893 and 1895. Sir Thomas Lipton entered the field in 1899 with the first of his five *Shamrocks* which were successively defeated by syndicate-owned yachts of the New York Yacht Club, *Columbia* in 1899 and 1901; *Reliance* in 1903; *Resolute* in 1920, and *Enterprise* in 1930. *Enterprise* was the first of three defenders sailed by Harold S. Vanderbilt and designed by W. Starling Burgess. *Rainbow,* which defeated Thomas O. M. Sopwith's *Endeavour* in 1934, was the second and *Ranger* of which Vanderbilt was sole owner and the firm of Sparkman and Stephens was co-designer with Burgess, the third, beating Sopwith's *Endeavour II.*

In smaller craft, American yachtsmen have never enjoyed the monopoly of victory that they have in America's Cup yachts, though they have always won their share and more. International racing has been held in many different types of craft, ranging in size down to 12- and 14-foot sailing dinghies. One of the best known is the six-meter class in which a dozen nations have competed for the Scandinavian Gold Cup, British-American Trophy, Seawanhaka Cup and other prizes. The most widely representative is the Star Class, which started in America but now sails in more than a score of countries throughout the world. The Stars are small one-design sloops, 23 feet over all and of inexpensive construction, in which several international events are held annually, including a world championship in which, up to 1946, only one nation, Germany, had ever taken top honors from American sailors.

Ocean Racing.—Though the first transatlantic yacht race was sailed in December 1866, by the big schooners *Henrietta, Fleetwing* and *Vesta,* this branch of the sport really began to attain its present popularity early in the 20th century, among owners of relatively small but seaworthy cruising yachts. The best known ocean races, all biennial fixtures, are the race from the east coast of the United States to Bermuda and that from the west coast to Honolulu, both of which date back to 1906, and the British Fastnet race from southern England to the Irish Coast and back. Transatlantic races are occasionally held, and many coastwise races, a greater or lesser part of which are in the open ocean. The popularity of this type of racing has grown very rapidly since about 1920, and has not only provided competition of the highest caliber, attracting many of the ablest yachtsmen in the sport, but also has been instrumental in developing a type of yacht which, with only slightly less speed than the extreme racing type, combines excellent cruising accommodations and the ability to go to sea and take the weather as it comes, as was proved in World War II when many of these ocean racing yachts were used by the Coast Guard, winter and summer, in a protective antisubmarine patrol along the coast. The modern ocean racing yachts are relatively small, ranging approximately from 35 to 75 feet in length over all, and are manned almost entirely by amateur crews.

Yacht Racing Classes.—The number and variety of yacht racing classes are legion, many being strictly local and consisting of only a few boats while others are national and even international in extent and run into thousands of



boats. In a general way, however, they may be grouped into (a) one-design classes (b) rating classes and (c) handicap classes. One-design classes are, as the name implies, boats all as nearly alike as they can be made in hull, rig and equipment, success in racing being entirely dependent on the skill of skipper and crew in keeping their boat and gear in top-notch condition and in sailing her. Such classes range from small open dinghies costing only two or three hundred dollars to big yachts of 50-foot waterline length. Rating classes are those in which all yachts compete without time allowance, but in which considerable latitude is possible in design, construction and rig. They are rated according to measurement formulas. Such classes are the six- and twelve-meter, R, Q, M, and 30-square meter classes and the modern America's Cup sloops of the J or 76-rating class. In handicap classes, boats are rated either according to one of many rating formulas or on past performance, and each one except the fastest receives a time allowance which is subtracted from her elapsed time in a race to determine her corrected time, prizes being distributed according to corrected time. Ocean, long-distance and port-to-port races are usually run on this basis.

Yacht Racing and Rating Rules.—A code of Yacht Racing Rules, governing competition among sailing yachts, has been adopted as standard in all yachting countries through the efforts of the North American Yacht Racing Union and corresponding yachting bodies in other countries. It is a lengthy document but its most important and often-invoked sections are those dealing with right of way. These are based on the Rules of the Road at Sea, but are more detailed and complicated because the Rules of the Road are designed to keep ships from approaching within risk of collision of each other, while the Racing Rules assume that competing yachts will be in close quarters most of the time and are designed to prevent actual collision.

Yacht Rating Rules.—Rating rules are those by which yachts are measured to determine in what racing classes each shall compete, or what time allowance each will receive in handicap racing. Originally simple rules, many of them have become extremely complicated in efforts to prevent designers from turning out freak boats which, while fast, are undesirable in other respects such as seaworthiness, cost, etc. They are based on different combinations of many factors such as length, beam, draft, tonnage, displacement, girth, sail area, weight of ballast, etc., and contain many limiting factors covering construction, equipment, rigging, etc. A naval architect, in racing yacht design, tries to produce the fastest boat of a given rating for a certain class, or a boat that will be fast yet have a low rating when handicapped under a given rule. There are many such rules, some still simple and applied only to one or two individual races while others are internationally used and applied to many races. Among the latter are the Universal Rule, under which the America's Cup boats and many American racing classes have been built; the International Rule, used both in Europe and America, particularly in the 6-, 8-, 10- and 12-meter classes; the Cruising Club Rule under which many important ocean races are handicapped, and the Square Meter or Sail Area Rule,

governing such classes as the 22- and 30-square-meter boats.

Yacht Speeds.—In displacement type hulls (i.e., those that go through the water and do not lift out and "plane") potential speed is a function of the square root of the waterline length. Thus a 36-foot waterline yacht that will make 8.4 knots under ideal conditions has speed-length ratio of 1.4, which is unusually high, whereas a 100-foot waterline yatcht making only 10 knots has a ratio of 1.0, which is poor. This, of course, applies to theoretical maximum speed, which is seldom reached by any yacht. Actual speed depends not only on the design, sails and rigging of the yacht but on the way she is sailed, the smoothness of her bottom, the wind, sea, tide and many other conditions.

This speed-length ratio theory does not apply to planing hulls, which include light, fast motor craft and a few light sailing types like the inland scows, since in those boats most of the hull is actually lifted out of the water by their motor or sail power and resistance correspondingly reduced. Hence speeds of 20, 30, or 40 knots may be made in boats 20, 30, or 40 feet long, and even much greater speeds in racing motorboats.

Sailing yacht speed records are of little significance as so much depends on conditions that are seldom twice the same. The best time ever made around a 30-mile triangular race course was by the America's Cup class sloop *Yankee* in a trial race in 1930, of 2 hours 47 minutes 59 seconds, or an average speed of about 10.7 knots. Her fastest 10-mile leg in that race was made at 13.3 knots. The transatlantic sailing record, made by the 134-foot waterline schooner *Atlantic* in 1905, is 12 days 4 hours 1 minute from Sandy Hook Lightship to The Lizzard, an average of 10.32 knots. The Bermuda race record, by the 50 foot waterline sloop *Highland Light* in 1932, is 71 hours 35 minutes 45 seconds for 628 miles.

Yacht Design and Construction.—The early yachts were replicas of commercial, naval and fishing vessels of their era and locality, modeled and built by the same men. The British revenue cutters, the fast able Sandy Hook pilot schooners and the fishing vessels of New England all had their influence on pleasure craft. In fact some were sold to become yachts, and vice versa, many yachts being converted to pilot vessels, fishermen and packets.

Before the middle of the 19th century practically every yacht was built to lines taken from a small model whittled and scraped to shape by an expert from a block of pine. The modern practice of designing a yacht on paper according to scientific principles came in, in America, after the Civil War when such men as A. Cary Smith, Edward Burgess and Nathaniel G. Herreshoff showed the way to the modern science of naval architecture which drafts and calculates each line and element of a yacht before building is started.

Concurrent with scientific designing came the gradual evolution of distinct yacht types, though the influence of commercial types is evident in many yachts even today, such as that of the Gloucester fishing schooners on seagoing cruising yachts. There is no one single "yacht type" but there are many types of yachts, each designed for the waters in which they are to be used, the type of use to which they will be put, and the requirements of their owners as to speed, comfort, seaworthiness, etc.

Yacht construction has likewise gradually diverged from commercial practice. Yachts are built of lighter materials, on construction principles which provide strength with relatively light weight (though often relatively heavy cost), especially in racing craft. Wooden frame-and-plank construction has always been standard yacht construction, though iron and steel hulls began to appear in large steam and sailing yachts in the latter part of the 19th century. World War II, aggravating the shortage of high-grade yacht building lumber, accelerated experiments in the use of substitutes, and the postwar revival of yacht building made increasing use of steel, in smaller yachts than hitherto, and of aluminum, molded plywood, sheet plywood and plastics.

Until well into the 20th century almost every yacht built, sail or power, was an individual creation of the designer and the builder to the order of the owner, and this remains the ideal with most yachtsmen. However, considerable economies in engineering and building are possible in turning out a large number of identical boats, and by the beginning of World War II the stock boat (i.e., one designed and built on the initiative of the builder and offered to buyers as a completed unit) has been widely accepted.

Power Yachts.—Steam power was applied to yachts during the latter part of the 19th century and in the early 1900's the ownership of a magnificent and luxurious steam yacht, used more often for social entertaining and ostentatious display than for satisfying any real taste for the sea, was a part of the equipage of many multi-millionaires. By the 1930's steam had been almost wholly superseded, in these large yachts, by the Diesel engine. The naphtha launch had a brief vogue in the late 1800's and early in the 20th century the internal combustion gasoline engine began to be fitted to pleasure craft, both as the prime motive power and as auxiliary power in sailing yachts. The refinement and increasing cheapness and reliability of gasoline engines rapidly brought power yachting within the reach of those of modest means, and motorboating paralleled the development of the automobile, from a luxury and curiosity status to an everyday vehicle used by many thousands of people for pleasure, small motorboats costing but a few hundred dollars being obtainable by 1940. Speeds increased as gasoline engines became lighter and more powerful, until by 1940 "runabout" type pleasure craft making up to 30 and 40 miles per hour and small cruising boats making 12 or 15 knots were not unusual. Following World War II a great increase in the popularity of power as well as sailing craft, on inland lakes and rivers as well as on salt water, was noticeable. Motorboating requires less skill and experience than sailing, and consequently appeals to many who might hesitate to take their first taste of boating under sail. The Diesel engine, operating on cheaper and safer fuel, is newer than the gasoline engine; it has not only replaced steam in big yachts but also replaced gasoline engines in many of the slower motor cruisers from 35 feet up in length, although the Diesel is heavier per horsepower and more costly to install than gasoline power.

To the work of yacht designers and builders and engine manufacturers in the developing of fast, able and dependable motor yachts the world

owes many of the smaller naval craft that helped win World War II—the motor torpedo boats, submarine chasers, and other military craft, the principles of whose design, building and powering were based largely on yacht practice.

Yachts in War.—From the earliest times, yachts have served their countries in times of war. British and Dutch naval histories as far back as the 17th century include many mentions of yachts as a part of the fighting fleets. In the United States, a number of yachts were converted into privateers when the War of 1812 started and brought in some of the first prizes. In the Civil War, yachts, among them the *America,* served as dispatch and blockading vessels. Steam yachts formed a part of the fleet that won the Battle of Santiago in the Spanish War. In World War I several steam yachts served with distinction. In World War II practically all the larger Diesel yachts were taken over by the Navy for escort, patrol, antisubmarine and other duties; smaller Diesel and gasoline yachts formed an important part of the coastal defense fleet, and many sailing yachts were formed into a coastal observation and listening patrol. The Navy and Coast Guard found the yachtsmen of the country a fertile source of experienced seagoing personnel during wartime.

YADKIN, yăd'kĭn, a river in North Carolina about 202 miles long; it flows east and south and joins the Uharie River to form the Pee Dee River. Yadkin is also a county in North Carolina.

YADRINTSEF, yăd-rĭn'zĕf, **Nikolai Michailovitch,** Russian author: b. Siberia, 1842; d. Barnaul, Altai Mountains, June 29, 1894. Accused in youth of conspiring for the independence of Siberia, he was exiled to Archangel, but later was permitted to return and was appointed on the staff of Governor-General Kaznakof. Between 1865 and 1875 he traveled extensively in Siberia, publishing the results of his explorations and in 1882 founded at Petrograd (later removing to Irkutsk), the *Eastern Review,* a strong popular weekly devoted to the interests of Asiatic Russia. In 1891–1892 he made careful explorations in Mongolia, discovering the ruins of the ancient capital of the Tatar khans and forming archaeological collections of great value. In 1893 he visited the United States. He was the founder of the Siberian University and a promoter of universal education. Among his works are *The Russian Commune in Prison and in Exile; Siberia as a Colony* (1882).

YAGUARONDI, yä-gwä-rŭn'de. See JAGUARONDI.

YAHOO, yä-hōō', a name given by Swift in his *Gulliver's Travels* to a race of brutes, described as having human forms and degraded propensities. They were subject to the Houyhnhnms, or horses endowed with human reason. Hence, the term is applied to a rough, low, boorish, or uneducated person.

YAHWIST. See ELOHIST.

YAJUR VEDA, yă'jōōr vā'dà. See VEDIC LITERATURE.

YAK, yăk, the native name for the wild ox (*Bos grunniens*) of the mountainous regions of Tibet. There are two races: the wild yak, generally black, which is found near the snow line, descending into the valleys in winter, and a domesticated race, usually half-breeds, of various colors, black and white being most common. The yak is about the size of the common ox, to which it has a general resemblance, but it is covered with a thick coat of long, silky hair, hanging down like the fleece of a sheep, completely investing the tail, and forming a lengthy fringe along the shoulders, flanks and thighs. This fringe, which exists in both races, was apparently developed as a protection to the animal in its alpine haunts, as the long hair forms a sort of mat which defends the body from the effects of the cold when the animal is reposing in the snow.

The domesticated race is of great importance to the natives of Tibet. The yak is employed as a beast of burden, but never for tillage or draft; the milk is very rich and yields excellent butter; the flesh is of the finest quality, and that of the calves far superior to ordinary veal. The hair is spun into ropes and made into coverings for tents, and the soft fur of the hump and withers is woven into a fine strong cloth. The tails, often dyed red, are made into the chowries or fly-flappers, used in India. Yaks are often seen in zoological gardens and menageries, and have repeatedly been bred in Europe. It is probable that they might be advantageously introduced into the northern parts of the continents of America and Europe. They have, however, the disadvantages of not eating corn and not being able to live at a low elevation.

YAKIMA, yăk'ĭ-mô. See SHAHAPTIAN INDIANS.

YAKIMA, a river of the State of Washington, rising in the Cascade Mountains and after a southeastward course of about 175 miles, flowing into the Columbia about six miles west of Pasco and Kennewick, and 10 miles above the confluence of the Snake River. It flows through an important coal-mining region and its valley and those of its numerous short tributaries are among the most fertile in the state. The Northern Pacific Railway traverses the whole length of the valley of the Yakima, almost to its source. The chief tributary is the Naches River which joins the Yakima at the city of Yakima (q.v.).

YAKIMA, Wash., city and Yakima County seat; on the Yakima River; altitude 1,069 feet; 160 miles southeast of Tacoma; on the Northern Pacific and Union Pacific railroads; has a county airport, with airline service. Food processing and packing is its leading industry. Incorporated in 1886, it has commission government. Pop. (1940) 27,221; (1950 est.) 38,375.

YAKOBA, yä-kō'bä, now **BAUCHI,** bouchē', West Africa, a town in northern Nigeria, in the Province of Bauchi, finely situated on a plateau partly surrounded by mountains, 140 miles southeast of Kano, and on a caravan route. It is walled and the interior is finely diversified with gardens and ponds. The climate is healthful. Pop. province (1931) 1,025,310; town about 11,000.

YAKONAN (from *yakwina,* «spirit»). A linguistic stock of North American Indians, consisting of the Alsea, Yakwina, Kuich and Siuslaw divisions. They were physically of the type of the Northwest Coast Indians and were the southernmost tribe practising artificial deformation of the head. Their mythology and traditions were chiefly of the North but were somewhat modified by contact with the Indians of the California coast. Slavery existed among them until they came under the control of the United States. The home of the Yakwina was along Yaquina River, Oregon, from the site of Elk City to the sea; they were formerly numerous, occupying 56 villages in early days, but the tribal distinction of the Yakwina, as well as of the other Yakonan divisions, was gradually broken down through their preference for marriage outside the tribe; there are only a few Yakwina left and these reside on Siletz reservation, but their number is unknown. The Alsea formerly dwelt in villages along both sides of Alsea River, Oregon, and on the adjacent coast; they are now on Siletz reservation, and perhaps a few are on Grande Ronda reservation. The Siuslaw were also village dwellers, inhabiting Siuslaw River as late as 1857; they are probably extinct. The Kuich or Lower Umpqua, villages were on both sides of Umpqua River from its mouth upward for 30 miles; a few survivors still reside on Siletz reservation. The entire population of the Yakonan Indians probably does not exceed 400.

YAKUB BEG, yä-koob′ bēg, surnamed Attalik Ghazi («leader of the champions of the faith»), amir of Kashgar: b. Russian Turkestan early in the 19th century; d. 31 May 1877; He distinguished himself in the defense of Khokan against the Russians. But he first rose to great eminence after the recovery of Kashgar from the Chinese in 1864, when he acted as lieutenant to Buzurg Khan, whom he soon supplanted. For 12 years this remarkable man conferred on a large part of Central Asia the benefits of a settled though rigorous government. He drilled and disciplined a large civil staff, while his army contained the best native soldiers in Central Asia. In his foreign policy he was strongly anti-Russian, and ultimately friendly to Great Britain. China, however, set out to recover its lost Mohammedan provinces and had gained some victories when Yakub died — by assassination, some said. His realm at once fell in pieces. The Chinese armies overran the country (1878), and Kashgar again came under Chinese rule.

YAKUB KHAN, khän, ex-amir of Afghanistan: b. 1849. He was a son of the amir Shere Sli; was appointed governor of Herat by his father and became extremely popular, but in 1870 broke into open revolt, and in 1874 was imprisoned at Kabul. On the death of Shere Ali he was proclaimed amir (1879) and concluded a treaty of peace with the British at Gandamak. By the terms of this treaty he was to receive a British resident, and on his side to obtain from the British government a subsidy and aid in case of foreign attack. The murder of Sir Louis Cavagnari, the resident, with staff and suite, occurred in the following September. Yakub was suspected of complicity. Lord Roberts (then Sir Frederick) defeated the Afghan force 6 October and seized Kabul on the 12th. Yakub abdicated and fled to the British camp. In December he was sent to India as a deposed ruler. Died, 15 Nov. 1923.

YAKUTSK, yä kootsk′, Asiatic Russia. (1) capital of the Yakutian Autonomous Soviet Socialist Republic, on a plain surrounded by lofty heights, on the left bank of the Lena. The streets present a singular aspect, being composed of about 400 houses of European structure, standing apart, while the intervening spaces are occupied by winter *yurts* or huts of the northern nomads, with walls of cow-dung, earthen roofs, and doors covered with hairy hides. The principal buildings of the town are a large stone cathedral, other churches, a synagogue, a market-house and several educational institutions. Inundations are frequent and the town is consequently unhealthful. The trade is important, Yakutsk being the chief commercial emporium for the whole of Eastern Siberia. The principal articles of native produce are furs and fossil ivory, which are exchanged for European produce. Important fairs are held. Pop. about 10,000. (2) The Yakutian S. S. Republic has an area of 1,533,397 ('Century Dict.' and 'Encyc. Brit.' give 1,530,253; other authorities, 'Standard Dict,' Lippincott, Longman, agree with International') square miles, or about two-fifths of that of Europe. The surface is generally low in the north, but rises toward the interior, and in the south and east is covered by the Yablonoi or Stanovoi Mountains and their offshoots. A noteworthy feature of the country is the *tundras,* immense boggy plains, which stretch along the north. Farther south there are good pastures, and wheat and rye are successfully cultivated, even where the ground is frozen to a depth of 600 feet, the summer heat being strong enough to thaw it sufficiently deep for cultivation. There are a number of large rivers teeming with fish, the principal being the Lena. There are valuable forests in the south, frequented by numerous fur-bearing and other animals. Gold and salt are mined but other mineral wealth, including coal, is practically untouched. Caravans with Chinese and European goods collect the produce of the whole line of coast on the Polar Sea between the parallels of 70° and 74°, from the mouth of the river Lena to the farthest point inhabited by the Tchukchis. The towns are chiefly inhabited by Turks and Cossacks, but the great body of the people are nomads, consisting of Yakuts, Tunguses, etc. Frosts of 79.5° F. are recorded and the period free from frost is only about 37 days. The climate is the coldest in Siberia. Pop. about 325,000.

YALE, Elihu, English philanthropist; b. in or near Boston, Mass., 5 April 1648; d. London, England, 8 July 1721. His father was Thomas Yale, one of the original settlers in New Haven, Conn., in 1638, but who removed to Boston soon afterward and to England in 1651, followed by his family the next year. The son was educated in England, engaged in trade in India in 1672, and in 1687–92 was governor of the East India Company's fort at Madras. He returned to England in 1692 and, although he never revisited New England, he displayed his interests in the Collegiate School founded at Saybrook in 1700 by sending gifts of money and books to the amount of some £600 in 1715, 1718

and 1721. The largest gift, that in 1718, followed a suggestion from the college authorities that the college building then being erected in New Haven might be named for him. In 1745 the whole institution received the name of Yale College in his honor. Yale's latest years were passed at Wrexham, Denbighshire, North Wales, and his body is buried in the magnificent parish church there.

YALE, Linus, American inventor: b. Salisbury, N. Y., 4 April 1821; d. New York, 24 Dec. 1868. He was the son of Thomas Yale, an inventor, who was credited with having constructed a number of farm machines. His father also invented a bank lock in 1840, and manufactured it for a time in Newport, N. Y. Young Linus became interested in his father's work, and by 1851 had patented a safety lock. For the rest of his life he was a recognized authority on all matters pertaining to locks and safes. Becoming convinced of the necessity of abandoning the use of a keyhole as affording an easy means of introduction to the lock mechanism, he was led to the adoption of the permanent dial and shaft as used in the combination locks, and subsequently to the perfection of what is known as the «clock» lock. His most notable invention was the double lock, which comprised two locks within a single case, and was operated by the same or different combinations. He received gold, silver and bronze medals as first awards at various expositions.

YALE UNIVERSITY, New Haven, Conn. The idea of a college in Connecticut originated in the Oxford-bred mind of the Rev. John Davenport, who with his Puritan associates established the first settlement of the New Haven Colony in 1638. In 1648 the General Court convened and gave power to a committee «to consider and reserve what lot they shall see meet and most commodious for a college.» In 1701, according to tradition, ten Connecticut clergymen met in the house of the Rev. Samuel Russel at Branford and made a gift of books for «the founding of a College in this colony.» On 9 Oct. 1701, the General Court passed «An Act for Liberty to erect a Collegiate School» wherein «Youth may be instructed in the Arts & Sciences who thorough the blessing of Almighty God may be fitted for Publick employment both in Church & Civil State.» The original seat of the college was at Killingworth (Clinton) in the residence of the Rev. Abraham Pierson, first rector. The Bachelor of Arts degree was first conferred for work in course in 1703. In 1707 the college moved to Saybrook and in 1716 to New Haven. The first building was begun in 1717 and completed in 1718. The new building was named Yale College in honor of Elihu Yale, a retired East India merchant of New England ancestry then living in London, who had made a substantial gift to the Collegiate School. An amendment to the charter in 1745 gave the institution its present corporate form, «The President and Fellows of Yale College in New-Haven.» Connecticut Hall, Yale's first brick building, was completed in 1752 and is still standing. With its statue of Nathan Hale, 1773, it is perhaps the most striking reminder of the Yale of the 18th century. In 1792 the governor, lieutenant-governor, and «six senior assistants in the Council of this State» (later the six senior senators) were made members *ex officiis* of the Corporation. Yale had ceased to be a provincial New England institution and was drawing many students from the South and West.

The next step was transition from college to university. The School of Medicine was chartered in 1810 and began instruction in 1813. The Divinity School was organized in 1822 and the Law School was affiliated with Yale College in 1825. In 1831 Yale acquired the collection of historical paintings by John Trumbull, and the first Art Gallery connected with a college in America was erected in 1832 for their exhibition. The School of the Fine Arts was not established until 1865. Graduate courses in philosophy and the arts were organized in 1846. In 1854 the School of Applied Chemistry (1847) and the School of Engineering (1852) united in Yale Scientific School. This new school took the name of its benefactor, Joseph Earl Sheffield, and became the Sheffield Scientific School in 1861.

Ten years later (1871) an act of the General Assembly provided for the substitution of graduates in place of the six State senators on the Corporation. The General Assembly authorized the name Yale University in 1887. Later were established the School of Music (1894) and the School of Forestry (1900). Yale-in-China was founded by Yale graduates at Changsha in 1906. During the World War (1917–18) Yale's dormitories were turned into quarters for a Reserve Officers' Training Corps and a Naval Training Unit. The year 1920 marked the beginning of the administration of the Freshman Year under its own dean and faculty. After the war the School of Nursing (1923) and the Institute of Human Relations (1929) were established by the gifts of several foundations. The School of Engineering (since 1861 part of the Sheffield Scientific School) was reëstablished in 1932. An Undergraduate Residential College Plan was inaugurated in 1933.

Since the founding of the Collegiate School in 1701 the following have been Rectors or Presidents of Yale. (The change from Rector to President occurred during the administration of Thomas Clap, 1740–66): Abraham Pierson, 1701–07; Samuel Andrew, 1707–19; Timothy Cutler, 1719–22; Elisha Williams, 1726–39; Thomas Clap, 1740–66; Naphtali Daggett, 1766–77; Ezra Stiles, 1778–95; Timothy Dwight, 1795–1817; Jeremiah Day, 1817–46; Theodore Dwight Woolsey, 1846–71; Noah Porter, 1871–86; Timothy Dwight, 1886–99; Arthur Twining Hadley, 1899–1921; James Rowland Angell, 1921–37; Charles Seymour, 1937–

The final authority in the «Government, Care, and Management» of the university is the Corporation, a body of 19 trustees, consisting of the President of the university, the Governor and Lieutenant-Governor of the State *ex officiis*, 10 Fellows who are the «Successors of the Original Trustees,» and six Alumni Fellows, elected one every year by the graduates to serve for six years. The Council of Masters, composed of the Masters of the residential colleges, serves as a committee of control in matters affecting the colleges. An Alumni Board, composed of representatives of all Yale alumni associations of one hundred or more members, serves to maintain mutual understanding between the university and its alumni. The Library, the Peabody Museum of Natural History,

the Observatory, and the Gymnasium are organized independently of the several schools.

The courses of study are offered in twelve schools. Each school has a faculty, a board of permanent officers, and a dean. All undergraduate students enter Freshman Year which prepares them for their three upper-class years in Yale College, or the Sheffield Scientific School, or the School of Engineering. Freshmen live together on the Old Campus and take their meals together in the University Dining Hall. Yale College, historically the progenitor of the university, offers courses of study in the liberal arts leading to the degree of Bachelor of Arts (B.A.). The Sheffield Scientific School offers courses leading to the degree of Bachelor of Science (B.S.) in the following fields: Chemistry (including physiological chemistry or bio-chemistry), physics, biological science (including pre-medical studies), plant science (including pre-forestry studies), psychology, mathematics; and in certain basic technical and economic studies which prepare for careers in industry and commerce and are designated as Industrial Administration and Applied Economics, respectively. The School of Engineering provides courses leading to the degree of Bachelor of Engineering (B.E.) as follows: chemical engineering, civil engineering, electrical engineering, mechanical engineering and metallurgy.

Besides the four undergraduate schools there are eight graduate and professional schools: Graduate School, School of Medicine, Divinity School, School of Law, School of the Fine Arts, School of Music, School of Forestry, and School of Nursing. The Graduate School offers training in a great variety of fields, either for teaching (generally in colleges and universities) or for research. It confers the degrees of M.A., M.S. and Ph.D. For those who do not desire highly specialized training with emphasis on research, there is a Division of General Studies not leading to a degree. In the School of Medicine the courses of study leading to the degree of Doctor of Medicine are divided into two periods, of about two years each. The first period is devoted to basic courses which are required of all students; the second is devoted to work in Clinical Medicine. Graduate courses leading to the degree of Master of Public Health and Doctor of Public Health are also given. The New Haven Hospital (550 beds) and the New Haven Dispensary (110,000 visits annually), allied with the school, serve as centres of clinical instruction. The Divinity School is undenominational and gives instruction in the history, doctrine, and polity of all the leading Protestant churches. Degrees conferred are Bachelor of Divinity and Master of Sacred Theology. The School of Law offers a three-year course leading to the degree of Bachelor of Laws; additional courses of one or two years each lead to the degrees of Master of Laws, Doctor of Civil Law, or Doctor of the Science of Law. Students in the regular curriculum receive preparation for the practice of law in any State. The School of the Fine Arts offers professional courses in architecture, drama, painting, and sculpture, and its general courses are open to the student body of the university at large. The School of Music offers a three-year course leading to the certificate, a five-year course for the degree of Bachelor of Music, and graduate courses for the degree of Master of Music. Closely associated with the School of Music is the New Haven Symphony Orchestra. The School of Forestry (1900) was one of the first institutions in the United States to give professional training in forestry for those who expect to enter public service or forest industries. The summer session is conducted in the Yale Forest at Union, Conn. Field instruction and practice are also involved in the Eli Whitney Forest of 22,000 acres near New Haven and on large private tracts in Louisiana and Arkansas. The School of Nursing, through the generosity of the Rockefeller Foundation, was founded in 1923 on the 50th anniversary of the Connecticut Training School for Nurses, the institution which it succeeded. The curriculum of 32 months includes public health and community work as well as hospital service, leading to the degree of Master of Nursing.

The Institute of Human Relations (1929) promotes co-operative research in the sciences concerned with individual and social behavior. The Institute of International Studies was organized in 1935. The Bureau for Street Traffic Research (1938) provides training in techniques for the safe and efficient control of street and highway traffic.

Yale's buildings number more than 100. Across College Street from the New Haven Green is the Old Campus with its traditional Yale fence, and Connecticut Hall. Around it are dormitories, recitation halls, and two chapels. To the west is the Memorial Quadrangle with the Harkness Tower, gift of Mrs. Stephen V. Harkness in memory of her son, Charle W. Harkness, B.A. 1883. This quadrangle designed by James Gamble Rogers, B.A. 1889, was first occupied in 1920. In 1933 the southern portion of the Memorial Quadrangle became Branford College, the northern portion became Saybrook College; funds for the remodeling were the gift of Mrs. Harkness' son, Edward S. Harkness, B.A. 1897.

The Bicentennial Buildings (College and Grove Streets), designed by Carrère and Hastings, were erected in 1901 and 1902 by the alumni to commemorate the founding of the university. One wing contains the University Dining Hall; the other, Woolsey Hall, an auditorium seating 2,800. Portraits of distinguished graduates and others are hung in the Dining Hall. The Newberry Organ in Woolsey Hall is a memorial to John Stoughton Newberry, the gift of his family. In Memorial Hall, a circular building which joins Woolsey and the Dining Halls, are tablets commemorating individual Yale men and those who died in the Revolutionary, Civil, Spanish-American, and World Wars. The Alumni War Memorial forms a colonnade on the south side of University Hall and was erected in 1927–28 as a tribute to Yale men who died in the World War.

The Sterling Memorial Library, designed by James Gamble Rogers, B.A. 1889, completed in 1931, was one of the many buildings erected from funds provided by the trustees of the estate of John W. Sterling, B.A. 1864. All public rooms are on the first floor, including Linonia and Brothers Library, Rare Book Room, and Yale Memorabilia Room. On upper floors are the «Yale Library in 1742» and special collections which include the library of the

American Oriental Society, the Babylonian Collection, the Speck Collection of Goetheana, the Mason-Franklin Collection, and the Yale Collection of American Literature and many others. The total number of volumes in the several libraries of the university is about 2,850,000; the Sterling Memorial Library contains approximately 2,151,000.

The first wing of the present Gallery of Fine Arts was completed in 1928. The building contains the administrative offices of the School of the Fine Arts and of the Gallery, classrooms, studios, a lecture hall, and galleries in which are exhibited the Jarves Collection of late Mediæval and early Renaissance Italian Paintings, the Mabel Brady Garvan Collections of American Arts and Crafts, Achelis Collection of Prints, Hobart Moore Memorial Collection of Textiles, Antiquities from Greece, Rome and Europe in the Middle Ages, and many others. The Peabody Museum of Natural History was completed in 1925. The exhibition halls contain collections in Mineralogy, Paleontology, Zoology, Anthropology, and the Bingham Oceanographic Collection.

The Sterling Divinity Quadrangle, William Adams Delano, B.A. 1895, architect, is Georgian Colonial in style. It is about a mile north of the campus on Prospect Street. Funds for its construction came from the estate of John W. Sterling. The quadrangle contains Marquand Chapel, libraries, offices, and classrooms, together with a refectory and dormitory accommodations for 180 men students.

The buildings of the School of Medicine, the New Haven Hospital and the New Haven Dispensary occupy two blocks about half a mile south of the Old Campus. The principal buildings are the Sterling Hall of Medicine, the Anthony N. Brady Memorial Laboratory, the Clinic Building (centre of the Hospital group), the Raleigh Fitkin Memorial Pavilion, the Farnam Memorial Building, the Sarah Wey Tompkins Pavilion. The building of the Institute of Human Relations, which is continuous with the Sterling Hall of Medicine, contains the offices, laboratories, and clinic of the Department of Psychiatry and Mental Hygiene, and the Clinic of Child Development.

Yale has recognized the social and educational values inherent in small groups by establishing residential colleges for the students in the undergraduate schools. Nine have been completed: Berkeley, Branford, Calhoun, Davenport, Timothy Dwight, Jonathan Edwards, Pierson, Saybrook, and Trumbull; a tenth college, Silliman was completed in 1940. The college plan was made possible through gifts from Edward S. Harkness, B.A. 1897. Each college has its own library, dining hall, kitchen, common rooms, squash courts, and accommodations for about 200 students. At its head is the Master who lives in the college. Associated with him as active Fellows are about 15 members of the faculty, some of whom reside in the college, and all of whom have studies there in which to meet students. Attached to each college is a group of Associate Fellows who share in its life. Sophomores, Juniors, and Seniors of the undergraduate Schools (Yale College, Sheffield Scientific School, and the School of Engineering) live in the colleges.

About 90 per cent of Yale undergraduates participate in some kind of sport or exercise under university auspices. The Walter Camp Memorial Gateway, designed by John W. Cross, B.A. 1900, forms the Derby Avenue entrance to the Yale Bowl and Field. The Yale Bowl has a seating capacity of 75,000. Yale Field of 145 acres is devoted to various athletic sports. West of the Walter Camp Gateway lies the Ray Tompkins Memorial tract of some 700 acres where there are bridle paths, cross-country courses, and a golf course. Crew quarters are provided in the Adee Boat House on New Haven Harbor, the Bob Cook Boat House on the Housatonic River, and the Gales Ferry Boat House on the Thames. The Payne Whitney Gymnasium on Tower Parkway is a memorial to Payne Whitney, B.A. 1898, the gift of his wife and children, Mrs. Charles Shipman Payson and John Hay Whitney, B.A. 1926. The building designed by John Russell Pope, was completed in 1932 and is a great indoor playground with facilities for all kinds of games and exercise.

The Church of Christ in Yale University (non-sectarian) has an unbroken history going back to 1757. Under the direction of the University Chaplain, and a board of deacons, composed of students and members of the faculty, the Chapel invites the attendance and membership of all members of the university of whatever creed.

The university awards numerous scholarships, fellowships and prizes. In 1939–40, 732 undergraduates received scholarship and beneficiary aid totaling $311,489. Additional awards to graduate and professional school students, together with supplementary employment made available by the Bureau of Appointments, raised the 1939–40 total to more than $1,300,000. Prominent among the university's public lecture courses are the Silliman Memorial Lectures on Science; the Francis Bergen Memorial Lectures on English literature or drama; the Lyman Beecher Lectures on Preaching; the Bromley Lectures on journalism, literature, or public affairs; the Dwight H. Terry Lectures on religion in the light of science and philosophy; the William L. Storrs Lectures on problems of law and jurisprudence; the Trowbridge Memorial Lectures and the Ryerson Memorial Lectures in the School of the Fine Arts.

As of 1 Nov. 1939, Yale's student enrolment was 5,747. Every State in the Union was represented as well as the District of Columbia, Alaska, Hawaii, the Philippine Islands, Puerto Rico, and 36 foreign countries. On full-time teaching appointment in 1939–40 were 163 professors, 78 associate professors, 139 assistant professors, and 190 instructors. The total faculty numbered 1,024. Yale's total endowment in 1938–39 was $100,448,707; income $7,584,772.43, and gifts received amounted to $1,189,200.78.

CARL A. LOHMANN,
Secretary, Yale University.

YALTA, yôl'tà, city, USSR, located in the Crimea, RSFSR, on the Black Sea, 30 miles east of Sevastopol. Because of its mild climate, it has been a popular resort since the mid-19th century. The surrounding area produces tobacco, grapes for wine, and other fruit. At nearby Livadiya, site of the former winter palace of the czars, a Big Three conference was held in February 1945 (see PACTS AND CONFERENCES: WORLD WAR II—*Crimea Conference* [*Yalta*]). Pop. (1926) 28,838.

YALU, yä'lo͞o' (Korean AMNOK; Jap. ORYOKKO), river, Asia, forming the northwestern boundary between Manchuria and Korea. Rising from the southern slope of the Chang Pai Shan (Paektu-san), it flows south for some 60 miles and then turns westward near Hyesanjin. After receiving two tributaries, the Hochun and the Changjin, it bends north and then southwest, becoming very wide with the influx of many more tributaries, and eventually empties into Korea Bay, an arm of the Yellow Sea. Flowing in a winding channel through gently rolling hills and steep-walled valleys, the Yalu takes 491 miles to cover a distance less than half that as the crow flies, and its basin extends over an area of 24,185 square miles. The chief tributaries are the Hun on the Manchurian side, and the Chasong, Tongno, and Chongman on the Korean side. The river is navigable for about 420 miles by small boats, and timber is floated in rafts from the upper reaches. The entire estuary is an important industrial center for light metals, chemicals, and wood products. Sinuiju, opposite Antung, Manchuria, is the chief city on the Yalu; a major sawmilling and industrial center, it was heavily bombed in the Korean War. At the mouth of the river is the flourishing port of Yongampo.

The Yalu was the scene of fighting in the Sino-Japanese and Russo-Japanese wars. In October 1950, during the Korean War, United Nations forces reached the Yalu at Hyesanjin, only to be forced back by the invading Chinese Communist troops. In June 1952, the huge power plant of the Supung Reservoir was almost destroyed by United Nations planes.

YAM, the popular name for various plants of the genus *Dioscorea* of the family Dioscoreaceae, and loosely applied in the southern United States to certain varieties of the sweet potato. The true yams belong to a genus consisting of more than 150 species widely distributed through the tropics. They have herbaceous twining or creeping stems, broad leaves, and small dioecious flowers, followed by three-angled capsular fruits containing winged seeds. The fleshy roots of some species are widely eaten in tropical countries. The tubers of *D. alata,* one of the best-known species, usually attain a length of three feet and a weight of 30 pounds, but specimens three times as large are not uncommon. They are black or brownish outside and pink within, and are rich in starch. Among other edible species are *D. sativa, D. aculeata, D. rubella,* and *D. globosa.* The air potato (*D. bulbifera*) is an Asian species cultivated to some extent in the United States. The cinnamon vine (*D. batatas*), also known as the Chinese yam or Chinese potato, is often cultivated as an ornamental plant. It bears cinnamon-scented white blossoms.

YAMA, yŭm'à, in Vedic mythology, the first man, who became the ruler of the blessed dead. In Hinduism he was transformed into the judge of the dead, whom he sends, according to their actions, to the celestial or the infernal regions. He is offered oblations of water.

YAMADA. See UJIYAMADA.

YAMAGATA, yä-mä-gä-tä, PRINCE **Aritomo,** Japanese soldier and statesman: b. Choshu Province, Japan, April 22, 1838; d. Odawara, Japan, Feb. 1, 1922. Educated by the patriot Shoin Yoshida, he was active in the overthrow of the shogunate, and in 1869 he was sent by the new imperial government to study the military systems of France and Germany. In 1873 he became minister of war, and in 1877 he directed the government's operations against the Satsuma rebels. In the following year he became chief of general staff, and in 1884 received the title of count. He was minister of home affairs in 1885. Appointed prime minister in 1889, he held this office until 1891, when he became minister of justice. He proved himself a skillful strategist in the Sino-Japanese War, and was made a marquis at the close of the war in 1895. From 1898 to 1900 he served once more as prime minister, and during the Russo-Japanese War was chief of general staff. In 1905 he became president of the Privy Council, and in 1907 was raised to the rank of prince. Yamagata was the spokesman of the military faction of the ruling oligarchy, and as such was the principal opponent of Prince Hirobumi Ito (q.v.). He originated the policy of having only active army or navy officers serve as army and navy ministers—a policy which did much to further the rise of militarism in the 1930's.

YAMAGATA, city, Japan, capital of the prefecture of the same name, situated in Honshu, on the Mogami River, 30 miles west of Sendai and 180 miles north-northeast of Tokyo. It is a silk center and has metalworking establishments. Among its notable buildings are an ancient Shinto shrine and a castle of the feudal period. Pop. (1947) 98,632.

YAMAGUCHI, yä-mä-go͝o-chē, city, Japan, capital of the prefecture of the same name, situated in Honshu, on the Fushino River, 35 miles north of Shimonoseki. It has popular hot springs and considerable commerce and industry.

From the 12th century on, Yamaguchi was the seat of the Ouchi family, and by the early 16th century it had become a flourishing cultural center. In 1551 the city was visited by St. Francis Xavier, who established a Christian mission there (like the other early missions, it was destroyed in the 17th century). Subsequently the Ouchi declined in power, and their place was taken by the Mori, who remained as feudal lords until 1868. Pop. (1947) 97,975.

YAMAMAI, yŭm'à-mī, a large Japanese silkworm (*Antherea yamamai*) which feeds on the oak and produces green-tinted silk, known by the same name, which is extensively used in Japan and to a lesser extent elsewhere.

YAMANOUCHI GUN. See ORDNANCE.

YAMASKA, yä-mäs'ka, Quebec, Canada; (1) a village and railway junction of Yamaska County, on the Yamaska River, 31 miles north of Saint Hyacinthe. The river affords power for several mills. Pop. about 900. (2) A county bordering on Lake Saint Peter; area, 183,705 acres. Capital, Saint François du Lac. It is drained by the Yamaska, Nicolet and Saint Francis rivers. Pop. 16,204. (3) A river flowing from Brome Lake, Brome County, west, then north, and after a course of about 100 miles through a fertile country, draining into the Saint Lawrence River at Lake Saint Peter.

YAMBO, yäm'bō, **YANBU,** yän'boo, or **YEMBO-EL-BAHR,** yĕm'bō-ĕl-bär, Arabia, a seaport town on the Red Sea, in the kingdom of Hejaz, 115 miles west of Medina, of which it is the harbor. Marking the end of the third quarter of the caravan journey from Cairo to Mecca, the town bears the title "Gate of the Holy City." The town consists of a long row of white houses built of limestone and coralline, standing on the edge of an arid plain. It has considerable imports and transit trade between Suez, Jidda and Medina. Pop. about 6,000.

YAMEO (also **LLAMEO, LAMA, LAMISTA** or **LHAMEOS),** South American Indian tribe of northeastern Peru, living along the Marathon (Upper Amazon), the lower Huallaga and Javery rivers, and formerly between the Tigre and Napo rivers. Physically they are smaller than the other tribes of the region. They have a distinct language, and while formerly warlike are now in the main peaceable agriculturists and weavers. The portion of the tribe living farthest to the east maintains its primitive customs, but the larger part of the tribe has become merged in the general country population. Franciscan missionaries brought most of the tribe under the influence of civilization. Consult Brinton, D. G., 'The American Race' (New York 1891).

YANA ("people"), a small tribe, forming the Yanan (or Noje, or Nozi) linguistic stock of North American Indians, whose former habitat was bounded on the east by a mountain range a little west of Lassen Butte, and terminating near Pit River, in northern California; on the north by a line running northeast to southwest, passing near the northern side of Round Mountain, three miles from Pit River; on the west by a line extending from Redding southward on an average 10 miles to the eastward from Sacramento River; north of Redding it approximates twice that distance. They were massacred by the miners of the neighboring country in August 1864, all but 50 being killed. The tribe and stock were represented in 1884 by 35 individuals divided into two groups — one at Redding, the other in their original country at Round Mountain and in 1902 but six remained. They have a tradition to the effect that they came from the East and it is said that in physical traits they differ markedly from all the northern California Indians.

YANA, yä'nä, or **JANA,** Eastern Siberia, a river which rises in the Verkhoyanskii Mountains, and after a northerly course of about 750 miles enters the Arctic Ocean through Yana Bay, near Ustjansk, by seven large and many small mouths.

YANCEY, William Lowndes: American political leader and orator: b. Ogeechee Shoals, Ga., 10 Aug. 1814; d. 27 July 1863. He was the son of Benjamin Cudworth Yancey, a political leader of the South, who died at the age of 36. His stepfather was the Reverend Nathan Beman of New York. Yancey studied at Williams College, but lack of funds arrested his course there before he was graduated. He entered the law office of B. F. Perry at Greenville, S. C., was admitted to the bar in 1834, and began to publish the Greenville *Mountaineer,* which was opposed to nullification, and supported the Union. In 1835 he married Miss Earle of Greenville, who was possessed of a considerable fortune in negro slaves. Yancey resolved then to abandon law and undertake cotton planting at Catawba, Ala. However, a local feud resulted in the poisoning of the Yancey wells and the consequent death of the slaves, and he was forced to abandon the plantation. He re-entered his profession, resumed his journalistic efforts, and became a commissioner in bankruptcy. At Wetumpka, near Harrowgate Spring, Yancey owned and edited a weekly newspaper, and established a flourishing law practice. He sat in the Alabama legislature, and was active in reform measures (1841–44). After a vigorous campaign he was elected to Congress for the term 1844–46. After a duel with Representative Clingman of North Carolina, Yancey resigned from service in Congress, disappointed in that body. He moved to Montgomery, Ala., where he entered the firm of Elmore and Yancey, and soon recuperated his lost fortune. He now began a career of unofficial political leadership, peculiar to himself. At the National Democratic Convention at Baltimore Yancey led the movement which resulted in the adoption of the "Alabama Platform." This instructed the delegates not to vote for any candidate opposed to government protection of slavery. In spite of this organized effort, General Cass, the nominee of the Baltimore convention, received the electoral vote of Alabama.

When the question of secession was under consideration in 1851, Yancey favored withdrawal from the Union. When the State refused to summon the legislature to submit the question of convention to the people, he summoned a non-partisan mass State convention which sent representatives independently to the Democratic convention at Cincinnati. Yancey now became the controlling force in the radical politics of the State. He also made a canvass of the North, speaking eloquently in favor of secession and slave owners' rights, after the meetings of the Charleston Democratic Convention. The election of Lincoln was partly due to the split in the Democratic party which Yancey led. After the secession he was sent by the Confederacy to secure the recognition of the various European governments. His efforts at London and Paris were unsuccessful and he returned in 1862, when he was elected senator of the legislature of Alabama. He served in the Confederate Senate until his death. Consult Du Bose, J. W., 'Life and Times of William Lowndes Yancey' (Birmingham 1892).

YANES, yän'ĕz, **Francisco Javier,** Venezuelan diplomat: b. Caracas, Venezuela, 6 May

1861. From 1892 to 1897 he was vice-consul and acting consul-general of Venezuela at New York and in 1901–03 served as Spanish secretary and chief of the translations division of the United States Philippine Commission, Manila. From 1905 to 1910 Señor Yanes was secretary of the governing board of the International Bureau of American Republics and after 1910 served as assistant director and secretary of the governing board of the Pan-American Union, Washington, D. C. At the Jamestown Exposition of 1907 he represented the International Bureau of American Republics and was a member of the jury of awards. He was a member of the American Academy of Political and Social Science, the American Society of International Law, and of many other learned bodies. Señor Yanes wrote on literary and political subjects. Died, Washington, D. C., 25 Feb. 1924.

YANG-BAN (two divisions, civil and military). The name first given to the privileged classes in Korea, during the Korai dynasty (918–1392), when the inhabitants were classified as nobles, commoners and slaves. The nobles, owing allegiance to the king, exercised within their own domains both civil and military authority. In time, these functions and classes were separated, the civil officers being called East Division and the military, West Division, according to their place at court. After 1392, under the new dynasty, when Buddhism fell and Confucian ethics and Chinese ideas prevailed, many able commoners entering politics, the ruling classes numbered five, nobles, local yang-ban, middle-class men, common people and slaves. In this new classification, the noble yang-bans held the chief government offices and were immune from taxation. If not earning a living, they lived off the people. The chief families or clans were the Kim, Chwe, Pak, Li, Chong and An (the Six Families), and later the Min and Cho. The stories of their bitter feuds make up the substance of modern Korean history, culminating in the murder of Kim Ok Kun and Queen Cho. With other clans and their subdivisions, numbering over a score, there were, in 1910, 54,000 yang-ban families, comprising one-fiftieth of the households in Korea; two central provinces having a total of 35,630 families; though the yang-ban are scattered all over the peninsula. Without domains or fixed stipends, the yang-bans, despising labor and looking only to official positions and income — when there are but 17,000 offices of any and all sorts open to Koreans — the condition of 37,000 families in this proud class is that of poverty. In old days, a man in high office would have 200 or 300 hangers-on to look after, the public looking on his supporting so many relatives as a great virtue. When Korea, in 1912, for the third time in its history, was given the name of Chosen, apart from the creation of a new class of nobility pensioned by the Japanese government, all the old class distinctions and privileges — of amazing and curious variety — were abolished. Yet as social ideas, habits and customs die slowly, the yang-ban, like the old samurai of Japan, still enjoy, locally, much of the old-time prestige. The history of Korea, especially in its modern phases, cannot be understood without some understanding of the social influence of the yang-ban and their feuds. Consult Hulbert, 'The Passing of Korea' (1906); Griffis, 'Corea, the Hermit Nation' (1907), the official Annual Reports on Reforms and Progress in Korea (1917–18), and the Eastern Asia Official Guide Book: Vol. I, Manchuria and Chosen.

YANGTZE KIANG, yäng'tsĕ-kĕ-äng, the name generally given to one of the greatest rivers of China throughout its entire course, although this name is only applied in China to the lower course of the river, the entire river being called simply Kiang, or Ta Kiang (river or great river), while in the various provinces it traverses it is generally known by special names. It rises in the Tangla Mountains in mid-Tibet, about lat. 35° N. and long. 89° E., at an altitude of from 16,000 to 19,000 feet, and is first known by the name of Muru-Ussu. In its upper course it is sometimes called the Kincha-kiang. Its upper course through the mountainous region of Tibet extends to about 1,100 miles, during which its windings and falls present numerous striking scenes of natural beauty. It crosses the Chinese frontier in the province of Sze-chuan, then flows southward and eastward through Yunnan and northeast back through Sze-chuan Yunnan. Between the town of Li-kiang in this province and Hui-li in Sze-chuen, for a course of about 250 miles, it flows in an easterly direction through a winding channel or mountain gorge of imposing grandeur. Traversing the whole province of Sze-chuen in a northeasterly direction and passing in southeasterly direction into the province of Hu-peh, it reaches at King-chau the great Chinese plain, and traversing the provinces of Ngan-hui and Kiang-su, and passing the cities of Han-Yang, Han-kau, and Wu-chang, a great seat of the tea exporting trade, Ngan-king, Nanking, and Chin-kiang, it enters the Tung-hai, or Eastern Sea, above Shanghai. Its direct course from its source to its mouth is estimated at 1,800 miles; its course with windings is about or considerably over 3,000. It receives numerous affluents, and is crossed by the Grand Canal, which forms a junction between it and the Hoang-ho. The summer rains combined with the melting snows of the mountains in Tibet cause the river to risĕ at times as much as 40 or 50 feet at Hankow and Chin-kiang, resulting in great loss of life and serious damage to crops and other property. The drainage area is about 650,000 square miles, and it is estimated that the river annually carries away 6,428,000,000 cubic feet of sediment; the volume of water is 770,000 cubic feet a second. Steamers of 5,000 to 6,000 tons burthen easily reach Hankow, 680 miles from the sea, except at low water in winter. The river and the ports of Chin-kiang and Han-kau were opened to foreign navigation in 1860, I-chang (1,000 miles up), and others since. A British squadron sailed up the river in 1861 for more than 800 miles. The last 200 miles of its course is through practically level land, and in the first 1,000 miles the rise of the river is only 130 feet. It constitutes a most important waterway, carrying about one-half of the sea-borne traffic of China; and it is equally valuable commercially as a means of intercommunication throughout the country. The navigation above the confluence of the Tung-ting is interrupted by rapids. The tidal

influence reaches in February to Lake Poyang, 436 miles from the sea.

YANG AND YIN, in Chinese philosophy, terms employed to indicate the two phases, light and darkness, under which the supreme principle of the universe, *Tai-ki,* displays itself in the world of phenomena, Yang and Yin being, in various proportions, blended in all forms of existence.

YANKEE, term used in the United States to designate natives of New England. The name was applied during the Revolutionary War, by the British to the Americans; and in the American Civil War, by the Confederates to the Union soldiers. In Europe the term is sometimes improperly applied to natives of the United States as a whole. The word is of uncertain origin; it may be a corruption of English or Anglais, which was formerly current among the Massachusetts Indians. See NICKNAMES.

YANKEE DOODLE, a popular song of the United States, which for more than a century and a half has enjoyed the status of a national air. The origin of the song is uncertain, but most of the legends concerning it place its beginnings towards the middle of the 18th century, during the French-Indian Wars. The most common legend concerns a certain Dr. Richard Shuckburg, a physician attached to the British Army at Albany, who composed the song to make fun of the provincial Yankee troops. There is little substantiation for this story, but research has established that the song, and many of its verses were probably composed during the 1750's, and that it was used in derision of the Colonials by the British. From then it became very popular and by 1767 many versions were current in the American colonies. The first known appearance of the song in print occurred in 1782, when it appeared in James Aird's *A Selection of Scotch, English, Irish, and Foreign Airs,* which was published in Glasgow. The fact that this collection contains several Virginia airs, and a Negro jig, lends weight to the belief that the tune of *Yankee Doodle* is actually of American origin. Its first known American printing was as part of Benjamin Carr's *Federal Overture,* composed in 1794 and published in Baltimore in 1795.

The use of *Yankee Doodle* as a song to poke fun at the Yankees continued to the early days of the Revolutionary War. It is said that when Lord Hugh Percy's troops marched out of Boston in April of 1775, bound for Lexington and Concord, they kept step to the strains of *Yankee Doodle.* At Concord they were routed by the Colonial troops, and as they beat a disordered retreat to Boston the Yankees followed them, themselves singing *Yankee Doodle.* From that time the song has been considered an American patriotic air. Consult Sonneck, O. G., *Re-*

Consult Sonneck, O. G., *Report on "The Star-Spangled Banner," "Hail Columbia," "America," "Yankee Doodle"* (Washington, D.C., 1909).

JOHN TASKER HOWARD.

YANKEE GANG, a term used in Canadian sawmills for a method adapted for sawing logs 21 inches in diameter and under. It consists of two sets of gang saws, connected by parallel ways. The slabbing gang reduces the log to a balk and slab boards after which the balk is transferred to the stock gang, which rips it into lumber.

YANKTON, city, South Dakota, Yankton County seat, situated on the Missouri River at an altitude of 1,232 feet, 63 miles southwest of Sioux Falls; it is served by the Chicago and North Western, Chicago, Milwaukee, St. Paul and Pacific, and the Great Northern railroads. Grains are grown in the county, and cattle, sheep, hogs, and poultry raised. Chief industries in the city include food packing, the manufacture of egg cases, boxes, industrial alcohol, and the growing and shipping of seeds and nursery stock. Fireworks, cigars, and soft drinks are further products of industry. Yankton is the site of Yankton College and of Mount Marty Junior College (Roman Catholic). The city has a Carnegie library and contains a state mental hospital. There are many memorials of the time when the West was young and turbulent. Yankton was permanently settled by whites about 1855, and from 1861 until 1883 it was the capital of Dakota Territory; the site of the territorial capitol, erected in 1862, is marked. A marker on the courthouse lawn commemorates an Indian massacre of early days. Yankton was incorporated as a town in 1862, and as a city in 1869. It has a commission form of government. Pop. (1950) 7,709.

YAO, you, semilegendary Chinese emperor: supposed to have reigned about 2357–2258 B.C. He was the first of three model emperors extolled in the *Shu-king* (Canons of History), the oldest Chinese source of pre-Confucian history, which was supposed to have been edited by Confucius himself. In the works of Confucius, Yao is celebrated as the embodiment of all the virtues requisite for his high position. In 2296 B.C., during his reign, occurred the great Chinese flood. The year 2277 B.C. marked the beginning of the Chinese Era of Yao. He chose for his successor not his son but a young man named Shun, who was famed for his piety and who became the second of the moral emperors.

YAP, in the Caroline Islands, is in the North Pacific some 500 miles southwest of Guam; the three or four islets constituting Yap are regarded as a single island. The soil is rich, and tropical products are cultivated. Under the Japanese, Yap was the headquarters of an administrative district; there were three government schools, and Roman Catholic missions. Numerous ruins of an ancient civilization have been found. Discovered in 1791, Yap, in common with other islands of Micronesia, was a possession of Spain, who frustrated a German attempt in 1885 to claim it. However, after Germany purchased the whole of Micronesia (with the exception of Guam) in 1899, Yap became an important transpacific cable station, and this was the cause of a dispute between the United States and Japan when the latter, following World War I, was given a mandate for all former German possessions in the North Pacific. A settlement was reached in 1921 and embodied in a treaty, signed Feb. 11, 1922, by which the United States obtained the right of free access to Yap to operate the cables free from Japanese control or censorship; Americans also gained the right of residence and ownership of real and personal property. Pop. (1946) 3,673. See also CAROLINE ISLANDS.

YAPOK or **YAPOCK**, yä-pŏk′ (also called YAPACH and OYAPOCK), a small ratlike marsupial (*Cheironectes variegatus*) of the opossum family (Didelphyidae), which is found in Central and South America. It is rather larger than a common rat, with large, naked ears, and a long, nearly naked tail; fur brown above, with three transverse bright gray bands, interrupted in the middle, white below. It differs from the opossums in having webbed hind feet and being an expert swimmer and diver. Its habits closely resemble those of the otter, and it feeds on fish, crabs and other aquatic animals.

YAQUI, or **YAKI**, yä′kē, a North American Indian tribe of Piman stock and of the Cahita division, living in the state of Sonora, Mexico, along the Yaqui River. They are industrious and are generally engaged in agricultural occupations and in weaving, although there are miners and pearl divers among them. They have the clan system of government and have always been determined enemies of the Mexican government, against which they have waged long and bitter warfare. Repeated wars have reduced the tribe from numbers which once reached 40,000 to about 13,000.

YAQUI, a river, Mexico, in the state of Sonora, with two head streams, both bearing the same name, one rising in New Mexico and one in Chihuahua. The confluence of the two streams occurs about 200 miles from the coast and the river then flows in a southwesterly direction and empties into the Gulf of California. It is about 420 miles long and is navigable at but few points, owing to the rugged, mountainous country and many cañons through which it flows.

YAQUINA BAY, inlet of Pacific Ocean, in Oregon, at the mouth of the Yaquina River. It forms the harbor of Newport.

YAQUINA RIVER, Oregon, northwest of Corvallis, flows 50 miles in a westerly direction past the city of Toledo into Yaquina Bay at Newport.

YARACUY, yä-rä-kwē′, state, in the northwestern part of Venezuela, comprising the Yaracuy Valley. The capital of the state is San Felipe. The climate is tropical; the rainy season extends from June to December. Mineral resources include copper, lead, platinum, iron pyrite, coal, and marble. The fertile land of the valley produces sugar cane, cacao, corn, rice, yucca, cotton, tobacco, bananas, and coffee. Area, 2,741 square miles; pop. (1950) 132,790.

YARD, yärd. (1) As a nautical term, a spar slung from a mast and serving to extend a sail. Yards are either square, lateen, or lug sail; those for square sails are suspended across the mast at right angles, and are of a cylindrical form, tapering from the middle, which is termed the "slings," toward the extremities, which are called the "yard arms." (2) A standard measure of length, equal to three feet or 36 inches, the foot in general being made practically the unit. As a cloth measure the yard is divided into four quarters, equaling 16 nails. A square yard contains nine square feet, and a cubic yard 27 cubic feet. It was legalized in England in 1855, the previous legal measure, established in 1760, having been destroyed in the Houses of Parliament fire, Oct. 16, 1834. A legend exists to the effect that the original English yard was established by Henry I, and was the length of his arm. See also WEIGHTS AND MEASURES.

YARKAND, town and oasis, China, in Sinkiang Province, situated on the Yarkand River, about 100 miles southeast of Kashgar, 3,900 feet above sea level. It is enclosed by a ditch, and a thick mud wall with towers at intervals. The streets are intersected by numerous canals. The inhabitants, like those of Kashgar, are very mixed in regard to race. The prevailing religion is Mohammedanism. There are 120 mosques and some caravanseries. During the period in which Eastern Turkestan was severed from China a commercial treaty was concluded at Yarkand in 1874 between Sir Douglas Forsyth, representing Great Britain, and Yakub Beg, who was then the independent ruler of Eastern Turkestan. Commercial intercourse with India sprung up in consequence. The oasis of Yarkand yields gold and precious stones, and is rich agriculturally. Pop. (1947 est.) 60,000; oasis 311,159.

YARMOUTH, yär′mŭth, town, Maine, in Cumberland County; altitude 80 feet; on Casco Bay; 11 miles northeast of Portland; on the Grand Trunk, and Maine Central railroads. Fishing and seafood packing are the principal industries. Yarmouth, settled in 1636, was once a shipbuilding port. North Yarmouth Academy was founded in 1810. Pop. (1950) 2,669.

YARMOUTH, town, Massachusetts, in Barnstable County; extending from Cape Cod Bay on the north to Nantucket Sound on the south; about six miles east of the town of Barnstable, on the New York, New Haven and Hartford Railroad. It was once famous for its fishing fleet. Places of interest include Friends' Meeting House (1809), Indian mounds, and an ancient cemetery. The town was settled and incorporated in 1639. It includes the villages of Bass River, South Yarmouth, West Yarmouth, and Yarmouth Port. Pop. (1950) 3,297.

YARMOUTH, city and port of entry, Nova Scotia, Canada, in Yarmouth County, on the Bay of Fundy, the Atlantic Ocean, and the Canadian National and Canadian Pacific railways. It is popular as a summer resort. Fishing, lumbering, iron founding, and the manufacture of cotton duck are the chief industries. It ships Irish moss and strawberries. At the head of its educational institutions is Yarmouth Academy. Pop. (1951) 7,790.

YARMOUTH, Great, or **YARMOUTH**, county borough, England, in the county of Norfolk, 22 miles east of Norwich, and 110 miles northeast of London, on a narrow slip of land between the Yare and the sea. It is connected by a bridge over the Yare with Little Yarmouth, or South Town, in Suffolk, and is on the Great Eastern and the Midland and Northern railroads. The older part, near the river, is remarkable for its 145 narrow lanes at right angles to the main streets, known as the "rows" in which the houses were once the homes of the wealthy burgesses. Between the older part of the town and the sea is the modern part, with a marine

parade and other attractions. The parish church, founded in 1101, is the largest parish church in England, being 230 by 112 feet; and the market-place is also of great size. There is an excellent town-hall, a large custom-house, an ample library and museum, a borough jail, a lofty Nelson monument, the royal hospital and royal naval lunatic asylum, the aquarium, two good piers and an ancient jetty. The North and South Quays stretch along the river for nearly two miles. The harbor is in the Yare, and is accessible by vessels drawing 18 or 19 feet. Immediately off Yarmouth, and parallel to the shore, is a great range of sand-banks, between which and the land is the safe anchorage of Yarmouth Roads. Yarmouth is the great seat of the English herring-fishery, in which about 300 vessels and 3,000 hands belonging to the port are employed; many are likewise engaged in the mackerel fishery, and in that for cod and other whitefish. Most of the fish are cured, the herrings known as «Yarmouth bloaters» being highly esteemed. There are malting-houses, boat-building yards, rope-works, silk-crape factories, trawl-net works, etc. Yarmouth has risen into considerable importance as a watering-place. It suffered from both air and sea raids during the European War. Area, 3,568 acres. Pop. (1931) 56,771.

YARN, any textile before woven into cloth. Cotton yarn is numbered according to the number of «hanks» contained in a pound of 7,000 grains. Each hank, or skein, measures 840 yards. Worsted yarn has 560 yards to the skein; woolen yarn has 1,600 yards to the skein or run. Linen yarn is wound upon reels, and made up into leas, hanks and bundles. Flax and jute yarn is numbered according to the number of leas of 300 yards per pound.

YAROSLAVL, yä-rō-slăv', or **JAROSLAV,** Russia, (1) a city, capital of the province of Yaroslavl at the confluence of the Kotorosli and Volga rivers, 173 miles northeast of Moscow. It is the see of an archbishop. The Uspenskij Cathedral was begun in 1215, and there are numerous other old churches, several monasteries, schools, gymnasia, a theological seminary, and a lyceum with a law faculty. The left bank of the Volga is the suburban and residential portion of the city and contains many beautiful dwellings. The city is chiefly engaged in manufacturing and commerce, the right bank of the Volga being lined for two miles with quays. There are numerous cotton and linen mills, silk factories and bell foundries The city was founded about 1024 and was the chief town of a municipality in 1218–1471, then coming under the rule of Moscow. The village of Velikoje Selo, included in the city, was the centre of the linen manufacture of Russia, and had an annual output valued at $3,000,000. Pop. about 112,000. (2) The province has an area of 13,751 square miles, and is bounded by the provinces of Cherepovets, Vologda, Kostroma, Vladimir and Tver. It was one of the smallest but most thickly populated provinces in Russia. The surface is level and well watered by the Volga and its tributaries, the Mologa and Sheksma. The western portion has numerous ponds and marshes, the largest being Lake Nero, near Rostov, from which the Weska flows. The Volga is connected with the Neva by two canals, through which considerable commerce is carried on. Market gardening, timber cutting, mining, flax, livestock and poultry raising and manufacturing are the chief occupations. There are extensive linen and cotton mills, and factories for the manufacture of chemicals, machinery, metal ware, flour, tobacco and spirits, making Yaroslavl one of the principal manufacturing provinces of Russia. Considerable commerce is carried on by the two railway lines, the Rybinsk-Petrograd and the Yaroslavl-Moscow-Vologda. Its principal commercial cities are Rybinsk and Yaroslavl; while Rostov, Mologa, Danilov and Poszetchon are important trade centres. Pop. about 1,364,500.

YARRA-YARRA, yä'rą-yä'rą, or **RIVER YARRA,** Australia, (1) river of Victoria on which Melbourne (q.v.) stands. It is about 100 miles long, but is not navigable above Melbourne, owing to its falls. (2) A lake of Western Australia, east of Darling Range and 150 miles north of Perth.

YARRELL, yăr'ĕl, **William,** English naturalist: b. London, 3 June 1784; d. Yarmouth, Norfolk, 1 Sept. 1856. Led to note carefully the habits of birds and fishes in 1825 he sent his first contribution to the *Zoological Journal,* a notice of some rare British birds observed in the years 1823–25. The same year he became a Fellow of the Linnæan Society, to whose *Transactions* he repeatedly contributed interesting papers on the subject of birds, and in 1849 became its vice-president. His chief work is his 'History of British Birds' (2 vols., 1839–43; 4th revised edition 1881–85). He also published 'The History of British Fishes' (2 vols., 1835–36).

YARROW, Harry Crecy, American physician: b. Philadelphia, Pa., 19 Nov. 1840. He was educated in the schools of his native city and at Geneva, Switzerland, and in 1861 was graduated from the Medical Department of the University of Pennsylvania. His first service in connection with the Union Army was as examining surgeon for the Pennsylvania reserve corps. On 18 July 1861, he was regularly mustered in as assistant surgeon of the Fifth Pennsylvania cavalry, known as the «Cameron Dragoons.» He was in action at Dranesville, Va., in December 1861, and several minor engagements, and the following month resigned to accept a position of acting assistant surgeon and executive officer in the United States army general hospital at Philadelphia, where he remained late in the year 1864, when he was detailed, with other surgeons, for service at Hilton Head, S. C., in anticipation of the fall of Fort Sumter. In July 1872 he resumed service with the Engineer Corps as surgeon and naturalist with the expedition for explorations west of the 100th meridian. In 1876 Dr. Yarrow was ordered to the Centennial Army Hospital at Philadelphia and in 1878 was assigned to duty, in the Army Medical Museum at Washington, where he remained until 1887. He was then attached to the Army Dispensary in Washington and was connected with that institution until 1898, when he resigned. In the meantime he was for 15 years honorary curator of the Department of Herpetology in the National Museum at Washington. He has been a member

of the medical faculty of the George Washington University for over 20 years, and was a trustee of that organization. Dr. Yarrow is a member of various medical and scientific associations. He is the author of 'Study of Mortuary Customs among the North American Indians,' and has written a number of valuable papers on biological, medical and ethnological subjects.

YARROW, or **YARROW WATER,** Scotland, a celebrated pastoral stream in Selkirkshire, which rises at Yarrow Cleugh, and, running east a few miles, forms a beautiful lake, called the Loch of the Lowes, which discharges its water into Saint Mary's Loch. Issuing from the latter, the river, after a course of 16 miles through the district of Ettrick Forest, flows into the Ettrick, a tributary of the Tweed, near Selkirk, its total length being about 25 miles. It is famous in Scottish song, and has been celebrated in poems by Scott, Wordsworth and others.

YARROW, an erect, hairy composite herb (*Achillea millefolium*), sometimes called milfoil. The terminal corymbs of small white, or occasionally rose-colored flowers, are large, compound and fastigiate. The leaves are from two to four inches long, and are cut into numerous fine segments, which are very pubescent. Yarrow is a common plant of roadsides, and has been introduced from Europe. It has been used for a long time as a tonic and astringent, and enters into an ointment for dressing wounds. Several species of *Achillea* are garden plants. Sprigs of yarrow plucked from a young man's grave, by lovesick maidens, who repeat meantime a mystic formula, are expected to invoke the images of their lovers, in dreams.

YARUMAL, yä-roo-mäl, Colombia, a town in the department of Antioquia, on the Nechi, 50 miles northeast of Medellin. Gold mining and stock raising are the chief industries. Pop. about 21,250.

YATAGHAN, yăt'ą-găn, the Turkish name for a sort of dagger-like sabre with double-curved blade, about two feet long, the handle without a cross-guard, much worn in Mohammedan countries.

YATES, David Gilbert, American physician: b. New Jersey, 1870. He was graduated M.D. at New York University in 1898 and specialized thereafter in affections of the eye, ear and throat. He was senior assistant surgeon at the New York Eye and Ear Infirmary; was aural surgeon to the New York City Children's Hospital and Schools, and assistant surgeon at the Manhattan Eye, Ear and Throat Hospital. He is a contributing editor of the *Medical Critic* and author of numerous medical papers. D. 9 May 1918.

YATES, Edmund Hodgson, English journalist and author: b. Edinburgh, 3 July 1831; d. London, 20 May 1894. After a secondary education he obtained a post in the secretary's department of the general post office in 1847, and in 1862 became head of the missing-letter department. Meanwhile he was also active in various literary works — writing dramatic critiques for the *Court Journal* and the *Daily News,* contributing to numerous periodicals, editing short-lived humorous journals, *Comic Times* and *The Train,* and doing some successful farces. In 1855 he instituted a gossipy personal news column in the *Illustrated Times,* the first of the sort, and elaborated the idea when in 1858 he became editor of *Town Talk,* in which he soon made an attack on Thackeray which resulted in his expulsion from the Garrick Club; in 1860 he became acting editor of *Temple Bar,* of which he was editor-in-chief in 1863–67; and for a time he was also editor of *Tinsley's Magazine.* Among his subsequent ventures were *Time: A Monthly Miscellany* (1879–84), and *The World.* He served seven weeks' imprisonment in 1885 for a libel against the Earl of Lonsdale, published in *The World* in 1883. He lectured in the United States in 1872, and in that year withdrew from the post-office department. In 1873–74 he was special correspondent for the New York *Herald.* The best of his works in fiction are probably 'Broken to Harness' (1864), originally published in *Temple Bar,* and 'Black Sheep' (1867). His 'Edmund Yates: His Recollections and Experience' (1884; 4th ed. 1885) contains much interesting material.

YATES, Lorenzo Gordin, American naturalist: b. England, 8 Jan. 1837; d. 1909. He came to the United States in 1853, and after teaching in Wisconsin, he later studied medicine and dentistry. He served in the geological survey of California under Prof. J. D. Whitney (q.v.), and had charge of the scientific department of the Froebel Institute, Los Angeles, Cal. He has published 'California Digest of Masonic Law' (1867); 'Charm Stones' (1886); 'The Ferns of Ceylon' (1887); 'Notes on Hawaiian Ferns' (1887); 'The Channel Islands' (1890); 'The Mollusca of Santa Barbara County and New Shells from the Santa Barbara Channel' (1890); 'All Known Ferns'; 'Aboriginal Weapons of California' (1900); 'Prehistoric California' (1903).

YATES, Richard, American politician: b. Warsaw, Ky., 18 Jan. 1818; d. Saint Louis, Mo., 27 Nov. 1873. He was graduated at Illinois College, Jacksonville, in 1838; practised law at Springfield, Ill., sat in the State legislature 1842–49, and was sent to Congress as a Whig in 1850. In 1860 he was elected governor of Illinois and was re-elected in 1862, becoming one of the notable «war-governors.» He was a strong opponent of slavery, and an ardent supporter of the government during the Civil War, taking an active part in the organization of volunteer regiments. He was United States Senator in 1865–71, and afterward United States railroad commissioner.

YATES, Richard, American politician, son of the preceding: b. Jacksonville, Ill., 12 Dec. 1860. He was graduated from Illinois College in 1880 and from the law department of the University of Michigan in 1884. After being city attorney of his native place, 1885–91, he was judge of Morgan County, Ill., 1894–97, and United States collector of internal revenue at Springfield, Ill. (1897–1900). In 1901 he was elected governor on the Republican ticket of Illinois for the term ending 1905. In 1913 he was appointed by the governor of Illinois a member of the State railroad commission and 1914–16 a member of the new Illinois State public utilities commission. He was a member of Congress 1919–32. D. 11 Apr. 1936.

YATES, Robert, American statesman and jurist: b. Schenectady, N. Y., Jan. 27, 1738; d. Albany, N. Y., Sept. 9, 1801. Educated in New York City, he settled in Albany after his admission to the bar in 1760. At the outbreak of the American Revolution he was a member of the Albany committee of safety, and represented his city at several provincial congresses and at the state constitutional convention. In 1777 he was appointed to the Supreme Court of New York, becoming chief justice in 1790.

During the 1780's Yates was a leading anti-federalist. A delegate to the Constitutional Convention of 1787, he left it on the ground that the Convention had been called to revise the Articles of Confederation, and was exceeding its powers in drafting a new instrument of government. He campaigned against ratification and voted against it in the Poughkeepsie convention which ratified the federal Constitution for New York. His notes of the secret proceedings and debates of the Constitutional Convention were published in 1821.

He was twice defeated in campaigns for the governorship of New York. He resigned from the state supreme court in 1798, and concluded his career by serving on the commission which settled title to lands disputed between New York, Massachusetts, and Connecticut.

YATES, William, English Baptist missionary: b. Loughborough, Leicestershire, Dec. 15, 1792; d. at sea, July 3, 1845. Ordained a Baptist minister 1814, he accepted an appointment with the Baptist Missionary Society and sailed for Calcutta the next year. He settled at Serampore, then returned to Calcutta, where the greater part of his time was spent translating the Bible into eastern languages. For the English he composed dictionaries, grammars and manuals of Hindustani, Arabic, Sanskrit, Bengalee. He was awarded an M.A. (1831) and D.D. (1839) by Brown University in the United States.

YATES CENTER, city, Kansas, Woodson County seat; altitude 1,099 feet; 20 miles northwest of Chanute; on the Missouri Pacific Railroad. It is in a productive farming region of which the principal crops are corn, wheat and oats. Nearby are oil and natural gas wells and limestone and sandstone quarries. Pop. (1950) 2,178.

YAWL, yôl, a small ship's boat, propelled by four or six oars. Also applied to a jolly boat, a small fishing boat, and to a sailing boat similar to a cutter, but having a small sail at the stern.

YAWNING, yôn'ĭng, or **GAPING,** an involuntary and wide opening of the mouth and inhalation of breath, generally produced by weariness, intense absorption causing an involuntary interruption of full breathing, or by an inclination to sleep; sometimes by hunger, sympathy, etc. It often precedes the fit in some intermittent fevers, hysteria and spasmodic asthma, and in some instances, by the frequency of its recurrence, becomes a real disease. Persons suffering from heart disease may be liable to yawning fits. It is supposed by some to be determined by an interruption of the pulmonary circulation. Yawning is performed by expanding the chest, by extending the lungs, by drawing in, gradually and slowly, a large quantity of air, and gradually and slowly exhaling it after it has been retained for some time, the muscles of the chest being restored to their natural state. Its effect upon the muscles brought into play is sometimes very restful. When yawning is troublesome, long, deep respiration, or drawing in the air at long intervals, relieves it. It also occurs in certain animals. It often seems contagious or sympathetic, the sight of another person yawning frequently inducing the act.

YAWS, a disease occurring in Africa, the Caribbean, the East Indies, and other tropical regions. It is characterized by cutaneous yellowish tumors, numerous and successive, gradually increasing from specks to the size of a raspberry, one at length growing larger than the rest; core a fungous excrescence; fever slight, and probably irritative merely, and less noticeable in adults than in children. It is contagious, but cannot be communicated except by the actual contact of yaw matter to some abraded surface, or by inoculation, which is sometimes effected by flies. It is also called framboesia, from the French *framboise,* a raspberry. Some authorities regard it as a form of syphilis.

YAZD. See YEZD.

YAZOO (an Indian word meaning "River of Death"), a river in Mississippi, formed by the junction of the Yalobusha, Tallahatchie rivers, and several bayous thrown out by the Mississippi River in the northwestern part of the state. Its general direction is southwest. It is a deep, sluggish stream, the total course being nearly 188 miles, and very irregular. It enters the Mississippi about 11 miles above Vicksburg. It is navigable all the year. The Tallahatchie River receives part of its waters from the Mississippi; so that small boats from the Mississippi can enter the Yazoo at its source and re-enter the Mississippi not far from Vicksburg. The Yazoo flows through one of the richest cotton-raising regions of the South, growing long-staple cotton.

YAZOO CITY, Miss., city and Yazoo County seat; altitude 120 feet; on the navigable Yazoo River; 42 miles north of Jackson, and on the Illinois Central Railroad. Because of its location on the eastern border of the rich delta region between the Yazoo and Mississippi rivers, it is an important market and shipping center. The chief agricultural products of the region are cotton, farm crops, and lumber. The chief industrial establishments include lumber mills, cottonseed-oil mills, cotton gins, cotton compresses, petroleum refinery, nitrogen fertilizer factory, grain elevator, and machine shops. The principal public buildings are the county courthouse, opera house, and library. Yazoo City was settled in 1824 as Hanan's Bluff and enjoyed a booming river trade for many years. In 1830 it was incorporated as Manchester and in 1839 the name was changed to Yazoo City. During the Civil War two skirmishes were fought in the city, and at low water the hulk of a Federal gunboat, sunk by the Federals in the river, is visible. In 1904 the city suffered heavily from fire; practically all the business portion and many ante-bellum houses were destroyed. Rebuilt, the city has a modern appearance. It is the birthplace of Rear Admiral Thomas Pickett Magruder. Government is vested in a mayor and council. Pop. (1940) 7,258; (1950) 9,746.

YAZOO CITY, Military Operations at and near. Yazoo City was chosen by the Confederates as a site for a navy yard, at which were constructed some formidable iron-clads. Upon General Grant's approach to Vicksburg from the rear, in May 1863, the Confederates abandoned Haynes' Bluff, near the mouth of Yazoo River, upon which Lieut.-Commander John G. Walker, of the United States navy, went up the river with a small gunboat fleet to destroy all the works at Yazoo City. As the expedition approached the city, Lieut. Isaac N. Brown, of the Confederate navy, set fire to and destroyed three powerful rams which he had nearly completed, and upon which the Confederates were placing great dependence. Walker set fire to everything else of a public character, including the navy yard, containing five saw-mills, planing-mills, machine-shops, etc., and the expedition then returned. Early in June, Kimball's Union division was sent up the Yazoo to destroy the railroad bridge over the Big Black near Canton; but upon arriving at Mechanicsburg, Kimball found a large Confederate force in his front at Yazoo City and Liverpool, and as the river, on which he depended for supplies, was rapidly falling, he returned to Haynes' Bluff. After the surrender of Vicksburg, 4 July 1863, a report reached General Grant that Gen. J. E. Johnston was fortifying Yazoo City, and that a number of steamers were at the place, employed in supplying his troops. A naval and military expedition was organized to capture or destroy the steamers and take the place. Four vessels, under Lieut.-Commander Walker and 5,000 men under Gen. F. J. Herron, in transports, went up the Yazoo from Haynes' Bluff 12 July, and approached Yazoo City at noon next day; the Confederates were reported in force, and the iron-clad gunboat *De Kalb* was pushed ahead and opened her guns to ascertain the number and position of the enemy's guns. The Confederates had a battery of six heavy guns and the town was held by the 29th North Carolina infantry. Finding the defenses formidable, Walker dropped back and notified Herron, who at once landed his troops and a combined attack was made. After a slight skirmish on shore the Confederates fled, previously setting fire to four large steamers. Six heavy guns and one steamer fell into Union hands. Herron captured nearly 300 prisoners. While the *De Kalb* was moving slowly along and firing on the enemy, she ran on a torpedo and sank in 15 minutes. All on board were saved. Herron destroyed all public property, captured about 2,000 bales of cotton and returned to Vicksburg 21 July.

On 3 Feb. 1864, in co-operation with General Sherman's Meridian expedition (q.v.), a combined expedition of gunboats and transports with troops was sent up the Yazoo River from Vicksburg, with instructions for the gunboats to explore Yazoo and Sunflower rivers and all their tributaries. The gunboats were five in number, under command of Lieut.-Commander Owen, United States navy. Five transports conveyed the 11th Illinois and 8th Louisiana (colored) infantry and 35 colored cavalry, in all 982 men, under command of Col. James H. Coates, who was instructed to reconnoitre above Yazoo City and to obtain corn and forage on the Sunflower or on the Yazoo, and also to seize at least 1,000 bales of cotton and to destroy all flats or boats used to cross from the east to the west. From its start the expedition was annoyed by Gen. L. S. Ross, who, with a brigade of about 1,200 men, was guarding the Yazoo River and the Mississippi Central Railroad, and who, on 3 February, opened fire with artillery upon one of the gunboats when near Liverpool Heights. Coates landed his men, had an indecisive fight with Ross in which he lost six killed, 21 wounded and eight missing, and at night withdrew to his transports. Next morning the expedition, under fire of Ross' artillery and musketry, passed up the river, the gunboats clearing the way to within four miles of Yazoo City, where it remained until 6 February, when two gunboats, having been ordered to reconnoitre, reported that the place was occupied in force, with five guns in position and another in course of erection. The guns opened, two shots taking effect on one of the gunboats, and the gunboats and transports fell down the river below Satartia, where, on the morning of 7 February, Coates disembarked his entire command, drove back some Confederate skirmishers and at night withdrew to his transports. On 8th February the expedition again pushed up the river, two gunboats passed the city and the transports landed their men within a mile of it. Next day Coates took possession of the city, and on 11 February moved up the river, arriving at Greenwood on 14 February, where he remained until 19 February, gathering cotton, corn and forage. He then received orders to fall back to Yazoo City. On 28 February when within six miles of the place he ordered his small force of cavalry to move in rear of the city and take possession of all roads leading out of it. That afternoon he landed at Yazoo City and took position in some redoubts commanding the roads. Major Cook, with 50 colored cavalry, was sent toward Benton. When nearly six miles out Cook ran into Ross' brigade, by which he was roughly handled and pursued nearly to the city, losing eight killed, 35 wounded and 10 missing. Coates' pickets were much annoyed and on the morning of 5 March were driven in. Ross had been joined by Gen. R. V. Richardson's Tennessee brigade of about 600 men and at 10 o'clock the two brigades, about 1,600 men, making a determined attack, forced portions of the Union line and gained the streets of the town. At the same time they used artillery upon the redoubt, on the Benton road beyond the town, which, with the adjacent rifle-pits, was held by a part of Coates' command and repulsed all Confederate effort to carry. At 2 P.M. Coates, with those who were not in the redoubt, made a charge through the streets and the Confederates withdrew and gave up the attempt upon the redoubt. The Union loss in the engagement was 19 killed, 80 wounded and 18 missing. The Confederate loss was six killed and 51 wounded. On the evening of 6 March Coates started on his return to Vicksburg. He took with him over 1,700 bales of cotton, and much corn and forage. The total loss of the expedition was 31 killed, 121 wounded and 31 missing.

On 19 April 1864 a small detachment of a colored brigade, under command of Col. H. Scofield, marched from Vicksburg for Yazoo City and two gunboats went up the river to co-operate in an attack on the city. Scofield skirmished sharply with a part of Gen. Wirt Adams' brigade and on the night of 20 April bivouacked 15 miles below the city. On 22 April the gunboat *Petrel* in attempting to run past Yazoo City in order to fire upon the works from above, was fired upon by a section of artillery and a detachment of sharpshooters of Adams' brigade. The men were driven from the guns, the crew from the boat, and most of them captured, including Acting Master McElroy. The Confederates seized the boat, removed her eight guns and burned her. Next morning the expedition returned to Vicksburg.

E. A. Carman.

YAZOO FRAUD, The, a name given to the sale of lands in the western part of Georgia by a corrupt legislature, to certain large companies in 1789. This action caused great excitement and bitter controversy until settled by the United States Supreme Court in 1810.

YAZOO PASS AND STEELE'S BAYOU EXPEDITIONS. In the Civil War after the battle of Chickasaw Bayou, 29 Dec. 1862, and the capture of Arkansas Post, 11 Jan. 1863, General Grant ordered the army to Young's Point and Millikin's Bend, where he took command in person 30 January. Work on the projected canal across the peninsula opposite Vicksburg was pushed, but on 4 February Grant questioned its success, and began to look for other routes by which the army could reach the high ground either north or south of Vicksburg. Two projects were considered. One involved cutting away from the Mississippi into Lake Providence from a point 70 miles above Vicksburg. This lake, a former bed of the river, was connected by Bayou Baxter with Bayou Macon, a navigable stream, which led to the Tensas, thence into the Washita, and finally into the Red River. Thus it was hoped the army could be transported to the lower Mississippi to co-operate with Banks against Port Hudson. It is 470 miles by the main river from Lake Providence to the mouth of Red River, and much farther by the winding bayous. Upon the cutting of the levee at Lake Providence the water from the river flowed in rapidly and the six miles of the lake beyond were soon available. But Bayou Baxter was found choked for miles with fallen trees and a thick growth of timber overhanging it. General McPherson's entire corps was engaged for some time in attempting to open this channel and those below it. In March this project was abandoned.

On the east side of the river, a few miles below Helena, was Yazoo Pass. This had formed the old route of river steamers through the Coldwater to the Tallahatchie, and the Yallabusha to Yazoo City, but it had been closed for some years by a strong levee. By reopening this route it was believed to be possible to reach the high ground on the Yazoo bluffs north of Vicksburg. This Yazoo Pass plan promised greater success than the Lake Providence scheme. Under Lieut.-Col. Wilson of the engineers, later Maj.-Gen. James H. Wilson, the levee was cut 2 February, a way was cleared to the Coldwater, and the Pass opened to navigation on 24 February. Brig.-General Ross, with 4,500 men, was ordered into the pass upon light draft transports, and, preceded by gunboats, penetrated by that stream to the Tallahatchie, and thence to the Yallabusha, where the expedition, after an advance of 225 miles, was stopped 11 March by Fort Pemberton, near the juncture of the last-named streams. It was a strong work in a bend which commanded both. The fort was found to be so situated that in this time of high water neither troops nor gunboats could reduce it although the gunboats attacked on 11 and 12 March. As it stood only a few feet above the water, attempts were made to flood it by cutting the levee at Austin above Helena, and widening the cut into Yazoo Pass. These were unsuccessful. The expedition, after several attempts on the fort, withdrew. On the way back a reinforcement under General Quimby was met, 22 March, and this officer ordered a return to Fort Pemberton for further efforts. He soon became satisfied that the fort could not be reached, and ordered final withdrawal. The gunboats could not turn in the narrow channels and were forced to back out over a large part of the route. General McPherson's corps had been ordered into the pass, but was delayed for lack of light draft transports and later the intended movement of the army by that route was abandoned. Meantime the Confederates had gathered a strong land force under W. W. Loring, which became first harassing and soon after most threatening. Sherman, preceded by five gunboats of Admiral Porter's fleet, was dispatched in haste 16 March through Steele's Bayou, by which route it was hoped he could reach the Yazoo, relieve Ross, then supposed to be in danger of capture, and at the same time find a practical way for the army into the Yazoo. Sherman had a winding and difficult route of 150 miles before he could reach that stream. From Steele's Bayou, which he entered at Eagle Bend, he passed to Black Bayou and thence to Deer Creek. This opened into Rolling Fork by which he could enter the Big Sunflower, and by this stream reach the Yazoo. Even with the tremendous energy of his advance Sherman was barely in time to save the gunboats which had been attacked in Deer Creek by land forces, and were so hard pressed that Admiral Porter was considering the blowing up of his fleet and retreating with his crews through the swamps. These several attempts through the bayous east and west of the river had been carried on over hundreds of miles and against the most formidable obstacles of flooded country, dense forests and heavily obstructed streams. They were finally abandoned and the army reassembled at Millikin's Bend and Young's Point. From this position the army subsequently moved in the final campaign against Vicksburg.

H. V. Boynton.

YEAR, the period in which the revolution of the earth round the sun, and the accompanying changes in the order of nature, are completed. The accurate determination of the

length of the year, which required great knowledge of astronomy and exact observations, could only be reached by the successive efforts of many generations. (On this subject see CALENDAR). There are years of various lengths, according to the principle adopted in measuring them. The sidereal year is the interval that elapses while the sun moves from a star to the same star again (of course this motion is only apparent), a period the length of which is slightly affected by nutation, but on the average is equal to 365 days, 6 hours, 9 minutes, 9.6 seconds. The tropical or civil year, sometimes called the solar year, is the time in which the sun moves from the vernal equinox to the vernal equinox again; its mean length is 365 days, 5 hours, 48 minutes, 49.7 seconds. This is the year as commonly understood. On account of the precession of the equinoxes it is rather shorter than the true period of the earth's revolution. A lunar year is the time required for 12 revolutions of the moon, which is 354 days, 8 hours, 48 minutes, 37 seconds. Bisextile, or leap year, is a calendar year to which one day is added, making 366 days instead of 365. February of a leap year has 29 days. A light year is a linear measure used by astronomers to measure the distances of intrestellar space. See also DAY; SIDEREAL TIME; SUN DIAL.

YEARDLEY, yērd'lĭ, or **YARDLEY, Sir George,** American colonial governor: b. England, about 1578; d. 1627. After seeing service in the Netherlands he came to America in command of Sir Thomas Gates' expedition. This was wrecked at the Bermuda Islands, but he reached Virginia in 1610 and was acting governor of the Virginia colony 1616–17. Returning to England the next year he was there knighted and chosen deputy governor of the colony filling the office in 1619–21. By his instructions was summoned the first legislative assembly ever gathered in America, the House of Burgesses. The company was dissatisfied with his administration and he was succeeded by Wyatt. He remained in the colony where he served on the council and in 1626 Charles I again made him deputy governor.

YEAR'S MIND. See MONTH'S MIND.

YEAST, or BARM, is a micro-organism of the vegetable kingdom and belongs in the order of the *Gymnoasceæ* to the family of the *Saccharomycetes,* of which there are three classes, namely, *Monospora, Saccharomyces* and *Schizosaccharomyces.* The main characteristic of the first class, as its name indicates, is that it only develops one spore in the ascus. Thus far only one type, the *Monospora Cuspidata,* which is parasitic in *daphiniadæ* which it destroys, has been determined. There are many representatives of the second class, while only a few of the third have up to the present time been identified. The second class — the *Saccharamyces* — is generally what is understood under the term yeast, not only in the brewery but also in the distillery and the compressed yeast fabrication. Its structure is very simple; it consists of a single cell, which has few distinguishing characteristics. Each cell of the saccharomycetes is more or less globular or ovoid in form and, just as every other vegetable cell, consists of a colorless, viscous substance (protoplasm), a cell-wall (membrane), and also a nucleus. In the protoplasm there are observed, according to the species of the plant cell, different numbers of spaces filled with cell-juice, which are termed vacuoles.

In young yeast cells the cell-wall, or membrane, is very thin — 0.4 to 0.9 μ — and has almost the same refractive power as the protoplasm which it surrounds. The membrane is thickened through external influences, especially when the yeast-cells must develop in or upon a highly nutritious medium. An increase in the thickness of the cell-wall is also accompanied by greater impermeability and a corresponding decrease in the fermentative capability of the cell. Through the action of acids or alkalies upon the yeast cell the layers of the cell-wall can be shown, which are two, and sometimes three, or even more in number. Chemically the membrane of the yeast cell consists of cellulose (erythro and achroo-cellulose), pectinic compounds, and plasmatic components, for which reason it is very nitrogenous. The cell contents consists of protoplasm with more or less glycogen. (According to Laurent there is 32.28 per cent glycogen in the dry substance.) In the young yeast cell the whole interior is filled with protoplasm; in a short while, however, apparently hollow spaces appear, which are filled with the reserve nourishment necessary for the vitality of the cells. The nucleus furnishes the substances necessary for building up the cell, and, according to its chemical composition, belongs to the albuminoids in the class of the *proteids,* and especially to the nucleins. The form of the nucleus varies considerably; in a young cell it is spheroid, flattens out with increasing age to a disc whose periphery is no longer entire, but is lobed; elliptical shapes were also found.

The nucleus is in some instances of a considerable size; its diameter in some cases being one-third of that of the cell. Concerning the inner structure of the nucleus it was observed that the nucleus of the yeast cell has a pellicle as well as a nucleolus, which is spheroid, and is situated in approximately the centre of the nucleus, the space between the pellicle and the nucleolus being filled with nucleus plasma (*Karyoplasma*), this having a netlike structure through which the nucleolus is suspended. One or more vacuoles were observed in several types of yeast in the Karyoplasma under certain conditions, especially when the cells were transferred into fresh nutrient solutions. With the beginning of the propagation of the cell a corresponding development of the nucleus takes place, in either one of two ways, that is, the direct division (Amitosis), or the indirect division (Karyokinesis, Mitosis). The manner in which the nucleus divides itself differs in the various types of yeast. The yeast cell is propagated in one of two ways, either through oxygen spore formation, budding, or through endogen spore formation, the real sporulation.

In the former case a new cell is detached from the parent cell, while in the latter the new cells (spores) are formed inside the parent cell, which it leaves only upon complete maturity. Several recent investigators are inclined to believe in the sexuality of yeast, and close research

with various yeasts, as *Sacch. farinosus, Sacch. Bailii,* etc., has been made.

Two types of yeasts have in the course of time become culture plants in the real sense of the word, through intentional continuous cultivation for certain definite purposes. These types are (1) that known as the bottom yeast in the manufacture of beer, and (2) that which is the cause of the fermentation of the top-fermented beers and of the whisky mash. The former is so called because it settles in a thick, creamy layer upon the bottom of the fermenting vat during the slow fermentation of lager beers in temperatures of 40° to 50° F. (4.5° to 10° C.), while the latter is termed top yeast because in the more rapid fermentation at 54° to 65° F. (12° to 18° C.) (ale, weissbeer, etc.), it is separated as a yellowish brown foam, which is forced to the surface by the escaping carbonic acid gas. It is the last-named species which furnishes almost exclusively the material for the manufacture of that product known as compressed yeast.

As has been said, there are a number of independent species of yeast, which vary not only according to form and size of the cell, but also according to the composition of the nutrient medium in which they live, hence according to chemical and physical properties. Yeast flourishes luxuriantly only then when it finds not only qualitatively but also quantitatively, in the nutrient medium all the substances necessary for its nutrition. The brewer, distiller, etc., therefore endeavors to produce as vigorous a yeast as possible, in order to be enabled to conduct the fermentation in the manner best suiting his purposes. For such normal nourishment, it is essential that diverse substances are at its disposal.

Yeast thrives well when, besides water, carbon in the form of sugar, nitrogen in albuminous compounds or ammoniacal salts and various mineral components, especially sulphate of magnesia and potassium phosphate, are at its disposal. If the necessary nutriment is lacking the vitality of the yeast cell may rest, but the cell does not perish.

Various analytical data are at hand in regard to the composition of the yeast. Dumas found that the yeast contains:

	Per cent
Carbon	50.6
Hydrogen	7.3
Nitrogen	15.0
Oxygen, sulphur and phosphor	27.1

Mitscherlich found top yeast of the following composition:

	Per cent
Carbon	47.0
Hydrogen	6.6
Nitrogen	10.0
Sulphur	0.6
Oxygen	35.8

The differences found between bottom and top yeasts have been very slight. Wagner experimented upon top and bottom yeasts and obtained the following averages:

	Top yeast per cent	Bottom yeast per cent
Carbon	49.8	48.4
Hydrogen	6.8	6.0
Nitrogen	9.2	9.2
Sulphur + oxygen	34.2	35.8

A yeast may have all the necessary organic substances in the proper form and amount, yet it will not flourish if the salts are lacking. The yeast in this case is the same as any other plant organism, which must perish if it is deprived of its mineral nourishment. Hence a knowledge of the requirements of mineral substances for a yeast is of utmost importance, and many examinations were made to secure data on this point. Mitscherlich found in the ash of

	Top yeast per cent	Bottom yeast per cent
Phosphoric acid	53.9	59.9
Potash	39.8	28.3
Soda + magnesia	6.0	6.0
Calcium oxide	1.0	1.0
Silica	traces	0.0

The most essential substances which the yeast requires for its sustenance are, accordingly, phosphate of potassium and phosphate of magnesia. The above data are from elementary analyses. Naegeli later instituted investigations which should show the amount of the various combinations, which are observed in a yeast. According to his observations the yeast, when treated with water until its soluble components are absorbed, gives up to the water 37 per cent of the total weight of the dried yeast. The bodies thus brought in solution consist of compounds closely related to vegetable slime. The amount of moisture in a yeast is exceptionally large, for if it is completely dried it loses 83 per cent of its weight, so that in 100 parts of yeast only 17 parts are solid components. The mucous part of the yeast cell, the protoplasm, contains more water than the membrane which surrounds it, and consists chiefly of albuminoids, and about 2 per cent of peptone. Accordingly the composition of the yeast with 8 per cent nitrogen is:

	Per cent
Cellulose and vegetable slime	37
Common albumin	36
Easily converted glutine (caseinic protein)	9
Peptones (precipitable by lead acetate)	2
Fat	5
Ash	7
Extractive aubstances	4

According to E. C. Hansen of Copenhagen, yeast is divided into two groups, the real Saccharomycetes, which are capable of forming endospores, and the non-saccharomycetes, which never form spores. He subdivides the former into such which separate out sucrase and engender alcoholic fermentation, that is, which vigorously ferment saccharose, dextrose and maltose, as brewer's yeast; and such which ferment saccharose, dextrose, levulose but not maltose, as, for example, *Saccharomyces Ludwigii; Sacch. exiguus,* and into such which do not separate out sucrose and do not excite alcoholic fermentation, as *Saccharomyces membranæfaciens.*

The non-saccharomycetes Hansen divides into three groups; such which ferment solutions of dextrose and invert sugar, as *S. Rouxii, S. apiculatus;* such which separate out no sucrase but ferment saccharose, maltose and dextrose, as *Monilia candida,* and finally such which ferment saccharose, glycose, galactose and lactose, the lactose yeasts. In practice the division into culture and wild yeasts would be appropriate. The yeasts can also be safely divided according to their power of attenuation, that is,

the decrease in the density of the nutrient medium due to fermentation. The attenuation reached by a yeast in a diastase-free beer wort has been agreed upon as the limit, and in accordance therewith the brewers' yeasts are graded, and we have the Frohberg type with high attenuation, and the Saaz with low attenuation. Van Laer has defined a new type, Logos, so that now we have the types Saaz-Frohberg and Frohberg-Logos, with all intermediate grades. The numerous wine yeasts vary according to their resistibility against heat and acids; the amounts of sugar produced by them, and the amount of fruitesters, which they impart to the liquid. The distillers' yeasts, mostly top yeasts, are known by their resistance against acids, and foreign ferments, through their fermentative capability and the amount of alcohol developed.

No one can deny that yeast induces alcoholic fermentation, but how this is accomplished is still a matter of controversy. Liebig and other chemists maintain that fermentation is called forth by a ferment contained in the yeast cell, while Pasteur deems it the necessary consequence of life without oxygen. Naegeli claims it to be a transferring of the motion of molecules of protoplasm of the yeast to the fermenting liquid. Eduard Buchner and Rudolf Rapp of Munich discovered in the yeast cell a fermentation-inciting enzyme — zymase — which, however, can only induce fermentation once after the cell is completely destroyed. This discovery, which is of much scientific import, has not yet been made applicable in practical arts.

Besides the culture yeasts, there are a number of wild yeasts, which can produce great disturbances in the liquids infected by them. In order to avoid such infection by wild yeasts and also by bacteria, Hansen experimented and succeeded in preparing a pure yeast culture, that is, a culture originating from a single cell. Such a culture is not only free from all wild yeasts and bacteria, but also can and does remain unchanged as all cells are of the same nature. A reliable fermentation process can only be obtained by the use of one single type.

Such pure cultures are variously prepared; the oldest and best known method is that of Hansen, which has recently been modified by Dr. Lindner of Berlin as the droplet-culture. Both investigators employ for the further development of the young vigorous cultures the propagation apparatus, which when once supplied with an absolutely pure culture can be used for a long time if proper care is observed. Upon this pure-culture method a new brewing process is based which permits of entirely sterile work from boiling the beer to the putting it on the market. This process, invented by Nathan, has been called by him in honor of Hansen, the senior in the art of pure culture, the Hansena process. Another method to obtain yeast of a high degree of purity is that in which a mixture of yeast is exposed to definite conditions of temperature, aeration, kind of nutrition, action of light, pressure and motion that *one* yeast of definite properties develops more and better than the other yeasts in the mixture. If, further, the corresponding layer is removed from the yeast and propagated under the aforesaid conditions, a pure yeast of a uniform character is finally obtained. This process, founded by Delbrueck of Berlin upon his scientific observations in American breweries, was further elaborated by him. An idea of the importance and value of pure yeast culture can be had from the fact that almost all the larger breweries and distilleries employ apparatus for propagation and endeavor through observing the utmost care to protect their yeast against infection. But yeast is not only of great import to the brewer and distiller, but also to the baker, as the quality of his wares depends upon the quality of the yeast used, and in consequence thereof a special industry, that is, the manufacture of compressed yeast, has been introduced. Compressed yeast is chiefly made from distillers' yeasts; but in some instances also, beer yeasts, which must be purified and disembittered, are utilized. The price of compressed yeast in comparison to beer yeast is considerably high, but the baker has the advantage that by using the former his wares obtain a larger size than when the latter is used. The process of fermentation with compressed yeast develops more slowly than with beer yeast, hence the dough requires more time to ripen. Much progress has been made in the compressed yeast fabrication and diverse methods are employed in its manufacture. Many operations must be carefully and accurately observed in order to obtain a salable product. In the main these operations are: (1) Preparation of a fluid in which the yeast can properly develop, either under simultaneous formation of alcohol or without the formation of much alcohol; (2) preparation of a mass, in which there is a corresponding amount of vigorous seed-yeast, which is added to the above-mentioned fluid (preparation of the mother-yeast); (3) bringing together of the nutrient medium with the stock yeast or "setting"; (4) reproduction of the yeast with or without simultaneous fermentation; (5) separation of the newly formed yeast from the fluid by skimming, etc.; (6) washing the yeast, or removing the last traces of the nutrient medium; (7) pressing of the washed and separated yeast mass; (8) forming the compressed yeast into cakes of suitable size; (9) packing of the cakes for the trade and for shipping.

For some time yeast, especially beer yeast, has been used in medicine, and has been successfully employed partly fresh and partly dried, in tablet form in cases of furunculosis, flemonen, acne, psoriasis, and other skin diseases, dyspepsia and partly in diabetes. See BREWING.

YEATS, William Butler, Irish author: b. Dublin, June 13, 1865; d. France, Jan. 29, 1939. Early years spent in County Sligo deeply influenced his later work. He was educated in England and Ireland, and was for three years a student of art, but turned to literature in 1886. He was a leader in the foundation of the Irish Literary Society and the National Literary Society of Dublin, and a prime mover in the Irish Independent Theatre, thus becoming one of the chief representatives of the Irish Literary Revival (q.v.). Yeats had no superior as a lyric poet in his generation, but he was perhaps best known as a playwright. After a few years spent in the literary circles of London and Paris, he returned to Ireland in 1896 and devoted himself assiduously to literature, drawing largely on Gaelic myth, legend and folklore. In 1903–1904 and again in 1914 and 1920 he lectured in the United

States on subjects connected with this movement. In his early career Yeats produced both simple, ballad-like lyrics, and elaborate poems richly detailed. By 1914, however, he had turned against this last form with *Responsibilities* and his subsequent poetry is noted for its austerity and taut construction. Some of Yeats' most powerful plays are in verse, but the preference of his audience for prose kept him from developing this form more fully. *In Plays for Dancers* (1921) and *The Cat and the Moon* (1924) he turned to fantasy. He received the Nobel Prize in 1923, and was a senator of the Irish Free State, 1922–1928. Among his other works are *The Wanderings of Oisin* (1889), *Countess Kathleen* (1892), *The Wind Among the Reeds* (1899), *The Cutting of an Agate* (1912), *The Wild Swans at Coole* (1917), *Autobiographies* (1926), *The Tower* (1928), *Collected Poems* (1933), and *Collected Plays* (1934). Consult MacNeice, Louis, *The Poetry of W. B. Yeats* (New York 1941) and Hone, Joseph M., *W. B. Yeats (1865–1939)* (New York 1947).

YELLOW, one of the prismatic colors; the color of that part of the solar spectrum situated between the orange and the green; a bright golden color, the type of which may be found in the field buttercup, which is a pure yellow. United with blue it yields green; with red it produces orange.

YELLOW-BASS, PERCH, etc. See Bass, Perch, etc.

YELLOW BAYOU, Engagement at, and Banks' Retreat from Alexandria. General Banks arrived at Alexandria, La., on his retreat from Sabine Cross Roads April 25, 1864. Three days later General Hunter handed him an order from General Grant to close up the campaign against Shreveport without delay and return A. J. Smith's troops to General Sherman, for operations east of the Mississippi. Hunter returned with a letter from Banks to Grant with the information that Porter's fleet was above the Alexandria Rapids in a critical situation should the army abandon it. As to the further prosecution of the Shreveport and Texas campaign that was not to be thought of, and Banks turned his attention to getting Porter's fleet below the rapids. These falls were a mile in length, filled with rugged rocks, which at the time were nearly bare. As the vessels needed at least seven feet of water to float them, they seemed to be doomed. The plans for their release were suggested and executed by Colonel Joseph Bailey of the Fourth Wisconsin Cavalry. The work began on April 30, nearly the entire army at different times being detailed for the duty; 2,000 to 3,000 lumbermen from Maine and the Northwest cut down trees; others were set to collecting stones, bricks, etc., including whole houses and sugar mills with all their machinery and kettles, and in a week a dam of timber and stone, with sunken barges in the center, had been constructed across the river, 758 feet in width, raising the water from five to seven feet deep on the rapids. The work had been prosecuted day and night, the men working up to their waists and exposed to a hot sun. The water having risen, three gunboats and another vessel ran down the rapids on the afternoon of May 8, and lay to just above the dam. Early in the morning of the 9th two of the barges broke loose, making a gap in the dam 66 feet wide, through which the water rushed in a great torrent, and the four vessels went down safely through the opening. Six gunboats and two tugs were still above the rapids, waiting for a higher rise in the water. The damage to the dam was partially repaired and wing-dams were constructed on the upper falls, which shed the water from either side into the channel between them. They were completed by the 11th, when the water had risen to six and a half feet. Meanwhile the heavier vessels had been lightened by stripping from them their armor plates and landing some of the heavy guns, ammunition, chain cables, anchors and provisions, and on the 12th all the vessels had run down the falls and through the dam into deeper water. Meanwhile the Confederates had gotten in Banks' front, south of Alexandria, and taken position on the river 25 miles below the town, where May 1 they captured and sunk a transport, and on the morning of the 3d captured a transport, on her way up the river with 425 men of the 120th Ohio on board. Some of the men were killed and wounded, all the officers and 270 men were captured. On the evening of the 4th another transport carrying 400 men of the 56th Ohio, while going down the river, convoyed by the gunboats *Signal* and *Covington,* was attacked by artillery and musketry, and the gunboats went to her assistance. About 125 men on the transport were killed and wounded; she was soon disabled; the *Covington,* after losing more than half her men, was abandoned and burned; the *Signal* also was disabled and, with the transport, surrendered. No further attempt was made to run the blockade, and for two weeks Banks' communication with the Mississippi was closed. The fleet having passed below the falls and the river rising insuring a safe passage of all the bars below, the gunboats and transports started on the morning of the 13th of May, and in the afternoon Banks marched out of Alexandria for Simsport. From the start his front, flanks and rear were harassed by cavalry and artillery, and on the 16th he had a severe engagement near Mansura, in which the Confederates were driven from position they had taken across the road to Simsport, which place his advance reached on the evening of the 17th. Here it was found that the pontoon bridge was too short to span the Atchafalaya and Colonel Bailey again improvised a crossing. The transports were ranged side by side across the river, with the planking of the pontoons laid across their bows, making a level road of about 700 yards, over which the main body of the army with its trains and artillery began passing on the 19th. While this bridge was under construction, A. J. Smith's command was drawn up in line at Yellow Bayou, covering the rear of the army and the crossing of the Atchafalaya. Here Smith's troops were attacked on the afternoon of the 18th by General Wharton's cavalry and General Polignac's infantry. Smith's skirmishers were driven in, and at first the Confederates gained some advantage; but General Mower, who was in immediate command of the Union line, made a countercharge with two brigades of infantry and one of cavalry and the Confederate attack was repulsed. In endeavoring to follow up his success Mower was checked by a heavy artillery

fire, and withdrew to a thicket, where he formed a new line and brought up artillery. The Confederates renewed the attack and were repulsed with some loss. The thicket now took fire and made an impassable barrier between the two sides, and Mower withdrew, leaving his dead and wounded on the field. The Union loss was 38 killed, 226 wounded, and three missing; the Confederate loss, 452 killed, wounded and missing, of whom 180 were taken prisoners. The army had all crossed the Atchafalaya on the 20th. Banks yielded the command to General Canby, who had been ordered to relieve him; the navy and transports passed into the Mississippi; and the Red River campaign, one of the most humiliating of the war, had ended. On the return march from Alexandria the Union loss was about 165 killed, 650 wounded, and 450 captured or missing. General Taylor says the Confederate loss in the entire campaign, from Sabine Cross Roads to Yellow Bayou was 3,976. Consult *Official Records,* vol. 34; Taylor, *Destruction and Reconstruction;* Mahan, A. T., *The Gulf and Inland Waters;* Century Company, *Battles and Leaders of the Civil War,* vol. 4 (New York 1887).

YELLOW BOOK, The, an English periodical which was published by Matthews and Lane in London from 1894 to 1897. Henry Harland was literary editor; Aubrey Beardsley, art editor until 1896, provided the most highly discussed caricatures of the era. A quarterly, containing short stories, articles, and poetry as well as drawings, its contributors included such names as George Moore, Max Beerbohm, Ernest Dowson, and Stephen Phillips. *The Yellow Book* was very important to that short literary period which has been called "the yellow '90's."

YELLOW BOOK OF FRANCE, a government publication issued regularly since 1861, designed to furnish historians and others with official information. It is similar to the British Blue Book and the German White Book. Several publications of this type were issued by the belligerents during World War I; many of these were merely propaganda designed to influence public opinion in neutral states.

YELLOW COPPERAS, a name sometimes used for the mineral copiatite. Crystallization, monoclinic, usually in translucent pearly yellow plates; hardness, 2.5; composition, a basic sulphate of iron; specific gravity, 2.1. Found near Copiapo as an incrustation on coquimbite; also in other places in South and North America.

YELLOW-EYED GRASS, the common name of the genus *Xyris,* composed of rush-like plants, with bright yellow flowers produced from the summit of a naked scape, conspicuous in sandy bogs in July and August. They are mostly of tropical distribution about the world. The common yellow-eyed grass (*X. flexuosa*) has a bulbous root; equitant, linear, twisted leaves; an erect, two-edged, twisted scape; roundish, acute heads, supporting a number of small yellow flowers projecting from between the scales, with perianth and other parts of the flowers in threes. Another species with pretty, large petals (*X. caroliniana*), occurs near the sea from Rhode Island southward. *X. fimbriata,* a plant two feet high, the divisions of its calyx conspicuously fringed on the wing-margined keel, and plumose at the summit, is found in the pine barrens of New Jersey and southward. The foliage and roots of *X. indica,* of *X. americana,* and of *X. vaginata,* are used for a remedy for leprosy and the itch, in India, Guiana and Brazil.

YELLOW FEVER (also known as yellow jack; black vomit; Fr. *fievre jaune;* Span. *fiebre amarillo;* Port. *febre amarella;* Ger. *Gelbfieber*), an acute self-limited disease caused by a virus and transmitted to man by means of mosquitoes. The incubation period is short (three to six days) and recovery is followed by durable immunity.

Symptomatology.—A frank attack is characterized by acute onset of severe headache, pains in the back and neck, rapid rise of temperature, prostration, injection of the eyes and mucous membranes; followed by albuminuria, discomfort in the epigastric region, vomiting of blood-streaked and then chocolate-brown to black (coffee grounds) material, fall in pulse rate out of proportion to temperature, and jaundice. In fatal cases death ensues around the sixth or seventh day, preceded by suppression of urine, delirium, and coma.

History.—The first unquestionable description of the disease in the New World was given by Diego López de Cogolludo in describing an epidemic which occurred in Yucatán, Mexico, in 1648, although it is not unlikely that it may have existed prior to this date. Shortly thereafter it was recognized in other colonies in the Caribbean area and later along the east coast of Brazil. With periodic recessions and recrudescences, it was for more than two and one-half centuries a scourge to South American and Caribbean ports, and on occasions made seasonal excursions to northern cities in the United States and southward to Argentina and Chile. It was conveyed principally by boats or ships, which in those days carried fresh water in open casks that constituted favorable breeding places for the mosquito vector. Thus seaports and towns along navigable waterways were particularly affected. Notable epidemics occurred in Baltimore, Philadelphia, and New York. New Orleans and other southern United States ports were repeatedly invaded, and towns along the Mississippi River as far as St. Louis were at times infected. These excursions northward were seasonal in character, occurring during the warmer months of the year and promptly terminating with the advent of cold weather. It has been estimated that 500,000 cases occurred in the United States between 1793 and 1900. The last epidemic in the United States was in New Orleans in 1905.

The history of the disease in Africa is obscure, but it is likely that it existed there long before it was recognized in the Americas. Indeed, it is not improbable that it originated in Africa and was transported to the New World during the early days of the slave traffic. Severe epidemics occurred in Spain and southern Europe during the 18th century.

Evolution of Knowledge.—Prior to 1900 nothing was definitely known concerning the cause or mode of transmission of the disease, although a number of hypotheses had been suggested. Dr. Carlos Finlay (q. v.) of Cuba had advanced the theory that it was transmitted by mosquitoes, but it remained to Dr. Walter Reed (q. v.) and his associates Dr. James Carroll,

Dr. Aristides Agramonte, and Dr. Jesse W. Lazear to furnish conclusive proof. In a series of classic experiments performed upon human volunteers near Havana in 1900 they demonstrated that the agent causing the disease was transmitted from man to man by a mosquito *Aedes aegypti,* of the subspecies *Stegomyia* and formerly known as *Stegomyia fasciata.* They also demonstrated that the agent was so small that it would pass through a filter (Chamberland) which would inhibit the passage of bacteria. This may be considered the first time that a human disease was shown to be caused by a filterable virus.

In addition, they established the incubation and infectious period of the disease in man and presented convincing evidence that it was not transmitted by contact, excreta, or soiled clothing. These observations were of utmost practical significance, as they not only pointed the way to effective control of the disease but condemned as futile many of the practices based upon the assumption that the disease was contagious.

Finlay had previously performed some experiments purporting to show this mosquito to be the vector, but in view of subsequently acquired knowledge of the conditions requisite to transmission, it is doubtful if any of his attempts were successful. Certainly he furnished no convincing proof. Yet, in the words of Walter Reed, "To Dr. Carlos J. Finlay of Habana, must be given, however, full credit for the theory of the propagation of yellow fever by means of the mosquito."

It should also be mentioned that Reed and his associates were aided by the observation of Dr. Henry Rose Carter that when a case of yellow fever is introduced in a community there is a delay of around two weeks before secondary cases develop. In their experiments they thus allowed the mosquitoes to "incubate" for a time after feeding on a person ill with yellow fever before permitting them to bite a normal volunteer. They found that an incubation period of about 12 days is required before the mosquito can transfer the infection.

The application of the discovery of Reed and his associates led to dramatic accomplishments. Through the control of the mosquito vector, yellow fever was eliminated from urban centers where it had long been endemic. The successes of Dr. William Crawford Gorgas (q. v.) in Havana and Oswaldo Cruz in Rio de Janeiro, Brazil, in ridding these cities of the infection stand out as notable examples. Indeed, it was hypothecated that by concerted action the disease could be eradicated from the New World, since it was supposed that man was the only vertebrate host and *A. aegypti* the only insect vector. For a time, it appeared that the campaign which was inaugurated would succeed, but outbreaks began to occur here and there which could not be satisfactorily explained by this hypothesis. Subsequent discoveries revealed the reason.

The next significant contribution was made in 1928 by Dr. Adrian Stokes, Dr. Johannes H. Bauer, and Dr. N. Paul Hudson, members of a commission sent by the Rockefeller Foundation to the west coast of Africa, who succeeded in transmitting the infection to monkeys, thus permitting the study of the disease under controlled laboratory conditions. Dr. Stokes paid for this discovery with his life, for he contracted the disease and died. Before an effective vaccine was developed other laboratory workers became infected and several died but, undaunted, the investigations were pursued and discoveries followed step by step in rapid succession. The infectious agent was definitely proved to be a filterable virus; mice were infected with it by intracerebral inoculation; it was cultivated in flasks with embryonic tissue and in embryonated chicken eggs; an immunity test was developed which made it possible by examining their blood serums to identify persons and animals who had been infected; attenuated strains of the virus were produced by cultivation in tissue culture and by passage through white mice, and these strains were effectively used for vaccinating against the disease; other species of mosquitoes besides *A. aegypti,* some of which occur only in tropical forests, were found capable of transmitting the virus; many species of primates were found to be highly susceptible to infection; it was demonstrated that the virus exists in certain forested areas of tropical South America and Africa and that persons visiting these forests may contract yellow fever.

It may be added that conclusive proof that the disease was a virus infection discredited the claim advanced several years previously by Dr. Hideyo Noguchi (q. v.) that it was caused by a spirochete, named by him *Leptospira icteroides.*

Nature of the Virus.—The virus is among the smaller of the known viruses and measures only 20 millimicrons (.000008 inches) in diameter. As found in nature it is pantropic, in that it attacks the viscera such as the liver and kidneys, and circulates in the blood stream. It produces a rather characteristic mid-zonal necrosis of the liver cells which is useful as a means of diagnosis. But it has neurotropic tendencies, and strains have been developed by brain-to-brain passages in mice which attack primarily the central nervous system.

Diagnosis.—While the severe case of yellow fever presents a rather characteristic picture, it may be closely simulated by other diseases. Moreover, mild or even subclinical infections may occur and entirely escape clinical recognition. Consequently the laboratory offers the only certain means of diagnosis. There are three methods: (1) isolation and identification of the virus by withdrawing blood during the acute stage of the disease and inoculating the fresh serum subcutaneously into monkeys or intracerebrally into white mice; (2) microscopic examination of the liver in fatal cases; and (3) by the protection or neutralization test. For the latter, two samples of blood are required, one taken during the first three or four days of the disease and a second taken 10 or more days later. The serum from each sample is mixed with a predetermined amount of virus, and the mixtures are inoculated intracerebrally into groups of white mice. If the mice inoculated with the first serum-virus mixture die and those inoculated with the second serum-virus mixture survive, a diagnosis of yellow fever is warranted. If there is no difference in the survival of the mice in the two groups, it may be concluded that the disease was not yellow fever.

Mortality.—The mortality in frank cases of yellow fever may be high and death rates of

50 per cent have been reported. But many mild and inapparent infections occur, and death rates based upon the total infected may not exceed 5 per cent.

Treatment.—Beyond keeping the patient quiet, regulating fluids and diet, and handling symptoms as they arise, there is no effective treatment.

Epidemiology.—It will be appropriate first to describe the cycle of the virus through the insect vector and the animal host, as the epidemiology of the disease is conditioned by this cycle. When an infected insect (mosquito) bites a susceptible animal (man or primate) a small amount of the salivary excretion which contains the virus is injected into the animal. The virus proceeds to multiply and after two to four days begins to circulate in the blood stream. It continues to circulate for several days, not usually for more than one week, when it disappears as the result of the development of neutralizing antibodies. If a normal (uninfected) mosquito vector bites the animal host during the period when the virus is circulating, the virus then proceeds to multiply in the body of the mosquito reaching the salivary glands after 10 or more days, and the mosquito is then able to transmit the virus to a second animal host, thus continuing the cycle. The mosquito suffers no ill effect from the virus and remains infective throughout its life, but the virus is not transmitted through the egg to a second generation of mosquitoes.

In animals the disease may be mild or even symptomless, or it may be severe and frequently fatal, depending upon the species of animal. No chronic or carrier stage of infection has ever been observed in animals. Thus, as far as time is concerned, the mosquito is a more permanent reservoir of the virus than animals. Man and primates (monkeys) are by far the most susceptible animals, and only mosquitoes have been incriminated as vectors.

There are two epidemiological patterns of the disease: (1) urban yellow fever, involving only man and domestic mosquitoes; and (2) jungle yellow fever in which the virus is maintained by passage through forest animals and forest mosquitoes, the infection of man being fortuitous and secondary.

The epidemiology of the urban form is simple and well understood. The infection is transmitted from man to man by means of the mosquito. In the Americas the mosquito responsible is *A. aegypti*. In Africa other species of mosquitoes may play a role.

The epidemiology of the jungle form is more complicated and all phases of it may not yet be known. It is known, however, that several species of sylvan mosquitoes are capable of transmitting the virus and most, if not all, of the primates are susceptible to infection. In South America the virus has been found most frequently in mosquitoes of the genus *Haemagogus*. The virus has also been found in captured monkeys (*Callithrix penicillata,* a species of marmoset), and immune monkeys, indicating previous infection, are commonly found in forests harboring the virus. In addition, the virus may be easily maintained in the laboratory by cyclic passage through primates and haemagogus mosquitoes. Some species of marsupials are rather susceptible to infection and under laboratory conditions may serve as the mammalian host in the cyclic passage of certain strains of jungle yellow fever virus, but there is no convincing evidence that they play a part in the propagation of the virus in forests. Likewise, studies in African forests point to primates as the principal, if not the sole, mammalian host. In Africa, however, circumstantial evidence implicates a sylvan species of *Aedes* (*A. africanus*) as the important vector.

In South America, jungle yellow fever is endemic in the forests of the Amazon, Orinoco, and Magdalena watersheds and in humid coastal forests of the State of Baiá, Brazil. Also, it has made periodic excursions southward in the Paraná River system as far as the Argentine border. In Africa, its extent is not well defined, but it is probably present in most of the large tropical forests of equatorial Africa. Jungle yellow fever is an important problem for two reasons: first, because persons entering forests which harbor the virus may be bitten by infected mosquitoes and contract the disease; and second, because it constitutes a reservoir of the virus difficult, if not impossible, to control.

With the suppression of urban yellow fever in South America, nearly all human infections since 1940 have resulted from contact with the forest, and the last few urban outbreaks which occurred resulted from the introduction of a jungle virus into towns where *A. aegypti* still existed. Indeed, if it were not for jungle yellow fever, the goal of eradicating the disease from the Americas would have been achieved.

While the birthplace of yellow fever may never be determined with certainty, it is an interesting subject for speculation. Since the viruses which have been isolated in Africa and South America, both from forest animals and mosquitoes and from urban outbreaks in man, are all virtually identical, it must be inferred that they had a common origin. If the transfer of the virus from one continent to another occurred since the discovery of America, the weight of circumstantial evidence points to the origin of the virus having been in Africa, for the following reasons: (1) *A. aegypti* appears to be an Old World mosquito transplanted to the Americas from Europe or Africa, where its closest relatives are found; (2) the combined incubation and infectious period of the disease is so short as to preclude the virus being transported across the Atlantic by man alone, especially during the time of sailing vessels; (3) if it did cross the Atlantic, it must have been with the aid of an insect vector, probably a domesticated mosquito such as *A. aegypti* which is known to be associated with epidemics aboard ships; (4) since *A. aegypti* has been responsible for urban or man-mosquito-man epidemics in the New World, it is highly improbable that such epidemics occurred prior to the arrival of this mosquito. It is therefore enticing to hypothecate that the virus was at one time brought, along with the mosquito, from Africa and thus place the onus of both of these plagues upon the Dark Continent. According to this hypothesis the forest cycle of the virus in South America would be secondary to its original introduction by man and mosquitoes. Otherwise it would have to be assumed that *A. aegypti* was introduced to South America, became infected with the jungle strain of the virus, initiated urban epidemics, and was then transported back to Africa along with the

virus — a much more complicated chain of events.

It is also a matter of speculation whether the virus originated among forest animals and insects or in man. As there are a number of virus diseases infectious to man, such as Rocky Mountain tick fever and equine encephalomyelitis, which it is almost certain derive from animals or insects, it is not improbable that yellow fever had a similar origin.

Urban Prevention and Control.—Prevention of the urban or man-mosquito-man form of the disease is relatively easy in the New World, since the vector (*A. aegypti*) is a highly domesticated mosquito. It is found only about human habitations, and breeds almost exclusively in artificial containers, such as water barrels, tin cans, earthen vessels, and roof-gutters. By destroying unnecessary water containers, oiling and screening those which must be retained, and controlling the result of the antilarval campaign by search for the mosquitoes in houses, the species may be reduced beyond the danger point, or even eradicated. Indeed, in the long run eradication is more economical and has been accomplished in most of the cities and towns of tropical and subtropical South America. The use of DDT, both as a larvicide and as a house spray, has further facilitated the eradication of this mosquito. The elimination of yellow fever from ports and cities where it was formerly endemic is one of the signal triumphs of preventive medicine.

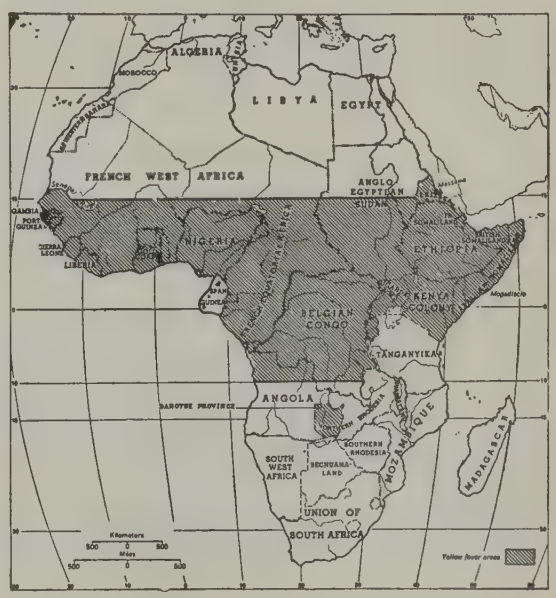
Jungle Yellow Fever.—There is no known feasible method of combating the disease in forest animals and mosquitoes, and considering the enormous extent of the forests harboring the virus, there is little hope of accomplishing anything in this respect. Vaccination, however, is an effective means of protecting exposed persons, and anyone entering forests where the virus may exist should be vaccinated.

Two vaccines are now in use. They differ somewhat in method of preparation and administration, but both consist of living attenuated or modified yellow fever virus. The one more widely used was developed in the United States and is prepared from the so-called 17D strain of virus. This attenuated strain was obtained by repeated passage of a virulent strain of yellow fever virus in tissue culture. In the process of the tissue culture passages the virulence of the original strain was largely lost. This derivative or 17D strain when administered subcutaneously to man produces only a very mild infection with no or insignificant symptoms; yet it has the property of stimulating immunity to fully virulent strains of yellow fever virus. The vaccine is prepared by inoculating embryonated chicken eggs with the 17D strain, incubating the eggs for an additional four days, harvesting the embryos and extracting the juice. The embryo juice is distributed in ampules and desiccated while in the frozen state. Immediately before use the desiccated juice is diluted with physiological saline solution and administered by subcutaneous inoculation. This vaccine was extensively used in the immunization of American armed forces during World War II. Following vaccination with certain lots of the vaccine, inflammation of the liver (hepatitis) and jaundice developed. It was later discovered that the hepatitis was caused by a hitherto unknown virus that was present in the human serum, obtained from supposedly normal persons, which had been used in diluting the vaccine. When the use of human serum was discontinued, the post-vaccination hepatitis ceased.

The second type of vaccine is advocated by the French and has been used in vaccinating large numbers of natives in West Africa. It is prepared from a strain (French neurotropic) which has been modified by serial brain-to-brain passage in mice. This strain is somewhat more virulent than the 17D strain, but the French report only mild reactions and no serious complications from its use. It is made from the brains of infected mice. The brain substance is emulsified in salt solution and frozen and dried. It is administered by the scarification method, similar to that employed for vaccination against smallpox. One administration of either vaccine suffices to produce immunity in about 95 per cent of those vaccinated. The immunity develops in 10 days to two weeks and is known to persist for four to six years, probably longer.

International Control.—Great care should be exercised to avoid the introduction of yellow fever virus into countries where *A. aegypti* exist. The hazard is increased by the extensive development of airplane travel. This mosquito is widely distributed and occurs, for example, throughout the Far East, the Mediterranean area, and the southern United States. The introduction of the virus by humans may be avoided by requiring vaccination of all persons coming from or passing through regions which harbor the virus. Regulations to this effect are now generally in force. Also, airplanes should be sprayed with insecticides to avoid transportation of living mosquitoes.

For purposes of international quarantine control the Expert Commission on Quarantine of the United Nations Relief and Rehabilitation Administration, whose functions have now been taken over by the World Health Organization, has designated the shaded areas shown in the following maps of South America and Africa as endemic yellow fever areas. Persons coming from these areas are subject to quarantine regulations which include vaccination against yellow fever at least ten days prior to entering other



countries. Persons entering these areas should also be vaccinated, particularly if they are likely to come in contact with forests.

R. M. TAYLOR,
International Health Division of the Rockefeller Foundation.

YELLOW-HAMMER, originally, in Great Britain, the common yellow bunting (*Emberiza citrinella*), which is yellow above, varied by dark-brown patches, the under parts being pure yellow, and the wing-feathers dusky black, with brown or yellow edges. The flanks are of a brownish hue. The nest is placed on the ground, and is composed of grasses, moss, roots, etc., and lined with hair. When fat, in the autumn, the birds are much in request for their flesh. They are regarded with superstitious dislike in some districts, and their eggs are broken by boys whenever they are discovered, a foolish saying being current that each egg contains a drop of "devil's blood." The birds are caught and fattened for the table in Italy. In the United States the term is misapplied to the golden-winged woodpecker or highhole. See FLICKER.

YELLOW JACK, a quarantine flag displayed at naval hospitals and from vessels in times of epidemics (see QUARANTINE). Also a common name for yellow fever.

YELLOW JACKET, any species of small American wasp, marked with black and yellow stripes. See WASP.

YELLOW JOURNALISM, a highly colored sensational manner of presenting news. The term, coined in the 1880's, described Joseph Pulitzer's methods of building circulation for the New York *World,* imitated by W. R. Hearst.

YELLOW RATTLE, a scrophulariaceous plant *Rhianthus crista galli,* an annual herb with opposite, lanceolate, sessile leaves and terminal, one-sided, leafy-bracted spikes of yellow flowers. The corollas are two-lipped, with an arched upper lip, and three-lobed lower one. The capsule is orbicular and flat, with several round-winged seeds, which rattle about the pod when shaken, and have given rise to other descriptive names, such as rattle, rattlebox, penny-rattle, etc. In European fields it is very abundant and becomes a pest, since it is parasitic and attaches itself by suckers to the roots of living grasses.

YELLOW RIVER. See HWANG or HOANG-HO.

YELLOW-ROOT, either one of two ranunculaceous plants, one being known as the shrub yellow-root. (*Xanthorrhiza apiifolia*). Its long roots and rootstock, leaves, bark and pith are bright yellow, and the root is extremely bitter and astringent, and is used as a tonic. This yellow-root grows in the southern United States and has pinnate leaves clustered at the top of a short stem, giving the plant a fern-like aspect. The foliage turns to gorgeous scarlet and orange in the autumn. The five-parted flowers are wine-colored. The other yellow-root (*Hydrastis canadensis*) is known also as golden-seal, or yellow puccoon; its root is a tonic drug. The plant has abundant reniform, palmately-lobed, basal leaves, and two cauline ones, the uppermost of these subtending the solitary, greenish-white flower. The puccoon is found in woods in the eastern United States and furnished the Indians with a favorite yellow dye.

YELLOW SEA, or **HWANG-HAI,** hwäng-hī′, a gulf of the Pacific Ocean, extending between the northeast coast of China and the western coast of Chosen or Korea, northward to Manchuria; length about 620 miles; greatest breadth about 400 miles. North and northwest it terminates in the gulfs of Liao-tung and Pe-chi-li, the latter of which receives the waters of numerous large and important rivers. On the east coast are numerous groups of islets, part of them included in the Korean Archipelago. The Yellow Sea is very shallow, having in no part a greater depth than 300 feet, and is so named from the muddy lemon-yellow color of its waters near the land, caused by the large quantity of alluvium continually brought into it by the Hwang-ho or Yellow River, and the Yang-tse Kiang, which gradually tends to decrease its depth. Sand banks are numerous off the Chinese coast, and there are several islands off the Chosen coast.

YELLOW-WEED. See DYER'S ROCKET.

YELLOW-WOOD, a name applied to several timber trees and shrubs, including *Cladrastis lutea.* This is an uncommon leguminous tree, known in cultivation as the virgilia, American or Kentucky yellow-wood, and is indigenous to the United States from Ken-

tucky southwards. The yellow-wood attains to a height of 60 feet, with a trunk some two feet in diameter. It usually divides into two or three limbs not far from the ground, which ramify into slender and somewhat drooping branches, forming a broad, graceful head. In winter the smooth, silvery-gray bark of its main trunk and red-brown of its delicate sprays are very interesting. The limbs, however, are brittle and break easily. The foliage of the yellow-wood consists of light-colored, odd-pinnate leaves, turning to clear yellow in autumn; and fragrant panicles a foot or more long, of flowers, pea-like and milk-white, droop from the ends of the branches. The fruits are linear legumes. A yellow dye was made from the hard golden-tinted wood, which is used for fuel and occasionally for gun-stocks. The yellow-root (q.v.) (*Xanthorrhiza*); the Osage orange (*Toxylon pomiferum*), a favorite hedge plant; fustic, a dyestuff yielded by the wood of *Chlorophora tinctoria,* a West Indian tree with oblong, taper-pointed leaves and an edible fruit; and *Schaefferia frutescens,* the valuable boxwood of the West Indies, are all known as yellow-woods. Australian yellow-woods are the *Acronychia lævis, Hovea longipes* and *Xanthostemon pachysperma;* and the white teak, or Queensland yellow-wood (*Flindersia oxleyana*), also called light yellow-wood, is a tall, slender tree with many branches. Another tree called light yellow-wood is the *Rhus rhodanthema,* bearing large red flowers, and growing to 80 feet in height. It is native to Queensland, and yields a fine cabinet-wood, close-grained, capable of taking a fine polish, sound and durable. Natal yellow-wood is a tree of about the same height (*Podocarpus elongata*), with a close-grained wood which will not bear exposure out of doors, but is extensively used for furniture and interior house-building. The bastard yellow-wood of the same region is *P. pruinosa,* with a tough durable wood, also used in house building; still another species (*P. latifolia*), an evergreen about 80 feet high, having an aromatic wood, is the East Indian yellow-wood. This same name is given to the satin-wood (*Chloroxylon swietenia*). The prickly yellow-wood is *Zanthoxylum caribæum* (q.v.).

YELLOWBIRD, any of several familiar birds prevailingly yellow in plumage. In the United States the name belongs to two small garden-visitors. One is the goldfinch (q.v.), and the other often distinguished as "summer" yellow-bird is a warbler (*Dendroica æstiva*), common in summer throughout all the eastern United States and Canada. It is greenish yellow, brightest on the breast, where it is diversified by salmon-colored streaks. The song is a melodious trill, often heard among the roses and lilacs of the garden, where the bird is likely to fix its deep nest of hempen shreds in an upright fork. The eggs are pink, with reddish and purplish dots. This nest is one of the receptacles most often chosen by the cow-bird for its surreptitious egg; but the yellowbird frequently defeats the intruder's object, by building a new nest on top of the first one, burying the strange egg.

YELLOWHEAD. a yellow-headed blackbird. See BLACKBIRD.

YELLOWLEGS, a genus (*Totanus*) of birds of the family *Scolopacidæ,* large snipe-like species with cross-barred tail-feathers, well-marked gape, long, slender non-sensitive bill and greenish yellow legs, from which they take their common names of yellowlegs, greenshanks, etc., while, because of their constant noisy calling, they are known to gunners as tattlers or tell-tale snipe. The greater yellowlegs (*T. melanoleucus*) inhabits during some part of the year nearly the entire American continent and breeds chiefly north of the United States, in which it is well known as a coastwise migrant. It is 13 to 14 inches long, with a spread of wings of two feet. Above the color is a mixed dark ashy, varying with the age and season, below white streaked and barred with ashy black. Although chiefly a maritime bird, this species also migrates through the Mississippi Valley and is found about the lakes of the interior; and even along the coast it is fond of frequenting the fresh and brackish pools on the meadows, where it finds an abundance of food in the small fishes, mollusks, shrimps and crabs. It also eats worms, insects and the spawn of fishes, which it catches with great facility. During the migrations, which occur in April and from late August to October through the greater part of the United States, it is commonly seen in small parties of six or eight, often consorting with other species of tattlers, willets and godwits. The flight is swift and often elevated, and in alighting in pools in which they wade leg-deep they keep the wings raised until well settled. They are extremely alert and noisy and thus provoke the indignation of gunners. The nest is a grass-lined depression on the ground and the four, pyriform, greenish yellow, brown and gray blotched eggs measure upward of two inches in length. The lesser yellowlegs (*T. flavipes*) is in form and colors nearly an exact miniature of the last, but is only 10 or 11 inches long, with a spread of 20 inches. Its range and habits are similar to those of the larger species, but it is much commoner in the East, flies in larger flocks and is better known to shooters of shore-birds. The eggs are more variable, the ground-color being clay or buff, and the markings usually very bold and distinct. The European greenshank (q.v.) occasionally straggles to our shores and may be distinguished from *T. melanoleucus,* which it resembles in size, by the distinctly green color of the lower legs and feet. About a dozen related species are found in other parts of the world and the genus *Helodromas,* containing our solitary and green sandpipers, is closely allied. For methods of shooting see SANDPIPER.

YELLOWPLUSH PAPERS, The, a series of satirical papers by William M. Thackeray, which appeared in *Fraser's Magazine* in 1837–38, as 'The Yellowplush Memoirs,' and in book form in 1841 in the volume entitled 'Comic Tales and Sketches.'

YELLOWS, a disease of the peach (q.v.).

YELLOWSTONE, formerly **SUBLETTE,** a lake in the Yellowstone National Park (q.v.), at the northeast base of the Rocky Mountain range. It has an elevation of nearly 7,800 feet above sea-level. It is irregular in form, having extensions called West Arm, South Arm

and South-East Arm. The Yellowstone River flows through the lake, or as sometimes given, the lake is an expansion of the river. It is about 20 miles long and 15 miles wide.

YELLOWSTONE, a river which has its rise in the Shoshone Mountains, in the northwestern part of Wyoming, near lat. 44° N. It flows north, entering the Yellowstone National Park (q.v.) at the southeast corner, and passes through Yellowstone Lake, which is usually called an expansion of the river. From the lake the course is northeast, east, then northeast to the Missouri River, which it enters at Buford, on the boundary between Montana and North Dakota. The total length of the stream is about 1,000 miles. It is navigable for nearly 800 miles from its junction with the Missouri. The largest tributaries come from the south, and are Big Horn, Powder, Rosebud and Tongue rivers. The Grand Cañon of the Yellowstone (see YELLOWSTONE NATIONAL PARK) is one of the wonderful sights in a region of wonderful scenery.

YELLOWSTONE NATIONAL PARK, the oldest and largest unit in the national park system, is a government reservation in the northwestern corner of Wyoming, and slightly overlapping the state boundaries into Montana on the north and west and Idaho on the west and south. Originally laid out with dimensions of 62 miles (east-west) by 54 miles (north-south), the park then had an area, in round figures, of 3,350 square miles. In 1929, 1930, and 1932, it was enlarged by annexation of some hitherto unprotected adjacent lands, and the original boundary was changed. In 1891, almost 20 years after the park was established, more than a million acres of forest land adjoining it on the east and south were set aside as the Yellowstone Timber Land Reserve, and in 1902 the Yellowstone Forest Reserve, now the Shoshone National Forest, was created, with headquarters near Cody, Wyoming. A little south of the southern boundary of the Yellowstone is the Grand Teton National Park, created in 1929.

Topography.—The geologic history of Wyoming is nowhere more vividly recorded than in the Yellowstone region. Of its several lofty plateaus, the Central, Pitchstone, Mirror, and others, the Central, with an elevation of about 7,000 to about 8,500 feet, is the highest; it is enclosed by ridges with peaks up to an altitude of 10,000 or 11,000 feet above sea level. The Continental Divide crosses the park from the southeastern corner to a point about midway between the southwest and northwest corners. The crest of the Absaroka range forms the eastern boundary of the park; the Gallatin Range extends down into the park from Montana, and to the south are the rugged Teton Mountains. Peaks in the western half of the Yellowstone vary in altitude from the 8,000 feet of Roaring Mountain to the 11,155 feet of Electric Peak. Mt. Washburn, in the north central section, reaches 10,317 feet. Among the highest points in the park are Eagle Peak, 11,360 feet, and Pollux Peak, 11,081; these are near the eastern boundary, and further to the east are ranges with numerous peaks exceeding 11,000 feet in height above sea level, as Sunlight Peak, 11,977 feet, and Fortress Mountain, 12,073 feet.

Volcanic and Glacial Aftermath.—The natural phenomena that abound in the park and make it an object of governmental supervision and popular interest are of volcanic and to some extent of glacial origin. In the geology of this and surrounding regions the evidences of ages of earth-history are exceptionally accessible. In one era of this history there was great volcanic activity, which was peculiarly extensive in the region of the Yellowstone. Here through ages mountains were built up, then worn down by erosion; basins filled, then washed bare again. Lava flows and the accumulation of ash beds marked alternating stages in the conformation of the land; in the Central Plateau of the Yellowstone they have been traced to great depths. The Absarokas are made up of volcanic rocks; this entire mountain range reveals to the geologist a history which includes a period of volcanic action. At another geologic period, too, glaciers gouged their way through parts of northwestern Wyoming.

Rivers and Lakes.—The Yellowstone River, rising in Wyoming south of the park, flows north into Yellowstone Lake, then through its grand canyon and on northeastwardly across Montana to join the Missouri, of which it is one of the principal tributaries. Shoshone, Lewis, and Heart lakes lie to the southwest of Yellowstone Lake. Smaller lakes scattered through the area are Gallatin, Swan, White, Cascade, Grebe, Wolf, Grizzly, Firehole, Mary, Beach, Mallard, Buffalo, Lilypad, Beula, Sylvan, Eleanor, Turbid, Twin Lakes, and Lake of the Woods.

Yellowstone Lake, at an altitude of 7,731 feet above sea level, has a water surface of 139 square miles, and a shore line of 100 miles. Its maximum depth is 300 feet, and its waters are blue or green, as the daylight varies. There are three or four islands, of which Frank Island is the largest. Back of a narrow beach stand the forests, and in the background tower mountain peaks. Some water plants grow in the lake; only native species of fish, the blackspotted or cutthroat trout, are found here, though many from outside the park have been introduced in its other waters; and in summer wildfowl—ducks, geese, swans, herons, sandhill cranes—frequent the grass-carpeted islands. At one time the lake was some 150 feet higher and 20 miles longer, extending to the base of Mt. Washburn. At that time the Continental Divide followed a different line, and the lake drained to the south and west, through the channel now held by Snake River, and emptied into the Pacific.

Fishing Bridge, a renowned fishing spot, spans the Yellowstone River at the outlet of Yellowstone Lake. The river flows a little to the west of north, through the cascades and past an area of mud geysers; then it turns off to the northeast, over the falls and into the Grand Canyon of the Yellowstone. The Upper Fall is 109 feet high; the Lower, or Grand Fall of the Yellowstone, more than 300. Showers of spray are sent up, which when touched by the sunlight look like innumerable, varicolored jewels. The canyon is more than 20 miles long; it is the supreme wonder of this «Wonderland.» On one side its walls are some 1,200 feet high; on the other there is a broken descent, with talus of delicately tinted chalky formations, marked at intervals by towering pinnacles of rock standing out in bold relief against the brilliant background. These take on many fantastic forms, creating the illusion that one is

YELLOWSTONE NATIONAL PARK: *Above:* Cloud and geyser seem to meet in this unusual feature. *Below:* Hot water pools and colored mineral deposits left by the overflow are found at Mammoth Hot Springs.

Ewing Galloway, N. Y.

YELLOWSTONE NATIONAL PARK: Flowing north through the park, Yellowstone River plunges some 300 feet over Grand Falls into Yellowstone Canyon

Screen Traveler from Gendreau

looking down upon the decaying splendors of antique architecture. From the base of these solemn sentinels the descent to the waterline is as abrupt as that from surface to torrent on the opposite side. Though the channel is from 60 to 160 feet wide, it appears no more than a silvery thread. At the northern end of the canyon are the Tower Falls, with a drop of 132 feet; these are the waters of Tower Creek making their way into the gorge of the Yellowstone. From this point the river follows a course slightly north of west into Montana. Other rivers are the Snake, which flows out of the park on the southern side; Falls and Bechler rivers, in its southwestern corner; Madison and Firehole rivers, in the western section, and Lamar River, in the northeast. A number of creeks, coming down from the high ranges, feed these streams.

Hot Springs and Geysers.—Most renowned of Yellowstone «sights» are the geysers. There are more than 3,000 springs, pools, and geysers. The latter are in the western half of the park, grouped in six basins; from north to south, the Norris, Lower, Midway, Upper, Shoshone, and Heart Lake basins. The Upper, which is the most active of these basins, contains Old Faithful, the most famous of all the geysers. It is a little apart from the other members of the group. Its eruptions, occurring with a fair regularity of timing, giving it its name, come at intervals of not less than 35 nor more than 80 minutes, and usually of 65 minutes. The eruption is preceded by a subterranean rumbling; then come vapor clouds, and finally a column of water rising to a height of 125 to 170 feet. The play of sunlight on the vapor produces a magnificent show of colors. Also in this basin are Giant Geyser, with a water jet attaining a height of 250 feet; Giantess, with an eruption that occurs not more than twice in a twelvemonth, lasts more than four hours, and reaches a height of 200 feet; and Riverside, which spouts obliquely, over the Firehole River, not vertically. Castle Geyser's cone is said to look like the ruins of an old castle. An interesting group is called Lion, Lioness, Big Cub, and Little Cub; their pre-eruption signal is likened to the roar of a lion. Others in various areas are Rocket, Grotto, Mastiff, Bijou, Monarch, Whirligig, and Catfish; Bijou was formerly called Young Faithful.

The hot springs and pools are related to the phenomena of the geysers; all together constitute a hot-water system extending throughout the western half of the park. A hot spring may look like the basin of a live geyser; a geyser may turn inactive and become a mere hot-water pool. These phenomena are regulated by variations in the nature of subterranean passages and reservoirs, affecting the flow of steam. The so-called «paint pots,» such as Fountain Paint Pot, are pools or spouters of mud; Mud Volcano, between Yellowstone Lake and Yellowstone Falls, looks like a caldron of simmering chocolate. Nymph Lake is bordered by many boiling pools and hot springs; Frying Pan Spring bubbles like grease in a pan, and gives forth sulphurous odors. Sapphire Pool boils every 12 minutes, overflowing its basin but producing no jet. The waters of many of these springs are beautifully colored by algae, dissolved rock, or reflection of bordering forests.

Climate.—The climate of Yellowstone Park is somewhat less extreme than that of the surrounding regions, but the summers are short and the winters severe. From mean temperatures of 18° to 20° in January and 62° to 65° in July, there may be variations to 40° below zero in winter and 90° above in summer. The park season runs from 20 June to 12 September; but the north entrance and some 60 miles of road are kept open all year, and from 1 May to 20 June and 12 September to 15 October limited accommodations for motorists are provided. The park is increasingly appreciated as a winter sports area, with skiing and snowshoeing, and the finest wildlife display found anywhere in America.

Flora and Fauna.—The Yellowstone forests are mostly of evergreens. Varieties of pine found here are lodgepole, limber *(Pinus flexilis)*, and whitebark; of fir, alpine and Douglas; of spruce, Engelmann; and of juniper, Rocky Mountain. Aspen, red birch, cottonwood and alder also occur. Trees are cut only in connection with the making of roads and trails, and to provide open space for camps. There are grassy meadows; gray hillslope areas of sagebrush, and sterile, bare spots near the hot springs. The painted cup or Indian paint brush *(Castilleja linariaefolia)*, the state flower of Wyoming, is found in practically all parts of the park. Other plants growing here are the gentian, wild rose, forget-me-not, windflower, buttercup, harebell, primrose, and mallow. Dogwood and Oregon grape also abound.

«Wildlife» in the park is protected. Bear, deer, and elk (wapiti), are numerous. Among the species of bear found here are the black and grizzly. There are antelopes and mountain sheep. A buffalo (bison) herd ranges in the less accessible eastern part of the park. More than 220 species of birds frequent the park, including ducks, geese, hawks, eagles, and the rare trumpeter swan.

The species of fish in the park waters include several varieties of game fish, as eastern brook, Loch Leven, Mackinaw, blackspotted or cutthroat and rainbow trout; Montana grayling, and the Rocky Mountain whitefish. There are also blob, chub, sucker, and dace. Some trout have been transplanted from Loch Leven, in Scotland; attempts to introduce landlocked salmon and largemouth bass have been unsuccessful. A Fish and Wildlife Service pamphlet says: «The native fish life of the park was profoundly affected by the great lava flow in Pliocene times.» When the lava cooled and the watercourses resumed their flow, many species were unable to get up the streams to the plateau. To make sport for anglers, it was necessary to stock the streams. There are hatcheries in the park. No fishing license is required, but the catch allowance is limited. The fishing season commonly is opened on 30 May.

History.—Previous to the 1870's the Yellowstone region was the least known area in the West. In 1806 John Colter, a member of the Lewis and Clark expedition and probably the first white man to set foot in this wonderland of the West, struck out on his own to explore, and in the following year he entered the present park area, from the south. His reports of the marvels of the region were regarded as products of imagination rather than accurate observation. For years afterward these inaccessible lands were visited only by hunters, trappers, and traders, in quest of furs. The famous scout

«Jim» Bridger (q.v.) told stories with the flavor of Baron Munchausen's, and it was only slowly that the underlying truth came to be recognized. Newspapers of the Northwest printed letters that gradually gained the public's confidence. In 1859 the federal government sent an expedition under Capt. W. F. Raynolds to explore the region, but it was unable to get through the mountains and fulfill its mission. The Civil War diverted attention from these explorations, but in 1870 Surveyor-General H. D. Washburn of Montana explored the region and published a report, while his associate N. P. Langford wrote articles which were widely circulated and which have been described as masterpieces of narrative and description. Reports of a federal expedition sponsored by the United States Geologic Survey and headed by Dr. Ferdinand V. Hayden, geologist, who had been a member of the Raynolds expedition, were published in 1871. The Washburn and Hayden reports attracted nationwide attention and, supported by the authority of state and federal agencies, commended popular acceptance. Congress passed an act creating the park «for the benefit and enjoyment of the people,» and on 1 March 1872 President Grant signed the bill.

Nathaniel P. Langford, who had been a member of the Washburn expedition, was the first superintendent of the park; he served five years, without compensation. In 1877 he was succeeded in the superintendency by P. W. Norris, who in turn gave way to P. H. Conger in 1882, followed by R. E. Carpenter in 1885. To Langford is given credit for guarding the park against designs of exploitation, and establishing its permanent status as a national possession. From 1886 to 1916 the park was administered by the army; in the latter year the National Park Service, in the Department of the Interior, was established. During the period of army control Gen. Hiram M. Chittenden (q.v.) built roads and published the results of his study of the park. Meanwhile, in 1894, a new act of Congress re-enforced the original legislation; it created the office of resident commissioner, with John W. Meldrum as first incumbent. In 1916 the National Park Service act was passed. In 1929, after ten years of service as superintendent of the park, Horace M. Albright became director of the national park system, an office which he held until 10 Aug. 1933; and Roger W. Toll succeeded him as head of the Yellowstone administration. Superintendent Toll served until his death in 1936, when he was succeeded by Edmund B. Rogers. As has been noted above, in 1929, 1930, and 1932 the park was enlarged by annexation of adjacent lands previously unprotected.

During the period of army administration a military post, Fort Yellowstone, was maintained; it was abandoned when the National Park Service assumed control, in 1916. The post was taken over by the service as headquarters for the park administration. The site is at Mammoth Hot Springs, five miles south of the north entrance. Up to 1928 the postoffice here was the only one serving the Yellowstone, but since that year several have been added. In the years preceding 1900, the maximum number of visitors was 10,680 in 1897. In 1905 attendance was considerably more than doubled. For some years thereafter it fell off, but in 1915, when automobiles were first admitted into the park, the total of visitors quickly rose to more than 50,000 a year. In 1929 the number was in excess of 260,000. In the early 1930's it slumped again, but in 1940 a new record of more than half a million had been set. This was exceeded in 1941 when 581,761 persons visited the park.

General Information.—No railroad runs into the park, but the Northern Pacific has a station at Gardiner, Mont., at the north entrance, and the Union Pacific has one at West Yellowstone, Mont., at the west entrance. Other railroad service is given by the Northern Pacific at Bozeman, and Red Lodge, Mont.; the Burlington, at Cody, Wyo.; the Chicago, Milwaukee, St. Paul and Pacific at Gallatin Gateway, Mont.; and the Union Pacific at Victor, Idaho. There are also bus services to these points. Travelers by air are landed at the West Yellowstone airport; airline connections are made at Butte, Mont., and at Billings, Mont. Bus tours over park roads are available.

Within the park, the main road system is roughly in the form of a figure 8. The Grand Loop Road, as it is called, includes 142 miles of improved highway. Connecting the Grand Loop with the five park entrances are about 100 miles of approach roads, while other subsidiary roads leading to interesting features bring the grand total to approximately 300 miles within the park. A number of trails are available for those who prefer to go afoot into the less frequented wilds. Rules for car operation are strictly enforced.

The park is well equipped for the comfort and convenience, health and safety of the visiting public. There are hotels, lodges, tourist cabins, cafeterias, automobile campgrounds, and gasoline stations. The campgrounds are supplied with water, sanitary facilities, and grates for outdoor cooking. Some 30 smaller sites are scattered throughout the park for persons who wish to avoid the main points of concentration. Several picture shops are operated; there are general stores and news stands at the principal centers, and automobile supply and repair shops. Boats, fishing tackle, saddle horses, and guides may be rented or hired. At Mammoth Hot Springs hospital service is available; trained nurses are stationed at the hotels and lodges, and medical service is available upon call, anywhere in the park. There are several postoffice, telegraph, and telephone stations. Through the park season, church services, both Protestant and Catholic, are held at several locations each Sunday.

Ranger naturalists conduct parties at Mammouth, Norris Geyser Basin, Madison Junction, Old Faithful, West Thumb, Yellowstone Lake, Fishing Bridge, Canyon, and Camp Roosevelt. Nature walks are conducted daily, and each evening, at most of these points, campfire talks are given. Museums have been established at Mammouth, Old Faithful, Norris Geyser Basin, Madison Junction, and Fishing Bridge. Official information bureaus and interesting exhibits are maintained in conjunction with these museums. A field exhibit near Obsidian Cliff "interprets" that mountain of volcanic glass for visitors; other roadside exhibits are located near Willow Park, Nymph Lake, Tuff Cliff, and Firehole Canyon.

In its effort to preserve unimpaired the park's scientific value and picturesque attractiveness—to make it inure to both «the benefit and the

enjoyment of the people"—the government seeks co-operation by the public in observance of the rules and regulations safeguarding the forests against fire, the park animals against harm, and the public itself against accident or injury. Consult Chittenden, Hiram M., *The Yellowstone National Park* (Palo Alto, Calif. 1940); Haynes, J. E., *Guide to Yellowstone National Park* (St. Paul, Minn. 1940); publications of the Office of National Parks, U. S. Dept. of the Interior.

YELLOWTAIL, or **BLANQUILLO,** a trachinoid fish (*Caulolatilus princeps*) of the coast of Southern California and southward, allied to the Atlantic tilefish (q.v.), which reaches a length of 40 inches. It abounds about rocky parts of the coasts, is good food and interesting as a gamefish.

YELLOWTHROAT. See MARYLAND YELLOWTHROAT.

YEMASSEE, The, "The Yemassee, a Romance of Carolina" (1835), one of the earliest and on the whole perhaps the best of the novels of William Gilmore Simms (q.v.), deals with the little-remembered Yemassee War of 1715 in a manner still effective after all the intervening changes of fashion in romance. Much of the material indeed recalls the older romantic commonplaces: the aspen-like heroine Bess Matthews; Gabriel Harrison, irresistible in love and war, who turns out to be the Palatine Charles Craven, capriciously masquerading; bloody, swaggering pirates; Indians as cruel as eloquent; and the accustomed paraphernalia of raids and sieges, and powwows and heroics. But along with these are such solid realities as Hector, the Negro slave, obviously studied from life as Simms knew it, and Mrs. Grayson, the settler's wife, too hard and strong to be a mere heroine. Above either romantic commonplaces or normal realities stands one episode so powerfully conceived and handled that it ought to have a secure place in the world of the imagination—the episode in which Matiwan, devoted Indian mother, kills her son Occonestoga in order that he may not suffer the disgrace which his tribe has already decreed for him. The book is packed with varied adventure, breathlessly recounted in a style often turgid and verbose but capable at times of dramatic economy and intensity. It is accurate as to topography, and is steeped in that traditionary lore of South Carolina upon which Simms drew for his happiest successes.

CARL VAN DOREN.

YEMASSEE WAR. See COLONIAL WARS IN AMERICA.

YEMEN, yĕm'ĕn, an independent imamate of southwestern Arabia, south of Saudi Arabia and north of the Aden Protectorate, bounded on the west by the Red Sea. The area is estimated to be 75,000 square miles, and the population numbers some 3,500,000. The capital is San'a (pop. 25,000), and other towns of the interior include Dhamar and Ta'izz; the principal seaports are Hodeida (pop. 40,000) and Mocha. Yemen contains some of the most fertile sections of Arabia, wheat, barley, alfalfa, grapes, and figs doing well in the interior highlands, and dates, sorghums, tobacco, sesame, senna, and indigo being cultivated in the coastal plain of the Tihama and other valleys; on the terraced western mountain slopes, at altitudes between 3,500 and 6,800 feet, the principal products are the world-famed Mocha coffee and kat (or khat), a narcotic plant which rivals coffee in value. Gold and silver are mined, and petroleum deposits may exist. Settled prior to 1,000 B.C., Yemen was subject at various periods to the Egyptians and the Ethiopians (see ARABIA—*History*). The people were converted to Islam in A.D. 628, and the country formed part of the Ottoman Empire from the 16th century down to the close of World War I. The imam (ruler) of Yemen enjoyed considerable autonomy under Turkish sovereignty, but his postwar claims to extensive territories involved him in disputes with Saudi Arabia which culminated in occupation of the imamate in 1934 by troops of that kingdom; the Treaty of Taif, concluded in June of that year, defined the boundaries between the two countries. Consult Scott, H., *In the High Yemen* (London 1942).

YEN, Japanese monetary unit, coined in 5, 10, and 20 yen gold pieces; the single yen piece is not coined. The yen is divided into 100 sen; and the rin is the tenth part of a sen.

YENBO, Saudi Arabia, seaport on the Red Sea, 115 miles west of Medina. It is used extensively by pilgrims to the Holy Places of Islam, and has a considerable transit trade. Pop. about 6,000.

YENIKALE, Strait of. See KERCH, STRAIT OF.

YENISEI, yĕn-ē-sā', river of the Russian Soviet Federated Socialist Republics, one of the longest streams in the world. It rises in the Sayan mountains of the Tuva Autonomous Region and flows generally north for a distance of 2,360 miles to enter a gulf of the Kara Sea, an arm of the Arctic Ocean; the estuary of the Yenisei is 140 miles long and has a breadth varying from 3,000 feet to 14 miles. The river has a drainage area of 1,042,000 square miles. Large cities on the banks of the river include Minusinsk, Krasnoyarsk, Yeniseisk, and Turukhansk; it is navigable to the last-named for large vessels. The waters of the Yenisei are clear and rich in fish. They are navigated by paddle steamers, drawing barges, and by a number of five or six cornered flat-bottomed boxes which convey flour down the stream, and are broken up at their destinations. The Yenisei receives from the right the Upper Tunguska (the outlet of Lake Baikal), the Stony (or Middle Tunguska), and Lower Tunguska. The voyage of Nils Adolf Erik Nordenskjöld (q.v.), in the summer of 1875, from Tromsö, Norway, to the mouth of the Yenesei opened up a trade by sea with northern Siberia; there are six weeks during the summer when the passage to and from the Yenesei can be made with little difficulty. The river is obstructed by ice for almost six months at Turukhansk and for about seven months at Krasnoyarsk, at which point the river is crossed by the Trans-Siberian Railway.

YENISEISK, yĕn-ē-sā'ĭsk, Soviet Union, town of the Krasnoyarsk Territory of the Russian Soviet Federated Socialist Republics, on the Yenisei River 200 miles north of Krasnoyarsk.

It possesses a notable museum of natural history and archaeology. The town lies in the center of a gold mining area, and carries on an extensive business in furs. Between May and November river steamers afford communication up the Yenisei from Yeniseisk to Krasnoyarsk. The town was founded in the 17th century. Pop. (1939) over 10,000.

YEOMAN, yō'mȧn, a term of early English origin first meaning a countryman and later used for a class of those who cultivate the soil. In Chaucer the yeomen are retainers, but later appear to have become small freeholders, the intermediate class between the gentry and the laborers. The word was also used for farmers, those who rented land. In the 18th century the landholding yeomen declined in number. The older meaning of retainer still exists in the Yeomen of the Guard (q.v.).

YEOMANRY, a force of volunteer cavalry in Great Britain consisting to a great extent of country gentlemen and farmers possessing their own horses and requisite equipment. The force was first raised in 1761 for home defense and the suppression of rioters, but it was not organized until 1794. The yeomanry were organized in regiments on a county basis, and underwent short periods of annual training. They were liable to be called out in aid of the civil power in case of riot at any time; in case of actual invasion, or the appearance of an enemy on the coast or during a rebellion, they might be assembled for actual service; they were then subject to the Mutiny Act and Articles of War, and might be called upon to serve in any part of Great Britain. For their services during the South African War, 1899–1902, they received the title of Imperial Yeomanry. In 1907 they became part of the territorial forces.

YEOMEN OF THE GUARD, in England, a corps of veteran soldiers of stately presence, employed on state occasions in conjunction with the gentlemen-at-arms as the bodyguard of the sovereign. The yeomen were constituted a corps in 1485 by King Henry VII, and they still wear the costumes of that period. The officers of the corps are a captain, ordinarily a peer, a lieutenant, and an ensign—all old army officers. There are also a "Clerk of the Cheque" and four "Exons," besides noncommissioned officers (messengers, sergeants major, yeoman bedgoers, yeoman bed-hangers), and 100 privates. They are the oldest military body in England. Their dress is striking; a red tunic faced and striped with purple and ornamented with gold lace; red knee breeches and red stockings; a ruff and a plumed hat; steel gilt halberd with red and gold tassel, and an ornamental sword.

YEOVIL, yō'vĭl, municipal borough, England, is situated in Somersetshire on the river Yeo, 127 miles southwest of London. It is a market center for the dairying area surrounding it. The town's industries include the manufacture of gloves, which have been made here since the 16th century, and large engineering works.

The Church of St. John is a notable edifice in the Perpendicular style of Gothic architecture, and is often called the "Lantern of the West." The town itself has been in existence since Anglo-Saxon times. Pop. (1951) 23,337.

YERBA MATE. See Maté.

YERBY, yĕr'bē, **Frank (Garvin),** American author: b. Augusta, Ga., Sept. 5, 1916. Of Negro parentage, he graduated at Paine College, Augusta, in 1937, took a master's degree at Fisk University the next year, and studied in the department of education at the University of Chicago during 1939. He taught in the English department at the Florida Agricultural and Mechanical College, Tallahassee, 1939–1940, and at the Southern University, Scotlandville, La., 1940–1941, and during World War II was engaged in war industry. His first story to be published nationally was "Health Card," treating objectively of a Negro couple in the hands of military police, which appeared in *Harper's Magazine,* May 1944; it won the O. Henry Memorial Award special prize for a first published short story in 1944, and was reprinted in the O. Henry collection for that year. Other of his stories dealing with the Negro people of the South were soon accepted by other magazines, and with publication of his first novel, *The Foxes of Harrow* (1946), Yerby achieved immediate success. Among his books are *Golden Hawk* (1948); *Pride's Castle* (1949); *Flood Tide* (1950), and *Saracen Blade* (1952).

YEREMENKO, Russ. yĕ-ryĕ-myân'kô; Ukrain. yĕ-ryā'myĕn-kô, **Andrei Ivanovich,** Russian army officer: b. Markova, Ukraine, Oct. 14, 1892. Conscripted into the Imperial Russian Army in 1913, he served in the ranks on the eastern front during World War I. In 1917, following the Treaties of Brest-Litovsk (q.v.) between Russia and Germany, he became a guerrilla leader in the Ukraine, and after the revolution in October of that year he joined the Red Army.

During World War II he took command of a field army on the northwest front, and his success in directing the forces which broke the German siege of Stalingrad earned for him the orders of Lenin and Suvorov.

YEREVAN, yĕ-rĕ-vän', or **EREVAN,** ĕ-rĕ-vän, city, Soviet Union, and capital of the Armenian Soviet Socialist Republic, lies 110 miles south of Tiflis, on the Zanga River, altitude 3,170 feet. The city is an important industrial and cultural center, and is situated in an orchard area with mountains to the north, and to the south the Aras River valley at the foot of Mt. Ararat. Its industries are the manufacture of machinery, synthetic rubber, nitrate fertilizers, tires, paints, lacquers, and window glass.

The city was founded c.661; was captured by the Russians in 1827, and by them ceded to the Turks a year later. Pop. (1946 est.) 300,000.

YERKES, yûr'kĕs, **Charles Tyson,** American financier: b. Philadelphia, Pa., June 25, 1837; d. New York, N. Y., Dec. 29, 1905. He became a stockbroker in Philadelphia in 1859, and entered banking in 1862. For refusal in 1871 to give preference to the city of Philadelphia for bonds sold on its account, he was indicted for misappropriating city funds, was convicted, and imprisoned. Pardoned after seven months in prison, Philadelphia cancelled her claim against him. In 1882 he removed to Chicago, Ill., and there acquired a controlling interest in the street railway system. He presented Yerkes Observatory (q.v.) to the University of Chicago.

YERKES, Robert Mearns, American psychobiologist: b. Breadysville, Pa., May 26, 1876. He graduated from Harvard in 1898, and taught comparative psychology there from 1901 until 1917. For the next two years he was director of the psychological laboratory at the University of Minnesota, and thereafter he headed the research information service of the National Research Council until 1924. In that year he went to Yale as professor of psychology, and in 1931 he was appointed director of the laboratory of comparative psychobiology at the Yale School of Medicine. His experimental studies of animal behavior were particularly noteworthy. Numerous works by him include *Introduction to Psychology* (1911); *The Mental Life of Monkeys and Apes* (1916); *The Mind of a Gorilla* (1927); *The Great Apes,* written in collaboration with A. W. Yerkes (1929), and *Chimpanzees: A Laboratory Colony* (1943).

YERKES OBSERVATORY, astronomical observatory of the University of Chicago (q.v.), located on Lake Geneva, near Williams Bay, Wis. It was founded in 1892 by Charles Tyson Yerkes (q.v.), who presented funds to the university sufficient for its building and equipment. It has a refracting telescope with an aperture of 40 inches. See also Observatory; Telescope.

YERMAK, Timofeyev. See Ermak Timofeev.

YEVPATORIYA, Russ. yĭf-pŭ-tô′ryĭ, or **EVPATORIA,** ĕf-pā-tōr′ĭ-ā, town, Russian SFSR, in west Crimea, is a Black Sea port, situated 40 miles north of Sevastopol. It is a center for the agricultural area around it which produces grain and livestock. The town's principal industries are salt working, meat and fish processing, and manufacture of clothing. It is largely a residential town, covering an area of two miles west to Lake Mainok—the latter being a salt lagoon.

Founded in the 1st century A.D., the old Tatar town still occupies the eastern section, while the new Russian section on the west grew up after 1910. It was annexed by the Russians in 1783; in 1854 Anglo-Saxon troops landed nearby, and in the following year the town was occupied by the Turks. Pop. (1926) 23,512.

YEW, evergreen coniferous shrubs or trees of the genus *Taxus.* The leaves are flat needles arranged in two ranks to the right and left of the stem, but in a horizontal plane. The flowers are dioecious, and have no perianth; the male inflorescences are composed of a few stamens partly united at the apex of a scaly, axillary stalk, with shield shaped bracts forming a spherical head. The female flowers are axillary, naked ovules seated on a fleshy annular disc, which becomes cup shaped and scarlet, and nearly encloses the bony seed. The European yew, a tree famous in the annals of Old World gardens, is *Taxus baccata.* It is readily recognizable by its lustrous foliage, so dark a green as to appear velvety and almost black in the shadows. When rather young the typical yew has a broadly pyramidal head, but in its old age it becomes ragged and broken, not unlike an aged hemlock. Some trees have attained a great age, and they reach to a height of 100 feet, and sometimes to a diameter of 10 feet. In cultivation there are several varieties of yew, including the Irish, with fastigiate branches and columnar habit, and the golden yews, with foliage, which, to a certain extent, is yellow. The dark yew was a favorite tree for planting in churchyards. It is even now a common plant in European cemeteries, and has been for centuries a symbol of mourning at funerals, and especially at those of unhappy lovers.

> Lay a garland on my hearse
> Of the dismal yew

This couplet in the *Maid's Tragedy* is an allusion to this custom. In India the yew is a sacred tree, its wood and gum being burned as an incense, and branches of it carried before ceremonial processions. Although the sweet and juicy scarlet aril of yew fruit does not seem to be poisonous, the enclosed seed is regarded with suspicion, especially when eaten by children, in any quantity. Young branches of yew, too, are dangerous to cattle, which are frequently killed by feeding upon them. The trunks of yews are twisted, ridged, and gnarled, and the shreddy bark has the rich red brown tone of an old cedar. The wood is hard, with an orange red or brown heart, which takes a fine polish and is valued for cabinet work and veneers; since it is also fine and close grained, flexible and elastic, easy to split and durable, yew wood was the chosen material for the bows of the English archers, and no other wood has ever equaled it for that purpose. The Indian tribes of the northwestern American coast arrived at the same conclusion in regard to the beautiful *Taxus brevifolia,* indigenous to that region and similar in appearance and size to the European tree. It was used by them for bows, spear handles, paddles and fishhooks, and is the most durable timber that man can find for his fence posts. There is another arborescent American yew, found in Florida, a bushy tree (*T. floridana*) with many stout spreading branches and a short trunk. It rarely exceeds 30 feet in height. A Japanese species (*T. cuspidata*), with a bright red bark, is of bushy habit, and more hardy and successful than the European yew. This is a great favorite with the Japanese, who clip it into fantastic shapes. The most familiar yew in Canada and the eastern United States is *T. canadensis,* a very low, shrubby species with decumbent branches radiating in every direction and forming thickets hard for a man to travel through, but a first-rate cover for grouse. It grows in moist lands under the shade of trees, and is readily recognized by its dark foliage and the glowing, crimson, oblong, cuplike fruits.

YEZD, yĕzd, Iran, capital of a province of the same name, in an oasis on a sandy plain, 175 miles southeast of Isfahan. The old part of the town, enclosed by a high mud wall, is defended by a citadel within which are a governor's palace, the principal mosque, and several public buildings. The chief manufactures are silk stuffs, velvets, and coarse woolens known as *numuds.* There are more Zoroastrians in Yezd than in any other Iranian town. The city dates from the 5th century. It was visited by Marco Polo in 1272. Pop. (1941) 60,066.

YEZEDEES or **YEZIDIS.** See Religious Sects.

YEZO, former name of the Japanese island of Hokkaido (q.v.).

YGGDRASILL, or **YGDRASIL,** ĭg′drà-sĭl,

in Scandinavian mythology, the giant ash tree overspreading the whole world and reaching above the heavens. It binds together earth, heaven and hell, and its roots stretch out to the Asa or Aesir gods in heaven, to the frost giants, and to the underworld. A marvelous fountain springs up under each of these three great roots; and in the tree, whose boughs drip continually with honey, dwell an eagle and the squirrel Ratatöskr. At its roots the serpent Nithöggr gnaws, and between the serpent and the eagle runs the squirrel constantly endeavoring to provoke the two to strife.

YIDDISH LANGUAGE. Yiddish, the Englishized form of German *Jüdisch* (Jewish), is one of the names applied to the various German dialects spoken by the Jews of German origin in the diaspora, in eastern Europe and elsewhere whither Jews have emigrated. In Russia it is known under the name of *Jargon,* while philologically it is generally spoken of as *Judeo-German.*

No literary documents of any consequence bear upon the condition of this group of dialects previous to the 16th century, and even in the printed works up to a hundred years ago the literary norm seems to have attempted an approach to the literary German, though even then the deviation was considerable and fairly uniform. In the last century the spoken dialects have been asserting themselves in the literary productions, so that the uniformity no longer exists, each author writing in the variation familiar to him from childhood.

It seems that at first, in the Middle Ages, the German Jews employed the language of their Christian neighborhood without any change whatever; in their intercommunication with their co-religionists they transcribed this German with Hebrew characters and introduced, Germanizing them, such Hebrew words as were necessitated by the observances of the Mosaic faith. When the German Jews, in the 14th and 15th centuries, settled in Poland, they were cut off from the rest of the German nation, and so their native dialects perpetuated themselves in the form in which they were brought from their homes. They were subjected, however, to the double influence of their Slavic neighborhood and the language of the Bible and the Talmud, to which the Jews devoted themselves with unwonted zeal. In vocabulary, the Yiddish is predominantly German, less than one third having been derived from Slavic, Rumanian, and Hebrew sources. In pronunciation, the influence of Russian and Polish is doubtful or less transparent, while Hebrew, instead of affecting it, was itself affected by the current pronunciation of Yiddish. In syntax and idiom, both the Slavic and the Hebrew have considerably modified the native German, without, however, obliterating the original German basis. At present, three chief varieties may be distinguished in the Yiddish of Russia, the Lithuanian, the Polish, and the Southern; the dialects in Austria and Hungary are more nearly related to the two latter, while the Rumanian is more akin to the Polish variety. In the United States all three varieties may be heard, but they are strongly influenced in vocabulary by the English; and in the periodic press the Lithuanian variety, affected by literary German, seems to supersede all other dialects. The three varieties correspond to their places of origin in Germany, the Lithuanian issuing from a Middle-German home, the other two from various Upper-German localities. The precise *provenience* has not yet been ascertained, as the linguistic study of Yiddish has heretofore been greatly neglected.

The chief differences between Yiddish and the modern German are these: Phonetically, Yiddish represents a mediaeval stage of German when, for example, *î* and *ei* were still carefully distinguished, while *u* before a nasal had not yet changed into *o;* on the other hand, the consonantism, especially the treatment of *pf,* seems to correspond to a later stage. The vocabulary of Yiddish is rich in words only sporadically found in German dialects and common to the Middle-High-German literary language. The words from the Hebrew are phonetically treated as Yiddish words, while those from Russian and Polish, to some extent, underwent the changes due to the peculiarity of Yiddish, and present some interesting data to the Slavic scholar. In grammar, Yiddish has developed certain peculiarities which are common to various German dialects. Most prominent are the disappearance of final unaccented *e,* of the genitive case in the declension of the noun, of the imperfect tense in the verb. In syntactic structure, Yiddish resembles English, rather than German, and in English-speaking countries naturally adopts some of the English idioms. But, on the whole, Yiddish is an important group of German dialects, well worthy of a thorough study by the Germanic philologist.

Leo Wiener,
Emeritus Professor of Slavic Languages and Literatures, Harvard University.

YINGKOW. See Newchwang.

YLANG-YLANG, ē'läng-ē'läng, a tree of the custard apple family, found in southeast Asia, from the flowers of which is distilled an exquisite perfume. The tree attains a height of 60 feet, and has drooping, greenish-yellow flowers, three inches long, of great fragrance. The first flowers appear in the third year, and in the eighth the yield is as high as 100 pounds; the bloom occurs every month. Perfume is distilled from the petals by the use of water only, no chemicals being required.

YMIR, ü'mêr, in Scandinavian mythology, the personification of Chaos, or the first created being, produced by the antagonism of heat and cold in Ginnungagap, the primeval abyss. Slain by Odin and thrown into Ginnungagap, his flesh was transformed into land, his bones becoming the mountains, his blood the rivers and lakes, his hair the forests, while his skull constituted the heavens, and his brains the clouds.

YOAKUM, city, Texas, in De Witt and Lavaca counties, 120 miles southwest of Houston, served by the Southern Pacific Railroad. It is the center of an agricultural region, and leather products are manufactured. An annual harvest festival, the Tomato Tom-Tom, is held here. Pop. (1950) 5,231.

YOGA, yō'gä (meaning, in Sanskrit, concentration) one of the six schools or systems of philosophy, that of Patanjali, the essence of which is meditation. It believes in a primordial soul which has had existence from an earlier period

than primeval matter, and holds that from the two arose the spirit of life (Mahanatma). Theoretically at least, its devotees can acquire even in this world entire command over elementary matter by certain ascetic practices, such as long continued suppression of the respiration, inhaling and exhaling the breath in a particular manner, sitting in 84 attitudes, fixing the eyes on the tip of the nose, and endeavoring, by force of mental abstraction, to unite themselves with the vital spirit which pervades all nature and is identical with Siva. When this mystic union is effected, the Yoga can make himself lighter than the lightest, or heavier than the heaviest substance, or as small or as large as he pleases; he can traverse all space, can become invisible, can equally know the past, the present, and the future, and can animate any dead body by transferring to it his own spirit. It is claimed that the whole doctrine of the Yoga works toward the establishment of the Supreme Being; and that it possesses the means by which the soul may become finally united with the Creator from whose hand it came. The system is said to have been founded by Patanjali (q.v.), who claimed that eight distinct stages were necessary in the development of the soul before it reached that condition in which it was exempt from further transmigrations. These stages are yama (self-control), niyama (religious observances), prānāyama (breath regulation), pratyāhāra (restraint of senses), dhāranā (making the mind firm), dhyāna (meditation), samādhi (deep contemplation). These correspond generally to the general characteristics of the system given above. Each stage must follow in its order and is dependent upon the attainment of all the stages that precede it; and the great object of the whole is to reach the final stage. Owing to the difficulty of the attainment of all these successive stages of perfection, the adherents of the Yoga believe that it is very rarely that any one reaches them all in this life and that consequently most persons must pass through several births and existences in the attainment of the final goal. In the course of this progress, however, one is believed to acquire wonderful powers. He is enabled to make himself light or heavy, at will; to acquire a knowledge of the past and the future; to understand the language of all animals; to penetrate the thoughts of others; to remember all that has happened to him in supposed former stages of existence; and even to transcend all this and to attain to a knowledge of what is going on or has taken place in the stars and in all other worlds. To these powers, the believer in the Yoga adds that of the ability to make himself infinitely small or large beyond imagination. These are accompanied by wonderful powers of body and will and the nicest discrimination in all things, together with the ability to transport oneself anywhere suddenly at will. These wonderful powers are gradually acquired, and finally result in the complete separation of the soul from the corporal body in the ultimate triumph of the former.

YOKE, a piece of timber, hollowed or made curving near each end, and fitted with bows for receiving the necks of draft animals, by which means two are connected for hauling loads. A frame of wood fitted to a person's shoulders for carrying a pail or other load suspended on each side. The ancients regarded the yoke as a symbol of slavery, and it was customary for vanquished armies to pass under a yoke, formed like a gallows, of two upright spears, and a third fixed transversely at top. The word *subjugate* (*sub,* under, and *jugum,* yoke) is a reminder of this custom.

YOKKAICHI, yôk-kī-chē, Japan, seaport on the south coast of the island of Honshu, on Ise Bay 23 miles southwest of Nagoya. There are manufactures of silk and cotton goods, paper, and a unique type of faience. The hot springs of Yunoyama are 12 miles from the city. Pop. 58,471.

YOKOHAMA, yō-kō-hä'mà, Japan, seaport on the island of Honshu, in Tokyo Bay 18 miles southwest of Tokyo. In 1859 it superseded Kanagawa, which it now includes, as a treaty port open to foreign commerce, and subsequently it became the country's principal seaport. Commercial buildings occupy the east of the city, the western part being residential and the center containing the prefecture, customhouse, and other official buildings. Yokohama was practically destroyed by a great earthquake on Sept. 1, 1923, and the tidal wave and fire that followed. The reconstructed city contains a large number of modern concrete structures along wide thoroughfares. The long breakwaters built during 1889–1896 to convert the open roadstead into a safe harbor were also damaged severely by the earthquake and required extensive reconstruction. Yokohama is the center of Japan's silk exporting industry. Pop. (1940) 968,091.

YOKOI HEISHIRO, yō-kōy hāy-shē-rō, Japanese philosopher and statesman: b. Kumamoto, before 1810; d. Kyoto, Feb. 15, 1869. His fame as a scholar in Chinese and as lecturer and expounder of the Oyomei philosophy (q.v.) made the feudal castle lords compete for the honor of his presence and the use of his talents. Many of the makers of the modern Japan evolved after the civil war of 1868 were his pupils, carrying out his ideas. His best work was done in Fukui. When the new government was formed in 1867, after the coup d'etat in Kyoto, the aged scholar was summoned to advise the new men in power. Gaining their confidence, he proposed that the *eta* and *hinin* (not human), outcasts numbering nearly one million, should be raised to citizenship, and that freedom of conscience be permitted. He was attacked by ruffians in the street, shot, and beheaded for "holding evil opinions," that is, for Christian idealism. When the emperor proclaimed the constitution of Japan in 1889, Yokoi was accorded posthumous honors.

YOKOSUKA, yō-kō-sōō'kà, Japan, seaport and naval station on the Bay of Tokyo, 12 miles south of Yokohama. The spacious landlocked harbor possesses modern docks and shipbuilding yards. About a mile from the town is the grave of Will Adams (q.v.), the first Englishman to enter Japan. Pop. (1935) 182,871.

YOKUT INDIANS, a group of about two dozen small tribes, forming the Mariposan linguistic stock of North American Indians, occupying an irregular area in central southern California from Fresno River in the north to near the southern extremity of Tulare Lake in the south, and between the Sierra Nevada in the east and the Coast Range in the west; the Yokuts occupy

a strip, 10 to 20 miles wide, extending southeastward from Tulare Lake along the eastern base of the latter range to Mount Pinos, about lat. 34° 45′, together with an isolated area, occupied by the Cholovone division, in San Joaquin Valley from the Tuolumne northward. The tribes in general were segregated by the natural features of their territory, such as river valleys, and each tribe had its hereditary chief. Their village consisted of a single row of tule-thatched, wedge-shaped houses, with a continuous *ramada* or shelter of brush along the front. In early times, when large game was abundant, hunting formed an important pursuit, but with the coming of the whites and the disappearance of the game they were compelled to resort almost exclusively to the products of the soil, the streams, and lakes, although rabbits and quail were always abundant and were commonly trapped. Seeds of various kinds were gathered for use as food, as also were grasshoppers, caterpillars, worms, and the larvae of insects. Dogs were raised for the same purpose, and even skunks were not despised; but the coyote and the rattlesnake were always tabooed. Their basketry, excellent in shape, design, and execution, formed their chief handiwork. The Yokut women were chaste before the settlement of their country by the whites. Marriage was perhaps by purchase, the husband residing at the house of his wife; infanticide was practised in cases of deformity, and the dead were generally cremated. The Yokuts are now but a remnant of a once comparatively populous group of tribes. Early warfare with the Paiutes, who pressed them closely from the east, and later and more disastrous contact with white ruffians who found the Indians in their way, practically exterminated many of the tribes. Their present population is about 500, of Indian habits and life. But numerous members of the race have been absorbed into the life of the nation and are no longer numerated as members of the Yokuts tribes.

YOM KIPPUR, a rabbinical term designating the Jewish Day of Atonement. See ATONEMENT.

YONEZAWA, yō-nĕ-zä-wä, Japan, a city in the northern center of the island of Honshu, east of Niigata. In Japanese annals it had a long and interesting feudal history. Its old castle grounds now constitute a public park. For more than 150 years the town has been famous for its silken fabrics. Pop. 50,448.

YONGAMPO, yŏn-gäm′pō, Korea, a seaport on the left bank of the Yalu estuary, near Uiju, with a large harbor. It played an important part in the Sino-Japanese War of 1894–1895 and in the Russo-Japanese War of 1904–1905. See KOREA.

YONGE, yŭng, **Charlotte Mary,** English novelist and children's writer: b. Otterbourne, Hampshire, Aug. 11, 1823; d. there, March 24, 1901. She was educated privately in Otterbourne, where she lived all her life and where she came under the influence of John Keble (q.v.), the Anglican theologian of High Church views who was vicar of neighboring Hursley. The inculcation of the High Church faith became the dominating note of her long series of novels and other books, of which there were more than 160 in all. She made her name widely known in 1853 by the publication of a novel entitled *The Heir of Redclyffe;* she devoted part of the proceeds to fitting out a missionary vessel. *The Southern Cross,* for service in the Southwest Pacific. Her next great success was with *The Daisy Chain* (1856), the profits from which went towards establishing a missionary college in Auckland, New Zealand. Among subsequent works of fiction were *The Prince and the Page* (1865); *The Dove in the Eagle's Nest* (1866); *The Caged Lion* (1870); and *The Pillars of the House* (1873). The dialogue in her novels was inspired, and she had great power of characterization. Nevertheless, her later novels showed her to be out of touch with the new generation, which had cast off the smug manners and pseudo-culture of the Victorian period. Besides novels, she also wrote a great number of biographical and historical works, including *Kings of England* (1848); *History of Christian Names* (1863); *Cameos from English History* (1869–99); *Life of Bishop J. C. Patterson* (1873); *The Book of Golden Deeds* (1874); and *Eighteen Centuries of Beginnings of Church History* (1876).

From the age of seven until her death she taught Sunday school, and at the age of 20 she began to publish articles in the *Magazine for the Young.* She edited the *Monthly Packet,* a juvenile magazine, from 1851 to 1890; edited two Sunday school papers; and, generally under the pseudonym "Aunt Charlotte," wrote many books for children. Christabel Coleridge's *Life of Charlotte M. Yonge* (New York 1903) includes her autobiography; Ethel Romanes published *Charlotte Mary Yonge: An Appreciation* (London 1908).

YONKERS, N. Y., a city of Westchester County, on the Hudson River at the mouth of the Nepperhan River, 14 miles north of New York City; it is served by the New York Central Railroad and by passenger and freight river steamers. A river ferry links the city with Alpine, N. J. Yonkers (the "Terrace City") is built on a series of terraces which rise from the Hudson to an elevation of 426 feet above tidewater. The view from the elevated portions includes a long distance up and down the Hudson, the Palisades on the opposite bank of the river, and the beautiful valley to the east.

From early times Yonkers has been a shipping and trading point. A hat factory was established here in 1840, and an elevator plant in 1854. Sugar is refined and carpets manufactured, and other products of industry include wire and cable, chemicals, clothing, and dental supplies. The city has a frontage of nearly five miles on the Hudson, and extends along the Bronx River for about seven miles. It contains several parks. The Frederick Philipse Manor House, built in 1682 and enlarged in 1745, is of historical interest; it was used as the city hall from 1867 until 1872, when it became the property of the State of New York and was constituted a museum. Yonkers also has a Hudson River Museum. In the northern part of the city, a section named Glenwood, is Greystone, a beautifully landscaped and planted estate created in 1873 by Samuel Jones Tilden; later it came into the possession of Samuel Untermyer, who left it to the city—but the gift was not accepted. Also in Glenwood is the Boyce Thompson Institute for Plant Research, founded in 1924, which specializes in the study of plant growth as affected by light and chemicals.

The city has four large hospitals, the General, Professional, St. John's and St. Joseph's; and Leake and Watts Orphan Home, the Hebrew Home for the Aged and Infirm, and private institutions. The public and parochial school systems are good. Here are St. Joseph's Seminary, training men for the Catholic priesthood, and Sarah Lawrence College for women (in Bronxville). Three daily newspapers are published here, the oldest dating from 1863.

There was an Indian village here, Nappeckamack (town of swift water), and the site was bought in 1639 by the Dutch West India Company. In 1648 Adriaen Van der Donck built a mill here, and Jonkheer (Master) Van der Donck's estate was called De Jonkheer's Land—shortened and anglicized to Yonkers. It became a part of Philipse Manor in 1672 and the town was called Philipsburg. The town of Yonkers was founded in 1788. Yonkers had a population of 7,500 in 1855 when it was incorporated as a village, and about 15,000 in 1872 when it was chartered as a city. At that time the southern part was called Kingsbridge. The growth of the population was very rapid in each of the decades from 1890 to 1940. As late as 1930 more than one quarter of the total population was foreign born, with Italians, Poles, Irish, Scotch, Germans, Czechoslovaks, and English (ranking in that order) accounting for three fourths of the alien born. The city is governed by a mayor and a common council. Pop. (1940) 142,598; (1950) 152,798.

Consult Cushman, E., *Historic Westchester, 1683–1933* (Yonkers 1933)

YONNE, yôn, France, a northern interior department bounded by Seine-et-Marne, Aube, Côte-d'Or, Nièvre and Loiret; area, 2,892 square miles; capital, Auxerre. The surface is generally intersected by low hills, sometimes barren, but usually covered with fruitful vineyards, which yield the famous Chablis, Joigny, Auxerre and Tonnerre wines. The climate is temperate, and the air pure and healthful, except in some wet, marshy spots. The minerals include iron, red and yellow ocher, building stone, lithographic stones, pavement and potter's clay. The manufactures are of coarse woolens, woolen covers, serge, glue, sugar, glass, etc. The trade is in wheat, wine, vinegar, wood and charcoal, ship timber, wool, cattle, iron and ocher. Pop. (1936) 271,685; (1946) 266,014.

YORCK (or **YORK**) **VON WARTENBURG,** yôrk fŏn vär'tĕn-bo͝ork, Count **Hans David Ludvig,** Prussian army officer: b. 1759; d. Oct. 4, 1830. He served in the Polish campaign of 1794 and in the war against France in 1806, and reached the rank of major general in 1807. During Napoleon's invasion of Russia in 1812 he commanded the Prussian contingent. When he realized that the Grand Army of France was doomed, he concluded with the Russians the convention of Taurogen which neutralized the Prussian forces. During the campaign of 1813–1814 he commanded a Prussian corps against France, fighting successfully at Möckern and Bautzen on the Katzbach, and at Leipzig; and also took part in the assault upon Paris.

YORICK, yŏr'ĭk, (1) The king's fool, whose skull is apostrophized by Hamlet in the fifth act of Shakespeare's tragedy of *Hamlet.* (2) The pseudonym adopted by Laurence Sterne in *A Sentimental Journey.* (3) The parson in Sterne's *Tristram Shandy,* intended as a portrait of himself.

YORITOMO, yô-rê-tô-mô (Minamoto Yoritomo), Japanese soldier and statesman; b. 1147; d. 1199, one of the most famous characters in Japanese history. In the middle of the 12th century Japan was dominated by two rival military clans, the Minamoto and the Taira. In 1160 the Taira defeated the Minamoto and killed one of their chieftains, Yoshitomo. His son Yoritomo was banished and lived in exile until 1180, when he gathered an army consisting of his father's retainers and some new followers. He met a much larger army of the Taira and defeated them brilliantly with the help of his younger brother Yoshitsune (yô-shê-tso͝o-nĕ, 1159–1189). The final decisive battle of this campaign was a naval engagement at Dan no Ura, near Shimonoseki, in 1185. The power of the Taira was broken, and Yoritomo became actually the ruler of Japan, although nominally he was subject to the emperor. In 1192 he was given the title of shogun, or military governor. He established his capital at Kamakura, and he was the first of a succession of shoguns who ruled Japan under the feudal system until the middle of the 19th century, when European influence entered the country.

He became jealous of Yoshitsune, who was honored as a hero for his military and naval victories. Yoshitsune, hearing that his brother planned to have him assassinated, raised an unsuccessful rebellion, after which he was murdered by one of his brother's followers.

Yoritomo proved to be an able and intelligent governor, and he instituted many reforms, both civil and military. He was brave, astute, and calculating, ready to use any means to achieve his ends. See also Japan—*History: From the Earliest Times to 1853.*

YORK, yôrk (House of York). This English royal line was founded by Richard Plantagenet, 3d Duke of York, grandson of Edmund of Langley, 1st Duke of York (see York, Duke of). The York kings, who reigned between 1461 and 1485, were Edward IV, Edward V, and Richard III. On their behalf the Wars of the Roses (see Roses, Wars of the) were fought.

YORK, Duke of, a title frequently conferred on the second sons of British monarchs. It was first borne, however, by Edmund of Langley (1341–1402), fifth son of Edward III, who received the title in 1385 after accompanying Richard II to Scotland. Three times between 1394 and 1399, while the king was absent from the realm, he acted as regent. In 1399 he failed to defend the king's interests in opposition to Henry of Lancaster; and ultimately supported the latter, who ascended the throne as Henry IV. Edward of Norwich or Edward Plantagenet (1373?–1415), elder son of Edmund, succeeded as 2d Duke of York. Richard II, his cousin, made him admiral of the fleet and appointed him to other posts. As reward for his assistance against the lords appellant, in 1397, the king made him grants of land and conferred upon him the duchy of Albermarle and the office of constable of England. In 1399 Henry IV deprived him of his offices and estates for participating in the murder of Thomas of Woodstock, duke of Gloucester,

but he was restored to favor in 1401. He was imprisoned for a few months in 1405 for his share in the attempt to kidnap the earl of March and Roger Mortimer, the latter's brother. Serving under Henry V in the English invasion of France, he was killed at Agincourt while commanding the right wing of the army. RICHARD PLANTAGENET (1411–1460), grandson of Edmund of Langley and nephew of Edward of Norwich, succeeded as 3d duke of York. His mother was Anne Mortimer, granddaughter of Lionel, duke of Clarence, the third son of Edward III; by virtue of this descent, the house of York alleged its superior right to the throne over that of the house of Lancaster, which was descended from the fourth son of Edward III. He was the lieutenant general of Henry VI in France and Normandy (1436–1437 and 1440–1445) and the king's lieutenant in Ireland (1447–1457); and during the king's illnesses (1454–1455 and 1455–1456) he served as protector of the realm. In 1460 he marched his forces on London to claim the throne for himself. A compromise was reached whereby he was proclaimed heir apparent and protector. The Lancastrians forced him to give battle at Wakefield, where he was killed. Two of his sons ascended the throne as Edward IV and Richard III; a third was George, duke of Clarence. RICHARD PLANTAGENET (1472–1483), duke of York, second son of Edward IV, was a victim of the struggle for the crown after his father's death. He and his elder brother, Edward V, were put to death in the Tower of London, supposedly on the orders of the protector, the duke of Gloucester, who gained the throne as Richard III.

The title of duke of York was also borne by Henry Tudor (later Henry VIII), Charles Stuart (later Charles I), James Stuart (later James II), and Henry Benedict Maria Clement Stuart (see YORK, CARDINAL). George III created Frederick Augustus, his second son, duke of York and Albany (q.v.). The dukedom of York remained in abeyance until 1892, when the title was conferred upon the second son of the prince of Wales (later Edward VII), who ascended the throne as George V. The latter's second son bore the title from 1920 until his accession in 1936 as George VI.

YORK, Alvin Cullum, American soldier: b. Pall Mall, Tenn., Dec. 13, 1887. He fought in France during World War I. As a sergeant of the 328th Infantry, 82d Division, in the Argonne on Oct. 8, 1918, he killed 20 Germans and captured 132 of the enemy and 35 machine guns. He was awarded the United States Medal of Honor and the French Croix de Guerre. Subsequently he established the York Foundation for the education of mountain children and became a local leader of the prohibition and world peace movements.

YORK, CARDINAL (HENRY BENEDICT MARIA CLEMENT STUART), last prince of the British royal house of Stuart: b. Rome, Italy, March 6, 1725; d. Frascati, Italy, July 13, 1807. He was the second son of James Francis Edward Stuart (the Old Pretender) and brother of Charles Edward Louis Philip Casimir Stuart (the Young Pretender). Soon after birth he was created duke of York by his father, then in exile. In 1746 he went to Rome, where, the next year, Pope Benedict XIV made him bishop of Ostia and a cardinal; in 1761 he was made bishop of Frascati. Through the favor of the French court he enjoyed the revenues of two rich abbeys, and he also had sinecure benefices in Spain and Spanish America. After his brother's death in 1788 he assumed the title of Henry IX, king of England. Stripped of his fortune by the French Revolution, he took refuge in Venice. Now penniless, he was awarded an annual pension of £4,000 by George III; he bequeathed certain of the British crown jewels in his possession to the prince regent (later George IV).

YORK, city and county borough, England, county seat of Yorkshire, at the confluence of the rivers Foss and Ouse, 20 miles east-northeast of Leeds. The ancient city, with a circuit of nearly three miles, is enclosed by double walls, originally Roman but restored by Edward I and partly repaired at subsequent periods; the walls are pierced by four imposing gates or bars. The city forms a perfect storehouse for the antiquary. The minster or cathedral dates from the 7th century, but did not begin to assume its present form till 1171, and was not completed till 1472. A square massive tower rises from the intersection to the height of 235 feet, and two other lofty towers of graceful proportion, 196 feet, flank a richly-decorated western front, divided by paneled buttresses into three compartments, of which that in the center is chiefly occupied by a beautiful window and a splendid portal. Measured without the walls, the whole length, from east to west, is 524 feet, and the width across the transepts, north to south, 222 feet; length, from west door to choir, 264 feet; length of choir, 162 feet; breadth of body and side aisles, 109 feet. The interior consists chiefly of a lofty nave, separated from its aisles by long ranges of finely clustered columns, a still loftier choir, lighted by a magnificent and beautifully blazoned window, and a Lady Chapel continuing the choir, and containing some beautiful monuments. The chapter house, entered from the north transept of the cathedral, is a richly decorated octagon, and near it is a fine old chapel, originally forming part of the old archiepiscopal palace, and now appropriated to the library. Other notable buildings and establishments are an ancient Gothic guildhall (1446), and spacious mansion house adjoining; the fine old ruins of Saint Mary's Abbey; Clifford's Tower, part of the city castle founded by William the Conqueror; the fine old merchants' hall. Manufactures include iron and steel products, glass, chemicals, and leather goods. The archbishop of York has the title of primate of England; the city's chief magistrate takes the title of lord mayor.

York may have been the early British *Caer Ebranc* of the Brigantes; and under the Romans, as *Eboracum* or *Eburacum,* it was the capital of the British province and headquarters of the 6th legion. Hadrian lived here in 120, while Severus and Constantius Chlorus died here. After the departure of the Romans, York so far retained its importance as to become the capital of Northumbria, whose king, Edwin, in 624 made it an archiepiscopal see. In the 8th century its diocesan school attracted students not only from all parts of the kingdom, but from France and Germany, and sent out scholars who afterward acquired European celebrity. Here the first English Parliament was held by Henry II in 1160. In later times it makes a distinguished figure in almost all the great epochs and events of English history, during the Civil War surrendering tc the Parlia-

mentarians after a siege of several weeks. Pop. (1951 est.) 105,336.

YORK, town, Maine, in York County, situated on the Atlantic Ocean 25 miles south-southwest of Biddeford; it is served by the Boston and Maine Railroad. The town, which includes the summer resorts of York Beach and York Harbor, is generally known as Old York. It has a number of buildings of historic interest, among which is the jail, now a museum, which is one of the oldest in the United States. The township contains several villages. York was set off in 1622, from land granted by the Plymouth Council to John Mason and Ferdinand Gorges. In 1624 the place was called Agamenticus. On March 1, 1640, a territory of 21 square miles was incorporated as a borough by Sir Ferdinando Gorges, and chartered as the city of Gorgeana in 1642. This was the first municipal corporation made by the English in North America. On the death of Charles I, in 1649, Gorgeana City, Isle of Shoals, Wells, and Kitterytown united and established a confederacy. In 1652 the confederacy and all of Maine came under the control of Massachusetts. The city charter of Gorgeana was revoked, and the name changed to York. The limits of the present town are about as in 1652. In the early years the town suffered from Indian depredations; one attack, in 1692, resulted in the massacre or capture of about one half the inhabitants. In 1716 the legislature of Massachusetts made York the shire town of Yorkshire, now York County. Pop. (1940) 3,283; (1950) about 3,500.

YORK, city, Nebraska, seat of York County, 41 miles east of Grand Island, served by the Burlington Lines and the Chicago and North Western Railroad. Farming and stock-raising flourish in the county and it is a large egg producing center. The city has a varied list of industrial activities, including the manufacture of feed grinders, medicines for livestock, and foundry and machine-shop products. It is the trading center for a considerable area. York has public and parochial schools, and is the seat of York College, a coeducational institution opened in 1890. Here too is the state farm of the Independent Order of Odd Fellows. An orphanage supported by the Methodist Episcopal Church also has a farm. Three parks, East Hill, Harrison, and Central, afford recreational facilities. Outside the city limits is a state reformatory for women, with a farm; in 1933 women prisoners in the state penitentiary were moved to this institution, which was opened in 1920. York was laid out in 1869 and was incorporated in 1872. Two years later an academy was established. The neighboring settlement of New York was added to the city in 1880. Pop. (1940) 5,383; (1950) 6,298.

YORK, city, Pennsylvania, and York County seat, altitude 370 feet, on Codorus Creek; 27 miles southeast of Harrisburg; on the Maryland and Pennsylvania; Pennsylvania; and the Western Maryland railroads; and state and federal highways, with an airport. It is in a productive farming section, which in colonial times was called the "breadbasket of America," and is now famous for its tobacco.

York is the trade name of ice machinery and air-conditioning equipment, and of safes and locks, made here. Other factory products are: cigars, cigar boxes, wall paper, other paper products, chains and cables, water turbines, artificial teeth, roofing and other building materials.

The city is laid out in blocks 520 feet long and 480 feet wide. The older blocks are built solid along the street, except for occasional narrow alleys, which lead to a second row of houses. The older houses are brick, many have a small porch three or four feet above the sidewalk. The center of the old town was Continental Square, site of the old courthouse. Three old church buildings are: the Friends' Meeting House (1765, 1766, 1780), St. John's Episcopal (1766, 1769), and the First Presbyterian (1789, rebuilt 1860). Christ Lutheran Church, built in 1813, is on the site of buildings of 1743 and 1753. Two modern Lutheran churches, Union (1928) and St. Matthew's (1933) have woodcarvings by the Oberammergau actor, Alois Lang. The principal parks are Highland, Farquehar (on a hill; play grounds; tiny model of the courthouse, built in 1756, torn down in 1841), and Penn Common, a park established by the Penn heirs. The York County Fair grounds have entrances dedicated to World War veterans.

A permanent settlement was made here in 1735 by a German colony, the first white settlement west of the Susquehanna. In 1741 the town was laid out by John, Thomas and Richard Penn. It was incorporated as a borough in 1787 and chartered as a city in 1887. In 1749 the first Court of General Quarter Sessions was held here. The first military company in Pennsylvania to offer resistance to Great Britain was organized in York in 1774. In 1777 the Continental Congress left Philadelphia, fearing capture by Howe's army, and convened in York September 30. Congress continued to hold sessions here until June 27, 1778. In 1863 Confederate forces occupied the city before the Battle of Gettysburg. Rifles were made in York in Colonial times; paper in 1800; a foundry and forge were set up in 1820; and a blast furnace in 1823. Early York achievements included a sheet iron river steamboat, 1825; the prize-winning coal-burning locomotive *York,* 1831; and *Codorus,* the first American wood-burning iron steamboat. The first railroad came in 1850, and the Codorus Canal was opened in 1853. Pop. (1940) 56,712; (1950) 59,704.

YORK, city, South Carolina and York County seat; 76 miles northwest of Columbia; on the Carolina and Northwestern, and Southern railways. Situated in the Piedmont section of the state, York is a tree shaded residential town in a cotton, grain, general farming and pine timber region. Manufactures include cotton and lumber products. Near by is the Kings Mountain National Military Park. York was settled in 1757 and until 1915 was called Yorkville. Pop. (1940) 3,495; (1950) 4,170.

YORK, a river in Virginia, formed by the confluence of the Pamunkey and Mattapony rivers. It is the tidal estuary of the rivers, which begins at West Point and flows southeast to the Chesapeake Bay, into which it empties about 18 miles north of the James River. It is 40 miles long and navigable to the head of tide water. At its entrance, on York Spit, is a lighthouse.

YORK, Battle of, in the War of 1812. Admiral Perry's victory at Lake Erie and Gen.

William Henry Harrison's defeat of Proctor at the Thames successfully concluded one part of the campaign for the invasion of Canada. As the next step Gen. Henry Dearborn planned to capture York (now Toronto), besiege Fort George by land and water, and then move on to Kingston after being joined by the troops at Buffalo, which were to capture Forts Erie and Chippewa. Leaving Sackett's Harbor defenseless, Com. Isaac Chauncey with 14 vessels, carrying 112 guns and 980 men, conveyed Dearborn, Zebulon M. Pike and 1,600 troops to York, which was attacked on the morning of April 27, 1813. The British garrison of 600 regulars and militia under Major General Sheaffe were driven back toward their main works but when about 60 yards away a powder magazine was exploded by the British causing great havoc and killing about 40 British and 100 American soldiers, Pike being among those mortally wounded. Nevertheless the Americans pressed forward and finally drove the regulars toward Kingston and captured the militia, besides large quantities of stores and a 10-gun brigade. The public buildings were then set afire.

YORK AND ALBANY, Frederick Augustus, Duke of. British army officer: b. London, Aug. 16, 1763; d. Jan. 5, 1827. The second son of George III, in infancy he was made prince-bishop of Osnabrück; he retained the bishopric until 1803. In 1784 he had been promoted to the rank of major general in the British army and created duke of York. He married Frederica (1767–1820), daughter of Frederick William II of Prussia, in 1791. During 1793–1795 he served in Flanders in command of the British forces against the French. He was made field marshal in 1795 and appointed commander in chief of the British army in 1798. Because his mistress, Mary Anne Clarke (1776–1852), accepted bribes to secure army promotions, he was removed from his post in 1809. Acquitted of corrupt practices by a House of Commons committee, he was reinstated in 1811. Though incapable as a field officer, he did much to revive the military spirit. Appointed his father's guardian (1818), on George IV's accession he became heir to the throne. He founded the Duke of York's School, London.

YORK COLLEGE, located at York, Nebraska. It was founded under the auspices of the Church of the United Brethren in Christ, and was opened to students in 1890. It is under the control of a board of trustees composed of three members at large, five members from York County, and representatives of nine conferences in the Southwest and Pacific areas of the church. A merger of the founding church and the Evangelical Church makes York College the only educational institution west of the Missouri River operated by the Evangelical United Brethren Church. York is a four-year liberal arts college, and offers work leading to the following degrees: A.B., B.S., and B.S. in Education. Its organization includes today the College of Liberal Arts, Expression Department, a Conservatory of Music, etc. A summer school is also maintained with courses which are intended especially for teachers. The Conservatory of Music offers courses in piano, organ, voice, and violin, and also band and chorus. Instruction in physical training is given, and a full program of sports is carried through the entire year. The students maintain Young Men's and Young Women's Christian Associations, and two literary societies. The college newspaper, *The Sandburr,* is published bi-weekly. A new building, Middlebrook Hall, a combined girls' dormitory and student union, erected at a cost of a quarter of a million dollars, was completed in 1949. The college is a member of the Nebraska Association of Church Colleges. Enrollment (1949–1950) 212.

G. T. Savery,
Business Manager, York College.

YORKSHIRE, county, England, bounded on the north by the Tees, separating it from Durham, east by the North Sea, south by Lincoln, Nottingham, Derby and Cheshire, and west by Cheshire, Lancaster and Westmoreland; area, 6,067 square miles. Yorkshire is divided into trithings, or three ridings, respectively, the north, east and west, each having a separate lord lieutenant, but a single high sheriff for the county. The main portion of the county forms a large central valley stretching southeast to the Humber, flanked on one side by the Pennine range and on the other by the Cleveland Hills, and drained chiefly by the Ouse and its tributaries. Considerably more of the North Riding is pasturage than is under cultivation, but it includes the vale of York, with an area of about 1,000 square miles, in which there is much fertile land growing all kinds of crops. It also includes the Cleveland district, with its great bed of iron ore. In the North Riding is the capital of the whole county, York, Scarborough, a favorite watering place, and Whitby, famous for its jet. In the East Riding the area under cultivation greatly exceeds that laid down in permanent pasture. Its industrial activity is centered in the great seaport of Hull. In the West Riding the proportion of land laid down in permanent pasture is larger than in any other, being two-thirds of that under cultivation. The West Riding has long been famous for its woolen and worsted manufactures, of which it is now the chief seat. Their development has been in modern times aided by the proximity of coal and iron. The great coal field of the West Riding yields not only the Silkstone bituminous coal, most valuable as a house coal, but also the Barnsley thick coal, semi-anthracitic. There are important manufactures of chemicals in both the South and the West Ridings. Leeds produces every variety of woolen goods, as well as manufacturing clothing and paper; Bradford, mixed worsted fabrics and yarns; Dewsbury, Batley and adjoining districts, shoddy; Huddersfield, plain goods, with fancy trousering and coatings; and Halifax, worsted and carpets; Barnsley is famous for its linen manufactures, of which Leeds also is a seat, as well as of that of leather. Next to the woolen and other textile industries comes the manufacture of iron and steel machinery, and implements of every description. Leeds is one of the principal seats of all kinds of mechanical engineering, and Sheffield of iron-work and cutlery. The county was a part of the kingdom of Diera from the 6th century until the Danish Conquest in the 9th century; and it suffered severely under the Norman Conquest. It has many ancient castles and fine examples of ecclesiastical architecture. Pop. (est. 1949) 4,607,590.

YORKTON, town, Canada, capital of Mackenzie District, Saskatchewan, 100 miles northeast of Regina and situated on the Canadian Pacific, and the Canadian National railways.

It is an important agricultural center, and is a distributing point for many wholesale concerns It has a tanning and flour mill, and manufactures brick and lumber. A Royal Canadian Air Force training base was located here during World War II. Pop. (1951) 7,074.

YORKTOWN, yôrk'toun, city, Texas, in De Witt County, 30 miles west-northwest of Victoria, and served by state highways and (for freight only) the Texas and New Orleans Railroad. It also has a municipal airport. A trading center in a farming and oil producing section, it has cotton ginning, cottonseed oil and peanut oil mills, and poultry packing. It was founded in 1848 by Capt. John York and was incorporated in 1871. Government is by mayor and council. Pop. (1950) 2,596.

YORKTOWN, town, Virginia, seat of York County, altitude 50 feet, situated on the York River, 11 miles east-southeast of Williamsburg. Here was fought the last important battle of the Revolutionary War, ending with the surrender of Lord Cornwallis on Oct. 19, 1781. The British threatened the town in 1814, and Union forces under Gen. George B. McClellan besieged it and drove out the Confederates in 1862. The Yorktown Battlefield, much of Jamestown Island, the Colonial Parkway, and the Cape Henry Memorial form the Colonial National Historical Park. Buildings of interest include Grace Church (1697), the Moore House, where the surrender of Cornwallis was negotiated, a courthouse containing records dating back to 1633, an old "customs house" (built about 1706), and a monument commemorating the victory of the allied French and American armies in 1781. The battlefield is preserved as nearly as possible as it was in 1781. For historical details see articles immediately following. Pop. (1950) 384.

YORKTOWN, Siege of, *in the American Revolutionary War.* After the Battle of Guilford Courthouse (q.v.), Lord Cornwallis with his army of 8,000 men withdrew in August 1781 down the York Peninsula to Yorktown in order to secure the protection of the British Fleet, which effectively ruled the coastal waters. He threw up numerous earthworks fortifying the town, and he also erected fortifications at Gloucester Pond, opposite Yorktown, on the York River. The Marquis de Lafayette, who had recognized the possibilities of trapping Cornwallis and had followed him to Yorktown, communicated with General Washington, then in his headquarters on the Hudson River, and the latter, with a force of over 6,000 men, two thirds of them French, left immediately (August 19), traveling by land to Philadelphia, then to Elktown at the head of the Chesapeake Bay, and arriving at Williamsburg September 14.

Meanwhile, the French fleet under Comte François de Grasse, numbering 24 ships of the line, had moved from their anchorage off Newport, Rhode Island, reached the Chesapeake River on August 31, and after anchoring at the mouth of York River, disembarked the 4,000 infantry on board. Cornwallis was securely blockaded both by sea and land, and with the recent additions of the French troops, was now outnumbered two to one. By the beginning of September York River was effectively closed and the Americans and the French began to strengthen their lines.

On September 5, the English squadron under Adm. Thomas Graves, who had been misinformed of the French fleet's whereabouts, appeared in Chesapeake, and in the naval battle that ensued, was thoroughly defeated, returning to New York. Immediately after the battle, the Comte de Barras, commander of a French flotilla at Newport, arrived, bringing with him eight additional ships of the line and 10 transports, also cannon for the siege of Yorktown.

The allied armies, now greatly superior in numbers to the enemy and confident of success, encamped closely around Yorktown and the siege was regularly begun on September 29. The first parallel trench was opened October 6 and completed October 9, when the Americans opened fire and the cannonade became constant and effective. On October 13, the Americans made an assault from a second parallel and the outer works of the British were carried by storm. At daybreak, October 15, the British made a sortie from their encampments with 350 men and succeeded only in spiking a few guns which were promptly restored to action. Cornwallis then attempted a night escape by boats, leaving his sick, wounded, and baggage behind, but a terrific storm frustrated the plan. On October 17 Cornwallis proposed to surrender, and on the 19th Brig. Gen. Charles O'Hara led out the entire British Army into an open field where, in the presence of the allied ranks of France and America, 7,247 English and Hessian soldiers laid down their arms and became prisoners of war; the garrison forces becoming prisoners of the United States, while the sea forces, numbering 850 sailors, were prisoners of the French.

Although neither side was conscious of the fact, the surrender actually represented the end of the war. Yorktown's surrender occasioned the downfall of Frederick North's cabinet in England, and King George III appointed American sympathizers in the new cabinet. There were no more battles of consequence during the Revolutionary War, even though the final drafts for peace did not arrive until nearly a year after the siege.

Consult Arthur, Robert, *The Sieges of Yorktown, 1781 and 1862* (Washington, D.C. 1927); Kibler, J. L., *The Cradle of the Nation* (Richmond, Va. 1931); Bonsal, Stephen, *When the French Were Here* (New York 1945).

YORKTOWN, Siege of, *in the Civil War.* On April 4, 1862, Gen. George B. McClellan, with 53,000 men and about 100 guns, started from Fort Monroe up the York Peninsula for his campaign against Richmond. His plan of operation was to move in two columns, one on the right direct to Yorktown and another along the James River westward of and beyond Yorktown to the vicinity of Williamsburg. Should the Confederate works at Yorktown and Williamsburg offer serious resistance he designed to land Gen. Irvin McDowell's 1st Army Corps, reinforced if necessary, on the left bank of the York or on the Severn, and move it on Gloucester and West Point, in order to take in reverse whatever force the enemy might have on the peninsula and compel him to abandon his positions. At the end of the first day's march Gen. Samuel P. Heintzelman's 3d Army Corps on the right bivouacked at Howard's Bridge and Cockletown beyond, and Gen. Erasmus D. Keyes' 4th Army Corps on the left, at Young's Mill, near James River. On April 5, Keyes resumed his march for the Halfway House, between Yorktown and Wiliamsburg, but had hardly got on the road when it was ascertained

that a large force of the enemy, with a battery, was at Lee's Mill, six miles beyond, barring the way over the Warwick. Keyes advanced and in the afternoon found the situation as reported, and after some artillery firing he encamped for the night. On the right Heintzelman advanced to near Yorktown, came under artillery fire from the works, and encamped fronting them, where he was destined to remain a full month. Yorktown, as well as the line of the Warwick southward to James River, was held by Gen. John B. Magruder with about 11,000 men, and was brilliantly defended.

For 10 days McClellan remained in front of Magruder, making some reconnaissances, but no serious demonstrations, although urged by President Lincoln to move upon and break the enemy's line. McClellan was instead engaged in bringing up troops and guns preparatory to a regular siege and was asking for heavy reinforcements and more heavy siege guns. He adopted the slow method of a siege because of his exaggerated idea of the Confederate strength in his front, although he at no time estimated the forces of Magruder at more than 15,000 to 20,000, and his own initial strength of 53,000 men had been increased to over 100,000 men. He declared himself seriously weakened by the removal of McDowell's corps of 33,400 men to protect Washington which had been left with a guard of less than 20,000 raw troops. However, at McClellan's urgent request, Gen. William B. Franklin's division was sent him April 10, but these troops were held aboard their transports until after the evacuation of Yorktown.

On April 16, an attempt was made upon Magruder's lines at Lee's Mill (q.v.) by a reconnoitering force of 200 men who were not reinforced, but resulted in failure, and McClellan, giving up the idea of carrying the Confederate position by assault, devoted his attention entirely to siege operations against Yorktown. Under the direction of Gen. Fitz-John Porter, who was made director of the siege, Gen. John G. Barnard, chief of engineers, and Gen. William F. Barry, chief of artillery, the operations were conducted elaborately and with great skill. General Barry reports that the siege train consisted of 101 pieces, among them two 200-pounder rifled guns and 40 mortars, varying in size from 13 inches to eight inches. In number and weight of metal these guns were far superior to those of the Confederates. The Confederate general, Joseph E. Johnston, who had been assigned to the defense of the peninsula and Richmond on April 17, had by that date no more than 50,000 troops on the line, and he made no strenuous attempt to interfere with McClellan's operations. However, he had determined to hold his position until McClellan was ready to attack and then to fall back without waiting to have his troops driven from their works. By April 30, McClellan had present for duty 112,392 men, including Franklin's division. McClellan proposed to open fire on the morning of May 6 with all his guns and to press the siege until final assault should be deemed practicable. But Johnston, who had learned that McClellan's batteries were approaching completion and would soon be ready to open fire, made his dispositions for retreat. On the night of May 3, leaving some serviceable heavy guns behind, he evacuated Yorktown and fell back to Williamsburg on the way to Richmond.

Bibliography.—Barnard, J. G., *The Peninsula Campaign* (New York 1864); McClellan, H. R., *McClellan's Own Story* (New York 1887); Allan, W., *The Army of Northern Virginia in 1862* (Boston 1892); Webb, A. S., *The Peninsula* (New York 1881–1908).

YORKVILLE, yôrk'vĭl, village, New York, in Oneida County, altitude 420 feet, situated on the Mohawk River, three miles west-northwest of Utica, and sharing its railway service. Yorkville, chiefly residential, was settled before 1800 and incorporated in 1902. It is on the old road to Fort Stanwix, and is six miles from the Oriskany Battlefield. Henry Inman, the American painter, was born here, and his home, built in 1792, is still standing. Pop. (1950) 3,528.

YORKVILLE, former village, New York, absorbed by New York City. It was bounded by what is now Lexington Avenue to the East River, and by 59th and 96th streets, with its center between 83d and 89th streets, east of the Old Boston Post Road. Points of interest include the Gracie Mansion, built about 1794, and situated in the Carl Schurz Park; Smith's Folly, a tremendous mansion built in 1795, of which only the stables, which have been converted into the Towle House, are standing; the New York Hospital and the Cornell University Medical College; and the famous Rockefeller Institute for Medical Research.

Yorkville was founded about 1790, and was successively a farming village, the center of fine country estates of wealthy New Yorkers, a commuting center from 1834 when the New York and Harlem Railroad connected with Prince Street, and later the section became known as a foreign quarter, first German and Irish, and then Central European.

YORUBALAND, yôr'ŭ-bà-lănd, a former independent kingdom of Africa, now part of Western Provinces, Nigeria, West Africa. The old kingdom was situated between Lagos Lagoon and the Niger River, and the Dahomey Territory and Dini country, and during the 17th century was a strong empire formed by several states of a common linguistic stock. However, owing to Moslem and Fulah depredations, it disintegrated into petty, warring kingdoms about 1830, and in 1888 became a British protectorate.

The natives, called Yorubas, are of Negro stock, but many have light skins, due to Arab and Berber blood. They were more civilized than neighboring tribes of Negroes, being an agricultural race, rather than stock-raising, and they lived in large, well-built communities. Their ancient capital was Ibadan (pop. 1931, 387,133), and other Yoruba cities include Abeokuta (45,763) and Lagos (126,108) Pop. about 3,166,000.

YOSEMITE NATIONAL PARK, yō-sĕm'ĭ-tē, California, one of the great scenic wonders of North America. It was established as a national park in 1890, after it had been ceded by Congress to California in 1864 as a public trust. In 1906, the State of California receded the park to the United States, under whose guidance it has since been. The grant originally embraced Yosemite Valley and the Mariposa Grove of big trees, but now includes within its boundaries Wawona Basin; Hetch Hetchy Valley; Tuolumne Meadows, near which are Waterwheel Falls, Muir Gorge, Tenaya Lake, Mount Lyell Glacier, and the Grand Canyon of the Tuolumne; and Merced and Washburn lakes. It has a total area of 1,182 square miles. The park is reached by

buses from Merced, Calif., which is the gateway town to Yosemite, while in the park itself there are hundreds of miles of bridle paths and hiking trails, and more than 150 miles of auto roads. Camping areas, stores, lodges, and hotels are conveniently located.

The valley is in the shape of a huge U, and is approximately seven miles long and a mile and a half wide. It stands nearly 4,000 feet above sea-level, while the tremendous granite cliffs that surround the valley stand as high as 3,500 feet above that. Over this ring of cliffs cascades the most impressive series of waterfalls in North America, some of them ranking among the world's highest.

Points of Interest.—Entering the valley from the lower end, one passes through the portal formed by El Capitan (7,654 feet), a gigantic mass of granite rising 3,609 feet above the valley floor on the north, and Cathedral Rocks, rising 2,592 feet, on the south. Over the side of Cathedral Rocks pours Bridalveil Fall (620 feet), and opposite is Ribbon Fall (1,612 feet). Through the valley winds the Merced River which initially plunges 594 feet over Nevada Fall, and further down drops 317 feet over Vernal Fall. Opposite Sentinel Dome (8,117 feet) are the Yosemite Falls (upper, 1,430 feet; lower, 320 feet). Between the upper and lower falls is a series of cascades, making the total drop 2,565 feet to the valley floor. Other falls are Illilouette (370 feet) and Widow's Tears (1,170) which flows during the spring. Other peaks surrounding the valley include: Basket Dome (7,602 feet); Clouds Rest (9,930); Glacier Point (7,214); Liberty Cap (7,072); North Dome (8,657); Half Dome (8,852); Eagle Peak (7,773); Taft Point (7,503). Mariposa Grove (q.v.) contains some superb specimens of giant sequoia.

History.—The valley, once the stronghold of the Yosemite (Grizzly Bear) or Awani Indians, was probably first seen by white men when a party led by Capt. Joseph R. Walker viewed it in 1833. The valley was entered in 1851 by a detachment of militia led by James D. Savage, which attempted to drive Tenaya, chief of the Yosemites, out of the valley. Lafayette H. Bunnell, a member of the expedition, suggested naming the valley Yosemity after the Indians living there. John Muir, the American naturalist, lived here from 1868 to 1874, and was later instrumental in helping to establish the national park. Horace Greeley was one of the valley's earliest visitors, and lent his support for preserving it.

YOSHIDA, yō-shē-dä, **Shigeru,** Japanese statesman: b. Tokyo, Sept. 22, 1878. The fifth son of Tsuna Takeuchi, he was adopted as a child by his father's friend, Kenzo Yoshida. He was graduated from Tokyo Imperial University Law College in 1906, and thereafter served in several subordinate posts in the consulates at Tientsin, Mukden, London, and Rome; in the embassies at Washington and London; as consul general in Tientsin (1922–1925) and Mukden (1925–1928); as minister to Sweden (1928); as vice minister of foreign affairs (1928–1930); and as ambassador to Italy (1930–1932) and Great Britain (1936–1939). He was imprisoned from June to August 1945 for urging peace efforts through British channels. In October 1945 he was appointed foreign minister in the Cabinet of Kijuro Shidehara, and on May 16, 1946, headed his first Cabinet—a coalition of Liberals and Progressives—which was sworn in on May 22. Originally criticized for his defense of Japan's conquest of Manchuria and for his associations with the Zaibatsu (family industrial monopolies), Yoshida emerged as Japan's leading political figure in the postwar occupation period. Regarded as ultra-conservative and pro-Western in viewpoint, he remained premier (except for the period May 1947 to October 1948) through several political and economic crises, and signed the Japanese Peace Treaty at San Francisco on Sept. 8, 1951.

YOSHIHITO, yō-shē-hē-tō, emperor of Japan: b. Tokyo, Aug. 31, 1879; d. Hayama, Dec. 25, 1926. The third son of Mutsuhito (Emperor Meiji), he was proclaimed heir apparent on his eighth birthday, and acceded to the throne as 123rd emperor (reign name, Taisho) on his father's death, July 30, 1912. He was educated at the Peer's School (1887–1891) and studied under tutors, traveled widely throughout his realm, and served in the House of Peers from 1897 until his accession. He was married to Princess Sadako in 1900; Hirohito, eldest of their four sons, succeeded him.

YOSHIMASA, yō-shē-mä-sä, Japanese shogun: b. 1435; d. 1490. Eighth in the line of Ashikaga shoguns, he was the grandson of Yoshimitsu (q.v.). His rule (1443–1474) was characterized by uprisings in 1461, resulting from famine and pestilence, and by the civil war of 1467–1477. He was known as an art patron, particularly of painting and the theater.

YOSHIMITSU, yō-shē-mē-tsōō, Japanese shogun: b. 1358; d. 1395. The third and most powerful of the Ashikaga shoguns, he ruled from 1367 to 1395. During these years he was instrumental in halting the civil war between the north and south (1392), in subduing piracy, and in fostering relations with China. On his retirement he became a monk, but continued to exercise authority from his palace at Kyoto.

YOSHINOBU, yō-shē-nō-bōō (also known as Hitotsubashi, hē-tō-tsōō-bä-shē), Prince Tokugawa. See Tokugawa.

YOSHITSUNE, yō-shē-tsōō-nĕ, Japanese warrior: b. 1159; d. 1189. The son of Yoshitomo, he was exiled as a child by the Taira clan, but escaped from his monastery prison with the priest, Benkei, and in 1180 led the Minamoto clan in an uprising against the Taira clan which culminated in the annihilation of the latter at Dan no Ura in 1185. Thereafter he was cruelly treated and finally slain by order of his jealous brother, Yoritomo, who became shogun in 1192.

YOST, yōst, **Fielding Harris,** American athletic director: b. Fairview, W. Va., April 30, 1871; d. Ann Arbor, Mich., Aug. 20, 1946. Educated at Lafayette College and the University of West Virginia, he coached football at several universities before becoming head coach at the University of Michigan (1901–1927) and director of athletics there (1921–1941). He devised several outstanding blocking and signaling systems in collegiate football, and wrote *Football for Player and Spectator* (1905).

YOUGHAL, yôl, urban district and seaport, Ireland, in County Cork, located on the

Blackwater, 27 miles east of Cork. The parish church is formed of the nave and aisles of the ancient collegiate church, built by the earl of Desmond in 1464; the Water Gate, the Clock Gate and Sir Walter Raleigh's house, Myrtle Grove, are other notable features. The export of agricultural produce and the fisheries are the chief industries. According to local tradition the potato was first planted at Youghal by Raleigh, who was mayor in 1588. Pop. (1951) 3,197.

YOUMANS, yōō'mănz, **Edward Livingston,** American scientist: b. Coeymans, N.Y., June 3, 1821; d. New York, Jan. 18, 1887. Partially blind at times through many years of his life, he pursued his studies by the aid of his sister, Eliza Ann Youmans, and became widely known as a popularizer of science. He lectured extensively and, in 1872, founded *Popular Science Monthly,* which he continued to edit until his death.

YOUMANS, Vincent, American popular song and musical comedy composer: b. New York, N.Y., Sept. 27, 1898; d. Denver, Colo., April 5, 1945. At the age of four he began playing chords on the piano, which encouraged his mother to have him study with the organist, Charles André Feller, and other teachers. After attending Trinity School at Mamaroneck, N.Y., and Heathcote Hall at Rye, N.Y., he entered a Wall Street brokerage house as a clerk in 1916. He enlisted in the navy during World War I and was assigned to an entertainment unit at Great Lakes Naval Training Station, where he was soon producing and writing musical shows. After the armistice he secured a job as song plugger for T. B. Harms, music publishers, and then rehearsed singers for Victor Herbert's musical productions. His first important success came with *Oh, Me! Oh, My! Oh, You!* sung in *Two Little Girls in Blue* (1921). Together with Herbert Stothart, he wrote the songs for *Wildflower, Mary Jane McKane,* and *Lollipop* (1923). The greatest triumph of his career was the score for *No, No, Nanette,* which opened in London and New York in 1925, and eventually had 17 companies touring throughout the world. Later shows for which he provided the music were *A Night Out* (1925); *Oh Please* (1926); *Hit the Deck* (1927); *Rainbow* (1928); *Great Day* (1929); *Smiles* (1930); *Through the Years* and *Take a Chance* (1932). In 1933 he went to Hollywood to write the score for the film, *Flying Down to Rio,* but that same year was forced to retire because of tuberculosis. For the next 10 years he lived in Colorado and California, studying serious music and working on an opera and a symphony. In 1944, his unsuccessful production of *Vincent Youmans' Ballet Revue* opened in Baltimore, but never reached Broadway.

During the 1920's and early 1930's, Youmans was one of the most gifted and prolific of the younger group of popular song and musical comedy composers. Among his best known songs were *Tea for Two; I Want to Be Happy; Hallelujah; Sometimes I'm Happy; Without a Song; Carioca; Drums in My Heart;* and *Orchids in the Moonlight.*

YOUMANS, William Jay, American chemist, brother of E. L. Youmans (q.v.): b. Milton, Saratoga County, N.Y., Oct. 14, 1838; d. Mount Vernon, N.Y., April 10, 1901. He studied chemistry at Columbia College and at the Sheffield Scientific School, New Haven, and was graduated from the medical department of the New York University in 1865 and practiced his profession for a time at Winona, Minn. In 1871 he was called to assist his brother editing the *Popular Science Monthly.*

YOUNG, yŭng, **Arthur,** English agricultural writer: b. London, Sept. 11, 1741; d. there, April 20, 1820. He was intended for a mercantile career, but early adopted the profession of agriculture, carrying on farms at various places, and especially on his paternal estate, near Bury Saint Edmunds. He soon became famous as a writer on farming and allied topics and especially for his agricultural tours. He also carried on an extensive correspondence with public men both at home and abroad, Washington being one of his correspondents. In 1784, he began the publication of his *Annals of Agriculture* of which 46 volumes were issued. This work had the most important influence upon the art of agriculture in England and a considerable portion of it was translated into French under the auspices of the government. In 1793, he was appointed secretary of the newly erected board of agriculture, with a salary of £400 a year. Young not only visited and examined with great attention many parts of England and Ireland, but also made several tours on the Continent. His work was highly important, not only in its service to agriculture, but from the standpoint of social and political observation. He became blind some years before his death.

Among his numerous works are *The Farmer's Letters to the People of England* (1767; enlarged edition 1777); *Six Weeks' Tour through the Southern Counties* (1768); *Six Months' Tour through the North of England* (1770); *Farmer's Guide* (1770); *Farmer's Tour through the East of England* (1771); *The Farmer's Calendar* (1771); *Tour in Ireland* (1780); *Travels in France during the Years 1787–1789* (1792–1794), treating of agriculture and national resources, the social and political condition of the people, this volume is the most trustworthy source of information regarding the state of France on the eve of the revolution; *Essays on Manures* (1804); *The Rise of Prices in Europe* (1815). By order of the French Directory his agricultural works were published in French in 20 volumes entitled *Le Cultivateur Anglais* (1800–1801).

Consult Leslie, Stephen, *Studies of a Biographer* (1898); his autobiography edited by Miss Betham Edwards (1898); and bibliography by Anderson in Hutton's edition of *Tour in Ireland* (1892).

YOUNG, Brigham, president of the Church of Jesus Christ of Latter-day Saints (commonly called the Mormon Church) from 1844 to 1877: b. Whittingham, Vt., June 1, 1801; d. Salt Lake City, Utah, Aug. 29, 1877. In early life he moved to Cayuga County, N.Y., where he followed the occupation of carpenter and glazier. In 1829, he moved to Mendon, N.Y., where he obtained from Samuel H. Smith, brother of Joseph Smith, the prophet, a copy of the Book of Mormon. His investigation resulted in his conversion and he joined the church, being baptized and confirmed April 14, 1832. He was ordained an elder and immediately began active service in the ministry, preaching and baptizing in the regions about Mendon. When the main body of the Latter-day Saints settled

in Kirtland, Ohio, he also made his residence there, and was actively engaged traveling and laboring in the ministry. He also spent much of his time as a carpenter and builder, assisting in the erection of the Kirtland Temple in 1833–36, and having the supervision of much of the work on that building. When the Council of the Twelve Apostles was organized in 1835, he was chosen as a member of that body, and, following the death of David W. Patten, became president of that council, which is the second council in the Church. He passed through the persecutions in Missouri in 1838–39 and led the members of the Church from that State to their refuge of safety in Illinois, following the exterminating order given by Gov. Lilburn W. Boggs of Missouri. In the fall of 1839 he started on a mission to Great Britain, where, with other members of the Council of Apostles, he labored until 1841, preaching and organizing branches throughout the British Isles, where thousands of converts joined the Church. Following the assassination of Joseph and Hyrum Smith, in 1844, Brigham Young, by virtue of his position as president of the Twelve Apostles, became the presiding officer of the Church, and when the Council of the First Presidency was again organized, he was unanimously chosen president, with Heber C. Kimball and Willard Richards as his counselors. On the forcible expulsion of the Church from Illinois in 1846, he led the Latter-day Saints through toils and dangers, which nothing but the most untiring energy could have conquered, over the plains and tablelands to the valley of the Great Salt Lake. Here, in the heart of the Rocky Mountains, he founded Salt Lake City, 24 July 1847, in a land most uninviting. Due to untiring industry and determined perseverance, this exiled people, under his direction, soon made the deserts blossom and the waste places fruitful and a pleasant habitation. In 1849 an attempt was made to organize a State, to be called the State of Deseret, that being the name given by the Latter-day Saints to that region. The United States government refused to sanction the new State, but in 1850 the Territory of Utah was organized and Brigham Young was appointed governor by President Fillmore. He served in that capacity until 1858, when he was succeeded by Alfred Cummings of Georgia. A false report having reached Washington that the «Mormons» had burned the court records and were in rebellion, President Buchanan sent out an army to the Territory. President Young declared that the Latter-day Saints had been driven and persecuted by armed forces so many times that they would not be so driven again. If an army with hostile intent entered the Territory they would find it a barren waste, in the condition in which the pioneers found it in 1847. The body of the people journeyed to the southern portion of the Territory, leaving in Salt Lake City only enough forces to apply the torch to every substance, including their homes, that would burn. When it was discovered that the records were intact and that the report of a «Mormon» rebellion was false, the matter was amicably settled.

During the administration of President Young, the doctrine of marriage for eternity, including plural marriage, was openly taught. This doctrine was based on a revelation given to Joseph Smith and recorded in July 1843. The practice of plural marriage brought on opposition, and laws were later passed by Congress against the doctrine, which finally resulted, during the administration of President Wilford Woodruff, in the abandonment of the practice by the Latter-day Saints.

Brigham Young was the friend of true education and with his associates founded the University of Deseret, now the University of Utah; the Brigham Young Academy, now the Brigham Young University in Provo, and the Brigham Young College in Logan, Utah. He encouraged and assisted in the building up of the Union Pacific and Southern Pacific railroads and the telegraph line across the plains, and in various other ways was the prime mover in the great development of the West. See MORMONS.

YOUNG, Charles Augustus, American astronomer: b. Hanover, N. H., 15 Dec. 1834; d. 4 Jan. 1908. He was graduated at Dartmouth in 1853, was professor of mathematics, physics and astronomy in Western Reserve College (1857–66); and of astronomy and physics in Dartmouth (1866–77). He was professor of astronomy at Princeton 1877–1906. He accompanied the eclipse parties to Iowa in 1869, and to Spain in 1870; the transit of Venus party to Peking, China, 1874, and organized the Princeton eclipse expedition to Denver in 1878. He was the discoverer of the green line of the solar corona in 1869, identifying it with the line 1,474 of Kirchoff's scale. At the 1870 eclipse he detected the so-called «reversing layer» surrounding the solar photosphere, and in 1872 at Sherman, Wyo., noticed the bright reversal of many lines of the solar spectrum in ordinary sunlight. He was recognized as an authority in spectroscopy and lectured in the courses of the Peabody Institute at Baltimore, the Lowell Institute at Boston, and at many colleges. He wrote 'The Sun' (1882); 'General Astronomy' (1889); 'Elements of Astronomy' (1890); 'Lessons in Astronomy' (1891); 'Manual of Astronomy' (1902).

YOUNG, Charles Mayne, English tragedian: b. London, 10 Jan. 1777; d. Southwick, Sussex, 28 June 1856. In 1798 he made his début at Liverpool as Young Norval and his first appearance in London, in 1807, was as Hamlet. As Hamlet, Iago and Falstaff he was seen at his best, but his repertoire was very extensive. In 1829 he declined an offer of $50,000 for a 10 months' tour in the United States and in 1832 retired with a fortune of $300,000. At his farewell benefit at Covent Garden, 31 May 1852, he appeared as Hamlet, with Mathews as Polonius, and Macready as the Ghost. Consult J. C. Young, 'Memoirs of Charles Mayne Young' (1871).

YOUNG, Clark Montgomery, American educator: b. Hiram, Ohio, 1856; d. 1908. He attended Hiram College and after 1883 was employed in educational work in South Dakota. He was secretary of the Territorial board of education of Dakota in 1889 and of the State board of education of South Dakota, and in 1892 became professor of history and sociology in the University of South Dakota, where he was dean of the faculty from 1902. Author of 'The State and Nation' (with G. M. Smith); 'History and Government of South Dakota'; 'Elements of Pedagogy'; etc.

YOUNG, Edward, English poet: b. Upham, Hampshire, July 3, 1683; d. Welwyn, Hertfordshire, April 5, 1765. He was educated at Oxford and in 1708 was nominated to a law fellowship in All Souls College. Befriended by the Duke of Wharton, an annuity of £100 was granted him by the duke. In 1719 and 1821, respectively, appeared his tragedies of *Busiris* and *Revenge,* both produced at Drury Lane. In 1725 he began the publication of a series of satires, *The Universal Passion.* He now took holy orders and in 1728 was nominated one of the royal chaplains. In 1730 the College of All Souls presented him with the rectory of Welwyn, in Hertfordshire, to which the lordship of the manor was attached. In 1731 he married Lady Elizabeth Lee, daughter of the Earl of Lichfield, and after his marriage the poet lived much in retirement at Welwyn, sadly disappointed that church preferment, which he so eagerly desired and so unscrupulously belauded those in power to obtain, was refused him. The work by which he is best known is *The Complaint, or Night Thoughts on Life, Death and Immortality* (1742–45), a series of argumentative poems in blank verse, intended to prove the immortality of the soul and the truth of the Christian religion—a work displaying great force of pious and somewhat gloomy reflection, and containing many lofty passages, but marred by a straining after antithesis and ornament. The *Night Thoughts* were translated into French and German and were as popular on the Continent as at home. Of Young's three tragedies, *Busiris* (1719) *The Revenge* (1721); and *The Brothers* (1753), only the second has kept a place on the stage. His *Night Thoughts* has never since ceased to be popular and many of its sententious lines have become proverbial. The poem is not destitute of real excellence, but a note of insincerity runs through it and the poet too often substitutes pomposity for dignity. Consult Mitford edition of Young's *Poetical Works* with *Life* (1854); Thomas, *Le poète Edward Young* (1901); *Worldliness and Other-Worldliness,* by George Eliot, in *Westminster Review* for 1857, reprinted in her *Essays and Leaves from a Notebook* (1884).

YOUNG, Ella Flagg, American educator: b. Buffalo, N.Y., Jan. 15, 1845; d. Washington, D.C., Oct. 26, 1918. She was educated at the Chicago Normal School, and took the degree of Ph.D. at the University of Chicago in 1900. She engaged in teaching in 1862, and was married to William Young in 1868. She was appointed superintendent of schools in Chicago in 1887, and in 1899 she became professor of education at the University of Chicago. She served as principal of the Chicago Normal School in 1905–09, and in 1909 she again became superintendent of Chicago schools, resigning in 1915. She was actively connected with various educational associations, and was in 1910–11 the first woman president of the National Education Association. In 1906–09 she edited the *Educational Bi-Monthly.* She published *Isolation in the School* (1901); *Ethics in the School* (1902); *Some Types of Modern Educational Theory* (1902), etc. Consult McManis, John T., *Ella Flagg Young* (Chicago 1916).

YOUNG, Franklin Knowles, American author and inventor: b. Boston, Mass., Oct. 21, 1857. He is the inventor of an automatic breech action for small arms and field artillery. Author of *The Minor Tactics of Chess* (1894); *The Major Tactics of Chess* (1898); *Grand Tactics of Chess* (1898); *Chess Strategics Illustrated; Field Book of Chess Generalship* (1923).

YOUNG, Sir Frederick, English publicist: b. London, June 21, 1817; d. Nov. 9, 1913. He was formerly a London merchant and traveled extensively in Greece, Turkey, South Africa and Canada. He was active in securing Victoria Park, London and Epping Forest to the public, and in establishing the People's Palace. He took great interest in emigration and was one of the earliest advocates of imperial federation. He published *Long Ago and Now* (1863); *New Zealand: Past, Present, and Future; A Winter Tour in South Africa* (1890); *A Scheme for Imperial Federation* (1895); *Exit Party* (1900); *A Pioneer of Imperial Federation in Canada* (1902), etc., and edited *Imperial Federation* (1876).

YOUNG, Frederic George, American educator: b. Burnett, Wis., June 3, 1858. He was graduated at Johns Hopkins University in 1886; was vice-principal of the State Normal School, in Madison, S. Dak., 1887–90; principal of the Portland High School, Ore., 1890–94; president of Albany College, Ore., 1894–95; and professor of economics and sociology in the University of Oregon 1895–1920; dean of the Graduate School 1900–20 and dean of the School of Sociology after 1919; editor of the *Commonwealth Review* of the University. He edited *Sources of the History of Oregon* and the *Quarterly Journal of the Oregon Historical Society.* Author of *Exploration Northward* (1898); *The Lewis and Clark Expedition in American History* (1901); *Procedure for Tax Reform in Oregon* (1909). Died Jan. 4, 1929.

YOUNG, George Ulysses, American mine owner and public official: b. Hamburg, Ind., Feb. 10, 1867. His parents emigrated to Kansas in 1880, and two years later, he began teaching school. He was admitted to the bar in 1890, and worked for several years in railroad construction. He was principal of the Williams schools (Arizona) for four years, and while there was owner of the Williams *News,* with Capt. W. O. O'Neill. Since 1903 he has been in the mining business, becoming vice-president and general manager of the Madizelle Mining Company, and president of the Young Mines Company. In 1916 he was elected mayor of Phœnix, Ariz., the first to serve under the commission form of government. From 1909–12 he was territorial secretary of Arizona.

YOUNG, James, Scottish chemist: b. Glasgow, July 13, 1811; d. May 14, 1883. He began his career as a cabinetmaker, but in the evenings studied chemistry under Professor Graham in Anderson's College, Glasgow, and became his assistant both there and afterward at University College, London (1832–38). Receiving appointments in chemical works at Manchester and elsewhere, he discovered a method of distilling oil from bituminous shale, and thus became the founder of the mineral-oil industry of Scotland, besides leading to the development of the petroleum industry in

America and elsewhere. (See PARAFFIN). He acquired a large fortune, endowed a chair of chemistry in Anderson's College, and fitted out at his own expense an expedition in search of Livingstone in 1872.

YOUNG, James Thomas, American publicist: b. Philadelphia, Pa., 23 Sept. 1873. He was graduated at the University of Pennsylvania 1893, and later studied at German, French and Swiss universities, taking the degree of Ph.D. at Halle in 1896. He is at present professor of public administration, University of Pennsylvania. He is the author of 'The New American Government and Its Work' (3d ed. 1933), and articles on political science and university training for business.

YOUNG, Jesse Bowman, American Methodist clergyman and author: b. Berwick, Pa., 5 July 1844; d. 1914. He graduated at Dickinson College in 1868, but had previously served three years in the Union army during the Civil War, becoming captain in the 84th Pennsylvania volunteers. Entering the ministry in 1868, he held pastorates in Pennsylvania and Kansas City, Mo., and was subsequently editor of the *Central Christian Advocate* (1892–1900). Author of 'What a Boy Saw in the Army'; 'Days and Nights on the Sea'; 'Helps for the Quiet Home' (1900); 'Our Lord and Master' (1903); 'Wellsprings in the Desert' (1905); 'Charms of the Bible' (1910); 'The Battle of Gettysburg' (1913), etc.

YOUNG, SIR John, BARON LISGAR, English statesman: b. Bombay, India, 31 Aug. 1807; d. Ireland, 6 Oct. 1876. He was graduated at Oxford in 1829, called to the bar in 1834, and sat in the House of Commons in 1831–55. He was lord of the treasury 1841–44; secretary of the treasury in 1844–46; chief secretary for Ireland in 1852–55; and lord high commissioner of the Ionian Islands 1855–59. He succeeded to the baronetcy on the death of his father in 1848 and from 1861 to 1867 was governor to New South Wales. Appointed governor-general of Canada in 1868 he filled this post till 1872, when he was succeeded by the Earl of Dufferin. During his Canadian governorship he suppressed the Riel rebellion in 1870 and was rewarded with the title of Baron Lisgar.

YOUNG, John Russell, American journalist: b. Downingtown, Pa., 20 Nov. 1841; d. Washington, D. C., 17 Jan. 1899. In 1857 he was copyholder on the Philadelphia *Press;* and later its news editor. At the outbreak of the Civil War he became war correspondent, and was with the Army of the Potomac from the battle of Bull Run to the end of the Chickahominy campaign, when he returned to Philadelphia and became managing editor of the *Press.* In 1865 he joined the editorial staff of the New York *Tribune,* resigning in 1869; established the *Morning Post* in Philadelphia; and the *Standard* in New York (1869); and was European correspondent of the New York *Herald* (1871–77). As correspondent of that paper he accompanied General Grant in his journey round the world in 1877, and was attached to the editorial staff of the *Herald* 1879–82. He was Minister to China 1882–85; and was appointed librarian of Congress 30 June 1897. Author of 'Around the World with General Grant' (1879); and editor of 'Memorial History of Philadelphia' (1895).

YOUNG, Owen D., American lawyer and industrial executive: b. Van Hornesville, N. Y., 27 Oct. 1874. He was graduated from St. Lawrence University (New York) in 1894, and from the law school of Boston University in 1896. He began practice in Boston in the latter year, and until 1913 was a member of the firm of Tyler and Young. Since then he has devoted the greater part of his time to industrial matters and to public service. Although well known prior thereto, Mr. Young established an international reputation in 1924, when as a member of the First Committee of Experts appointed by the Reparations Commission, he went to Europe and assisted in framing the so-called Dawes Plan, under which Germany made reparation payments to the Allies until 31 Aug. 1929. Mr. Young served as temporary Agent-General for Reparations under this plan during its inauguration. In 1928 he was appointed a member of the second commission of experts chosen to work out a plan of reparation payments based on a revision of the Dawes Plan, and served as chairman thereof. The commission sat at Paris from 11 Feb. until 7 June 1929, and turned in a report which came to be known as the «Young Plan.» In 1919 Mr. Young served as an alternate member of President Wilson's first Industrial Conference, and as a member of the same executive's second Industrial Conference. In 1921 he served as a member of President Harding's Conference on Unemployment; in 1924, as a member of the National Distribution Conference, and also as unofficial adviser to the London Conference of Premiers; in 1925–28 as chairman of the American Section of the International Chamber of Commerce. Mr. Young is president of the board of trustees of St. Lawrence University; of the Walter Hines Page School of International Relations; member of the General Education Board; of the International General Education Board; a trustee of Teachers College, Columbia University; of the Brooklyn Law School. The honorary degree of LL. D. has been conferred on him by Union College (1922), Tufts College, Harvard University, Dartmouth College (1924), Johns Hopkins University, Colgate University, Columbia University, Yale University (1925), Rutgers University, Princeton University, Lehigh University (1926), Brown University, University of the State of New York (1928), Hamilton College (1929), and University of California (1930). New York University conferred the degree of D. C. S. on him in 1927. He was chairman of the board of the General Electric Company, (1922–39), chairman of the board of the Radio Corporation of America until 1929, and is an officer or director of numerous other great corporations, including the Federal Reserve Bank of New York. Japan decorated him with the Order of the Rising Sun (4th class), 1921; France made him a commander of the Legion of Honor in 1924; Belgium conferred on him the Grand Cross of the Crown of Belgium in 1930.

YOUNG, Samuel Baldwin Marks, American soldier: b. Pittsburgh, Pa., 1840. He rendered important service in the Civil War, entering the Volunteer Army of the Union in 1861 as a private, and rose to a colonelcy at the end of the war. He was brevetted major for services at Sulphur Springs (1863); lieutenant-colonel at Amelia Springs (1865); colonel at Sailors Creek (1865) and brigadier-general of volunteers for his share in the final

action against General Lee. At the close of the Civil War he entered the regular army as second lieutenant, took part in the Indian Wars, commanded a brigade at Santiago, and won a decisive victory at Las Guasimas 24 June 1898. In 1899 he was in charge of the cavalry advance of Lawton's Division in its march through northern Luzon, and for his services was appointed military governor of northwestern Luzon; and later commander of the first district of the Department of Northern Luzon. He was then appointed commander of the Department of California. In 1902 he became first president of the Army War College Board, chief of staff and lieutenant-general of the army. He was retired 9 Jan. 1904. In 1909–10 he was president of the Brownsville Court of Inquiry; and from 1910 to 1917 was governor of the Soldiers' Home at Washington, D. C. Died 1 Sept. 1924.

YOUNG, Samuel Hall, American Presbyterian clergyman: b. Butler, Pa., 12 Sept. 1847. He was graduated at the University of Wooster, Ohio, in 1875, and at the Western Theological Seminary, Allegheny, Pa., in 1878; and ordained in the Presbyterian ministry in 1878. Going to Fort Wrangel, Alaska, as a missionary and explorer in 1878, he organized the first Protestant church in Alaska in 1879; and afterward held pastorates in California, Illinois, Iowa and Ohio. Sent to the Klondike in 1897, he established the First Presbyterian Church in Dawson in 1898; and organized missions in Eagle, Romfort, Nome and Teller. He was superintendent of Presbyterian missions in Alaska 1901–13; special representative for Alaska of the Presbyterian Board of Missions, New York, 1913–21; general missionary for Alaska 1922–25, and special representative. D. 1927. Author 'Alaska Days' with John Muir (1915).

YOUNG, Thomas, English physicist and archæologist: b. Milverton, Somerset, 13 June 1773; d. London, 10 May 1829. He was of Quaker parentage, and at the age of 14 possessed a remarkable knowledge of Latin, Greek, French, Italian, Hebrew, Persian and Arabic. He studied medicine at London and Edinburgh, taking his M.D. at Göttingen in 1796 and later studying at Cambridge. As early as 1799 Young wrote his celebrated memoir on the 'Outlines and Experiments respecting Sound and Light,' which speedily conducted him to the discovery and demonstration of the interference of light. This discovery alone, according to Sir J. Herschel, would have sufficed to have placed its author in the highest rank of scientific immortality. He described astigmatism in 1801; formulated a correct theory of color perception; and made important contributions to hæmadynamics. In 1801 he became professor of natural philosophy at the Royal Institution, and in 1802 foreign secretary to the Royal Society — an office which he held for the remainder of his life. The series of lectures delivered in connection with his professorship form the substance of his great work, 'Natural Philosophy and the Mechanical Arts' (1807). In 1811 he was elected physician to Saint George's Hospital. In 1818 he was appointed secretary to the board of longitude, superintending the 'Nautical Almanac.' He became also a linguist of high ability and is known for his successful pioneer work in deciphering Egyptian hieroglyphic inscriptions and working out the hieroglyphic alphabet. He was author of many scientific papers and of 'An Account of Some Recent Discoveries in Hieroglyphical Literature and Egyptian Antiquities' (1823). Consult Peacock, 'Life of Young,' and 'Miscellaneous Works,' edited by Peacock and Leitch (1855).

YOUNG, Sir William, Canadian jurist and statesman: b. Falkirk, Scotland, 8 Sept. 1799; d. Halifax, Nova Scotia, 8 May 1887. He was educated at Glasgow University, and later joined his parents in Nova Scotia, where he was admitted to the bar in 1826. He was elected to the legislature of Nova Scotia in 1832, and in 1839 he was, with Herbert Huntington, delegated to go to England to urge the establishment of a responsible government for Nova Scotia. He was appointed a member of the Executive Council in 1842, and in 1843–54 he was speaker of the legislature. He was Premier and Attorney-General of Nova Scotia in 1854–57, and was again Premier in 1859–60. He then retired from politics, and was appointed Chief Justice of the Supreme Court of Nova Scotia in August 1860. He was knighted in 1868; and in 1881 he retired from the bench.

YOUNG, William, American poet and dramatist: b. Illinois, 1847; d. 2 Oct. 1920. He published 'Wishmakers Town,' poems (1885–98); and the plays: 'Jonquil' (1871); 'The Rogue's March' (1872); 'Pendragon,' verse (1881); 'The Rajah' (1883); 'Ganelon,' verse (1888); 'The Home of Mauprat,' with J. G. Wilson (1882); 'Joan of Arc,' adaptation in verse (1890); 'If I Were You' (1892); 'Young America' (1894); 'The Princess of Bagdad' (1896); 'Ben Hur,' dramatization (1899); 'Woman's Wiles' (1898); 'The Sprightly Romance of Mersac' (1900); 'Oh, What Riddles these Women Be!'; narrative poem (1900); 'A Japanese Nightingale' a dramatization (1903); and 'The Sea-Green Man' (1907).

YOUNG ENGLAND, a political party active in London about 1844 and led by Mr. Disraeli, after he had begun to oppose the general policy of Sir Robert Peel. Besides its founder it contained some young men of ability and position, prominent among them being Lord John Manners, later Duke of Rutland; George Smythe, afterward Viscount Strangford; and Baillie-Cochrane, afterward Lord Lamington. Its program was the reconciliation of the aristocracy and the Church on the one hand, and the people on the other; and its adherents sought to re-establish the political ascendency of the aristocracy by demonstrating its ability to govern. Its principles were attractively expounded in Disraeli's two fictions, 'Coningsby' and 'Sybil.'

YOUNG GERMANY, a group of literary and political innovators in Germany, headed by Heine (q.v.). Its followers were devoted to the promotion of liberal ideals in literature and in politics, among them being Börne, Gutzkow, Laube, Heller and Kühne. The movement was strongest in the 1830's and collapsed after the failure of the revolution of 1848.

YOUNG IRELAND, the name applied to an Irish political group, active between 1840

and 1850. They at first adhered to O'Connell, but soon became very radical in their opinions; advocated physical force, and separated from the conservative Irish politicians in 1844. *The Nation* was their political organ and in this journal the Irish people were constantly incited to revolt. In 1848 John Mitchell (q.v.), one of the leaders of the party, was arrested and sent to Tasmania, and the attempted insurrection which followed soon collapsed, two of the leaders, T. F. Meagher (q.v.), and W. S. O'Brien (q.v.), being sentenced to death, but their sentences were presently commuted to transportation.

YOUNG ITALY («Giovane Italia»), a society of Italian republicans formed by Giuseppe Mazzini (q.v.) in 1831, whose aims were the emancipation of the Italian peninsula from the control of Austria, and the union of the various portions of the country under a republican rule. Its greatest activity was in 1834, when Mazzini led an unsuccessful invasion of Savoy. The influence of the society soon declined, but it was of service in arousing Italian patriotism and it formed the model for similar organizations elsewhere in Europe, such as Young France, Young Germany, etc.

YOUNG MEN'S CHRISTIAN ASSOCIATION. A Young Men's Christian Association is an organization composed of young men who are united together for the purpose of ministering to the spiritual, intellectual, social and physical needs of young men. Any young man of good moral character, regardless of race or creed, may become a member of this organization and enjoy its privileges; but only active members, who are ordinarily members of Protestant evangelical churches, can vote or hold office. Local associations are usually under the administration of a board of directors, which employs to administer its work officers known as general secretaries, physical directors, boys' secretaries, etc. Local societies are independent and autonomous in their administration, but are affiliated together into state and interstate, as well as national unions. These national unions are under the administration of a national committee. The national organizations are further united into a world's organization, having its headquarters at Geneva, Switzerland. The world's organization is administered by what is known as the central or World's Committee of Young Men's Christian Associations, 52 Rue des Paquis. Since December 1924 the official organization of the general body in the United States has been the National Council of the Young Men's Christian Associations of the United States. A similar National Council exists in Canada. The corporate title of the National Council of Y. M. C. A.'s of the United States is The International Committee of Young Men's Christian Associations.

History.—The establishment of the Young Men's Christian Association was occasioned by the growth of the modern city. The growth of cities to be found throughout the more industrial parts of the world created an environment which made necessary special efforts in behalf of young men. Without the rise of the city, the parlors, gymnasiums, reading-rooms, educational classes, Bible studies, religious meetings of this youth organization of over 1,761,000 members throughout the world with its secretaries, directors, committees, unique buildings, and useful influence would never have been started.

The association movement was founded by a young man who came from the country to the city. It was founded at first for commercial young men living away from home in cities. Without the spread of the city it might have remained a London institution, and never have become a world-wide organization. The city has become the dominant factor in modern life. Young men form the largest and most important element of the large army which is annually invading the city from the country. The proportion of young men in the city is much larger than in rural districts. In the city, the home and the church have a smaller place in the life of the average young man than in the country. The city is full of opportunities to gratify temptation. Contrasted with the country, where life is in the open air and activity is chiefly muscular, life in the city is indoors and far more full of nervous excitement. It should also be said that the city has brought young men together in large numbers, and so made possible an organization among themselves in their own behalf.

The history of the association falls into five periods: (I) Founding of the Association, 1844–55; (II) Development of the Association Ideal, 1855–78; (III) Expansion of the Movement, 1879–1913; (IV) Work During the World War, 1914–19; (V) The Last Two Decades.

Period I, 1844 to 1855. Founding of the Young Men's Christian Association.—The founder of the Young Men's Christian Association, George Williams, later Sir George Williams, who was born at Ashbury Farmhouse, near Dulverton, southern England, in 1821, grew into manhood at the time when the industrial revolution in England was attracting young men from the country to the town. He went to London in October 1841, and became a clerk in the dry goods establishment of which he was afterward the proprietor. At that time there were some 80 young men employed in the different departments of the business. Through Mr. Williams' efforts, a Young Men's Christian Association was organized, for the purpose of establishing religious services and Bible classes among the young men employed in various houses of business in London. This organization took effect on 6 June 1844. The name was suggested by Christopher Smith, George Williams' roommate. The constitution provided that the association should seek to promote the spiritual and mental improvement of young men engaged in the drapery trade, that its membership should be young men who gave decided evidence of conversion to God and that its management should be in the hands of a small board chosen from the membership. This movement rapidly assumed important proportions. Prayer meetings and Bible classes were soon established in 14 different business houses, and a «missionary» to young men was employed in January 1845. In 1848 apartments were rented, in which a library, reading-room, restaurant, social parlors and educational classes were provided; and young men who made no religious profession were invited, upon the payment of a small fee, to use the privileges of the organization, though they were given no share in its management and were known not as members but associates. A lecture course was established, which soon be-

came the most important lecture platform in London. Branches of the parent society sprang up in different parts of the metropolis, and provincial branches in different parts of the United Kingdom became affiliated with the parent society.

The association was marked by intense religious zeal. Through personal interviews by its members with young men, through Bible classes and evangelistic meetings for men, a persistent campaign was carried on to win young men to lead a religious life. The social services developed considerably during the first seven years. In 1851, in the Central Association, there were 225 members and 425 associates. There were estimated to be 750 members and associates in the other branches in the metropolis. At this time there were eight societies in London, and 16 in various parts of the United Kingdom. The 24 associations enrolled approximately 2,700 young men.

Knowledge of this work came to America in the fall of 1851 at three different centers—Montreal, Boston and New York. The first movement took place at Montreal, where, through the efforts of two young men who had become acquainted with the London work through published copies of the lectures delivered before the London Association, an association was formed on 25 Nov. 1851. In November 1851 George Petrie, who had become well acquainted with the London work during a visit to that city, called together a group of his personal friends in New York. These conferences, however, did not result in organization until encouraged by the success at Boston, where the first association in the United States was established.

A letter published on 30 Oct. 1851, describing in detail the work of the London Association, came under the eye of Capt. Thomas V. Sullivan, who was active in Christian work among seamen, and so impressed him that he determined to establish a society in Boston. His purpose was accomplished at a meeting held on 29 Dec. 1851, in the chapel of the old South Meeting House in Spring Lane. The Boston society laid great emphasis upon the association as a social center. It introduced the committee system, and inaugurated the plan of restricting voting and officeholding to members who were in good standing in an evangelical church. It was the Boston society which gave character and direction to the American movement. It immediately became one of the leading religious agencies of the city. Twelve hundred young men joined its membership; 10,000 copies of its constitution and by-laws were printed and scattered widely over the eastern part of the United States; representatives of the society assisted in founding associations at other points, and through its influence, by the year 1854, some 26 associations had been established in different parts of the Union.

Through the efforts of Chauncey M. Langdon, a government employee in Washington, and later a clergyman in the Episcopal Church, a convention of the American associations was called at Buffalo in June 1854. This convention established an alliance of the associations of the United States and Canada, under the supervision of an executive committee which was instructed to call annual conventions, and to do everything in its power to foster and extend the work of the associations. The organization was made international at the suggestion of a delegate from the association at Toronto, Ontario, who had been invited to the convention. This alliance was known as the American Confederation, and it was largely through its influence that the American movement rapidly extended the number of associations throughout North America.

In the meantime, through the efforts of George Williams and others, associations had been established at Paris and other points in France, and at Geneva, in Switzerland. Prior to the founding of the association, a movement known as the «Junglingsverein» (Youth's Union) had been started among young workingmen in Germany in the year 1834. This had already come into friendly correspondence with the associations in England. The German associations, while not on a strictly interdenominational basis, were invited into alliance with the Young Men's Christian Association, and continued actively in this fellowship until their withdrawal from the World's Alliance in July 1939.

The culminating event of the early period was the first convention of the associations of all lands, held at Paris in 1855, at which the memorable statement of belief known as «the Paris basis» was adopted. This has been called the apostles' creed of the association, and did much to unify the movement. It was proposed by Mr. Frederick Monnier, a layman from Strasbourg, and was read before the convention, all the delegates standing, «in which position it was then solemnly passed by the unanimous vote of the whole assembly. The members present then knelt together, gratefully to acknowledge the mercy of God and to entreat His benediction on the decision at which they had arrived.» The basis was as follows:

> The Young Men's Christian Associations seek to unite those young men, who, regarding Jesus Christ as their God and Saviour according to the Holy Scriptures, desire to be His disciples in their doctrine and in their life, and to associate their efforts for the extension of His kingdom among young men.

The reports of this convention showed the estimated strength of the association movement as follows:

	Associations	Members
Continent of Europe:		
Germany	130	6,000
Switzerland	54	700
France	49	700
Holland	10	400
Belgium and Italy	3	60
Total	246	7,860
British Isles	47	8,500
United States and Canada	36	14,000
Total	329	30,360

The period from 1844 to 1855 saw the association founded in the various Protestant countries, an international committee established for North American work and a uniform basis adopted by the associations of all lands. The fundamental principles of the association began clearly to emerge. Although the movement was at first primarily religious and spiritual in character, the association was led to add service facilities for ministering to the intellectual and social needs of young men. It recognized the principle that ministering to the needs of a man is one of the surest ways to promote his reli-

gious life; and on the other hand, that the Christian religion demands the development of all human powers and their use in the service of God. It was upon these two truths, the power of environment to mold character and the adaptation of the religion of Jesus Christ to redeem man in body, mind and spirit, that the Young Men's Christian Association rested its claim for recognition among the agencies of the Church.

Period II, 1855 to 1878. Period of Development of the Association Ideal.—During the years from the Paris convention in 1855 to the Geneva convention in 1878, when a central executive committee for the associations of the world was established, with headquarters at Geneva, the Young Men's Christian Associations were gradually developing a world consciousness as an organization, and slowly evolving a method of work for ministering to the needs of young men. During this period, the American associations rose to comparative pre-eminence, and the type of association developed here has in later years spread throughout the world.

The six years preceding the Civil War were remarkable for two events in the American associations, the creation of the International Committee, with its work of supervision, and the unique revival which stirred the entire country during the years 1857 and 1858. During these years, the central committee of the confederation was located respectively at Washington, Cincinnati, Buffalo and Philadelphia. This migratory plan was soon found to be a source of weakness, but much good was accomplished. Annual conventions were held, and information regarding the new movement was widely disseminated. Many new associations were founded; and at the outbreak of the war there were 240 associations in North America, with an estimated enrolment of 30,000 members.

In 1856 several members of the New York association established a union prayer-meeting, chiefly for men, at the Dutch Reformed Church, in Fulton street. This was carried on for nearly a year, and in the following September it was given over to Mr. J. C. Lamphier, the city missionary of the Dutch Reformed Church, with the understanding that it should be continued on a union basis. The committee of the association arranged to co-operate heartily in this meeting.

In the fall of 1857 came the financial panic which prostrated the business interests of the country. Large numbers of men began immediately to attend this noon prayer-meeting and, under the auspices of the New York association, many more union meetings were established in different parts of the city. Similar meetings were conducted by all the Young Men's Christian Associations throughout the country. It was estimated that over 300,000 persons were added to the evangelical churches of America as a result of this revival.

The years from 1861 to 1866 in America were overshadowed by the cloud of the Civil War. The financial depression and the distractions attending the outbreak of the war brought the association to the lowest point it ever reached. The Boston membership fell front 2,400 to 700. The New York City association, at the beginning of 1862, had but 151 members; it was burdened with a debt of $2,400, and its work had sadly declined. It is recorded that only 60 organizations survived the war; and yet, in the midst of this depression and apparent weakness, the association undertook one of the most heroic tasks ever undertaken by a religious organization.

Through the influence of the association in New York, heartily seconded by those of Boston, Washington, Philadelphia, Chicago and other places, the United States Christian Commission was organized. This was the first organized attempt, on a large scale, to minister to both the spiritual and material needs of soldiers in time of war. This form of effort became later a widely-organized service of the associations. In the Spanish-American War and in the Boer War a service program for the welfare of the soldiers was carried on by the associations. The same effort was made with marked success by the associations of Japan among Japanese troops in the Russo-Japanese War. The association was prepared with experience and resources on a world scale to render a similar social service to the Allied armies in the First World War. The plan of work of the United States Christian Commission was to send out delegates with supplies and needed comforts, who should spend some five or six weeks without remuneration, nursing the sick and wounded, distributing literature, conducting evangelistic and religious meetings, bearing messages from home, and in various ways encouraging and helping the soldiers. About 4,800 of these delegates were sent to the front during the Civil War. The following table shows the vast efforts of this commission in raising money and supplies for the soldiers:

*Receipts by the United States Christian Commission

	1862	1863	1864	1865 (4 mos.)	Total
Cash	$40,160	$358,200	$1,297,755	$828,357	$2,524,472
Supplies	191,096	558,637	1,584,592	1,432,298	3,766,623
Totals	$231,256	$916,837	$2,882,347	$2,260,655	$6,291,095

* Moss, 'United States Christian Commission.' p. 729.

This was an heroic service, and won for the association the admiration and confidence of the public. In the meantime, the New York City society had secured for its secretary Robert R. McBurney, and for its president William E. Dodge, Jr. It had on its board of directors Hon. Cephas Brainerd, who had been identified with its work from the beginning, and who had early perceived the true mission of the association. Mr. Dodge with his associates set about developing in New York a work specifically adapted to the needs of young men, and introduced a new era in association history. Mr. Dodge was in sympathy with the idea of a clean, home-like social center for young men, and with the providing of opportunities for physical training. It was at his suggestion that the constitution of the New York City association was

altered so as to provide for the erection of a gymnasium. Mr. Dodge was also influential in enlisting large gifts for the association. He was himself the largest donor to the first building.

The years from 1866 to 1870 mark the revival of North American work after the war. In June 1866 an international convention was called at Albany, which outlined a new policy for the associations. The plan of a migratory international committee was abandoned, and the headquarters were permanently established in New York City. Hon. Cephas Brainerd was, a year later, chosen chairman of this committee, a position which he held for 25 years. This convention announced the platform that the work of the association should be limited to young men, although it was some years before this became the actual practice. The convention established a day of prayer for young men in November, which has become a world-wide observance. It also arranged for the organizing of state committees, and the beginning of what is usually spoken of as state work. The great contribution of this convention, however, was the emphasis which it placed on the true field of the Young Men's Christian Association as distinctive work for young men. In his opening address, Mr. Brainerd said: «Our future progress rests upon an unswerving devotion to the primary objects and aims of this association—the social, mental, and religious improvement of young men. As organizations with these avowed objects, we challenge attention. As seeking these ends we are prominently before the world. Because of these things we are what we are. When we deviate from them, we trench upon ground assigned to others.»

As yet there was no uniformity among the associations in America as to the conditions of membership. At the international convention held in Portland, in 1869, it was decided that only members of evangelical churches should vote or hold office in the association, and it was stated that:

> We hold those churches to be evangelical which maintaining the Holy Scriptures to be the only infallible rule of faith and practice, do believe in the Lord Jesus Christ (the only begotten son of the Father, King of Kings, and Lord of Lords, in whom dwelleth the fulness of the Godhead bodily, and who was made sin for us though knowing no sin, bearing our sins in His own body on the tree) as the only name under heaven given among men whereby we must be saved from everlasting punishment.

In the meantime, in New York City a determined effort was being made to erect a suitable building adapted to the needs of young men. In addition to the work already undertaken for the spiritual, intellectual and social improvement of young men, it was decided to add a gymnasium for physical training. After an earnest canvass for funds, and a most careful study of plans, the historic building on the corner of 23d Street and Fourth Avenue, which provided under one roof for the various phases of association activity, was erected. This building cost $487,000, and was opened to the public in November 1869. Here was developed the modern type of the diversified work for the cultivation of Christian manhood, which has become characteristic of the American associations, and which later spread throughout the world.

A unique feature of this building, which has been widely copied in association buildings was the central reception-room or lobby, in which was the general office of the secretary, and through which every one must pass upon entering the building. From this reception-room opened the reading-room, the parlors, the amusement-room, the gymnasium, the library, the educational classrooms and the secretary's private office. This enabled the secretary in charge to oversee the various activities which were housed under one roof, and to keep in touch with the multitude of young men who took advantage of the privileges of the association.

The years from 1870 to 1878 in America may be characterized as a period of adaptation of the main idea of association to the needs of young men, and the extension of this work to various classes of young men. It is an interesting fact that, as soon as the organization specialized its work and limited it to young men, it immediately found a large field for service. In 1872, at Cleveland, a branch association was founded for work among railroad men. This met with a hearty response from the men themselves. A secretary was employed, rooms were opened at the railway station of the Lake Shore and Michigan Southern road and an effort made to extend the work elsewhere. Similar societies were also organized at a number of the terminal points, and in the fall of 1875 the attention of Mr. Cornelius Vanderbilt was called to this work. Through his endorsement other railroad officials became interested in this movement. It was soon found that it was worth while for railroad corporations to provide the facilities and attractions of a Young Men's Christian Association for the welfare of their employees.

As early as 1858, at the state universities of Michigan and Virginia, student Young Men's Christian Associations had been organized. Early in the 70's, Mr. Robert Weidensall organized similar societies in a number of colleges. By 1876 there were 25 college associations, with about 2,500 members. Through the influence of Mr. Luther D. Wishard, a student at Princeton, representatives of all college associations were invited to the international convention held at Louisville, Ky., in 1877. This resulted in the inauguration of the intercollegiate movement as a department of the work of the International Committee. An extended effort was also made during this period among German-speaking young men, and toward its close a parallel work was begun among colored young men.

One of the most important agencies developed during this time was the work of supervision. The International Committee located in New York steadily grew in resources and influence. A number of the most prominent Christian business men of New York City and other parts of the country accepted positions of responsibility upor this committee. In 1868 Mr. Robert Weidensall became the first traveling secretary, being located in the West with headquarters at Omaha, afterward Chicago. He was for many years in the service of the committee, doing a vast amount of pioneer work, organizing state committees, and introducing many new phases of work for young men. In later years he tried particularly to foster what is known as county work for young men in rural districts. Mr. Richard C. Morse accepted a position with the International Committee in December 1869, first as editor of the *Associa-*

tion Monthly, and in 1872 as executive secretary of the committee, in which position he continued until 1913, when he was succeeded by Dr. John R. Mott. Mr. Morse was then appointed consulting secretary.

At the close of this period, 1878, the American International Committee had in their employ eight traveling secretaries, and in addition to the general work, were supervising work for railroad men, college students, German-speaking young men and colored young men. The budget for 1878 showed an expenditure for supervision on the part of the International Committee of $16,875. The American associations at this time reported 141 employed officers. Of these, 100 were general secretaries, 21 assistants, 12 state and 8 international secretaries.

In other lands, while war, ecclesiastical conditions and general conservatism retarded the growth of the association, a marked development had taken place. Every three years conventions of the associations of all lands were held in different European cities. To these the American associations since 1872 have regularly sent representatives. During the early 70's, Mr. Moody held his evangelistic campaigns in the British Isles, and did a great deal to stimulate the work of the Young Men's Christian Association in securing money for buildings, in arousing spiritual zeal and in calling the attention of the Church to this important work. In 1878 some 40 representatives of the American associations attended the world's convention, which met at Geneva, Switzerland. Up to that time there had been no established headquarters for the world's work. General affairs had been administered from London through Mr. W. E. Shipton, the secretary of the London association. It was chiefly through the influence of the French and American delegates that the Geneva convention voted to organize the work of the associations in all lands under an advisory committee, which should have a quorum located at Geneva, Switzerland. Col. Charles Fermaud, an officer in the Swiss army, and a man with bright business prospects in Geneva, consented to give up his calling and accept the position of general secretary of this committee. By the year 1878, with the establishment of the world's committee, the Young Men's Christian Associations of the world may be said to have developed their ideal of work for young men.

Period III, 1878 to 1913. Period of Expansion.—Great expansion was the striking characteristic of the period from 1878 to 1913. The association ideal of a four-fold work for the whole man had been developed by the American associations under Robert R. McBurney's aggressive lead. This ideal was promoted throughout America under the supervision of the International Committee. The American type of work for young men in this period of expansion was soon to be extended throughout the world largely by the efforts of the American International Committee.

In North America the associations between 1878 and 1913 increased in membership six-fold, from 99,000 to nearly 600,000 members; in value of property 38-fold, from $2,300,000 to $88,300,000; the number of buildings 13-fold, from 56 to 770; the cost of current operation 36-fold, from $376,000 per year to $13,725,000.

The three chief factors which most profoundly influenced the association movement during this period were: (1) the securing of property, (2) of trained secretaries and directors who give their whole time to this service, and (3) the development of state and international committees of supervision. The carrying on of an all-round work for young men—physical, social, intellectual and spiritual—demanded not only experienced and able men to conduct the work, but commodious and properly adapted structures in which it could be housed.

The «discoverer and demonstrator» of the secretaryship was Robert R. McBurney, who was secretary of the New York City association from 1862 until his death in 1898. Under his leadership, this office was developed and the number of employed men increased. Of all the innovations the association movement brought forth, the most novel was the secretariate. To this may be attributed its permanence and continued growth. There were, in 1913, 3,853 men devoting themselves to this service as a life work, forerunners of a novel professional service in administering informal education and recreation. The pre-eminence of the American associations is perhaps due to this policy of employing salaried officers. About five-sixths of the secretaries employed by the associations of all lands are in the United States and Canada.

Not only have men been employed for supervisory work, but since 1870 there has been an increasing demand for Christian young men to devote their lives to service in the association as physical directors. Six hundred and thirteen such men were employed in 1913. To the Christian physical director, the Young Men's Christian Association owes the development of the physical department, which aims not only to give young men physical training and rugged, vigorous bodily development, but also to develop character. This department has proved a great attraction to young men. In 1896 the Year Book reported 52,672 men as using the physical department of the association. In 1918 there were 242,000 enrolled in gymnasium classes, of whom 118,000 were boys. Much of the progress of such physical programs was due to the leadership of Dr. Luther Halsey Gulick, who became instructor of physical training at the Association Training School at Springfield in 1886, in which position he continued until 1900. In 1888 he was also appointed secretary of the International Committee for the physical department, in which office he served until the spring of 1903. He was succeeded at the Springfield school by Dr. James H. McCurdy and on the International Committee by Dr. George J. Fisher. The Young Men's Christian Association long did the most extensive work in physical training of any agency in the country. It is also interesting that at one time 40 per cent of the physical directors in academies and colleges had been furnished by the association. The physical department has proved not only a means for physical well-being, which is much needed under modern city conditions, but also a means of helping young men maintain standards of personal purity.

In 1878 there were 8 international and 12 state secretaries and 94 secretaries in local associations. Just after the war (1919) there were 704 county, state, and international employed officers engaged in supervisory work, 30 instructors in the training colleges, 3,245 men

serving city associations, 550 with railroad associations, 139 with student associations, 78 with associations for colored young men, 77 with army and navy associations and 113 in other forms of service. There were a total of 4,936 salaried officers employed by the associations of North America.

In 1885, at Springfield, Mass., a school was established for the training of general secretaries for the Young Men's Christian Association. The year following a physical department was added for the training of physical directors. This school at first offered a two-years' course of study, which was later extended to three years. In 1890 a similar school was established at Chicago. This institution also conducts a summer term at Lake Geneva, Wis. In 1902 a summer school was established at Silver Bay, Lake George, N. Y. These educational agencies seek to thoroughly train officers for the Young Men's Christian Association as a life work. About one-sixth of the officers of the association have received training at these institutions. The courses of study cover the Bible, Church history, psychology, sociology, religious pedagogy, physiology, anatomy, anthropometry, physical diagnosis, physiology of exercise, gymnastics, athletics, aquatics, history of the Young Men's Christian Association, methods of work among young men, etc. There are about 500 students enrolled in these two institutions in addition to those attending the summer institutes. The summer schools long attracted so many of the employed officers (over 1,500 in 1919) that six additional summer schools were later established in the South, the West and in Canada. The Southern associations maintained for some years a graduate training college at Nashville, Tenn. The first summer school was held at Lake Geneva, Wis., in 1884.

The building movement in America soon developed with increasing momentum. In 1890 there were 205 buildings, valued at $8,350,000, in the United States and Canada; in 1900 there were 359; in 1902 there were 460. The number in 1919 passed the 1,000 mark, and the gross value of all real estate was over $96,000,000. Growth since has been phenomenal. There could be no greater testimony, no higher mark of the confidence of Christian philanthropists and ordinary men in the Young Men's Christian Association and its work than the investment of large sums of money in association property. The type of architecture developed by the Young Men's Christian Association is of the club order, its buildings being homelike and social.

One of the striking developments of this period in the city work has been the growth of the educational classes. Immediately upon the erection of the building on the corner of 23d Street and Fourth Avenue in New York City, evening classes were begun in different subjects for young men. Similar classes were carried on in other cities, and by 1892, 20,526 different men were under instruction. In 1892 George B. Hodge was appointed secretary for the educational department of the International Committee, and this work has been systematized and greatly developed by his successors and others. International examinations were now held annually, in which large numbers of students took part. International certificates were accepted by more than 100 different colleges and institutions. An illustration of the growth of this department was seen in Boston, where the association in 1918 reported 3,843 different students, studying in its educational department. This association had a law school which had been given by the legislature a charter, granting the right to confer degrees. It had the Huntington Avenue school for boys who are preparing to enter college. It had schools of engineering and of certified accountancy. The Boston association also subsequently incorporated «Northeastern College,» of which the educational director, Frank P. Speare, was president. This college supervised branch work in the neighboring city associations of Massachusetts and Rhode Island. Nearly every association provided a reading-room, 700 reported having libraries and many others were distributing stations for public libraries.

In 1918 the Year Book reported 82,000 students in the day and evening association schools. There were 327 secretaries and assistants supervising this work and 2,203 paid instructors who were giving part-time service.

The religious spirit of the association has been dominant from the beginning. All welfare work for young men—economic, physical or educational—was conceived of as an expression of the religious spirit and as contributing to a many-sided personality and a symmetrical Christian character. This distinguished the association from boys' clubs, social settlements, Boy Scouts and many other agencies for the social betterment of young men. There has been a large conservative element in the association which has held theologically to traditional orthodox teaching. The association did, however, make remarkable progress in its distinctly religious work. This became organized into a system with five features: (1) Religious meetings; (2) individual interviews; (3) classes in religious education; (4) social service; (5) missions. Religious meetings were chiefly held on Sunday afternoon. These were for many years almost exclusively of an evangelistic character, but in later years have in many cases become forums for the community where the great social, civic and religious problems of the day are discussed by prominent leaders from an ethical standpoint. At Springfield, Mass., under the leadership of Kenneth Robbie, such a Sunday afternoon forum was maintained for several years with an attendance often reaching 4,000.

Mr. Fred B. Smith during this period was secretary of the religious department of the International Committee. Under his leadership general evangelistic campaigns for young men were promoted culminating in the Men and Religion Forward Movement of 1912 in 60 North American cities. In 1918 there were reported 1,061,000 auditors at theatre meetings, 2,273,000 auditors at shop meetings. These were held outside association buildings. In the buildings there were reported 2,276,000 auditors at men's meetings and 295,000 at boys' meetings. There were a total of 6,000,000 auditors at these various religious meetings. There were 32,500 decisions for the Christian life reported and 6,434 young men reported as uniting with churches.

In religious education the chief emphasis was put upon Bible classes, but there was an increasing diversity of program which later evolved into a department of religious educa-

tion. In more progressive associations like the 23d Street branch in New York City, there were classes in «Christianity and Modern Thought,» led by the secretary, Burt B. Farnsworth, courses in Church history, life problems, sex hygiene and social service.

In spite of the depletion of attendance of young men at colleges and universities during the World War, most gratifying reports came from student associations. In 1917 there were 27,000 students in classes in religious education. These were chiefly in Bible classes, but nearly 3,000 were in mission study classes and 4,000 were in classes studying «North American Problems.»

An important phase of the religious work of the association was the interest in foreign missions which it has aroused among young men. The Student Volunteer Movement, which was an outgrowth of the student department, was the chief missionary agency in the colleges of this country. It annually secured a large number of students to volunteer for foreign missionary service. At one time as many as 4,000 students have been enrolled as volunteers in all colleges. In the men's colleges in 1917 the number was 1,237. In later years the effort became broadened to include all religious callings, home as well as foreign. In 1917 there were reported 280 undergraduates as preparing for the secretaryship of the Y. M. C. A. and 3,066 for the ministry.

This third period of association history was also marked by a great extension in the work for different classes of young men. In August 1895 the World's Student Christian Federation of undergraduates of all lands was established. This became the largest organization among undergraduates in the world. In the United States and Canada the movement has been extended to professional schools, theological seminaries and other institutions of learning. There were (1919) 791 college associations upon this continent, enrolling 51,117 student members. American student associations own buildings valued at $1,581,000. There were 137 student secretaries devoting their whole time to this work.

The work for railroad men also became one of the most remarkable features of Christian endeavor. Railroad corporations which controlled three-fourths of the railroad mileage on this continent contributed from the corporation funds large amounts toward the current expenses of the railroad associations. There were 122 buildings, valued at $7,422,000, occupied by these associations, with a membership of 94,000 railroad men. There were 550 secretaries engaged in this department.

Since 1879 the International Committee had employed a secretary to develop the work among colored young men. The work among colored young men was greatly stimulated by the offer of Julius Rosenwald of Chicago, a wealthy business man of Jewish race, to give $25,000 toward the erection of a building for a colored Young Men's Christian Association to any community which would raise $75,000 additional. This offer was continued for a period of many years, during which some 12 colored association buildings were erected. There were (1913) 150 associations of colored young men, with 17,600 members, with 77 employed officers, with property valued at $1,716,000. The secretary of the International Committee for this department was Jesse E. Moorland. There were nearly 90 Indian associations, with 900 members, under the direction of a traveling secretary, a native American Indian.

Largely as an outgrowth of the work for students in other lands, the American International Committee was invited by missionaries in India to inaugurate a work among young men in non-Christian lands. This work was always conceived as in subordination to the church and as a supplementary work where missions have already been developed. There were 118 secretaries of the American International Committee in India, Ceylon, Japan, China, Brazil, and other foreign lands (1913).

The policy on the foreign field was to develop self-governing and self-supporting local association and national committees. In countries outside of the United States, Canada and Europe there were 292 associations with 58,231 members, occupying property valued at $700,000. In these associations there were 462 employed officers, four-fifths of whom were natives. In the promotion of this work in 1910 President William Howard Taft invited a conference at the White House, attended by about 100 leading Christian laymen, which resulted in securing $2,000,000 for the foreign work.

Even before the Spanish War began steps had been taken to inaugurate a work among the seamen of the navy, and after the war a building was equipped for seamen at the Brooklyn navy yard. This department then developed rapidly, and in the course of time there was an organized movement among the seamen of the navy which was deemed promising. Through the munificence of Mrs. Helen Gould Shepard and Mrs. Russell Sage, an attractively equipped building has been erected for the Naval Association, near the navy yard in Brooklyn, at a cost of $1,000,000. Work was soon developed at seven other home ports and also in the Philippine Islands. There were 77 secretaries in the army and navy associations of the United States at the outbreak of the First World War.

For many years the work of the associations was limited to young men between 16 to 17 years of age and upward. It is an interesting sociological development that, in the prosecuting of its work for young men, the association has been led to give its attention to work among boys. Careful study led to the conviction that effort ought to begin at the age when the boy is becoming a man—at the dawn of adolescence. There are almost as many boys in cities between the ages of 12 and 17 as there are young men. The first boys' department was organized at Salem in 1869, but it is only in recent years that a determined effort has been made to organize a work among boys. In 1890 there were four secretaries giving their time to this department. This number had increased in 1903 to 107. It was 545 in 1919.

In 1903 there were 46,000 members in boys' departments. This number had increased by 1917 to 152,600. The work is carried on at 985 different points. The most unique feature of this department became known as the boys' camp, which was first developed by the Young Men's Christian Association, and later became a large factor in American life. In 1903, 214 summer camps were conducted by the American associations.

One of the most important developments of recent years has been the extension of the association among men engaged in industrial pursuits. The associations were originally for commercial young men. Afterward associations were organized for students and later for railroad men. The city associations in later years began to attract large numbers of skilled mechanics to their membership, and later in Eastern associations 35 per cent of the members belonged to this class. An industrial association existed in 1897 in connection with the Johnson Steel Plant at Lorain, Ohio, and an association building at a cost of $25,000 was erected for the use of the workingmen. Similar associations were established at Proctor, Vt.; Wilmerding, Pa.; Stampo, Ark.; Douglas, Alaska, and Cananea, Mexico. An extensive work was undertaken among the coal miners in Pennsylvania and the lumber men in a number of states. The Colorado Fuel and Iron Company and their employes combined to establish a series of associations among the workmen at the different plants of the company similar to the railroad Young Men's Christian Associations. It was the experience of the railroad and industrial associations which prepared the way for the unparalleled service rendered to the armies during the World War.

The distinctive industrial department was under the direction of Charles R. Towson of the International Committee, who had 11 associates. There were 117,000 industrial workers who were association members. In 70 cities special industrial secretaries were employed. There were 134 association buildings erected especially for men in industry at a cost of $4,717,000. In 1917 the companies contributed $417,000 toward current expenses and the employes paid an equal amount in membership fees.

The industrial revolution which attracted the young men to the city, and so created the basis for the Young Men's Christian Association, had to a large extent depleted the rural districts of young men. At the same time it remained true that a majority of young men were found in the country. There were 8,000,000 young men in the country districts of the United States and Canada. For many years an effort was made to discover some method of carrying on association work among these men. What is known as county work had proved so successful that in 19 different states county organizations were formed, the most extensive work being carried on in Michigan, where 32 county secretaries were employed in 26 counties. The plan provided for a county committee, which employed a traveling secretary to project, supervise and stimulate Christian work among the young men in the county, organizing Bible classes, men's meetings, in many cases establishing reading-rooms, social parlors, sometimes educational classes, and in some instances organizing clubs for athletics of various kinds. County conventions were held, and extensive activity programs among youth were conducted through the entire county. There were over 150 secretaries employed in county work.

Under Mr. Morse's leadership the staff of the International Committee had increased from two executive secretaries in 1869 to 93 on the home field and 175 on the foreign field in 1915. The budget of the committee had grown from $2,345 in 1869 to $354,000 for supervision of the home field and $433,000 for the foreign field. The North American type of association work for the whole man had largely through the influence of the International Committee spread to Europe and widely through the colleges and cities of Asia, Africa and South America.

Membership fees ranged from $2 to $25 per year in addition to receipts from dormitories, restaurants, educational classes and many other features. The income of the North American associations for the year ending 30 April 1917, exclusive of receipts from contributions and endowments, was $13,071,609—this amount was paid by the young men. The receipts from contributions were $2,140,114 and from endowment $325,561.

Period IV, 1914 to 1919. The World War Period.—The important features of these years were (1) the enlarged activity of the home work in the rural field, in industry and among boys; (2) the continued growth in the foreign field; (3) the novel work for the prisoners of war, both in allied countries and in the Central empires; and (4) and beyond all of these the transcendent work for the armies of America, France, Italy and Russia carried on by the American associations and for British and Canadian troops carried on by the British and Canadian associations. The work for war prisoners was peculiarly the task of the American associations prior to the American declaration of war against Germany in April 1917. No other country was free to undertake this service. By May 1916 there were over 4,000,000 men in the prisoner-of-war camps of Europe (Report International Convention, 1916, page 91). These men were in enclosures containing from a few thousand to 40,000 persons, who were practically without occupation. Through the efforts of Dr. John R. Mott and other American secretaries detailed from the foreign field, reciprocal permission was secured from belligerent governments and a most beneficent service inaugurated for this vast body of prisoners. The policy was to erect in each camp an inexpensive hut or service building, organize a camp association, establish educational classes, athletics and games, furnish a reading room, supply writing material, inaugurate shows and entertainments and carry on religious meetings or classes as desired. In co-operation with the Red Cross, food kitchens were established and supplied, the sick men nursed and clothing and other necessaries provided. During the first 17 months of the war $300,000 was raised in the United States for this work and the following year $1,167,322 was raised and expended for work in Europe among both prisoners and soldiers. This Christian service to the prisoners saved men from starving, restored morale, awakened new hope and often educated men for a new sphere in civil life.

On the Mexican border in the summer of 1916 there were a total of 150,000 American troops called into service under conditions, not only full of discomforts and hardships, but full of menace to moral character. The army and navy associations were quick to respond to this need. Thirty-eight temporary buildings were erected. Tents were used at six additional points and special motor equipments devised with moving picture machines, graphophones and other features. There were 350 secretaries,

clergymen and business men employed in this service. Free stationery was provided for the writing of 5,000,000 letters home. Recreational and educational facilities were promoted by trained leaders. For this work during eight months $308,000 was raised. At the entertainments there were present nearly 3,000,000 auditors; a customary type of religious work was carried out and over 13,000 soldiers registered new Christian decisions. The chairman of the Army and Navy Department of the International Committee was William Sloane of New York and the executive secretary John S. Tichenor. This work on the Mexican border prepared the way for widely extended service among American troops during the World War—the climax of the work of the Young Men's Christian Associations. Upon the declaration of war in April 1917 the International Committee immediately offered the services of all the Young Men's Christian Associations of America to the government, and this offer was cordially accepted by President Wilson.

On 10 April Dr. Mott called a conference of association leaders to meet at Garden City, L. I. He outlined plans for the establishment of a National War Work Council of 100, which should be appointed by the International Committee, carry on all work for the American soldiers and make reports to the International Committee. Dr. Mott asked that the associations raise $3,000,000 to sustain this work until 31 Dec. 1917.

The conference enthusiastically endorsed the plan proposed and devised methods to cooperate in securing the fund needed in 30 days. Two days later a meeting was held of the International Committee; the proposition was approved, the National War Work Council appointed and the first meeting called for 28 April. William Sloane became chairman, Cleveland H. Dodge, treasurer and Dr. John R. Mott, general secretary. George W. Perkins was made chairman of the finance committee; Lucien T. Warner, chairman of the committee on personnel and John Sherman Hoyt, chairman of the committee on activities.

It is well known how much vaster the American forces became by land, sea and air than was at first anticipated. The Young Men's Christian Association with heroic effort expanded its services to meet the enlarged need.

The advantages of this work to the comfort, the morals and the spirit of the troops was so great that requests came from the French government for a similar service to the French army. Later an urgent appeal was similarly responded to from both Russia and Italy. Under American leadership work for French troops was carried on at 1,350 *Foyers du soldat* and in Italy at 2,000 *case del soldato.* The British associations in the same manner did an extended work for the British soldiers in England and France. This effort was carried on under the leadership of the National Secretary, Sir Arthur Yapp, who was knighted by King George as a recognition of this service.

The Canadian associations under their own National Council ministered in an equally thorough manner to the Canadian army; about 700,000 Canadians were enlisted, of whom about 400,000 were sent overseas. This work overseas was in charge of Lieut.-Col. Gerald W. Birks of Montreal and in France under the direction of Maj. Ernest M. Best. This service began in Canada in August 1914 and was carried on during the entire war. The Young Men's Christian Association of Canada was made a part of the military establishment and the secretaries became officers in much the same manner as chaplains.

The work for the American army was divided into two sections, (1) the home camps; and (2) the work overseas. Overseas, E. C. Carter, who had been national secretary for India, was placed in charge at Paris. The first problem of the War Work Council was to secure funds. To these appeals the citizens of America responded with great liberality. The first request for $3,000,000 met with contributions amounting to $5,000,000. So vast did the work become that this amount subscribed in May 1917 was exhausted by October and it became necessary to borrow large sums. A second campaign, of which A. H. Whitford, general secretary at Buffalo, was director, was inaugurated in November 1917; an appeal was made for $35,000,000 to carry on the war work at home and abroad for one year. This appeal met with a response of $54,000,000. In the meantime other agencies beside the Young Men's Christian Association had become enlisted in a large way. As the association had been the pioneer since the Civil War in this form of effort it furnished certain standards and methods for work undertaken by other agencies. In accordance with the desire of the government Commission on Soldier's Activities appointed by the War Department, the various agencies, exclusive of the Red Cross, which were engaged in promoting welfare work for the army and navy combined their budgets for a joint campaign for November 1918. The budgets were approved by the commission and a total of $170,000,000 was asked for. Of this sum the allotment for the Red Triangle work was 58 per cent. Dr. John R. Mott was made director-general of this campaign and Mr. C. S. Ward, the originator of the short term campaign method for securing funds, was associated with him. In spite of the adjustments incident to the signing of the armistice during the campaign the effort was successful, the subscriptions amounting to $203,000,000—the largest voluntary offering for religious welfare work ever made.

Some facts about the activities carried on among all commands of troops on the home side of the Atlantic for the year ending 30 April 1919 are as follows (Year Book 1919): Different men served, 4,000,000; number of employed officers, 4,600; funds expended, $30,000,000; number of units, 1,171; attendance at entertainments, 27,000,000; participants in athletic sports, 2,500,000; lectures given, 39,044; attendance at educational classes, 5,404,000; at Bible classes, 2,085,000; at religious meetings, 14,181,000; decisions for the Christian life, 195,414. A most effective service was also rendered by the local associations throughout the country to soldiers on liberty leave, and a carefully organized work for the men in transit on the troop trains. The problem of personnel was most difficult; only men beyond military age could be used and the proportion of those interviewed who were qualified and were physically fit to stand the arduous work required was less than one in 10. Short term intensive courses of training cov-

ering one month were established. A total of 25,926 persons were recruited and assigned to this service at home and overseas, of whom 5,145 were women. Only 700 of those so assigned had previously been Y. M. C. A. secretaries. Of the total, 12,955 served overseas.

The most challenging work of all was with the Expeditionary Forces in France. Here over 3,000 miles from its base of supplies, the association undertook to serve 2,000,000 men scattered through France and later western Germany, both in leisure areas back of the front and in the war area itself.

The «Y» was operating in March 1919 in France 587 buildings erected by the association, 596 leased buildings and 782 tents and army buildings. «These buildings were used as centers where the men could congregate, write letters, read magazines, books and papers, play games, visit and feel relieved of a certain amount of the restraint necessary to army life.» (Perkins). In them were conducted concerts, moving picture shows, all sorts of entertainments and religious services. The buildings were open to all welfare organizations. Religious services were conducted by Protestants, Catholics, Jews and all other religious organizations, regardless of creeds.

A large number of well-trained athletes led in athletic games and in boxing and wrestling. Athletic supplies were given without charge to the soldiers. A number of theaters were operated in different parts of France.

In the canteen alone the «Y» in France from June 1918 to April 1919 handled 2,000,000,000 cigarettes, 32,000,000 bars of chocolate, 18,000,000 cans of smoking tobacco, 50,000,000 cigars, 60,000,000 cans of jam, 20,000,000 packages of chewing gum and 10,000,000 packages of candy. These were only a few of the items handled. Because of the difficulty in buying supplies, the «Y» operated in France 20 biscuit factories, 13 chocolate factories, three candy factories and three jam factories. All of this canteen service was undertaken unexpectedly and carried on in addition to the regular work for the men—physical, social, intellectual and religious.

It was not surprising that following the war a period of intense criticism arose among the soldiers, and later the American public, based chiefly on the difficulties encountered in operating these canteens. Chief Justice Taft, in his Foreword to the history of Y. M. C. A. services in the First World War ('Service with Fighting Men') said, «During the war, the burdens put upon the Young Men's Christian Association by the Government were too heavy. The limitations imposed by the paramount requirements of the campaign prevented it from doing all that was assigned to it. The Government gave up the canteen work overseas, and required the Y. M. C. A. to take it over. The difficulties that it had to meet are fully set forth in these volumes, and the short-comings of the service are candidly recognized and stated. These, which it was impossible to avoid, taken with the attitude of discontent of our soldiers after the Armistice, psychologically natural in their impatience to get home, led many to utter complaints and spread criticism that did the Association great injustice. Fortunately, a proper sense of proportion has returned and the probability of injury to the prestige of the Association, which was so freely predicted, has faded away, and the institution is stronger than ever in the appreciation of the people.»

Period V, 1920 to 1941. The Last Two Decades.—The two decades since the First World War represent two widely different periods: the former characterized by apparent prosperity, the latter characterized chiefly by the necessitous adjustments of depression years. In the first, demobilization of war services led to extensive scholarship and other assistance programs among returned service men. Association work was reorganized and augmented in permanent military establishments and housed in handsome buildings. Important developments in regular association services included establishment of a National Council composed chiefly of laymen, extensive modern building construction, greatly expanded budgets and contributed income as well as increase of indebtedness, and enlargement of program and staff in regular foreign service. In America important modifications also occurred through acceptance of progressive educational methods, and emphasis upon the individual as a whole, demanding well-integrated experience in clubs, forums and informal educational opportunities. Women and girls were increasingly admitted to membership and shared in activities. The first postwar decade was climaxed by the Twentieth World's Conference of Y. M. C. A.'s at Cleveland, preceded by the Third World's Assembly of Y. M. C. A. Boys' Workers and the First World's Assembly of Young Men at Toronto.

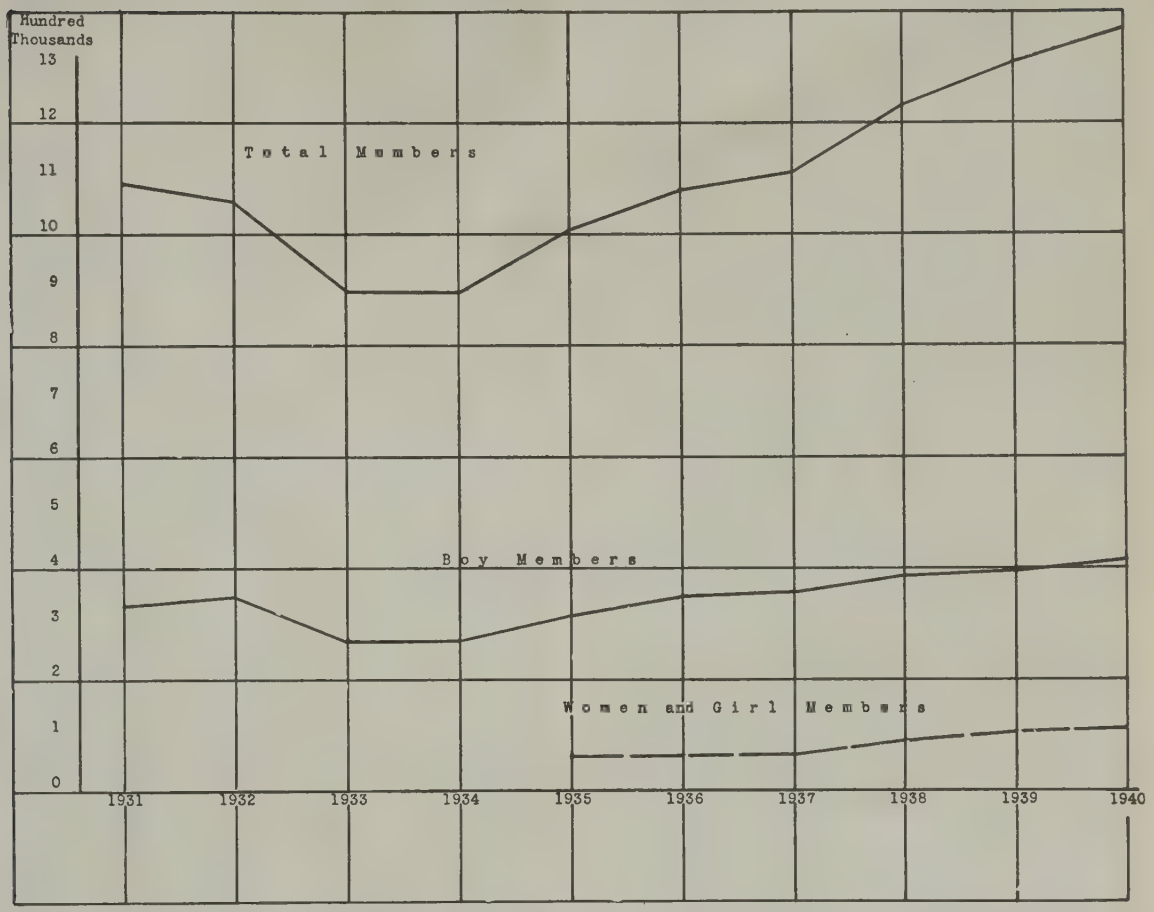
The effects of the great depression dominated adjustments of the last decade. The total income of over 60 millions in 1930 declined to but 35 millions in 1933, with attendant reductions of membership, salaries, staff and mounting debt. Nevertheless, through increased use of trained volunteers and gradual economic restoration these later years have witnessed marked growth of constituency, program enrichment, and experimentation with democratic youth organization. Boys' work gained in volume and effectiveness. More than seven thousand Hi-Y clubs were reported, and unified through plans for national registration and biennial national congresses. Specialized national councils among young men, industrial foremen, and students gave democratic control to characteristic youth constituencies.

In 1940 American associations numbered 1,196 with 1,224,410 members, 116,679 enrolled groups and expenditures of over 51 millions. Canadian associations numbered 76 with 51,582 members, 5,939 enrolled groups, and $2,186,400 expenditures. Combined capital investments were $267,000,000

With the advent of the Second World War, regular Y. M. C. A. services among military personnel, much extended by 1939, were combined with the Y. W. C. A. and four other private agencies in the United Service Organizations for national defense, for welfare and religious services in nearby communities. Fourteen millions were raised by the American people to finance these programs for the first year. Specialized club buildings were provided by the government.

At the end of 1942, there were 1,168 organized USO operations of which 694 were buildings with well-equipped club facilities (including 187 federal recreation buildings), 218 were modestly equipped service centers, 99 were service centers for aid to travelers, 99 were rest lounges

GROWTH OF ASSOCIATION MEMBERSHIP 1931 TO 1940
For United States and Canada



Note: There has been a significant rise in the number of members, following depression years—a gain much larger than that accounted for by the formal reporting (since 1935) of women and girl members by an increasing number of local associations.

for service men in railway stations and other transit points, and 58 were mobile service and maneuvers units. Of a total of 1,399 agency operations included in the above, the Y. M. C. A. was designated to operate 327 or 23.4 per cent. Of 1,911 specially assigned USO professional workers recruited under agreed standards and administered through national agency personnel offices, the Y. M. C. A. portion included 491 or 25.7 per cent. Outside continental United States, there were 88 special operations with a staff of 119 not directly administered by any single agency. Of these workers, the Y. M. C. A. supplied 51.

The conception of the United Service Organizations represents a genuine social innovation both in its interfaith character and in co-operation between private agencies and the federal government. Besides the Y. M. C. A., the Y. W. C. A., the National Catholic Community Service, the Salvation Army, the Jewish Welfare Board and the National Travelers' Aid Association joined in approaching the government as a group of private religious agencies to work, in line with their experience and genius, not in camp areas but in adjacent communities where service men on brief leaves wanted respite from military life and sought constructive relaxation and recreation among civilians. The partnership of government in providing nearly two hundred attractive recreation buildings was a natural development in places where a serious overload was created by the war emergency. The agreement left the agencies free to provide social, recreational and religious programs, in co-operation with local community organizations, among military and industrial groups. The American people subscribed 32 million dollars in late 1942 to carry this work through the operating year ahead.

OWEN E. PENCE,
Director, Bureau of Records, Studies and Trends, National Council of the Young Men's Christian Associations.

YOUNG PEOPLE'S CHRISTIAN ENDEAVOR UNION OF THE UNITED BRETHREN IN CHRIST, founded 5 June 1890. It is a union of all forms of young people's societies within the church, uniting them for the purpose of denominational direction. It was originally named the Young People's Christian Union. Its official organ, *The Watchword,* was founded in 1893. With its junior societies the organization numbers over

2,000 societies and more than 85,000 members. It contributes about $10,000 annually to missions.

YOUNG PEOPLE'S SOCIETY OF CHRISTIAN ENDEAVOR. See CHRISTIAN ENDEAVOR, YOUNG PEOPLE'S SOCIETY OF.

YOUNG PRETENDER, The, a title applied to Charles Edward Stuart, son of the Pretender. He was defeated by the Duke of Cumberland at Culloden, 16 April 1746.

YOUNG'S TRAVELS. In 1767 Arthur Young began that series of journeys, or farming tours, which were the basis for his graphic sketches of rural England, Ireland and France. His first trip included Southern England and Wales, and an account of his observations appeared in 1768 under the title 'A Six Weeks' Tour through the Southern Counties of England and Wales.' Following this first survey, he traveled through Northern and Eastern England from 1768–70; this resulted in 'A Six Months' Tour through the North of England' (4 vols., 1770), and 'The Farmer's Tour through the East of England' (2 vols., 1771). These books contain a wealth of information relative to the social, economic and political conditions in England during the latter half of the 18th century. Young was a most determined and indefatigable tourist. He visited practically every county in England, inspected farms, described farm methods and implements used. He met all classes of people, from peasantry to nobility. His information concerning rural conditions, such as rentals, produce, livestock, and means of transportation and communication in the kingdom, was founded on actual examination. Two features especially roused Young's indignation. In the first place, he saw on every side vast tracts of land uncultivated and in waste; even all the cultivated land, with rare exceptions, was placed under the same unvarying rotation. Everywhere there seemed to be inability to put the land to its best use. Then, too, Young had no patience with poor roads. In 1770, on the Preston-Wagan turnpike, he measured ruts "four feet deep and floating with mud, only from a wet summer"; and again he says, "I know not in the whole range of language terms sufficiently expressive to describe this infernal road. Let me most seriously caution all travelers who may accidentally propose to travel this terrible country, to avoid it as they would the devil; for a thousand to one, they break their necks or their limbs by overthrows or breakings down." His description of other highways is given in an equally lucid manner. Young's works on England were very favorably received, being translated into most of the European languages by 1792.

In 1776 he made a tour of Ireland, publishing his 'Tour in Ireland' in 1780. He remained in Ireland three years and during part of this time was occupied in managing an estate in County Cork. The result of his stay, nevertheless, was a survey of the country which, for accuracy, fullness of detail, and acuteness of observation, is invaluable to this day. He stated clearly and exposed unsparingly the causes which retarded the progress of Ireland. He strongly urged the repeal of the penal laws which oppressed the Catholics; he condemned the restrictions imposed by Great Britain on the commerce of Ireland, and also the perpetual interference of the Irish Parliament with industry. The work abounds in elaborate statistics and tables of prices; as Marie Edgeworth well says, it is «the first faithful portrait of the inhabitants.»

'Travels in France' (2 vols., 1792) is probably the best known of Young's writings. He made his first visit to France in 1787 largely as the result of an invitation from the French nobleman, the Duke of Laincourt. He traversed France in every direction just before and during the first movements of the French Revolution, and he paints not only a picture of French agriculture but describes institutional conditions in France at that critical period. This work, while of great intrinsic merit in itself, has been greatly enhanced and widely circulated because of the fact that it is one of the most valuable sources to which historians have turned for a comprehensive statement of the actual pre-revolutionary situation in France. He visited one out-of-the-way region after another, recording in diary fashion his impressions vividly and candidly. From the first page to the last he sets forth the abject wretchedness of the majority of the people and the stagnant conditions of trade and commerce caused by inefficient government. His earliest journey took him in a southwesterly direction through the Orleannais and the Berri, where for the first time he met with the *métayage,* which he described as «a miserable system that perpetuates poverty and excludes instruction»; and further, he describes the fields as «scenes of pitiable management; and the houses of misery.» Throughout the entire work the *métayage,* or farming on half profits, is condemned in the strongest terms. Poitou is described as «an unimproved, poor and ugly country.» Young said it seemed greatly in need of «communication, demand and activity of all kinds.» Journeying on to Languedoc, he found the land in a high state of cultivation and the peasants happy; he concluded his journey by a visit to Landes on his way to Bordeaux. Young's second journey took him through Brittany and Anjou, which he described as a land «possessing nothing but privilege and poverty» — while Maine and Anjou — «have the appearances of deserts.» His third tour of France covered a much greater area. He started with Champagne, traveled through Alsace-Lorraine, made his way through to Jura, Burgundy, the Bourbonnais, Auvergne; took a glimpse of the Rhone valley, visited Avignon and Compte de Nice. His impressions on this journey are not so full, and this fact is probably due to the extent of territory covered and the local disturbances. Young found that half, if not two-thirds, of the land was already in the hands of small proprietors. Peasants supplied the industry and carried out what improvements were made, thus illustrating his famous phrase, «The magic of property turns sand to gold.» The great *seigneurs* did nothing; they received the quit rents and enforced *tailles* and *corvées* and all the other oppressive incidents of feudal tenure. He drew a severe indictment against the French nobility, and even approved of the forceful seizure of the waste land by the

French peasantry. He severely censured the higher classes for their neglect of the soil,—«Oh, if I were a Legislator of France for a day,» he exclaimed at the sight of estates left waste and only to be used for game purposes, «I would make such great lords skip again.» Young saw the commencement of violence in the rural districts and his sympathies were largely on the side of the classes suffering from excesses of the Revolution, although he was never a thorough political follower of the Revolutionists. Tocqueville recognized his work as a first-hand authority on the rural conditions of the country on the eve of the Revolution.

Young was a highly sensitive, enthusiastic, impulsive, affectionate man and a great lover of nature. His 'Travels' are deservedly famous and have earned a wide reputation and have been of great influence. No better summary of the chief characteristics of Young's writings can be given than to quote the words of R. E. Prothero in 'English Farming, Past and Present.' «His careless ease of style, his racy, forcible English, his gift of happy phrases, his quick observation, his wealth of miscellaneous material, make him the first of English agricultural writers. . . . His tours, with their fresh word-pictures, their gossip, their personal incidents, and even their irrelevancies, have the charm of private diaries.» His varied agricultural writings, thus characterized above, were by far the most important agency in disseminating the information concerning those advanced methods introduced into England by Jethro Tull, Lord Townshend and Robert Bakewell and which constituted the agricultural revolution in 18th century England.

Consult the works mentioned. 'Travels in France' were translated in 1793–94 by Soulés (new version by M. Lesage, with an introduction by M. De Lavergne, 1836). An interesting review of the latter publication, under the title of 'Arthur Young et la France de 1789,' will be found in M. Baudrillarts' 'Publicistes modernes' (2d ed., 1873). Consult also Bethan-Edwards, Matilda B., 'Autobiography of Arthur Young' (1898); Prothero, R. E., 'English Farming, Past and Present' (1912; pp. 154, 184, 195–206, 286, 313, 470).

HARRY JAMES CARMAN,
Instructor in History, Columbia University.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION. The form of organization of the Young Women's Christian Association is a world-wide membership of women and girls bound together in voluntary association for the good of all and for the building of a better world. The aim of its members is to express both in deeds and words their conviction of the supreme importance of the Christian way of life both to the individual and to society. The term Young Women's Christian Association has come to be understood by most people to mean the whole movement—local, national, and world. This integration of thought and effort slowly growing over the years is the very essence of the fellowship. Through a thousand different events, meetings, letters, conferences and conventions, institutes and seminars, as well as the many face-to-face communications between individual leaders, this unity has been brought about.

In the United States, associations in the cities, colleges, and rural communities are organized into a national association called the Young Women's Christian Association of the United States of America. The National Board is the executive body of this association, chosen to carry out the policies adopted by the voting delegates at the national conventions, which are the regular business meetings of the National Association.

The name Young Women's Christian Association has been known in the United States since 1866. When the first organization bearing this title was formed in Boston, it had the same objective, the same evangelical church membership basis, the same combination of volunteers and employed working forces as obtain today. The first student association, Normal University, Illinois, dates from 1873. The student and many city associations on the evangelical basis (according to which only associations in which the right to vote was held by members of evangelical churches were received into affiliation) united in electing the American Committee with headquarters in Chicago; the Women's and Young Women's Christian Association of many other large cities holding various forms of charter united in the International Board.

In December 1906, after 18 months of constructive negotiation, the present national movement was formed of all local, city, and student associations affiliated with either body which wished to come in on their then existing basis, with the understanding that all associations in the future should have the evangelical church basis. Very few failed to avail themselves of this privilege. One hundred and thirty-two associations were represented by 392 delegates in that first convention, which voted policies for immediate action and elected the National Board. This board at once elected as president, Miss Grace H. Dodge, who had been chairman of the Joint Commission which had effected the union. Six years later, members of this board and a few other friends gave site and funds for the erection of the present national headquarters building at 600 Lexington Avenue, New York City.

The scheme of organization is as follows: The resident members of the National Board are assigned to committee work under eight departments—field work, department of method, foreign, secretarial, conventions and conferences, publication, finance, and office. Each department has an employed executive and other staff secretaries. The office department applies scientific management to the work of all the other departments. The publication department edits and publishes *The Association Monthly,* technical leaflets, Bible study texts; handles printing of the other departments; fills orders for books. The finance department makes the budget and secures the money. The secretarial department conducts a graduate training school in New York City; preparatory training centers in different parts of the country prior to this course; and a summer school with graduate courses for physical directors, house secretaries and lunch room directors. A bureau for placing association secretaries is also part of the work of this department. The foreign department co-operates with the World's Young Women's Christian

Association in sending American secretaries to India, China, Japan, South America, and Turkey. The field work department correlates the work of the 11 field committees with the work at headquarters.

If the field work department of the National Board can be called the clearinghouse, the department of method can be called the laboratory of the National Board. By visiting local associations, sharing in their work, studying other organizations of women and other Christian and social movements, a great body of information is gathered. This study and planning cover the needs and possibilities of all young women, their conditions and general environment in city, student, country and large town communities, with special emphasis at the present time upon the adolescent girls, the foreign-born young woman, the girls in business and professional life, the girls in industry, the girl at study, the girl in domestic service, the girl at home.

The National Board of the Young Women's Christian Association interests itself in the city, town and county associations throughout the United States and its territories. Through its Foreign Division it works with other members of the World's Committee of the Young Women's Christian Association in carrying on association work for women and girls in 53 countries. Permanent headquarters are in Geneva, Switzerland. In the Oriental countries work is undertaken by the association only upon invitation of the mission boards already working in the country. In its work of cooperation with other national movements, emphasis is placed on the training of national leaders so that the work in each country may grow out of the needs and desires of the women of that country and be commensurate with its developing leadership.

In the United States there are 1,008 local associations of which 590 are associations of students in colleges and universities. There are also 385 registered Y.W.C.A.'s in rural centers, 65 branches for Negro women and girls, 74 groups among the American Indians, and 18 International Institutes for foreign-born women and girls. The membership of the organization is about 500,000 of which 40,000 are student members. As membership in the organization is not necessary in order to avail oneself of its program, activities and privileges, this figure represents that interested group of women and girls who assume some degree of responsibility for the policies and maintenance of the organization. There are about 32,000 industrial girls, 55,000 business and professional girls, 293,000 younger girls, and 100,000 students sharing in the program of the association in the United States.

Consult Vance, C. E., *Girl Reserve Movement of the Young Women's Christian Association* (New York 1937); Sims, M. S., and McCulloch, R. E., *Women and Leadership* (Asilomas, Calif., 1938).

MARY S. SIMS,
Executive Committee for National Interpretation and Support.

YOUNGHUSBAND, SIR **Francis (Edward),** British soldier, explorer, and author: b. Murree, India, May 31, 1863; d. Lytchett-Minster, Dorset, England, July 31, 1942. A younger brother of Sir George John Younghusband (q.v.), he was educated at Clifton College and the Royal Military College, Sandhurst. Joining the 1st Dragoon Guards in 1882, he was promoted captain in 1889 and a year later transferred to the Indian Political Department. Meanwhile, in 1886 he had begun his explorations as a member of a Government of India mission to Manchuria; from Peking he returned to India via Chinese Turkestan in 1887. The neighboring Pamirs, the "Roof of the World" (now mostly comprised in the Tadzhik SSR), were first penetrated by him in 1889, when he also made a survey of Hunza which Russia was eyeing. Again on the Pamirs in 1890–1891, after British occupation of Hunza in 1892 he was political officer there. In 1893–1894, he was political officer at Chitral, and in 1895 as a correspondent of *The Times* accompanied the Chitral Relief Expedition which rescued a beleaguered British garrison. After service in the Transvaal and Rhodesia (1896–1897) he returned to India and was political agent at Haraoti and Tonk in 1898.

Russian influence in Tibet was becoming of increasing concern to the Indian government. In July 1903 Major Younghusband, resident at Indore, was sent as envoy to Lhasa with an escort of 200 Sikh pioneers. At the frontier the party waited in vain for an entry permit of the Tibetan government. Reports of continuing Russian intrigues with the Dalai Lama led the London government to reinforce the mission with a brigade under Brig. Gen. J. R. L. Macdonald. This force included 2,800 rifles, a mountain battery, machine guns, and field hospitals. In November the mission and escort crossed the frontier. After a difficult and long advance and several minor actions they marched into Lhasa, Aug. 3, 1904. A treaty, signed September 7, marked the successful accomplishment of the mission. Younghusband was rewarded with promotion to lieutenant colonel and a knighthood (K.C.I.E.). Bede lecturer at Cambridge in 1905, Sir Francis returned to India and was resident at Kashmir (1906–1909). His many books include *Heart of a Continent* (1896); *India and Tibet* (1912); *The Epic of Everest* (1927); *Life in the Stars* (1927); and *The Sum of Things* (1939).

YOUNGHUSBAND, SIR **George John,** British soldier: b. July 9, 1859; d. Crikhowell, Wales, Sept. 30, 1944. Eldest son of Maj. Gen. John William Younghusband and brother of Sir Francis Younghusband (q.v.), he was educated at Clifton College and the Royal Military College, Sandhurst. Commissioned in 1878, he was promoted captain in 1889, major in 1896, lieutenant colonel in 1900, and major general in 1911. Awarded the medal with clasp for services in the Afghan War of 1878–1880, he also received medals or was mentioned in dispatches for outstanding services in the Sudan (1885), India's Northwest Frontier (1886), the Burma War (1886–1887), Chitral Relief Force (1895), and the Philippines Campaign of the Spanish-American War. Fighting in the South African War (1899–1902) he was severely wounded, was breveted lieutenant colonel and made a Companion of the Bath (1900). Created Knight Commander of the Indian Empire (K.C.I.E.) in 1913, he received a second knighthood (K.C.M.G.) in 1915 while serving in World War I. A last tribute to his valor was the appointment as Keeper of the Jewel House, Tower of London, in 1917, a post he held until his death. His books include *The Story of the Guides* (1908); *The Tower from Within* (1918);

The Crown Jewels of England; The Jewel House; Forty Years a Soldier (1923).

YOUNGMAN, William, British botanist: b. Aug. 6, 1880. He was educated at the East Anglican School, privately, and at the University of London. He became professor of botany at Agra College (India) in 1910; and at Canning College, Lucknow, in 1911. He is a fellow of the University of Allahabad, and a member of the senate. In 1918 he was made economic botanist to the government of the United Provinces of India; and to the government of the Central Provinces in 1922. Nominated by the viceroy to be a member of the Indian Central Cotton Committee, he carried out extensive research and work for the improvement of the cotton crop in Central India. He served as a member of the legislative council of Ceylon in 1930–1931; and was director of agriculture, Ceylon; editor of the *Tropical Agriculturist;* chairman of the Rubber Research Scheme of Ceylon, and of the Coconut Research Scheme also of Ceylon, 1930–1935. His publications include various articles on tropical crops, and scientific papers on cytology in the *Annals of Botany.* He has traveled extensively in the Himalayas.

YOUNGSTOWN, yungz'toun, village, New York, on Niagara River, near its mouth on Lake Ontario, and 25 miles north of Buffalo. There is a United States Coast Guard station located here. Nearby is the site of Old Fort Niagara, restored in 1934. Pop. (1950) 932.

YOUNGSTOWN, city, Ohio, and Mahoning County seat, on the Mahoning River; 67 miles southeast of Cleveland, and 65 miles northwest of Pittsburgh; served by the Erie; New York Central; Baltimore and Ohio; Pennsylvania; Lake Erie and Eastern; and Pittsburgh and Lake Erie railroads; four airports, and airline connections at Cleveland and Pittsburgh. Youngstown is situated on a high ridge separating the waters that flow into Lake Erie and the Ohio River, and is surrounded by rolling hills that rise to 1,200 feet above sea level. The city is divided into north and south sections by the river, which is bridged at convenient points. The north section was settled first, and much of the newer southern section is residential in character. The main business street is on the north side of the river, which it parallels for three miles. The historic Public Square is 285 feet above Lake Erie, and 858 feet above sea level.

Industries.—Youngstown's growth and importance has been due to the development of the iron and steel industry. As early as 1805 a blast furnace was built with a capacity of two tons of pig iron per day. The second blast furnace in the United States to use raw block-coal and a rolling mill for making bar iron were both built here in 1846. In 1856 shipments of Lake Superior ores brought much new smelting industry to Youngstown, and blast furnaces sprang up rapidly during the next generation, using lake ore and Pennsylvania coal and coke as the native supplies became exhausted. Rolling mills were built between 1880 and 1896 and the first general steel mill in the valley was erected in 1895 by the Ohio Steel Company. The close proximity of limestone, one of the raw materials for steel making, has been a great aid to the industry. Limestone quarries nearby have a combined output of about 5,000,000 tons annually, and besides material for steel manufacture supply brick plants, agricultural lime and other by-products. During 1917 the American Iron and Steel Institute recognized the growing importance of Youngstown by creating the Youngstown District, which includes Lawrence and Mercer counties in Pennsylvania, and Mahoning and Trumbull counties in Ohio, embraces works in the Mahoning, Shenango and Beaver valleys, and adjacent territory, and produces one-sixth of the pig iron and one eighth of all the steel made in the United States. Nationally famous companies operate huge iron and steel blast furnaces, and a large number of steel works and rolling mills. Important coke plants are maintained at a number of Youngstown works, and from the by-products large quantities of tar, benzol, ammonium sulphate, toluol, xylol and solvent naphthas are made locally, while other by-products are shipped for manufacture elsewhere. In addition to the production of raw iron and steel Youngstown has extensive manufactures of finished steel products comprising mill machinery, sheets, bearings, shafting and structural shapes, seamless steel pipe and tubing, fireproof office furniture, and steel hooks. While the city is primarily known as a steel town it also has factories producing such diversified products as mechanical and moulded rubber goods, fine leathers, microphones, electric lamps and machinery, paint and varnish, brick, cement and cement blocks, airplane wood, automotive parts, mattresses, wall coverings, and chemicals.

Cultural Facilities.—Youngstown's schools stand high among those of the nation, due largely to the devotion and ability which has characterized superintendents and teachers since the beginning. Among these was Reuben McMillan (1820–1898) who with two short intermissions was superintendent from 1853–1886. The city's 72 schools include nine high schools and 20 parochial schools, with a total of over 1,200 teachers, while the student enrolment is more than 40,000. The educational system is planned on the 6-3-3 basis—comprising elementary (six grades), three junior high, and three senior high. The Ursuline Academy is a Catholic coeducational high school.

To supplement the schools the public library system is supported by taxation and under the direction of the Reuben McMillan Public Library Association of open membership. It has collections of approximately 160,000 volumes, a large staff of assistants and circulates nearly 1,000,000 volumes per year from its central building, branches and sub-branches.

The city is likewise the seat of Youngstown College, founded as a night school in 1888, organized as a college in 1908, and occupying a stone building of Tudor Gothic design completed in 1931. It is a coeducational institution of higher learning, offering courses leading to degrees in liberal arts, law and business administration and pre-professional courses in medicine, engineering, music and nursing.

The Youngstown Symphony is one of the leading organizations of its kind in this section of the country. Many famous artists are brought here through the efforts of the Monday Musical Club; and the Youngstown Players have been notably successful in promoting the Little Theater movement in the city.

Buildings.—Two of the handsomest build-

ings in Youngstown, and among the most noteworthy in the country, are the Butler Art Institute, erected by Joseph G. Butler, Jr., at a cost of $500,000, and opened in 1919; and the 3,000-seat Stambaugh Auditorium, costing $1,638,000 and modeled upon the design of the Pantheon of Paris, in which all the public community functions are held. The Butler Art Gallery is especially rich in the work of American painters. Youngstown likewise takes pride in the Mahoning County Courthouse, a classic building of Vermont granite, completed in 1911 at the cost of $1,000,000, and boasting murals illustrative of local history executed by E. H. Blashfield, C. Y. Turner, and A. E. Forenger. In 1915 Youngstown erected a $340,000 city hall, and it has a $375,000 Y.M.C.A. building, and a Y.W.C.A. building and annex costing $250,000. The Reuben McMillan Public Library (named in honor of a former school superintendent) is an Indiana limestone structure of classic style, built in 1911 at a cost of $155,000, of which $50,000 was contributed by Andrew Carnegie. Library service is given the entire city through this main library, its six branches and seven sub-branches. The Youngstown Natural History Museum is housed in the Lanterman Mill in Mill Creek Park, a structure dating from about 1845 and built on the site of the first grist mill in the Western Reserve

Parks.—Youngstown's 2,120 acre Mill Creek Park, known as "Ohio's Yellowstone," situated in the southwestern section of the city, is rated as one of the most beautiful natural parks in the country, and is largely the result of the 30 years' labor of the late Volney Rogers. The park is seven miles long, winding through a natural gorge. It has miles of drives, three large lakes with a number of islands, and three notable waterfalls. Besides this famous park Youngstown has other scenic and recreation parks, Lincoln, Crandall, Wick, Tod Memorial and Pine Hollow. There is an extensive system of playgrounds, in the city, capably supervised, for the use of children. Several of these have baseball and football fields with concrete grandstands; and there are high school stadiums for meets and sports. Privately owned and industrially sponsored playgrounds measurably increase the city's acreage devoted to athletic recreation, and there are a number of popular swimming pools, as well as the pleasure park Idora. A municipal golf course is maintained and there are excellently planned country clubs with the usual complement of sports. Altogether the park grounds open to the public embrace 2,633 acres. The park commission's funds are derived from the regular tax levy.

Newspapers.—Youngstown has one daily newspaper, the *Vindicator;* the *Legal News,* published weekdays; and the *Amerkai Magyar Hirlap,* and *Jewish Times,* weekly newspapers. *Daughters of America Magazine,* a monthly, is published here; as is *Jambar,* a semi-monthly student publication of Youngstown College.

Water Supply.—Youngstown has an ample water supply, planned to cover requirements of the city's growth for a 30-year period. Newest and most modern is the Meander Reservoir, built on Meander Creek and storing 10,000,000,000 gallons of water for domestic use. The city's industrial water supply finds its source in the Milton Reservoir, on Milton Creek, 17 miles from the city.

Government.—Youngstown holds its city elections biennially, electing a mayor, a president of council, and one councilman from each of the seven wards of the city. The clerk is appointed by the Council. A director of law and a director of finance are appointed by the mayor for a term of two years, and they with the mayor form the Board of Control which awards contracts for public work. In addition, the following department heads are appointed by the mayor: commissioner of public works, commissioner of buildings, chief of police, chief of fire department, commissioner of building inspection, plumbing inspector, electrical inspector, commissioner of water works, commissioner of streets, and sealer of weights and measures.

History.—The history of Youngstown is in a considerable measure a continuation of the story of New England. It was originally a part of the Western Reserve of Connecticut, and many of its pioneer settlers were from that state. There was a goodly proportion of college bred men among them, and many came to the valley with ample funds for the purchase of land and equipment. Their New England thrift, enterprise and industry, their high ideals of patriotism, and their appreciation of church and school left an indelible impression on those who followed them.

Youngstown was named for John Young, who came here in 1797, and bought an entire township at the junction of Mill Creek and Mahoning River, the purchase price exceeding $16,000, and the sale being consummated with the Westerr Reserve Land Company. Prominent in the early history of the settlement was Col. James Hillman, a well known Mahoning Valley trader, who greatly assisted Young in maintaining peaceful relations with the Indians still resident in the district. Within a year 10 families had established themselves at Youngstown, and a little later a gristmill was set up at the falls of Mills Creek. Early in the history of the village pockets of iron ore were discovered, and resulted in Daniel and James Heaton building the first blast furnace in the state of Ohio on Yellow Creek, east of Youngstown, in 1803, after Briar Hill block-coal, one of the most famous coals in the world, was found in the vicinity. This coal though bituminous, could be used in the raw state for making pig iron. Vast quantities of limestone, together with other substances needed to smelt iron ore, were found in the surrounding country, nature thus furnishing Youngstown with the raw materials that made it possible for the city to develop into a great iron and steel center.

The demand for speedier and better transportation created by the opening of coal mines and Youngstown's growing industries resulted in the building of the Pennsylvania-Ohio Canal, completed in 1839 and extending through the city to Cleveland and Pittsburgh. The first railroad was opened in 1853, to be followed later by the four great trunk lines that now enter the city.

Youngstown was the birthplace of Ohio's famous war governor, David Tod (1805–1868); Jesse Grant, father of President Ulysses S. Grant, grew to manhood here; John Brown, of abolition fame, lived and worked a few miles from Youngstown; William McKinley, the martyred President, was born nine miles from Youngstown; and James A. Garfield, another martyred President, once drove mules along the tow path of the old canal through Youngstown.

Youngstown was organized as a township in 1802, and in the same year the present public

square was given to the city by its founder. Incorporation as a town followed in 1848, and as a city in 1867. The county seat was removed here from Canfield in 1876, resulting in litigation that was not ended until 1879, when the court confirmed the city's claim to its new honor. Youngstown claims rank as the fifth city in the country in point of home ownership, and in the federal census of 1940 was the seventh largest city in Ohio. The city's population increased from 8,075 in 1870 to 44,885 in 1900; and 167,720 in 1940 to 168,330 in 1950.

YOUNGWOOD, borough, Pennsylvania, in Westmoreland County, 25 miles southeast of Pittsburgh. It has railroad shops and manufactures scientific instruments, especially thermostats. Pop. (1950) 2,720.

YOUNT, yŭnt, George Concepción, American pioneer in California: b. Burke County, North Carolina; d. Napa Valley, Mexico, Oct. 5, 1865. In 1818 he began the development of a farm in Howard County, Missouri, where he prospered as a cattleman. A neighbor embezzled his savings leaving him impoverished and discouraged. In 1825 he joined an expedition to Santa Fe and under the guidance of Ewing Young, trapper and guide, he too became a trapper and took part in several expeditions, extending his trips northward as far as Bear Lake. In 1830 he joined a Pacific bound expedition reaching Los Angeles, California, in February 1831. In 1834 he journeyed farther north finding employment at the missions of San Rafael and Sonoma. In 1835 he became a Mexican citizen and selected a broad and beautiful tract of land in Napa Valley, where he established himself as the lord of Caymus Rancho and as guardian of the frontier against Indian attacks. After the conquest of Mexico the influx of settlers caused him heavy losses, but by 1855 he had recovered much of his property.

YOUTH HOSTELS. See HOSTELS, AMERICAN YOUTH.

YOUVILLE, Marie Marguerite d', dyōō-vĭl′ (nee DUFROST DE LAJEMMERAIS, dü-frō′ dē là-zhàm-rĕ′), founder of the Grey Nuns of Montreal, was born Varennes, Canada, in 1701; d. Montreal in 1771. In 1722 she married M. d'Youville, but her husband died in 1730, leaving her with two children. She then began to devote herself to charity and in 1747 she was placed in charge of the Hôpital-Général in Montreal. Here she founded the order of the Grey Nuns.

YPRES, ē′pr′, commune, Belgium, in West Flanders Province. It was famous as a commercial center in medieval times. It lies in flat country, normally agricultural, overlooked by low ridges to the east and by higher hills of the Kemmel chain. It is about 36 miles by rail southwest of Bruges. Formerly one of the most important manufacturing towns of Flanders with a population of 200,000 in the 13th and 14th centuries, its chief manufactures were cotton and lace when, in World War I, it was the scene of four great battles. It was practically destroyed by German bombardment, especially heavy losses being the famous Cloth Hall (Les Halles) and the Cathedral of St. Martin. Following the war the city was rebuilt. It was again taken by the Germans during World War II. Pop. (1948) 17,073.

BATTLES

The first battle of Ypres began Oct. 19, 1914, the second on April 22, 1915, and the third on Sept. 20, 1917.

The first battle was one of the hardest fights of the entire war. It began with the advance of Rawlinson's corps towards Menin followed by advances of Pulteney's and Allenby's corps down the Lys in the same direction. At the same time the Germans began a general advance with the army of Duke Albrecht of Württemberg and the 6th German Army led by Crown Prince Rupprecht of Bavaria. By October 19 the whole front from La Bassee to the sea was engaged. The British were forced back on October 30 and on the 31st their line broke at Gleluvelt. A counterattack drove back the Germans and all ground lost was regained. The battle ended on November 12 and trench warfare began on this part of the front. The second battle (April 22-May 25, 1915) is memorable for the first gas attack of the war. It resulted in heavy casualties for the British and a reduction of the salient. In this battle the Canadian brigades were engaged and lost heavily. The total British losses were 2,150 officers and 57,125 men; the Germans reported losses of 860 officers and 34,073 men. Throughout the summer and fall of 1917 there was almost continuous fighting in the Ypres sector. Like the first and second battles little was gained by either side in the third battle and the losses were tremendous. The nature of the ground greatly hindered operations. The battle ended with the occupation on November 4 by the second Canadian Division of Passchendaele village.

In March 1919 the Belgium government intimated their desire of making Canada a grant of land in the city of Ypres for the erection of a memorial museum and shrine to the brave Canadian soldiers who in the defense of liberty had made the supreme sacrifice on the battlefields of the famous Ypres salient. It was also suggested not to rebuild the city but to leave its ruins standing as a lasting monument to unjustifiable and ruthless German aggression. See also WAR, EUROPEAN—MILITARY OPERATIONS ON THE WESTERN FRONT.

YPSILANTI, ĭp-sĭ-lăn′tĭ, a distinguished Fanariot family descended from the Comneni and of prominence as defenders of Greek liberties. Its most conspicuous members are ALEXANDER: b. Constantinople, 1725; d. 1805; hospodar of Wallachia 1774–1777, and again in 1796–1798, and of Moldavia 1784–1792. He propounded a scheme for the fusion of the Greek and Turkish people, but having incurred the suspicion of the Porte was executed. CONSTANTINE, his son: b. Constantinople, 1760; d. Kiev, Russia, July 28, 1816. He early planned the freedom of Greece, but his scheme was prematurely discovered, and he fled to Vienna. Pardoned by the sultan, he was hospodar of Moldavia 1799–1805. He then went to Russia, but returned to Bucharest with 20,000 men, in the hope of freeing Greece. The peace of Tilsit interrupting his plans, he returned to Russia. ALEXANDER, eldest son of the preceding: b. Constantinople, Dec. 12, 1792; d. Vienna, Jan. 31, 1828. He went with his father to Russia and, joining the Russian Army, served with distinction in various campaigns. In 1820 he became head of the secret association known as Hetaeria, whose aim was the independence of Greece, and in

March 1821 entered Moldavia and raised the standard of revolt among the Rumanians. He was defeated by the Turks at Dragaschen, near Galatz, June 19, 1821, fled to Austria and was imprisoned six years at Munkacs, Hungary. DEMETRIUS, brother of the preceding: b. Constantinople, Dec. 25, 1793; d. Nauplia, Aug. 16, 1832. After serving in the Russian Army, in 1821 he joined the Greek patriots in the Morea and played a brilliant part in the struggle. But though a brave and successful general, as his victory at Tripolitza and his defense of Argos show, his influence was constantly undermined by the "native" party, who never forgot that he was a Phanariot, and, therefore, a foreigner in part. In 1827, however, he was made commander in chief of the Greek Army but the ungenerous course adopted toward him by the government of Capo d'Istria compelled him to resign Jan. 1, 1830, and he then withdrew from public affairs. GREGORY, brother of the preceding: d. 1835.

YPSILANTI, city, Michigan, in Washtenaw County, altitude 713 feet, on the Huron River, 28 miles west of Detroit and eight miles east of Ann Arbor. It is on the main line of the New York Central Railroad running between Detroit and Chicago. Two well-known bus lines and numerous truck lines serve the needs of the community. The city is also connected with the Detroit Expressway.

It is the commercial center of a rich agricultural area. Manufactures include automobiles, dairy products, auto parts, oil stoves, paper, ladders, sheet metal machinery, iron castings, pressed steel, cement, and foundry and machine products.

The city is the site of the Michigan State Normal College, founded in 1849, the oldest teacher-training institution west of the Alleghenies. Cleary College, a business training school, is also located here. In addition to these institutions the city has a fine system of public schools. There is a well-equipped public library. There are 28 churches, representing 20 denominations.

History.—Ypsilanti was established in 1823 as a pioneer settlement on the Huron River by a small band of frontiersmen who were pushing their way west in search of new adventure. It was chartered as a village in 1832, and as a city in 1858. The government is the council-manager type operating under a special charter. Pop. (1950) 18,302.

YREKA, wī-rē'kà, city, California, and Siskiyou County seat; altitude 2,624 feet, about 320 miles north of San Francisco, near the Oregon line. It is served by the Southern Pacific, and Yreka Western railways, and Southwest Airways and is on state and federal highways.

It is the trading center for a prosperous agricultural and lumbering region. Stock raising and mining are also important. There are two schools, two libraries, a radio station, and two newspapers.

The city was settled in 1851 during the gold rush. In 1854 it was saved from a Klamath Indian raid by an Indian woman, Klamath Peggy, who warned the residents of the impending attack. It was incorporated in 1857. Pop. (1950) 3,227.

YRIARTE, ē-ryårt, **Charles Emile,** French journalist, artist and author: b. Paris, Dec. 5, 1832; d. there, April 10, 1898. He studied architecture as a pupil of Constant Defeux, became inspector of imperial asylums, and after this post was abolished, went on the Spanish expedition to Morocco in 1859 as correspondent and artist for the *Monde Illustré,* and in 1860 on Garibaldi's campaign in Sicily in the same capacity. From 1864 to 1870 he was editor in chief of the *Monde Illustré.* In 1881 he was made inspector of fine arts and in 1889 member of the superior council of fine arts. He wrote for the *Figaro* and for *La Vie Parisienne* over the pseudonym "Marquis de Villemer."

Among his numerous volumes of various character are *Portraits Parisiens* (1865); *Goya, sa vie et son oeuvre* (1867); *Les Tableaux de la Guerre* (1870); *Le puritain* (1875); *Venise* (1877); *Autour du Concile* (1887); and several works on the Italian Renaissance, such as *Florence* (1880); *Françoise de Rimini* (1882); *Matteo Civitali, sa Vie et son Oeuvre* (1885); *Autour des Borgia* (1890); and *Maso di Bartolommeo dit Masaccio* (1894).

YRIARTE, or **IRIARTE, Juan de,** Spanish linguist: b. Orotava, island of Teneriffe, Dec. 15, 1702; d. Madrid, Aug. 23, 1771. In 1714 he was sent to school at Paris and afterward he studied English in London and jurisprudence in Madrid, where he presently obtained a post in the royal library. In 1732 he became chief librarian and in 1742 translator for the ministry of foreign affairs. He published an important *Codices graeci manuscripti* (1769) and wrote many Latin and Spanish epigrams and proverbs, Latin poems, etc., included in his *Obras Sueltas,* 4 vols. (1774).

YRIARTE, or **IRIARTE, Tomas de,** Spanish dramatist: b. Orotava, island of Teneriffe, Sept. 18, 1750; d. Madrid, Sept. 17, 1791. He began to write in boyhood and in 1770 published his comedy, *Hacer que hacermos,* under the pseudonym, *Tirso Ymareta.* In 1870 he published a didactic poem, *La musica,* and in 1782 *Fabulas literarias,* considered the best fables in the Spanish language. He also wrote the first regular comedies in Spanish, the best being *The Spoiled Child* and *The Ill-Bred Young Lady* (1788), and published Spanish translations of French plays, Horace's *Ars Poetica* (1777), and four books of the *Aeneid.* In 1771 he succeeded his uncle, Juan de Yriarte (q.v.), as royal librarian.

YS, *ēs,* a more or less legendary city of Brittany situated on the bay of Douarnenez in Finistere and submerged in the 4th or 5th century. King Gradlon had the only key to the secret gate in its protecting dyke. His daughter stole it as a prank while banqueting with her lover late one night while her father slept, opened the gate and let the sea engulf the city.

YSAYE, ē-zà-ē, **Eugene,** Belgian violinist: b. Liége, Belgium, July 16, 1858; d. Brussels, Belgium, May 12, 1931. He studied at the Liége Conservatory and subsequently with Wieniawski and Vieuxtemps at Brussels. He made many successful European concert tours and in 1886–1898 he was professor in the Royal Conservatory of Brussels. He originated a new school of violin playing, embracing features of the German, the French and the Belgian schools.

He was considered to be one of the leading violinists of the world and was gifted

with marvelous powers of interpretation. He visited London in 1889 and established there as well as in the principal cities of the Continent a high reputation as a conductor and soloist. He first visited the United States in 1894 and toured the country repeatedly thereafter, becoming in 1918 conductor of the Cincinnati Orchestra. He returned to Belgium in 1922. He composed concertos for violin and piano, and *Suite Wallonne.* Died, Brussels May 12, 1931.

YSER, a river of Flanders, Belgium, about 48 miles long, canalized from Dixmude to Nieuport, where it is from 15 to 20 feet above the ground, a fact which proved decisive in the victory of the Allies at the Battle of the Yser (Oct. 16–31, 1914). The Germans on Oct. 16, 1914, made an attack on Dixmude, beginning the Battle of the Yser. The Germans outnumbered the Allies three to one and the campaign was going in their favor, when on Oct. 25 Joffre decided to flood the country held by the Germans, and a dam was constructed over the Yser canal. The water was slow to rise, but by the 31st, after the dikes had been cut, the Germans were caught in the flood, many were drowned and many others taken prisoners.

YTTERBIUM, a rare chemical element belonging to the yttrium group. Discovered by Marignac in 1878 in the mineral gadolinite, it was separated into two elements named neoytterbium and lutecium by G. Urbain in 1907. Also found in other minerals occurring in Siberia, Scandinavia and Greenland. Symbol, Yb.; atomic weight, 173. Its oxide Yb_2O_3 forms colorless salts with sulphuric acid, etc.

YTTRIALITE, a native silicate chiefly of thorium and the yttrium metals. It occurs in Llano County, Texas, in grayish-olive-green masses, associated with gadolinite and other minerals.

YTTRIUM, a rare chemical element discovered 1794 by Gadolin in the mineral gadolinite from Ytterby. It is always found in combination, some of the minerals containing it being gadolinite, xenotime, euxenite, yttrotantalite and polycrase. It is usually separated from the mineral by use of sulphuric acid or aqua regia. The element is obtained by heating the chloride with metallic potassium, by electrolysis of a molten mixture of the chloride and sodium chloride, or by heating the oxide with magnesium. It is a grayish-black, lustrous, metallic powder that burns in the air to the oxide Y_2O_3; soluble in dilute acids; symbol Y; atomic weight 89; valence 3. It forms a great many compounds closely resembling aluminum.

YUAN, or **YUEN,** a Mongolian dynasty which ruled in China in 1280–1367. The founder of the dynasty was Kublai Khan (q.v.), who by 1280 had conquered China and established complete jurisdiction. But while he was wise in government, a patron of literature and art, and executed public works of great importance, the Chinese was less sensible of the benefits he conferred than of the fact that he was a barbarian and placed barbarians in office to the exclusion of Chinese. He was succeeded by his grandson, Timur, who reigned in 1294–1307 as Yüan-chêng. A Mongol prince, Wu-tsung, was the third of the dynasty; and in 1312–1320, the Chinese became somewhat less resentful of the alien dynasty through the efforts of Jên-tsung, who paid honors to Confucius, replaced the Chinese in many offices, and in various ways succeeded in gaining the favor of his subjects. From his time the power of the dynasty declined rapidly in authority, and during the reign of the ninth ruler, Shun Ti, in whom were said to be all the faults and none of the virtues of his predecessors, revolts broke out all over China; the Chinese found a leader in Chu Yüan-chang, who forced Shun Ti to flee. He found refuge at Ying-chang Fu, and died there, the last of the dynasty.

YUAN SHIH-KAI, Chinese soldier and statesman: b. Hsiang Ching, province of Honan; d. Peking, June 6, 1916. Descended from a family long active in the service of the state, Yuan was destined from the beginning of his career to become a leader in military, foreign and domestic affairs. Yuan Chi-san, his grandfather, achieved distinction in suppressing the Taiping Rebellion (q.v.) and died (1864) as imperial commissioner and provincial commander in chief. Yuan qualified for a bachelor's degree and immediately attached himself to the (then despised) military profession. At the age of 20 he was appointed aide-de-camp to General Wu Chang-ching, then commanding the Chinese forces in eastern Santung. When the rebellion broke out in Korea (July 1882) Li Hung Chang, then the helmsman of China's ship of state, sent an expeditionary force, to which Yuan was attached, to the assistance of the emperor and quelled the uprising. Yuan in 1884 was given command of the Chinese garrison in Korea and the following year was appointed imperial resident. For the next nine years he was the de facto ruler, ably assisted by Sir J. McLeavy Brown. Yuan soon demonstrated his uncompromising attitude and autocratic methods, which involved him in many difficulties with the Japanese at Seoul. The Tonghak Rebellion (1893), the well-organized movement of the Nationalist Party, followed by the sinking of the *Kowshing,* first proved China's military weakness. Protected by British blue jackets Yuan escaped to the coast. After temporary peace Yuan was restored, Li Hung Chang sent 5,000 troops to Yuan and ordered them to be trained in the Western fashion. This marked the beginning of China's modern army. Yuan ruled this small force with a rod of iron, but the men were slow to accept subordination and Yuan could not instill the necessary spirit of devotion in his troops. After the coup d'état of 1898 and the subsequent resumption of power by the empress dowager, the military prowess and reputation of Yuan became an important factor. He always remained a close friend of the empress, who was able to maintain the ruling hand until her death, with the constant assistance of Yuan, by this time well versed in all important affairs of government. When at the death of the Empress Dowager Tzu Hsi (1908) Kuang Hsu came into power, he fulfilled an old grudge and caused Yuan's humiliating retirement, for it had been rumored that this close friend of the empress silently acquiesced in a plot to overthrow the state, in which Yuan's blood brother, Jung Lu, was the dominating factor. During the Boxer uprising (1900) the military experience of Yuan

became necessary and he was reinstated. Assisting the different viceroys in keeping the trouble confined to the immediate vicinity of Tientsin, at the same time he lent valuable aid to the Allied forces then in China. As viceroy of Chihli, November 1901, he was welcomed by the natives and foreigners as the best guarantee of restoration of order, and in this office he at once instituted educational and administrative reforms. His statesmanship was of a high order; he could always be trusted, and so with his appointment as administrative head of the foreign office at Peking (September 1907) and member of the Grand Council, the foreign diplomats welcomed Yuan as a statesman well liked and respected. However, on the almost simultaneous deaths of the emperor and the empress-dowager imperial politics declined and he was banished.

At this period China was in the throes of continual unrest, and lacking trained military leaders, was compelled to recall Yuan (October 1911); he was appointed president of the Council of Ministers on November 1, and prime minister two weeks later, with full power to meet conditions as he found them. His rise was rapid. The subjects in the south clamored for a republican form of government.

While the Manchu Tatar autocracy which had ruled the Celestial Empire since 1643, strove to withstand the inevitable, Yuan, fully realizing his ability to continue the actual domination of China whether it were termed republic or monarchy, consented to be proclaimed provisional president of the Republic of China (Feb. 15, 1912). Finally elected president Oct. 6, 1913, he immediately announced that China undertook to observe all treaties and obligations incurred by the Manchu regimen. He abolished the democratic opposition party, suspended Parliament, and appointed an Administration Council. The provisional constitution was completed in the spring of 1914, giving Yuan extensive powers. In November 1915 most of the provinces having voted for a return to monarchy, Yuan refused to ascend the throne as emperor; then changed his views and fixed the coronation for Feb. 9, 1916, and again abandoned the proposed idea of a monarchy. The provinces in the south again revolted, declaring that Yuan had forfeited his right by acceptance of the throne and proclaimed the vice president, General Li Yuan-hung, as president of the new republic, but he was not generally recognized. Upon the death of Yuan the appointment of General Li Yuan-hung became certain, and he stepped into office June 7, 1916.

YUBA, yōō'bȧ, a river in California formed by the junction of three rivers, North, Middle and South, which have their sources in the Sierra Nevada. The Yuba enters the Feather River just below Yuba City. In its upper course it has many picturesque gorges and several cascades.

YUBA CITY, town, California, located in Sutter County, altitude 50 feet, on the Feather River near the mouth of the Yuba; on the Southern Pacific Railroad, and on federal and state highways. It is about 42 miles north of Sacramento. With Marysville, across the Feather River, it forms one commercial community. In a fertile fruit growing region, peach packing is the main industry, which employs Mexican and Japanese labor. Pop. (1940) 4,968; (1950) 7,856.

YUCATAN, yōō-kȧ-tăn', a state of Mexico on the northern end of the Yucatan Peninsula (q.v.). Except for a range of very low mountains along the border with Campeche, the state consists entirely of a hot, sparsely inhabited plain, rarely as much as 100 feet above sea level, covered by low trees and dense thickets except where cultivated. Rainfall is limited and falls during the months of May to September. Corn is the principal crop, constituting almost 80 per cent of the people's food in one form or another. The capital is Merida (q.v.) which is linked by rail and highway with Progreso, the only port of importance, some 22 miles north of the capital. The humus is almost nowhere more than a few inches deep and consequently the cornfields must be moved every two or three years, a new section of the land being cleared and burned for this purpose. There are no rivers of importance. Cenotes or natural wells, however, are frequently found. These, and suitable well-digging sites, largely determine the habitable locations. An almost constant breeze permits the use of windmills to raise water for irrigation purposes. The chief crop is henequen from which sisal hemp is obtained for the manufacture of cordage and bags. Honey and tropical fruits are also produced in quantity. The area of the state is 14,867 square miles. Pop. (1940) 418,210; (1950) 516,899.

YUCATAN, Antiquities of. See MAYA; MAYAPAN.

YUCATAN PENINSULA, a projection of the North American continent between the Gulf of Campeche, the Gulf of Mexico, and the Caribbean Sea. It comprises the Mexican states of Campeche and Yucatan, and the Territory of Quintana Roo, British Honduras, and part of Guatemala. The extreme southerly portion is moderately mountainous and is covered with tropical rain forest. The peninsula becomes increasingly low and flat as it advances northward, the small mountains traversing the peninsula from the city of Campeche to Chetumal Bay appearing quite sizeable although almost nowhere do they exceed 300 feet in elevation. Rainfall decreases toward the north and there is an imperceptible change in flora and fauna, from that of the wet tropics to that of the dry tropics. The population consists largely of Maya Indians who are the descendents of the peoples whose civilization flourished in both the southern and northern sections of the peninsula long before the Spanish conquest. Their early capital was Mayapan (q.v.). The so-called Old Empire was at its height in the south and adjacent regions from the 4th century A.D. until the 10th century. About 1000 A.D., for reasons not entirely understood, the centers of habitation were moved northward to the present sites of the magnificent ruined cities of Chichen Itza, and Uxmal. See also MAYA.

YUCCA, yŭk'ȧ, the name of a genus of shrubs with clustered ensiform leaves, belonging to the Liliaceae family. The name is also used to designate the plants belonging to the entire family of yuccas. This includes not only the genus *yucca,* but several other genera, such as *Samuela, Clistoyucca,* and *Hesperoyucca.* The species are chiefly found in the United States, and Mexico, though they are found elsewhere. The best-known species in the United States is *Yucca filamentosa,* or the Adam's needle, which is

found in cultivation as far north as New England. The white or violet cup-shaped flowers, resembling huge lilies of the valley, are borne mostly on erect clusters or along most of the stalks; some shed a heavy fragrance when open at night. The coarse fiber of *Y. filamentosa,* called bear grass, has long been used in a small way as tie material in the South. In Mexico, however, there are several species with larger leaves that have since 1900 been exploited for their fiber, which has become known as a rather coarse substitute for the better cordage fibers. This coarse fiber is known as palma istle, pita sylvestris, and zamandoque. Yucca fiber is stiff, harsh, and brittle, and as prepared is not always of good color, and therefore can never take rank with the better fiber known as hard cordage fibers. (See FIBRE). *Yucca baccata* yields a fairly good fiber, and the parenchyma or pith, and the root possess detergent qualities, from which the name "soap plant" has been derived. The sun-cured, whitish-yellow inner leaves of *Yucca glauca* are used by the Arizona Indians for ornamental basketry, either entire or subdivided, and several other species are also employed in the domestic economy of North American Indian tribes for rude cordage, baskets, and sandals.

A very remarkable feature in the yucca is its fertilization by the aid of any of several species of small whitish moths of the tineinine genus *Pronuba.* The yucca flowers are so shaped as to be impossible of fertilization, and no other insects attach themselves to this plant. The yucca moth gathers a quantity of pollen in its jaws, then lays an egg in the pistil, and stuffs the hole in which it is laid with pollen, thus fertilizing the ovary. The caterpiller develops in the fruit pod, but does not seriously harm the plant. This extraordinary case of symbiosis was disclosed by Charles Valentine Riley in 1872.

YUCHI, a linguistic stock of North American Indians who once lived along the banks of the Savannah River. See UCHEAN.

YUECHI, yüĕ'chē', a nomad people, originally consisting of five separate tribes, who inhabited central Asia. In the 2nd century B.C. they were driven westward by the Hiung-nu (Huns), and about the year 126 B.C. they conquered and occupied the Greco-Bactrian kingdom founded by Alexander the Great, including parts of modern Afghanistan and Asiatic Russia. During this occupation the Yuechi united to form a single tribe called Kushans, from the name of the principal tribe of the combination. About 50 A.D. they invaded northwestern India where they founded the Kushan dynasty, bringing with them some of their adopted Greek and Persion culture. At the close of the 3d century A.D. they were driven out of India by the Guptas. Remnants of the Yuechi which had remained in Bactria formed a kingdom in eastern Afghanistan; but this was destroyed early in the 4th century by the Yuechi's traditional enemies, the Huns.

YUGA, yoo'gä, or **YOOGA** (Sanskrit, *Yoke,* a period of time) one of the periods into which the past history of the globe is divided in the chronology of the Hindus. There are four yugas: the Satya Yuga, containing 1,728,000 years; the Treta Yuga, 1,296,000 years; the Dwapara Yuga, 864,000 years; and the Kali Yuga, now in progress, which began about 3094 B.C., and which will extend to 432,000 years. Horace Hayman Wilson points out that these numbers originate in the descending arithmetical progressions of 4, 3, 2, 1, according to the notions of diminishing virtue in several ages applied to a cycle of 12,000 divine years, each equal to 360 years of mortals; and $12{,}000 \times 360 = 4{,}320{,}000$, the periods of the four yugas added together. This total period is a Maha Yuga or Manvantara. The close of a Manvantara is signalized by a *pralaya,* or apparent destruction of the world, which inaugurates the "night of Brahma," and endures until after a thousand cycles of time Brahma awakes and renews the cycle of the ages, or "day of Brahma." See also INDIA.

YUGOSLAV LANGUAGE, the language common to all the Yugoslavs (the Serbs, Croats, Slovenes, and Bulgars); one of the great group of Slav tongues. The Yugoslav language is subdivided into four dialects. Yugoslav scholars, who desire to promote the trend toward unity among the Yugoslavs, maintain that the form of each of these dialects has been artificially preserved in printed books, newspapers, and periodicals, whereas the Yugoslavs have a strong natural inclination to abandon their special dialects and to unify the language, just as they wish to unify their various states. The authorities attribute the continued existence of the dialects up to the end of World War II mainly to the propaganda through which the Germans largely dominated the Balkan countries to keep the Yugoslavs divided into small states, so that they (the Germans) could rule and exploit them. The unification of the dialects was attempted at the beginning of the 19th century under the leadership of Vuk Karadžić (Kardžić, 1787–1867), a Serb, Ljudevit Gaj (Gay, 1809–1872), a Croat, and Stanko Vraz (1810–1851), a Slovene. Only Gay succeeded in inducing his group (the Croats) to adopt as the Yugoslav literary language the dialect then spoken in Bosnia, Hercegovina, and Montenegro. Karadžić partly succeeded with the Serbians. They abandoned the ancient church dialect as their literary language, but adopted instead the dialect of the Belgrade (Beograd) streets, and expelled Karadžić from his native Serbia. Thus the Serbs were themselves divided. Those in Serbia adopted the Belgrade dialect as their literary language, and those outside Serbia—in Bosnia, Montenegro, Croatia, Hercegovina, and Dalmatia—joined with the Croats in using the "tristate" dialect as their literary language. This situation continued until King Alexander I (r. 1921–1934, q.v.), by proclamation, established the Belgrade dialect as the official language of the country, and prohibited the use of any other dialect within Yugoslavia, with the exception of Slovene, the use of which remained restricted to Dravska Banovina (see also YUGOSLAVIA). Vraz had completely failed to induce the Slovenes to adopt the "tristate" dialect. They had adhered to the doctrine of the Slovene scholar, J. B. Kopitar (1780–1844) that Slovene is a separate language, a doctrine in support of which he had written a grammar in 1808. In his disillusionment, Vraz, although a Slovene, refused to use the Slovene dialect, and became renowned as a Croat poet.

During the late 1860's, a group of Serbians tried to secure adoption of the "tristate" dialect, but were denounced as traitors to Serbism, and

forced to abandon their project. Many Turk, Greek, Rumanian, and French words were subsequently adopted by the Serbians, further accentuating the difference between the Serb and Croat dialects. During World War II, the Croats returned to the "tristate" dialect and declared it to be the official Croat language, while the Serbians introduced many additional foreign words, tending to create a separate Serbian language. Since the defeat of Germany, both groups have been trying to unify the language, and the move toward unity has been reflected in postliberation Yugoslav periodicals. The Serbians have been unwilling to abandon their use of the broad Magyar *e*, to which they have been accustomed for centuries. The Croats say *cijelo* (whole), *mlijeko* (milk), whereas the Serbians say *celo*, and *mleko*. This makes little difference in the language except in a few words. *Svet*, for example, can mean "holy" or "the world." But when the Croats mean "holy" they say *svet*, and when they mean "the world" they say *svijet*.

The Slovenes, like the Serbians, use the more abbreviated forms of words, but do not pronounce the *e* as broadly as the Serbians. They have many words which are not used by either the Serbs or the Croats. Their dialect has undergone a series of metamorphoses: the first, when they merged with the Celts, a second, when they were invaded by the Visigoths, a third, during the long period of German rule, which strongly influenced the dialect's development.

The language of the Serbs and Croats while still in its early days underwent an evolution through additions contributed by later Slav migrants from beyond the Carpathian Mountains. It had the best opportunity for natural development in those districts which were not under foreign rule, and which had the minimum number of newcomers, namely, the "tristate" region of Bosnia, Hercegovina, and Montenegro. The Slavs of this area, who seldom came in contact with foreigners, kept their language pure, and greatly improved it with use. Their dialect is naturally rich and rhythmical and became the source of almost all the Yugoslav folk songs and epic poems. But since its poets created their works (especially those with an historical background) from popular legend, they do not always conform to fact.

The Bulgars brought their dialect with them from their "old country" on the banks of the Volga River, where they had already mingled with tribes of a Turanian stock, retaining it in its semideveloped stage. This dialect differs widely from the other Yugoslav dialects in its lack of noun declensions and in the general poverty of its grammar. It should be called Macedonian rather than Bulgarian, since it was current in Macedonia at the time of the Slav Apostles. These innovators used it in translating the Bible, although they left in it many words which they found in the original translation written in the Glagolitic alphabet by the Croats (see CYRIL AND METHODIUS).

Apart from Bulgarian, the differences between the Yugoslav dialects are so insignificant that peasants from all parts of Yugoslavia can sit together and keep up a conversation, each speaking his own dialect. Intellectuals have sometimes preferred to use a foreign language, usually German. It is expected that, as the unity of the nation progresses, the native dialects will disappear, and that the Serbo-Croat Yugoslav dialect will become the literary language of all Yugoslavs. Characteristic differences between the dialects are illustrated in three different words—*kaj, ča,* and *što*—by which they express the English "what." The Croats, except in a very few districts, have abandoned their *kaj* and *ča* dialects for the *što* dialect. One cannot read one dialect and speak another. And since all the books are written in the *što* dialect, it is bound to prevail.

The Yugoslav language is rich in the number of its original words and in the flexibility of its grammar and word usage, which permits much exactness of description. This is especially true of the use of diminutive and augmentative forms of words. For instance, "the house" is *kuća*; but "a little house" is *kućica*; and "a big house" is *kućerina*. "The woman" is *žena,* but if one likes the woman referred to he will say *ženica;* if he dislikes her he will say *ženetina*.

The Yugoslav language has no article, and the words are grouped into three genders (masculine, feminine, and neuter) to denote their value, strength, and importance; but all the words must be pronounced according to their meaning. While iron and gold (*željezo, zlato*), for example, are both minerals, and are therefore of neuter gender, *željezo* must be pronounced hard and *zlato* soft. Every noun has both singular and plural forms, and is declined in seven cases, with changing endings. The declension of three common nouns is as follows:

	Man (Masculine)	Woman (Feminine)	Child (Neuter)
Singular			
Nominative	Čovjek (Čovek)	Žena	Dijete
Genitive	Čovjeka	Žene	Djeteta
Dative	Čovjeku	Ženi	Djetetu
Accusative	Čovjeka	Ženu	Dijete
Vocative	Čovjece	Ženo	Dijete
Locative	Čovjeku	Ženi	Djetetu
Instrumental	Čovjekom	Ženom	Djetetom
Plural			
Nominative	Ljudi	Žene	Djeca
Genitive	Ljudi	Žena	Djece
Dative	Ljudima	Ženama	Djeci
Accusative	Ljude	Žene	Djecu
Vocative	Ljudi	Žene	Djeco
Locative	Ljudima	Ženama	Djeci
Instrumental	Ljudima	Ženama	Djecom

In addition to the singular and plural forms of the noun, the ancient Slav dual form is still in use in some nouns, but invariably with a collective meaning, usually but not necessarily denoting a pair.

In contrast with the English, who have comparatively few words indicating family connections, the Yugoslavs, who for centuries lived in great families, have nearly 50 such words. Some of these have several variations to denote the approximate age of the family member referred to. While in English we say simply "son," regardless of the age of the individual, the Yugoslavs use *sučic* in referring to a child under five years of age, *sinak,* in referring to one under 10, *sinko* to one under 18, and *sin* to one older than 18.

The Yugoslavs vary the form of their verbs to indicate the character of the action described, to show, for example, whether the act lasts for a short or a long time, and whether it is re-

peated or completed. There are three past and three future tenses for each verb, according to the duration as well as the time of the act referred to.

Owing to this flexibility and to its large original vocabulary, the Yugoslav language is ideally adapted for poetry. This is believed to be the reason why the Yugoslavs developed such a rich collection of folk songs and epic poems written not by professional poets but by the people themselves. There are Yugoslav districts where the people, in carrying on their daily work, converse not in prose but verse, with regular rhythms.

While the Serbs and Croats use the same language, the Serbs use the Cyrillic alphabet. The Croats have long abandoned their Glagolitic alphabet for the more practical Latin characters, to which they have added some letters to express sounds peculiar to the Yugoslav language. In addition to the ordinary Latin alphabet, they use the following accented letters: *ć* (soft as in tune); *č* (hard as in church); *š* (as in short); and *ž* (as in azure). Because of the softness of their sounds they combine *j* (sounded like y) with the letters *d, l,* and *n.* The Serbs have a special sign for each of these sounds. An attempt has been made by some Croat authors to introduce a single letter for each of these sounds by crossing the letter required. But while these crossed letters sometimes occur in printed books, the innovation has not become popular with the masses.

The Yugoslave use *r* as a vowel in certain words, having dropped the *e* which formerly preceded it. Thus the former *perst* (finger) has become *prst,* and *kerst* (cross) now appears as *krst.* See *Bibliography* under SLAV LANGUAGES.

Z. KOSTELSKI,
Journalist and Historian.

YUGOSLAV LITERATURE, the literature produced by the various branches of the Yugoslavs. The Slovene and Bulgarian literatures are part of Yugoslav literature, but have to be treated separately on account of differences in the dialects. The Serb and Croat literatures, on the contrary, are identical, except that they are printed in two types, Latin and Slav (Cyrillic). Until the modern period, there was no separate Croat or Serb literature, both Croat and Serb writers of medieval times being known as Slovinian authors (Slovinski).

Early Works in the Slav Alphabet.—Yugoslav literature began with the invention of the Slav alphabet (q.v.). Before its introduction the Yugoslavs on the Adriatic coast wrote in Latin, not knowing that they could write their native language in Latin characters. The Slovenes were the first to use the Latin alphabet in writing their own language, beginning the practice in the 8th century A.D. The first attempts at literary production in Slav characters were written in Glagolitic, and consisted of religious poems and the liturgy. There were also some early translations of medieval romances, including the *Siege of Troy,* and *Alexander the Great.* Among the original works of this period (9th and 10th centuries A.D.), the most important were the *Chronicles,* written by the Priest of Duklia, which were translated into Latin and in the 14th century retranslated into the then modern Yugoslav dialect. By that time the art of writing had spread considerably, and there are many laws extant written in the Glagolitic alphabet, including those of Krk, Kastav, and Dubrovnik.

The Slavs along the Adriatic knew Latin as well as their native tongue, so that there was no great necessity for them to translate much of their literature into Slav. But the Slavs in the central Balkan area (Rascia) hated the Greeks, and having great monasteries, which provided a good opportunity to develop manuscript writing, translated many manuscripts from Greek originals for distribution among the clergy in other monasteries and in the parishes. These translations were written in the Slav alphabet as used by the church, and a rich collection of them is still preserved. The monks translated religious works and many secular manuscripts written by Greek authors. Some original works in the Glagolitic alphabet of this period have been preserved, particularly biographies of the kings of Rascia. The best known of these is the *Life of St. Sava* (first bishop of Serbia, 1219–1234), written in the 13th century by the monk Domentian (Domentijan).

Venetian and Turkish Conquests. Literature of Dubrovnik.—That many more manuscripts written in Cyrillic characters should have been preserved than of those written in the Glagolitic, is understandable. The Venetians, during the period of their control of the eastern shores of the Adriatic, destroyed everything Slav on the islands and along the coast. But the Turks, during and after their conquest, did not destroy the Slav monasteries. When the printing press was invented, the Slavs established a press in Venice (in 1468) but were compelled to move it to Senj (Segna) in 1481 and to Fiume in 1483. At that time all the Yugoslav lands were either under Turkish rule or fighting to preserve their independence of it. The only free area was the republic of Dubrovnik, and it became the center of Yugoslav literary activities. Authors from various islands and parts of the mainland under alien domination worked together there in promoting Yugoslav literature. Among the lyric poets were Šiško Menčetić-Vlahović (1457–1527), George Držić (1461–1501), Dinko (Dominik) Ranjina (1536–1607), and many others. Most prominent of the epic and dramatic poets were Marko Marulić (1450–1524), Hanibal Lučić (1485–1553), and Dominik Zlatarić (1558–1609). The great epic poem by Brno Krnarutić, published in 1587, describing the defense of Siget (1566) by the Croat Ban Zrinski (Zrinyi) against Suleiman the Magnificent, sultan of Turkey, is still extant and still read. The poet Marin Držić (1518–1567) wrote many comedies, including two said to have been used by Shakespeare as original sources in writing his *Midsummer Night's Dream,* and *Comedy of Errors.* Of all the poets which Dubrovnik produced during the medieval period, the greatest was Ivan Gundulić (Giovanni Gondolo, 1589–1638), author of *Osman,* an epic poem depicting the battles of the Slavs against the Turks, and advocating Slav unity. Gundulic's pastoral play *Dubravka* is still being staged, but of all his works *The Tears of the Returning Son* (probably autobiographical) is considered the best.

Yugoslav Renaissance.—Slovene literature was born with the Reformation. Its chief originator, Primuž Trubar (Primus Truber, 1508–1586) wrote many works in favor of the Reformation, which were printed in various types—

Gothic, Latin, Glagolitic, and Cyrillic. This period (the 16th and 17th centuries) is called the age of the Yugoslav renaissance, and marked the beginning of the movement for national unity. Such unity was first proposed not as a Yugoslav idea but as a Slav idea, so that we find many authors writing about the unity of all the "Slovinci," as they called themselves in those days. There was no separate Serb or Croat literature; authors and others of the various Slav nationalities referred to themselves as a single nation, not of Yugoslavs but of Slovinci, Vladislav Menčetić-Vlahović (1602–1666), for example, writing about them thus in his *Trublia Slovinska* (*The Slovinski Clarion*), a collection of poems published in 1676.

The Reformation had a great influence in reviving the old glagolica (works in the Glagolitic alphabet) because the friars of Istria and the Croat Littoral adhered to the Slav liturgy and had to issue new religious books for use in the churches.

This age was also the beginning of the Yugoslav folk poems. Folk songs had long existed among the Yugoslavs, but they were mainly short lyric poems, sung by girls about their love. The folk poems, on the contrary, were intended not to be sung, but to be recited or chanted. They were usually written in stanzas of 14 or 16 syllables, and depicted some historical event, local or national. To judge from the dialect used in these poems, they must have originated in southwestern Yugoslavia (Bosnia, Hercegovina, and Montenegro). Although they include historical data about the kings of the Nemanja (q.v.) dynasty, and especially about the third Battle of Kosovo Polje (1389, q.v.), they are far from presenting an accurate general historical picture, but were written and recited by the Yugoslavs mainly as they imagined the events had happened. For example, these poems picture Prince Marko (Kraljević Marko, Marko Son of the King, 1335?–1394) as a national hero and Vuk Branković (d. 1398) as a traitor, whereas Marko actually helped the Turks in their conquest of Serbia, while Branković died in a Turkish dungeon. There are many thousands of these poems; and since the Yugoslav language is well adapted for the creation of poetry, they are still being written. During World War II, when hundreds of these poems were written, it was not uncommon to see a peasant composing such a poem, about a battle or other event which had taken place the day before. Many poems of this type which are still accessible would have been forgotten if Friar Andrija Kačić-Miočić (1704–1760) had not undertaken to write them down as he heard them in his travels, as he said, "from Zara to Scutari and from Mostar to Kotor." He arranged his collection in chronological order and published them in book form under the title *Pleasant Conversations of the Slovinski People*. This book remains the best seller among the Yugoslavs, having been published in 20 editions, the first three of which were printed in Venice. Kačić specialized in collecting poems of historical value, and, as the people of the days when they were written recognized no difference between Croats and Serbs, all the kings of ancient Croatia and medieval Rascia were all known simply as "Slovinski kings."

Introduction of Yugoslav Literature in Western Europe.—The Western world became acquainted with these people's poems through Alberto Fortis, an Italian friar, who in 1774, in a description of Dalmatia, included his translation of a poem called *Hassan Aga's Wife*. This impelled the great Italian poet Nicola Tomasseo (1802–1874), whose mother was a Slav, and whom the Slavs call Nikola Tomašić, to translate many of these poems. In 1824, Jacob Grimm, the German mythologist, translated many into German, publishing three volumes of them. Goethe translated *Hassan Aga's Wife* into German, calling it a "jewel of poetry for all nations." Charles Nordier translated it into French, and Sir Walter Scott translated it into English. While this poem had a wide appeal abroad on account of its tender love story, that commemorating the building of Skadar was declared by Jacob Grimm to be "one of the most poignant poems produced by any people."

Awakening of the Yugoslav "National Conscience."—The beginning of the 18th century marked a short setback to the production of original native literary production among the Yugoslavs, most of the authors devoting themselves to the translation of works published in the Western countries or to the writing of historical works based on earlier material. Yet this age produced Dositei Obradović (1742?–1811), creator of a "national conscience" among the Yugoslavs. While still a boy, Obradović entered a monastery to gain an education. In 1760 he left the institution to travel through Europe and Asia, learning Greek, Latin, Italian, German, French, Russian, and English. He had begun to write in his youth, and wrote many books. These have a permanent place in Yugoslav literature, but his greatest work was in promoting the unity of the nation. His motivating thought is summed up in a sentence: "Who does not know that the people of Montenegro, Dalmatia, Hercegovina, Bosnia, Serbia, Croatia, Slavonia, Srijem, Bačka, and Banat speak the same identical language?" Religion made no difference to him. To Obradović "Bosnians and Hercegovinians are Turks by religion; but by race and tongue they are what their forefathers were and what their posterity will remain," namely Slavs. Obradović laid the foundation for cooperation among the Yugoslavs. Soon, in Vienna, there were three men of the pen working together for Yugoslav unification: J. B. Kopitar, a Slovene: Ljudevit Gaj, a Croat; and Vuk Karadzić, a Serb. When the French Revolution released the pent-up forces of nationalism, these men feared that each branch of the Yugoslavs might fall prey to separatist nationalism, dividing instead of uniting the nation. And so these three writers, instead of advocating Slovenianism, Croatism, and Serbianism, promoted Illyrism as a common name and program for all the Yugoslavs. The three took upon themselves to standardize Yugoslav writing, and to remold the diverse Yugoslav dialects into a unified language. Gaj and Karadžić ultimately succeeded, but Kopitar failed, since of all the Slovene authors only Stanko Vraz (1810–1851) adopted the new form, the rest preferring to retain their local dialect. This movement to unify the language and political thinking of the Yugoslavs stimulated the development of a new Yugoslav literature. The schools had just been opened to the peasants; and since Yugoslav is written phonetically, it is comparatively easy for adults to learn to read and write in a few hours. The national conscience had been awakened, and

although the Serbs preferred to use the Cyrillic alphabet, and the Croats the Latinic, there was no difference in the language. The motto was: "Brother is brother no matter what his religion." This period produced many volumes of poetry, including: *Jugoslavensko Kolo* (*A Yugoslav Wreath*), by Branko Radicević (1824–1853); *Gorski Vienac* (*A Mountain Wreath*), by Prince-bishop Petrović-Njegoš of Montenegro; *Kip Domovine* (*A Picture of the Homeland*), by Stanko Vraz; *Putnik* (*The Traveler*), by Petar Preradović; *Liepa naša domovina* (*Our Beautiful Homeland*), by Antun Mihanović (1796–1861); *Death of Smail Aga,* by Ivan Mažuranić (1814–1890); *The Resurrection of Illyria,* by Valentin Vodnik (1758–1819); *The Wreath,* by Francé Presern (1800–1849); and many others, by poets all inspired by the patriotic idea.

Contrary Trends During 19th and Early 20th Centuries.—Owing to political influences, the chief center of Serb literary activity now shifted from Novi Sad (Neusatz) to Beograd (Belgrade). This led to the development of two separate literatures, in two dialects, Serb and Croat, the fruit of the idea of a greater Serbia nurtured by successive Serbian governments. The proponents of separatism, instead of encouraging the growth of a unified literature among the Yugoslav peoples in harmony with their craving for national unity, used literature and politics alike as means of furthering their own plans. This era produced, among the Serbs, Jovan Jovanović (pseudonym Zmaj, 1833–1904), Vojislav Ilić (1862–1894), Djuro Jakšić (1832–1878), and many other writers. Among the Croats it produced Luka Botić (1830–1863), Ivan Trnski (1819–1910), Gjuro Arnold (1854–), Silvije Strahimir Kranjčević (1865–1908), and August Harambašić (1861–1911). And while the Serbs and Croats gradually separated, the Slovenes returned to literary unity with the Croats, producing many poets of whom the most important were Simon Jenko (1835–1869), and Simon Gregorčić (1844–1906). The gap between the Serbs and the Croats was artificially widened in romance and fiction as well as in poetry. While the Croat authors, August Šenoa (1838–1881), and others wrote novels with an historical background, the Serb authors, particularly Sima Matavulj (1852–1908), preferred to describe contemporary village life. Jovan Sterija-Popović (1806–1856), with his numerous plays of this period, could be called the founder of Serb drama. Laza Kostić (1841–1910) also popularized the drama with his translations of Shakespeare's works. The Croats developed the opera along with the drama, their dramatic and operatic works, like their fiction, being based upon historical events of patriotic significance.

The turn of the century was marked by a divorce of literature from politics—a development which helped to bring the Croats and Serbs together again. Books were still printed in the two types, but the Serbs now began to print the works of Croat authors in Cyrillic, and the Croats published the Serb works in Latin type, so that both groups became acquainted with the works of each other. Even the great dailies were printed partly in both types. On anniversaries, when celebrations were held in all the cultural centers, the Zrinskis (Croat heroes) were commemorated in Belgrade, and the great Serb poet Petrović-Njegoš, prince-bishop of Montenegro, was honored in Zagreb. The renaissance of the national idea had its influence on literature. The Croats, Ante Tresić Pavičić (1867–) and Srgjan Tučić (1873–1940), and the Slovenes, especially Ivan Cankar (1876–1918), wrote about Serbia with the same love as they would have written about their own districts, and the Serbians, Jovan Skerlić (1877–1914), and Milan Čurčin (1880–), glorified the Croat poets. This age brought out, among the Serbs, Jovan Dučić (1874–1943), Alexsa Šantić (1868–1924), Sinisa Stanković (1892–), Petar Kočić (1877–1916), Branislav Nušić (1864–1940), Vladimir Ćorović (1885–), and many others; among the Croats, Vladimir Nikolić (1829–1866), Vladimir Vidrić Petar (1875–1909), Vladimir Nazor (1876–), and Milan Begović (1876–); and among the Slovenes, Anton Aškerc (1856–1912), and Oton Župančić (1878–). The era also brought realism into the literature of the Yugoslavs. The leading exponent of the trend toward realism, the Croat author Eugen Kumičić (1850–1904), was followed by Ksaver Šandor (Gjalski, Djalski 1854–1939), Josip Kozarac (1858–1906), and a pleiad of others.

The picture of Yugoslav literature would not be complete without mention of the women who have participated in the production of literature as in every other phase of the movement for national unity. Women have contributed to all branches of Yugoslav literature, from the time of Cvijeta Zuzorić (Ital. Zuzzer, b. 1555). Among the women of the modern period who have found a permanent place in Yugoslav literature are: Marija Kumičić (1863–), Milka Pogačić (1860–), Maria Zagorka (1879–), Isidora Sekulić (1877–), Milica Janković (1881–), Zofka Kveder (1878–1926), Jelena Dimitrijević (1862–), and many others.

YUGOSLAVIA, a republic of southeastern Europe in the Balkan Peninsula, bordered on the north by Austria and Hungary; on the east by Rumania and Bulgaria; on the south by Greece; on the southwest by Albania; and on the west by the Adriatic Sea, the Free Territory of Trieste, and Italy. The area is 99,069 square miles. The population of Yugoslavia, according to the census of 1931, numbered 13,934,038; the census of 1953, 16,927,000. The density of population according to the census of 1953 is 171 per square mile. The capital is Belgrade (Beograd), with a population of 469,988. The basic monetary unit is the dinar (official rate of exchange since January 1952: 300 = 1 U.S. dollar). The national flag of the republic consists of three horizontal bars of blue, white, and red, with a red five-pointed, gold-bordered star in the middle.

Frontiers, Population, Political Divisions.—The total length of Yugoslavia's frontiers is over 2,600 miles, 1,000 miles of which are seacoast and islands. Boundaries have been shifted over a period of years by various treaties. (1) The Treaty of Bucharest (Aug. 10, 1913) at the conclusion of the Balkan Wars established the frontiers between Serbia and Bulgaria, and Serbia and Greece. (2) The decision of the Conference of Ambassadors (March 1913) outlined the boundaries between Serbia and Albania. (3) The Treaties of Peace of Paris (1919) established the borders between Yugoslavia and Austria, Hungary, and Rumania. (4) The Treaty of Rapallo (Nov. 12, 1920) between Italy and Yugoslavia defined the boundary between those two countries.

The frontiers between Serbia and Bulgaria, as established by the Treaty of Bucharest, were slightly changed, however, by the Treaty of Neuilly (Nov. 27, 1919) in favor of Yugoslavia, in order to give better protection to the railroad lines in the Timok, Morava, and Vardar valleys.

The establishment of the frontiers between Italy and Yugoslavia gave rise to considerable discussion during the Paris Peace Conference (1919), and this problem could not be settled at that time. The matter was not settled until one year later at the conference between Yugoslavia and Italy at Rapallo, where the Yugoslav delegation was forced to accept unfavorable terms. By this treaty, over one half million Yugoslavs remained in Italy.

After World War II, the frontiers of Yugoslavia remained unchanged except for those with Italy which were substantially altered. Italy ceded 2,950 square miles, including the whole peninsula of Istria, the islands in the Adriatic, and the cities of Zara and Fiume (Rijeka). The city of Trieste with its surrounding territory, which includes a large Slovene population, was detached from Italy and made a Free Territory with a special independent status. On Oct. 5, 1954, an agreement was initialed in London dividing this territory between Italy and Yugoslavia. (See TRIESTE, FREE TERRITORY OF.)

Approximately 90 per cent of the population are Serbs, Croats, and Slovenes, with the remaining 10 per cent composed of national minorities: Germans, 513,000; Hungarians, 472,000; Albanians, 441,000; Rumanians, 183,000; and several other small groups. (These figures are in accordance with the 1931 census.) It is estimated that 1,780,000 persons lost their lives during World War II. Also to be noted is the fact that the Jewish population was almost exterminated in Yugoslavia, either by the Nazis or by the Independent State of Croatia.

Under the Constitution of 1946, the Federal Peoples Republic of Yugoslavia was divided into six peoples republics, with populations and capital cities as follows:

Federative Unit	Population (1953)	Capital	Population (1953)
Serbia	6,527,966	Belgrade	469,888
Autonomous province Vojvodina	1,713,905	Novi Sad	83,223
Autonomous region Kosmet	809,234	Prichtina	24,199
Croatia	3,913,753	Zagreb	1,350,452
Bosnia-Hercegovina	2,843,486	Sarajevo	135,657
Slovenia	1,462,961	Ljubljana	138,211
Macedonia	1,303,906	Skoplje	121,551
Montenegro	377,189	Titograd	16,333

The Land.—There are several main mountain ranges in Yugoslavia. In the northwest the mountain belt, which is a continuation of the Alpine folding, is composed of the Julian Alps (highest peak, Triglav, 9,400 feet), the Karawanken, the Steiner Alps (highest peak, Grintovec, 8,395 feet), and some smaller ranges with a general direction of west to east. The Dinaric Alps (Karst area) and mountain region extend from Carniola south of the Ljubljana Basin through western Croatia, Dalmatia, and western Bosnia, then through Hercegovina and Montenegro to the Albanian border. They include in the northwestern part such ridges as the Velebit and Uskok Mountains. Farther inland, especially to the south in Bosnia, Hercegovina, and Montenegro, the elevation increases to such heights as the Durmitor (8,234 feet) and Majlic (7,840 feet) on the frontier between Montenegro and Hercegovina. In the far south there are parts of the Rhodope and Pind massifs which penetrate into Yugoslavia. In the northeast the Carpathian Alps slope toward the Pannonian Basin.

The lowest points above sea level are Djevdjelija, in the Vardar Valley in the south (165 feet), and the junction of the Timok with the Danube (110 feet) in the east.

These differences in elevation make the climate in Yugoslavia extremely varied, and consequently influence the variety of products of the soil. In Slovenia and in the mountains of the Dinaric system the climate is Alpine. In the central part of the country the climate is similar to that of central Europe; in the southern part, in the Vardar Valley and along the southern section of the Adriatic coast, it is Mediterranean.

In the north and northeast, the country is drained by the Danube (Dunav) and its tributaries—the Drava, Tisa, Sava, Drina, and Morava. In the south lies the basin of the Vardar.

Agriculture.—Yugoslavia is essentially an agrarian country with 78 per cent of the population occupied in agriculture. The great majority (80 per cent) are small landowners with average farms of 12.5 acres. In the kingdom of Serbia the agrarian problem was solved immediately after the country's liberation from the Ottoman Empire, when the land was divided into small farms belonging to peasants who were deeply attached to the soil which they had cultivated for generations. After World War I, the new Yugoslav state carried out an agrarian reform by breaking up the large landed estates in the former provinces of Austria-Hungary, allowing 1,250 acres as the maximum farm (except in a very few instances where the maximum of 3,750 acres was permitted). The Tito regime carried the agrarian reform still further by reducing the maximum farm allotment to 50 acres; by the law of May 22, 1953 the maximum was reduced further to 25 acres.

There are three main agricultural zones in Yugoslavia:

(1) In the central part of the country, in the Sava Valley from Zagreb to the east, embracing the Pannonian Basin, extending south to the Morava Valley as far as Leskovac (30 miles south of Niš), the main products are wheat, corn, sugar beets, and hemp. Also important is the growing of plums (Yugoslavia is the largest plum-growing country in Europe) and other varieties of fruit. The raising of cattle, horses, and especially hogs is extremely important in the national economy.

(2) In the zone extending northwestward from Zagreb through Slovenia to the Austrian and Italian borders, wheat, corn, barley, rye and oats are cultivated, though not on so large a scale as in the central part of the country. But the most important features of the economy are lumber and cattle raising, the latter being favored by the great expanses of pastureland. Bosnia, Slovenia, and Slavonia are the main sources of lumber. Western Slavonia has long been famous for its oak, while in Slovenia, prior to World War II, hops were produced on a large scale for export mainly to the United States.

(3) The third zone, comprising the Dalmatian coast and extending along the Adriatic shores southeastward toward the Vardar Valley, produces grains and a fair quantity of olives; it is

rich in tobacco in Hercegovina and southern Serbia. Along the Adriatic coast fishing is one of the main industries. South, in the Vardar Valley, there are poppy fields.

Between the mountain ranges there are several sheltered valleys which are rich in vineyards and orchards: Ljutomer in Slovenia; Vrshac in the Banat; Negotin in eastern Serbia; Mostar in Hercegovina; and Tetovo and Ohrid.

Mineral Resources.—Yugoslavia is rich in minerals but the extent of these resources has not yet been thoroughly explored. Several of the country's mines have been known since the time of the Romans and the Serbian medieval kingdom. The iron ore at Ljubija in western Bosnia (production 735,031 tons in 1939) is one of the most important of its kind in Europe. Another iron mine at Vareš is worked in conjunction with the coal mine and ore-smelting works at Zenica (central Bosnia). The Bor mines in eastern Serbia are known for their rich copper deposit (70,768 tons in 1939); the Trepča mines in southeastern Serbia produce zinc and lead (76,059 tons in 1939). Other minerals mined in Yugoslavia are coal and lignite, bauxite ore, chromite, antimony, and even gold (33,662 ounces in 1939). Several of the most important mines were foreign-owned (the Bor mines by the French and Trepča by the British); but the Tito government nationalized all mines, regardless of whether they were owned outside the country or not. The territory which Italy ceded to Yugoslavia by the Peace Treaty of 1947 contains the large mercury mine of Idria.

Industrial Development.—Since Yugoslavia is basically an agrarian country, its industries have not been highly developed. Prior to World War II, the chief industries were lumber in Slovenia and western Bosnia; textiles in Slovenia, Croatia, and Serbia; and light steel in Bosnia and Slovenia (Vareš and Jesenice).

The Tito government inaugurated in 1947 an ambitious Five-Year Plan having as its objective the industrialization of the country by utilizing the raw materials and minerals which Yugoslavia produces. This plan calls for the creation of heavy industry (steel, armament, machinery, and tools), as well as the extensive electrification of the country by harnessing many mountain streams with great hydroelectric potential.

Foreign Trade.—The total Yugoslav export in 1952 amounted to 73.96 billion dinars while import stood at 111.92 billion dinars (including 30,500,000 billion dinars representing aid from Western countries, mainly the United States).

The main articles exported were: maize, timber, lead, and copper. The principal imports were machinery, cotton goods, wool, and foodstuffs. Principal countries receiving exports were: Germany, 24 per cent; United States, 15 per cent; Great Britain, 14 per cent. Of the total imports, 20 per cent were from Germany, and 19 per cent from the United States.

Communications.—At the crossroads of the Eastern and Western worlds, Yugoslavia is neither geographically nor ethnographically a simple and united country. In its principal characteristics and general type, it is essentially a Balkan state; yet it belongs to central Europe also, especially to the Pannonian Basin with which it is connected by good lines of communication. In addition, Yugoslavia is a Mediterranean country owing to its extensive coastal area bordering on the Adriatic Sea.

The most important line of communication for Yugoslavia is the Morava-Vardar Valley which descends toward the Gulf of Salonika. The city of Thessaloníke (Salonika) offers the nearest access to the sea, and its port is the largest and most valuable on the Balkan Peninsula. The Congress of Berlin imposed upon Serbia the obligation of building a railroad line from Belgrade to Niš, and farther east toward the Bulgarian frontier; also a line from Niš toward the Turkish frontier in order to connect with the Turkish railroad system.

After the Balkan Wars, when Thessaloníke was given to Greece, the Greek and Serbian governments reached an agreement whereby Greece granted Serbia a free zone in the Thessaloníke port so that Serbian exports shipped through the Morava-Vardar Valley could reach the sea. In 1926 the Greek-Serbian agreement was expanded to assure new railroad and port facilities for Yugoslavia.

On the Adriatic Sea—before World War II the most important port was Split (Spalato); those of lesser importance were Sibenik, Gruz and Trogir. Fiume (Rijeka) was ceded to Yugoslavia by Italy after World War II, and with its excellent harbor facilities and good railroad connections, it is destined to play an increasingly important role in the economic life of the country.

Between the two world wars, Yugoslavia had to make considerable effort to adapt its railroad system to its changing economic needs. The most important rail line connecting the country with the west runs from Belgrade to Zagreb, where it branches off toward Fiume on the west, Trieste in the northwest, and Vienna via Maribor in the north. Another important railroad from Belgrade to the north runs through Novi Sad toward Budapest and Vienna. Connecting Yugoslavia with the south and east is a railroad extending from Belgrade, via Niš, to Sofia and Istanbul, and from Niš through Skoplje to Thessaloníke.

Railroad lines in northeastern Yugoslavia were greatly improved in the period between the two world wars, in order to assure better communication with Rumania and Poland. A rail line toward the Adriatic from Yugoslavia's northeastern border was under construction during that period to provide better facilities for the ports of the southern Adriatic.

Another important means of communication with other parts of Europe is the Danube River, which is Yugoslavia's cheapest means of transportation to the Black Sea. Navigable for a stretch of 1,800 miles, the Danube plays a vital role in the communications for all the countries of central Europe and the Balkans.

This importance had been recognized in 1815 at the Congress of Vienna which proclaimed the principle of free navigation of the Danube. The Congress of Paris in 1856 reaffirmed this principle as a "part of European public law," and instituted the European Commission whose duty it was to regulate navigation at the mouths of the river. The Paris Peace Conference in 1919 provided for a special commission, composed of Great Britain, France, Italy, and the riparian countries, with the object of assuring freedom of navigation on the Danube and preventing any discrimination in this respect by any riparian state. This commission, known as the Danubian International Commission, was established by a special convention in 1921.

The well-administered Danubian regime, as

created by the peace treaties resulting from World War I, proved to be not only important to Yugoslavia and other Danubian countries, but also to the whole European community.

With the signing of the peace treaties in 1946 with Hungary, Rumania, and Bulgaria, the principle of the freedom of navigation of the Danube was reaffirmed, but the practical application of this principle had not been put into effect, since the Convention of the Danube, signed in August 1948 (despite the opposition of the United States, Great Britain, and France) denies navigational rights on the Danube to any countries except the USSR and the riparian states.

Besides the Danube, which is of international as well as national importance, certain other rivers of Yugoslavia play an important role in the internal communications of the country. The most important of these is the Sava, which flows entirely through Yugoslavia, across the fertile plains of Croatia, Slavonia, and Srem, and is navigable from Sišak (a city 30 miles east of Zagreb) to its confluence with the Danube at Belgrade. Two other rivers, the Tisa and the Drava, which also flow through the rich Pannonian Basin, converge toward Belgrade, making that city the primary communications center of the country and its real capital.

Situated on a hill overlooking the junction of the Sava and Danube, and near to where the Drava and Tisa merge with the Danube, Belgrade dominates a great part of the Pannonian Basin —the Banat, Bačka, Srem, and farther up, Slavonia. This position gives the city a strategic importance which was recognized as early as Roman times. It was the terminal of the most important road in the Balkans which stretched from Stamboul (Constantinople) to Belgrade. In Roman days it was known as Via Militaris, then as the Imperial Road (Carski Put) of the Serbian medieval kingdom, and later as Stambouldjol, the principal road of the Ottoman Empire during the Turkish occupation of Europe. From Belgrade roads extend in all directions. Before the outbreak of World War II, an important highway was completed between Belgrade and the Hungarian frontier as a part of the great international road from Paris to Istanbul, which was to make use of the Imperial Road in its southern course. The Tito government achieved the construction of a modern highway to connect Belgrade and Zagreb (270 miles), to be known as the Highway of Fraternity and Unity.

Yugoslavia's system of roads lags behind Western standards, but is nevertheless sufficient to assure communication between the most important centers. One road of strategic value during the Ottoman Empire was known as the Bosnian Road, and connected Skoplje and Kosovo, continuing thence from Mitrovica to Novi Pazar, and farther northwest to Sarajevo. At that period it was a first-class road used for military and commercial purposes. Other roads are those connecting Sarajevo with the Adriatic over Ivan Planina, and the transversal roads from Kotor and Dubrovnik (Ragusa) through the Neretva Valley to Split, which were important during the Roman Empire. From Zagreb a system of roads connects the capital of Croatia with Fiume and Ljubljana, and in the northwest and north with Austria and Hungary.

A nearly perfect line of communication, which also constitutes a wonderful geographic unity, is the Morava-Vardar Valley. The watershed of these two rivers (the Morava running north and the Vardar south) is not, as is usually the case, mountainous territory, but comprises the gently rolling terrain of the Presevo-Kosovo Basin —old lake beds where the water flow is so slow that its direction can hardly be detected at first glance.

At Niš, the Nišava-Maritsa Valley leads easterly through Bulgaria toward Istanbul and has been utilized in the construction of a railroad from Niš to Sofia and farther on to Istanbul.

From Belgrade toward the north several lines connect the capital with the rich province of Vojvodina. The most important is the Belgrade-Novi Sad-Subotica line, as it is the most direct and shortest way to Budapest and other points in central Europe.

Belgrade is also the starting point of a narrow gauge rail line which runs through southwestern Serbia and joins the Bosnian railways at Višegrad. The railroad system in Bosnia was almost entirely—except for the Banja Luka-Sunja line —composed of narrow gauge roads. Austria-Hungary, which occupied Bosnia and Hercegovina by the decision of the Congress of Berlin in 1878, deliberately built narrow gauge railroads having no connections outside the provinces in order to prevent closer contact between Bosnia and Hercegovina and Serbia. Although the kingdom of Serbia, whose railroads were for the most part standard gauge, built a narrow gauge line in southwestern Serbia toward Bosnia, Austria-Hungary never permitted the final junction between the Serbian and Bosnian lines. It was only after World War I that a narrow gauge line was built between the Bosnian terminal at Višegrad and the Serbian terminal at Užice, thus assuring direct communication between Belgrade and Sarajevo (capital of Bosnia), and thence south to the Adriatic Sea.

The total railroad mileage is 7,223, of which about 2,000 are narrow gauge lines. After World War II, the Tito government built two railroads— Banoviči-Brčko (60 miles), and Samac-Sarajevo (180 miles). Both are of standard gauge in order to connect the capital of Bosnia and the rich coal basin around Banoviči with the trunk line running from Belgrade to Zagreb. The construction of those lines was widely publicized by the regime as being built by voluntary work of the youth of Yugoslavia as their contribution toward the reconstruction of the country.

Revenue and Expenditure.—Before World War II the official rate of exchange was 50 dinars to the dollar. The 1939 budget of Yugoslavia was 12,942,000,000 dinars of revenue with the same amount for expenditure.

Religion.—According to the census of 1931, nearly half the population are Serbs of the Orthodox faith (6,785,500); Croats and Slovenes of Catholic faith, 5,217,800 (Slovenes: 1,107,155); Moslems, mainly of Slav descent, 1,561,200; Protestants, 231,000; and Jews, 68,500. The Tito regime, asserting that it was necessary to take steps which would prevent religious passions from threatening national unity, has broken with prewar tradition and separated church and state. Marriage and divorce have thus been placed under the exclusive authority of the state, although the civil marriage which is required by law may be followed by a religious ceremony. According to the census of 1953, 25 per cent of the population was listed as religionless; of the remainder, 46 per cent are Orthodox, 36 per cent Catholics,

Education.—Elementary education is free and compulsory. In 1950–1951 there were 13,031 elementary schools with 1,524,987 pupils; 1,696 secondary schools with 485,876 pupils; 1,449 technical schools with 198,478 students, while colleges and the three principal universities (Belgrade, Zagreb, and Ljubljana) had a total enrollment of 60,395 students.

HISTORY

As a result of the Allied victory in World War I, and in pursuance of the principle of self-determination proclaimed by President Woodrow Wilson in his famous Fourteen Points Declaration, there arose out of the ruins of the Austro-Hungarian Empire several national states, one of which was the Kingdom of Serbs, Croats, and Slovenes, later renamed Yugoslavia. Actually it was not an entirely new state. Serbia and Montenegro, which became part of Yugoslavia, had already existed as independent countries. Serbia, whose medieval kingdom was destroyed by the Turks in the Battle of Kosovo on June 28, 1389, remained under the Turkish rule for more than four centuries. In 1804, under the leadership of George Petrović, called Karageorge (Karadjordje or Black George), founder of the Karageorgevich dynasty, the Serbs rose in revolt against the Ottoman Empire for the restoration of their independent state. Gradually, during the 19th century, Serbia's rights were increased by successive diplomatic acts, until in 1878 she was recognized by the Congress of Berlin as a sovereign state. On Feb. 22, 1882, the Serbian Parliament proclaimed the independent principality of Serbia, a kingdom whose territory extended over 48,300 square kilometers (18,648 square miles), with a population of less than 2,000,000. (See also SERBIA.)

Serbia was further enlarged after the Balkan Wars (1912–1913, q.v.) when she liberated her brothers in the southern parts of the Balkan Peninsula from the Turkish yoke. This acquisition of what is the present province of Yugoslav Macedonia almost doubled Serbia's territory and raised the population to 4,600,000.

At the same time the area of the tiny kingdom of Montenegro, which, protected by its impenetrable mountains, had never completely lost its independence to the Ottoman invaders, was nearly tripled, expanding from 6,000 to 15,300 square kilometers (2,316 to 5,907 square miles).

When Serbia was attacked by Austria-Hungary in July 1914, her Parliament (Skupština) proclaimed on December 7 [1] of that same year that Serbia was fighting for her dearly won independence and "for the liberation and unification of all our still enslaved brethren, the Serbs, Croats, and Slovenes, from the Austro-Hungarian Empire."

During World War I, the Yugoslav Committee (Yugoslovenski Odbor) was organized in London, in May 1915. This committee was composed of Serbs, Croats, and Slovenes who were political émigrés from Austria-Hungary, and who represented those populations.

On July 20, 1917, the government of Serbia and the Yugoslav Committee issued, on the island of Corfu, a declaration affirming the decision of the Serbs, Croats, and Slovenes to be united, according to the principle of self-determination, in a free, national, and independent state. The declaration further stated that the new state was to be a constitutional, parliamentary, and democratic monarchy, ruled by the Karageorgevich dynasty. The National Assembly was to be elected by general, direct, equal, and secret ballot, and must draw up the new constitution and pass it by a qualified majority and with the consent of the crown. The new state, the name of which was to be the Kingdom of Serbs, Croats, and Slovenes, was bound to assure the complete equality of all the three principal religions (Orthodox, Catholic, and Moslem), as well as that of the two alphabets (Cyrillic and Latin).

At the first sign of disintegration of the Austro-Hungarian Empire, the Serb, Croat, and Slovene delegates from all the Yugoslav ethnographical territory in Austria-Hungary founded (Sept. 23, 1918) the Peoples or National Council (Narodno Vijeće) at Ljubljana—later moved to Zagreb. This council was to represent all the political parties and groups. On October 6, the National Council asked the "union of all our people into one single, absolutely sovereign state." On October 16, the Croatian Parliament (Hrvatski Sabor) broke relations of Croatia, Slavonia, and Dalmatia with the Austro-Hungarian Empire, and on the 29th proclaimed their union with the sovereign state of the Serbs, Croats, and Slovenes.

On November 7, an agreement was reached in Geneva between the representatives of the National Council of Zagreb and the representative of the Serbian government, providing for the formation of a common government, composed of six members (three to be appointed by the Serbian government and three by the council). This common government was to conduct, until the meeting of the Constituent Assembly, the foreign policy, national defense, and the preparatory work for the meeting of the Constituent Assembly. All other business was to remain under the competence of the local governments.

The Geneva agreement was never put into effect, as a few days later, Nov. 11, 1918, the National Council of Zagreb voted to unite with Serbia. On November 12, the National Council of Vojvodina (northern province of Yugoslavia) passed a resolution to unite with Serbia. On November 26 [2] the Montenegrin National Assembly met in Podgorica and voted a union of Montenegro with the kingdom of Serbia.

Kingdom of the Serbs, Croats, and Slovenes.—On Dec. 1, 1918, a delegation of the National Council of Zagreb presented to the regent of Serbia, later King Alexander I, its decision to unite the Serbs, Croats, and Slovenes formerly under the Austro-Hungarian Empire with the two independent Serbian states, the kingdoms of Serbia and Montenegro. In his answer, the regent, in the name of King Peter I, accepted the union of Serbia with the territories of Serb, Croat, and Slovene states represented by the Peoples Council.

The first government of the new kingdom was formed on December 20, and the flag and coat of arms were instituted. The government decided that, pending the election of the Constituent Assembly, a provisional assembly, composed of representatives of Serbian and Montenegrin parliaments and of the Peoples Council should act in lieu of a Parliament.

[1] New calendar; old calendar, November 24.

[2] New calendar; old calendar, November 13.

Elections for the Constituent Assembly were held Nov. 28, 1920, and the government, presided over by the veteran Serbian statesman, Nikola Pašić, was able to steer the drafting of the new constitution which was adopted on June 28, 1921, by 223 votes against 35, and 161 abstentions. The passage of the constitution was secured by the votes of the two largest Serbian parties, the Radicals and the Democrats, together with the Moslems. The constitution provided for a unicameral system and divided the country into 33 districts.

The majority of the Croat and Slovene political parties abstained from voting on the constitution, while the largest political party of the Croats refused from the beginning to take a part in the work of the Constituent Assembly. They objected to the centralistic principles of the constitution, as well as to the rule of the Constituent Assembly that the constitution was to be adopted by a simple instead of a two-thirds majority.

Problems Within the Kingdom.—The consolidation of the new kingdom was fraught with difficulties from its inception, difficulties resulting both from the internal problems of the kingdom and from the hostile attitude of its neighbors. Furthermore, the new union was made still more difficult by the fact that despite the consanguinity and similar social structure existing between the Serbs, Croats, and Slovenes, they had never before lived in a common state. Moreover, even those dwelling in the Austro-Hungarian Empire had lived under different regimes and did not join the new kingdom as a unit. Slovenia had previously been divided between two Austrian provinces. Croatia, an independent state, had been bound to Hungary since 1102 in such a manner that her independence was purely nominal. Dalmatia was part of the Austrian monarchy. Bosnia and Hercegovina, after an occupation of 30 years, had been annexed to Austria-Hungary in 1908 and granted a special status, while the Serbian province of Vojvodina had belonged to Hungary. This diversity in regimes and variety of administrations sharpened the differences existing between kindred peoples. On the other hand, the cultural life of the Slovenes and Croats was influenced by Vienna and Budapest, while the Serbs looked to France for moral and cultural guidance.

Difficulties were further increased by the activity of the newly formed Communist Party, which in the elections of the Constituent Assembly polled 14 per cent of the electorate and held 58 out of 419 seats in the assembly. At the first congress of the Yugoslav Communist Party held in Vukovar, it adopted a program emphasizing the need to attain "the dictatorship of the proletariat by revolutionary methods and the organization of the state on the pattern of the Soviet Republic."

In the Constituent Assembly, and throughout the country, the Communist leaders, young, able, and aggressive, encouraged by their unexpected electoral success, used all their strength to break down democratic institutions and set up a totalitarian regime patterned after the Bolshevik system in Russia. By every means—strikes, local disorders, sabotage of utilities and transportation—they tried to impede the consolidation of the new state and to prevent the economic recovery of the country which had been deeply affected by the war. Profiting from the new freedom assured by the democratic institutions, they so threatened to wreck the new-born state that the government finally outlawed their party. The Communist members of the Constituent Assembly were deprived of their mandates, the party was dissolved, its publications suppressed, and party funds seized for the benefit of the state (Dec. 29, 1920).

The political life in Yugoslavia between the two world wars continued to be dominated by the strained relations existing between the Serbs and Croats. The Serbs entered the new state with a political philosophy formed through their centuries-long struggle for independence. Serbia was a homogeneous state without national minorities and without religious problems. For the Serbs it was inconceivable that a political party—no matter how radical its program might be—could take a stand of opposition against the state itself. From their struggle for independence they had acquired the conviction that only a centralized government, with strong local autonomies, would best serve the interest of the state and assure for it the maximum stability. By temperament and tradition an intensely democratic people, politically conscious, and a nation of sturdy, independent peasants attached to their soil, the Serbs were not moved in their attitude by desire for leadership over the Croats and Slovenes whom they outnumbered. They considered that in the new state they had the right to take the role due them on account of their abilities, their economic and numerical importance, and the contribution they had made toward the state's formation.

The Croats, on the other hand, strongly opposed the centralistic organization of the country, looking upon it as inimical to their determination to preserve their national individuality. After World War I this attitude came to the fore with almost explosive force. Before the war, Croatia had not exercised any great amount of influence in the general policy of Hungary or the Austro-Hungarian Empire, but nevertheless she had enjoyed satisfactory autonomies in local government. With the end of the empire and their ties with Hungary, the Croats engaged in a struggle for the recognition of their national individuality.

As stated previously, the Croat representatives (except a minority who belonged to the Serbo-Croat coalition formed in 1907) forcibly opposed the Constitution of 1921. Members of the strongest political party—the Croat Republican Peasant Party, led by an able but temperamental politician, Stefan Radić—refused even to take their seats in the Constituent Assembly. This party, which before the war had only a few members in the Croat Assembly, polled 70 per cent of the votes for the Constituent Assembly. Instead of going to Belgrade, party members met in Zagreb (capital of Croatia) and drafted their own constitution for a "peace-loving, independent Croat Republic." At each subsequent election (1923, 1925, and 1927) the Croat Republican Peasant Party maintained and even increased its position while continuing to abstain from taking part in the proceedings of the Yugoslav Parliament.

Radić went to both France and Great Britain in 1923 to plead against an organization of the country in which the Croat national independence was suppressed by the Serbs. He also journeyed to Moscow for the same purpose, but gained

little encouragement from the Bolshevik leaders who were deeply engaged in consolidating their own power and did not show much sympathy for Radić's appeal for Slav solidarity.

Meanwhile, the strongest Serbian political group, the Radical Party, under the leadership of Nikola Pašić, remained faithful to its centralistic conception of the state. On the other hand, the Serbian party second in importance, the Democratic Party, under the leadership of Ljubomir Davidović, worked to ease the tension in the Serbo-Croat relations. A short-lived Cabinet, presided over by Davidović (August to November 1924), failed to induce the representatives of the Croat Republican Peasant Party to take part in the proceedings of the Parliament.

Davidović was succeeded by Pašić, whose government jailed the Croat leader Radić upon his return to Zagreb, for his subversive activities while abroad. The Pašić government in coalition with the Independent Democratic Party (composed mostly of Serbs from Croatia under the leadership of Svetozar Pribičević) carried out new elections in February 1925 and obtained a workable majority. When the new Parliament met, the representatives of the Croat Peasant Party made their first appearance in spite of the fact that Stefan Radić and others of the party leaders were still in prison. Unexpectedly Radić's nephew, Pavle Radić, acting in behalf of his imprisoned uncle, made a startling declaration in Parliament, embodying the new policy of the party. After five years of stubborn opposition, the party recognized the Constitution of 1921 and the monarchy, dropping from its own title the word "Republican." It was known thereafter as the Croat Peasant Party.

Soon afterward another government was formed under the premiership of Pašić, and was composed of the Serbian Radical Party and the Croat Peasant Party, heretofore seemingly irreconcilable opponents. Radić, liberated from prison after the charges against him were abandoned, joined the new government a few months later. This government, now made up of the two largest Serbian and Croat parties, gave rise to the hope that relations with the Croats would now be solved in a manner satisfactory to all and would bring about the desired consolidation of the state; but this hope founded on the new coalition was not fulfilled. Radić, by his unpredictable actions, several times endangered the very existence of the government, and when the old statesman Pašić died in December 1926, the coalition government continued to function for only a few months longer. It finally expired in April 1927.

The new government under the premiership of a Radical, Velja Vukičević, was formed of dissident Radicals, the Slovene People's Party, Democrats, and Moslems from Bosnia. Radić, whose party was strengthened once more at the elections of 1927 (carried out by the Vukičević government), continued to take part in the National Assembly where, with his former arch enemy Svetozar Pribičević, he formed a powerful opposition group.

The relations between the Serbs (all of whose major political parties were represented in the new government) and the Croats grew worse. The tension climaxed in the Parliament on June 20, 1928. A Radical deputy from Montenegro, Puniša Račić, killed Radić's nephew, Pavle, and another leader of the party, George Basariček, while Stefan Radić himself was gravely wounded and died two months later.

The Croat Peasant Party and its ally, the Independent Democratic Party (headed by Pribičević), withdrew from the Parliament and left for Zagreb. After the death of Radić, the leadership of the Croat Peasant Party was assumed by Dr. Vladimir Maček.

Personal Regime of King Alexander I.—After the assassinations in the Parliament, the Vukičević government resigned and was succeeded by another coalition government, composed of the same groups but presided over by the Slovene leader, Dr. Anton Korošec. But relations between the Serbs and the Croats had almost reached the breaking point. On Jan. 6, 1929, King Alexander, believing that any parliamentary solution was impossible and that the unity of the state was endangered, abolished the Constitution of 1921 and formed a government under the premiership of the commander of the Royal Guards, Gen. Petar Živković. The king also feared that a continuing parliamentary crisis would greatly encourage Mussolini and his hostile policy toward Yugoslavia. In his manifesto, the king promised that the constitution would be restored as soon as the government had achieved the objectives of safeguarding the national unity and improving the administration. The king's personal regime had the support of several leaders of the major Serbian political parties, which brought about the split in those parties. The Slovene People's Party leader, Dr. Korošec, was vice president of the new government with which Dr. Mehmed Spaho, leader of the Bosnian Moslems, was also associated. But the Croat Peasant Party refused to support a government in which the Croats were represented by men who, though distinguished personalities themselves, had little political influence in Croatia.

On Oct. 3, 1929, the king took a most important step by substituting a new name—Yugoslavia—for that of Kingdom of the Serbs, Croats, and Slovenes. The new kingdom was divided into nine banovinas (instead of the 33 provinces as provided by the Constitution of 1921), named after the principal rivers flowing through them. The governors, or bans, of the various banovinas were to be appointed by the crown.

On Sept. 3, 1931, the king proclaimed a new constitution under the name of Yugoslavia. This constitution provided for a bicameral system: the House (Skupština), elected by general vote but open ballot; and the Senate, one half the members of which were elected by a special type of ballot and the other half appointed by the crown.

The elections carried out under the new constitution returned a majority to the newly formed Yugoslav National Party which supported the king's regime. The opposition refused to take part in the elections, this abstention being particularly heavy in the Croat parts of the country.

Continuing his efforts to fulfill his promise that the constitutional life should be restored, the king in April 1932 substituted for premier, in place of General Živković, one of the leaders of the Democratic Party, Dr. Vojislav Marinković. The latter resigned three months later, however, on account of ill health. Marinković's successors, Milan Srškić and Nikola Uzunović, in addition to their difficulties with the Croats, were beset by a serious crisis resulting from the general economic collapse in central Europe after 1931.

In Croatia itself a constantly strengthening radical group calling themselves the Ustaši was led by Ante Pavelić (who in 1941 was to become the head of the Axis puppet state, Independent Croatia). This movement was directed toward the destruction of Yugoslavia, and was accompanied by many acts of terrorism. It was supported by Italy and Hungary, where the Ustaši had training camps at Borgotaro and Janka Puszta, while their leader Pavelić enjoyed the hospitality of Mussolini.

Assassination of Alexander I; the Regency.—In 1934, the king, after a visit to Sofia, Bulgaria (which marked improved relations with that country), went to France for the purpose of discussing with French statesmen a common policy to oppose the increasing aggressiveness of the Nazis and Mussolini. He landed at Marseille on Oct. 9, 1934, and a few minutes later was killed by a Macedonian terrorist, Vlada Crnozemski. Louis Barthou, the French foreign minister, who had come to greet the king, was also a victim of the assassin. The conspiracy had been planned by Pavelić and had the full approval of Mussolini.

The death of Alexander was a heavy blow for Yugoslavia. He was a powerful personality, enjoying great prestige with the Serbs, as well as the confidence of the French and of his partners in the Little Entente and the Balkan Entente. Alexander was succeeded by his young son, Peter II, during whose minority the royal prerogatives were vested in a regency, consisting of three men named by Alexander in his last will: Prince Paul, Alexander's cousin; Dr. Radenko Stanković; and a Croat, Dr. Ivo Perović. It was Prince Paul, however, who actually assumed the powers of government, the other two regents taking little part in state affairs.

During the regency (Oct. 10, 1934–March 27, 1941), Prince Paul continued the personal regime of Alexander but with considerably less authority. Two elections were carried out (May 1935 and December 1938). In both, despite the electoral laws which greatly favored the official list, the governments of the successive premiers, Bogoljub Jevtić (Yevtić) and Milan Stojadinović, were nearly defeated. The united opposition of the Serbian parties (Radical, Democrat, and Agrarian) made repeated efforts to come to an agreement with the Croat Peasant Party. As a result, the united Serbian opposition and the Croat Peasant Party presented a common list of candidates, headed by Dr. Vladimir Maček. Despite this joint electoral action, Maček and the members of the Croat Peasant Party refused to take their seats in Parliament, and the united Serbian opposition failed to reach a definite agreement with Maček.

In February 1939, the regent, having lost confidence in Stojadinović (who had held the premiership since June 1935), replaced him with Dragiša Cvetković, leader of a minority in the Serbian Radical Party. Under pressure of events abroad which forecast the coming of World War II, the government of Cvetković, with the full approval of the regent, reached an agreement with Maček on Aug. 26, 1939.

By this agreement (*sporazum*), Croatia enjoyed complete autonomous status under the name of the Banovina of Croatia. The ban, or governor, of Croatia had to be appointed by the crown after being proposed by the Croat Diet. While Croatia was granted full autonomy, the rest of Yugoslavia continued under the unitaristic and centralistic system. Dr. Maček joined the government as its vice president, and several members of the Croat Peasant Party were appointed to important posts in the central government. The agreement (*sporazum*) did not solve the problem of Serbo-Croat relations, however, and was particularly opposed by the Serbs as having been reached without participation of their political parties; also as having included several Serbian districts in autonomous Croatia.

The Cvetković-Maček regime continued until March 27, 1941, when the regency and the government were overthrown by a popular uprising of the Serbs in protest over the signing of the Tripartite Pact with Germany.

World War II.—In the beginning of World War II, Yugoslavia was spared involvement in the conflict, preserving a precarious neutrality for 20 months. But after his conquest of western Europe, Hitler turned toward the Balkans. By increasing diplomatic pressure, he forced Yugoslavia to sign the Tripartite Pact in Vienna on March 25, 1941, but promised not to ask for passage of Axis troops or war material through that country. This situation differed from that of Rumania, Bulgaria, and Hungary, who, after signing the pact, had to permit the presence of German troops on their soil. The Serbs, in a violent popular reaction, overthrew the regency and the government two days later, thus practically repudiating the Tripartite Pact. Hitler's reaction to what he considered a personal affront was swift; on April 6 he launched a powerful attack on Yugoslavia from three sides, preceded by a merciless bombardment of Belgrade. The Wehrmacht, far superior in mechanized armament, broke the organized resistance of the Yugoslav Army in 10 days. The king, Peter II (who had ascended the throne after the coup d'état of March 27, 1941), accompanied by the new government presided over by Gen. Dušan Simović, went into exile in London to continue to fight on the side of the Allies.

Yugoslavia was divided between the Axis and their satellites, Bulgaria and Hungary, which at the time created the "Independent State of Croatia" whose head (*poglavnik*) was Ante Pavelić, and which included more than 2,000,000 Serbs. Serbia was reduced practically to its pre-Balkan War frontiers, but without the attributes of an independent state. The occupation of Serbia was marked by acts of extreme cruelty on the part of the Germans; but even these were surpassed by the atrocities committed in Pavelić's Independent Croatia. The official policy of the Pavelić Ustaši, which was publicly announced in the Pavelić Ustaši parliament, was the extermination of the Serbs in Croatia. Those who escaped murder were either forcibly evicted from Croatia, or forced to embrace the Roman Catholic faith. The unofficial estimate made by the government in exile of Serbs killed by the Ustaši reached the appalling figure of 600,000 men, women, and children.

When Yugoslavia surrendered to Germany on April 16, 1941, many of the officers and men refused to accept the surrender order and several small groups took to the mountains to continue an underground resistance. Out of these groups there soon emerged a man who was recognized as the leader of the resistance. He was General Staff Colonel Draža Mihajlović, later (January 1942) to become minister of war in the govern-

ment in exile. With the Nazi attack on Russia (June 22, 1941), a second resistance movement appeared in Yugoslavia under the leadership of the Communist Party.

Mihajlović tried to reach an agreement with this Communist-led movement in order to unite all forces fighting the enemy. In the autumn of 1941 such an agreement was reached between Mihajlović and Tito (Josip Broz), the mysterious leader of the Communist-dominated resistance, but it proved of very short duration. A resulting struggle between the two groups (Mihajlović's Četnici [Chetniks] and Tito's Partisans) developed gradually into actual civil war, all the more bitter as it was fought under enemy occupation. The official policy of the Allies, which at first had supported Mihajlović, shifted slowly in favor of Tito until, at the Teheran Conference (November-December 1943), the Allied leaders decided to extend their full material and moral support to Tito, as well as help him with Commando operations.

Mihajlović, whose action was mainly concentrated in the Serbian part of Yugoslavia (western Serbia and eastern Bosnia and Hercegovina), though abandoned by the Allies, continued his resistance to the enemy as well as to Tito and his Partisans. Tito's forces, on the other hand, were centered chiefly in western Yugoslavia, and he was unable to penetrate into Serbia until the autumn of 1944 when the Red Army entered this key state of Yugoslavia.

One of the features of Mihajlović's action against the enemy was his indirect assistance to the British offensive in North Africa in November 1942. On the vital railroad line from Belgrade to Salonika, he sabotaged the Nazi transports bound for the German Afrika Korps. For this action Mihajlović received telegrams of warm thanks from the Allied High Command in Cairo. Another Mihajlović contribution to the Allied cause was the rescue of more than 500 American airmen who, while returning from bombardment missions against enemy objectives in central Europe, parachuted from damaged planes onto territory under the Mihajlović control. Those rescued airmen were later safely evacuated to Allied bases in Italy.

To Tito the Allies extended their political as well as their military support. Under Allied pressure (particularly that of British Prime Minister Winston Churchill), King Peter dismissed, on June 1, 1944, the last government in exile (presided over by Dr. Božidar Purić, with Mihajlović as minister of war), and entrusted to Dr. Ivan Šubašić, the governor of Croatia, the task of forming a new government which would collaborate with Tito. Šubašić met Tito on the island of Vis in the Adriatic and reached an agreement (June 16) whereby the new prime minister recognized "the provisional administration established by the National Liberation Committee of Yugoslavia and by the AVNOJ (Anti-Fascist Council for National Liberation, Tito's provisional assembly). Tito, on his side, agreed that he would collaborate with the new government in exile and not raise "the question of the final organization of the country during the war." King Peter was even induced to make a radio appeal, on Sept. 12, 1944, to the peoples of Yugoslavia, asking them to rally under the command of Marshal Tito.

Abandoned by the Allies and repudiated by the government in exile, Mihajlović continued his fight against the Germans, but with the advance of the Red Army into Serbia (October 1944), after the Russians had refused his offer of collaboration, he retreated into Bosnia in order to avoid fighting against them. Mihajlović was finally captured by Tito's forces in March 1946 and tried by a Communist-packed court which sentenced him to death on July 15, 1946. On July 17 the death sentence was carried out.

Installation of Tito's Regime.—The Red Army took Belgrade on Oct. 20, 1944, and Tito immediately installed his regime as government de facto of Yugoslavia. The Allies at the Yalta Conference (February 1945) made specific provisions for the new provision government of Yugoslavia which should include both the members of the government in exile and Tito's Committee for National Liberation. The agreement of the Allies recommended full political freedom, and free and unfettered elections for the Constituent Assembly of the country. The provisional government was formed on March 6, 1945, with Tito as prime minister and Šubašić as foreign minister.[1] It soon became apparent that the government was exclusively dominated by the Communists, and that the solemn engagement concerning free elections and political freedom remained without effect. Šubašić and the other members of the government in exile resigned in the early fall of 1945.

No opposition newspaper was permitted to be published, nor were any political meetings allowed except in the parties composing the National Front, who were entirely dominated by the Communist Party. Under those conditions the opposition decided not to take part in the elections which were held on Nov. 11, 1945, with only one list of candidates presented to the electorate.

The Federal Peoples Republic.—The Constituent Assembly, in which the Communists held an overwhelming majority (425 members out of 563, composing both assemblies), met on Nov. 29, 1945, and the same day proclaimed Yugoslavia a Federal Peoples Republic, thus abolishing the monarchy without a plebiscite. On Jan. 31, 1946, the assembly voted a constitution for Yugoslavia patterned almost entirely on the Soviet constitution.

On Jan. 13, 1953, a new constitution was adopted by the National Assembly according to which the Federal Peoples Republic (FPRY) of Yugoslavia is a socialist democratic federal state of sovereign peoples equal in rights, composed of the Peoples Republics of Serbia, Croatia, Slovenia, Bosnia-Hercegovina, Macedonia, and Montenegro (the Peoples Republic of Serbia includes the autonomous Province of Vojvodina, and the autonomous region of Kosovo-Metohija).

The social ownership of the means of production and the self-government of producers constitute the basis of social and political organization of the country.

The federal authorities are: the Federal Peoples Assembly, the president of the Republic, the Federal Executive Council, and the Federal Supreme Court.

The Federal Assembly is composed of two houses: the Federal Council, and the Council of Producers. The Federal Council is composed: (1) of deputies elected by citizens on the basis

[1] The king remained in exile pending a popular decision on the question of the monarchy, and appointed a regency of three men to act on his behalf.

of universal equal and direct suffrage, one deputy for 60,000 inhabitants; (2) deputies elected by the republics among the members of their respective assemblies. (Each republic elects 10 deputies: the autonomous Province of Vojvodina 6, and the autonomous region of Kosovo-Metohija 4.). The Council of Producers is composed of peoples deputies elected by those engaged in production, transport, and commerce in proportion to the respective economic sectors in the total production of the FPRY. There is one deputy for every 70,000 producers. Both councils are elected for four years. The voters have the right to recall their deputies by secret vote.

Members of the Federal Council elected by the peoples republics and autonomous regions render decisions separately as the Council of Nationalities in matters of constitutional changes and economic plans or changes in relations between the several peoples republics.

The president of the republic is elected among the members of the assembly by the Peoples Assembly in joint session of both houses. He represents Yugoslavia within the country as well as internationally and proclaims laws by decree. He is the president of the executive council, supreme commander of the armed forces, appoints and dismisses admirals and generals, and presides over the Council for National Defense.

The Federal Executive Council is composed of from 30 to 45 members elected among the deputies of the Peoples Assembly; each of the six republics must be represented in the Federal Executive Council, and the presidents of the executive councils of peoples republics are ex-officio members of the Federal Executive Council which is responsible for its work to the Federal Assembly. There are six federal secretaries: foreign affairs, national defense, internal affairs, national economy, budget administration, and state administration. The secretaries of foreign affairs and national defense are appointed by the Federal Executive Council from among their members.

The organs of justice are the Supreme Court of the Federal Peoples Republic, the supreme courts of the republics and the autonomous provinces, the departmental and district courts. Peoples committees are the highest organs of state authority in the municipalities, towns, and districts.

The constitution guarantees personal freedom, free association, free press, freedom of speech, and right to work. Suffrage is guaranteed to all citizens regardless of sex, nationality, and creed. Women have equal rights with men and the same pay as men for the same work.

In actual fact the whole political life of the country is controlled by the Communist Party which, at the last congress of the party held in Zagreb in November 1952, was renamed Communist Union. Its membership in June 1952 stood at 780,000. The only political organization authorized to conduct political activities is the Socialist Alliance of the Working Peoples of Yugoslavia, a mass organization of nearly 8,000,000 members. This organization is entirely dominated by the Communist Party; its directing body and executive officers are the same as those of the Communist Union. At the elections in November 1953, 98 per cent of the deputies elected were members of the Communist Party, and the Socialist Alliance polled 95.7 per cent of the votes, while 4.3 per cent were void ballot papers. The list of the Socialist Alliance was the only one presented to the citizens. The constitution also guarantees private property as well as private initiative. In spite of this provision of the constitution, however, the government has nationalized by the law of April 28, 1948, all private enterprises and industries, the greater part of which had already been nationalized by the decree of Dec. 20, 1946.

The whole economic life of the country, as well as the foreign trade, is controlled by the government. On April 28, 1947, the Peoples Assembly voted a Five-Year Plan for the development of the national economy for the period from 1947 to 1951. The plan called for the increase of the national income from 132 billion dinars in 1939 to 255 billion in 1951. It provided for the investment of 278 billion dinars in the national economy during the period of 1947–1951, and for the increase in the value of the total production from 116 billion dinars in 1939 to 266 billion in 1951. It contained special provisions for building up the electrical industry and the electrification of the country, as well as the heavy industries—particularly metallurgy and engineering—and for the development of the country's mines.

Several laws enacted in 1951 and 1952 transferred control over heavy industry, farming, public utilities, etc., to the six peoples republics. The management of the various units is directed by individual councils of enterprise.

On April 29, 1948, at the end of the first year of the Five-Year Plan, the vice premier, Edvard Kardelj, admitted the difficulties which the government had encountered in carrying out this plan which was already behind the proposed schedule.

Since the split with the Cominform, July 1948, Yugoslavia has been reorienting its foreign trade toward the Western countries owing to the economic boycott of the USSR and its satellites. Prior to this event, the Yugoslav economy had been integrated in the Soviet bloc and, in conformity with Soviet policy, Yugoslavia refused in June 1947 to participate in the Marshall plan. The most important step in the new policy has been the trade agreement with Great Britain, signed at Belgrade on Dec. 26, 1949, which provided for an exchange of goods between the two countries up to $616,000,000 over a five-year period. In 1949, Yugoslavia was granted a credit in the United States of $3,000,000 for a steel mill; a loan from the American Export-Import Bank of $20,000,000, and a credit of $25,000,000 from the International Bank for Reconstruction and Development.

In December 1950, Tito received a grant from the United States of $70,000,000 for emergency relief assistance to save the country from starvation. In March 1951 he received another grant of $29 million for the purchase of industrial and raw material, and later in the same year an additional one of $60,000,000 in which France and Great Britain participated. By the end of 1952 the total amounts of those grants, credits, and loans from Western democracies exceeded $1 billion, including the initial assistance given by UNRRA in 1945–1946. On Nov. 14, 1951, the United States signed an agreement with Tito under which they supplied military material and services, the amount of which was not made public.

In spite of this economic, financial, and military assistance, Tito has refrained from including Yugoslavia in the system of collective security built up by the Western democracies.

On Feb. 27, 1953, Tito concluded a treaty of friendship with Greece and Turkey which provided only for political and military consultations without any specific engagement for a common action in case of aggression.

Constantin Fotitch,
Former Ambassador of Yugoslavia to the United States.

YUGOSLAVS (Slav Jugoslaveni, or Južni Slaveni, meaning the Southern Slavs), a name applied to all the Slavs of the Balkan area in southeastern Europe. The name Yugoslavs was coined by Prince-bishop Peter II (Petrović-Njegoš, r. 1830–1851) of Montenegro, in 1848, and embraces Serbs, Croats, Slovenes, and Bulgars, who in turn break up into many local groups. The inhabitants of Yugoslavia are called Yugoslavians.

The Yugoslavs migrated to the Balkan area from the cradle region of all the Slav peoples, north and east of the Carpathian Mountains (see Slavs). Their migrations continued for more than two millennia, the first occurring about 1500 B.C., the last about 640 A.D. The Slavs migrated in tribes, and lived under the tribal system, each tribe being a small nation in itself. Throughout their long history, the Slavs have never been a political unit, although several attempts have been made to unite them in a single state. This unity was always prevented, whether by the desire of individual tribes to remain independent, or by numerous invasions—by the Romans, Byzantines, Huns, Goths, Avars, Tatars, Magyars, Franks, and others. Certain of the tribes managed to unite and create small states, some of which gained recognition from their neighbors as semi-independent or independent territories, playing a significant role in medieval times. The most important of these states were Slovenia, Croatia, Dalmatia, Serbia, Rascia, Bosnia, Zeta (Montenegro), Macedonia, Bulgaria, Slavonia, Carinthia, Hercegovina, and the republic of Dubrovnik (qq.v.).

As members of the Slav family, the Yugoslavs speak a Slav dialect, which has become diversified into several subdialects.

The first known Slavs, the Sarmatians and Scythians (qq.v.), migrated in prehistoric times to the region which has become known as the Balkans, from the name applied to its mountains by these early settlers. (See also Balkan Mountains.) It is believed that they came up the Danube and then moved southward through the Morava Valley to settle in the neighborhood of Lake Ohrid. Whether any of them went further south and mixed with the Mediterranean peoples, is a matter of speculation. See also Yugoslav Language; Yugoslavia.

YUIT, the Eskimos of extreme northeastern Asia, inhabiting the area from East Cape to Cape Chukotski across Bering Strait from Alaska. They have also settled on Saint Lawrence Island in the Bering Sea. The Yuits migrated from America, probably in modern times, and their customs are similar to Alaskan Eskimos. A few of them follow the custom of wearing chips of wood or stone in perforations of their lips. Their language is different from their kinsmen across the straits, and then can be separated linguistically into four groups: the Noökalit of East Cape, the Aiwanat of Indian Point, the Wuteëlit of Cape Ulakhpen, and the Eiwhuelit of Saint Lawrence Island.

YUKIAN FAMILY, a linguistic stock of North American Indians, almost extinct, who lived in the small territory of northern California called Yuki. They were separated into several tribes, each of which had a different dialect. As they did not have a tribal name, they are referred to as the Yukian Family. They fished and hunted, although vegetables made up most of their diet. In appearance they were short, fat, and broad, and Yuki women decorated themselves by tatooing their faces, on the cheeks and chin. They were much like the Pomo tribe in living habits and beliefs. They thought that the world had been created by a being called Taikomol ("He who travels alone"), who was human in form and appearance. The Yuki have a reputation for being fighters, as they had periods of war with several different tribes. They also fought with the white invaders. The Ashochimi, or Wappo (Sp. *guapo,* "brave") were a detached portion living chiefly in the mountains between Geysers and Calistoga in Sonoma County.

YUKKEL, yŭk'ĕl, in England, the green woodpecker; United States, the flicker.

YUKON, yōō'kŏn, town, Oklahoma, in Canadian County, located 13 miles west of Oklahoma City and 13 miles east of El Reno. It was founded in 1891 by the Spencer brothers who owned 160 acres of land in the vicinity. The town is a small agricultural center and has some large flour mills which are its most important commercial enterprise. Pop. (1950) 1,990.

YUKON, the fifth largest river in North America, located mainly in the Territory of Alaska. It rises as the Lewes River in British Columbia, about latitude 59° N, and after a tortuous course of 2,300 miles, flows into the Bering Sea, on the southern shore of Norton Sound, through a many-channeled delta from 80 to 90 miles wide. The northernmost channel of the delta, the Aphoon Mouth, is the only one navigable. The Yukon has a drainage area of 330,000 square miles, most of which is in Canada. The main stream of the Yukon is formed at Selkirk, Yukon district, in latitude 63° N, by the junction of the Lewes and the Pelly rivers, about 120 miles east of the Alaska-Canada border. The Lewes River is constituted by the junction of the Big Salmon and the Teslin flowing from Teslin Lake and draining a group of small lakes in the region around Mounts Lansdowne and Lorne. The Lewes is navigable from its source northward for about 100 miles where it is obstructed by a canyon. Then it is navigable again from White Horse rapids to its junction to form the Yukon. From Selkirk, the Yukon flows northwest with many windings, passing through the famous Klondike gold field, receiving from the right the Stewart River, and at Dawson the Klondike, and from the left

the White River, Sixty Mile Creek, and Forty Mile Creek. It enters Alaska in about 65° N., and continues its northwestern course until the Arctic Circle is reached, when at the abandoned Fort Yukon it is joined on the right by the Porcupine River, bends suddenly, almost at right angles, and thenceforward has a general southwestern trend to its mouth.

The chief Alaskan tributaries of the Yukon are the Koyukuk on the right bank, and the Birch and Tanana on the left bank. Its whole course of 1,260 miles through Alaska is navigable by large stern-wheel steamers, and to Dawson in Canada; since the discovery of gold throughout the region in 1897, a regular summer service has been maintained; the first impracticable obstruction to navigation is at Miles Canyon, 1,866 miles from the mouth. In its lower course the Yukon is a broad, muddy stream flowing mostly through a marshy plain, and for nearly nine months of the year, from October to April, frozen over; its upper course is through the grand scenery of narrow mountain valleys and rocky gorges. The Yukon is the largest American river flowing into the Pacific; it is the 17th river of the world as to length, the seventh of the Western Hemisphere, the fifth of the North American continent, and the third in the United States. This last assertion is based on its whole length of 2,100 miles, however, but taking only that portion which is in the United States, or Alaska, 1,260; it is the fifth river of the United States, the Mississippi, Missouri, Arkansas, and Ohio rivers being longer. There are but four rivers in the world with a greater capacity: the Amazon, the Mississippi, the Missouri, and the Saint Lawrence.

YUKON GOLD FIELDS. See ALASKA; KLONDIKE, THE; NOME.

YUKON TERRITORY, Canada, is bounded on the north by the Arctic Ocean; on the east by the Mackenzie District (Northwest Territories), part of the boundary consisting of the watershed of the Selwyn Mountains; on the south by the Province of British Columbia, the boundary line being the 60th parallel of latitude except at the southwest corner of the territory; and on the west by Alaska. The territory is roughly a right-angled triangle of which the hypotenuse (the eastern boundary) runs in a northwesterly direction. The estimated area is 207,000 square miles. Population (1950 est.) 8,000.

Topography and Communications.—The central area consists of the Yukon Plateau, dissected by the Yukon River and its many tributaries. To the north and east are the British Mountains, the Richardson Mountains, and the Selwyn Mountains; to the southwest, the St. Elias Mountains, which extend into Alaskan territory and in which Mount Logan (19,850 feet high) and Mount St. Elias (18,008 feet high), two of the giant mountains of North America, are to be found, surpassed in the area only by Mount McKinley, in Alaska, which rises to 20,300 feet. The Peel River finds its way to the east, entering the Mackenzie River. The Peel and the Porcupine rivers (the latter a tributary of the Yukon) drain the Porcupine Plateau in the northern neck of the territory.

The Yukon River (q.v.), one of the great navigable rivers of the world, rises only 25 miles from tidewater at Skagway as the Lewes River and is navigable for over 2,000 miles from Whitehorse to the Bering Sea. It dissects the Yukon Plateau (elevation 4,000 feet) and has as its main tributaries the Lewes (now known as the Yukon), the Pelly, the Stewart, and the Porcupine. The best-known tributary is one of the smallest—the Klondike (q.v.), the placers of which made Yukon history. The Yukon is the artery of travel through the territory, with a railway from Skagway to Whitehorse giving access to the river immediately below the Whitehorse rapids. Dawson, at the confluence of the Klondike with the Yukon, is reached by river boat down the Yukon from Whitehorse. The silver lead mines at Mayo on the Stewart have placed that river among the arteries of traffic, for the concentrates are shipped down the Stewart, and up the Yukon to Whitehorse, there to be shipped by rail to smelters. Another traffic line has been added in the Alaska Highway, which enters from the south at Watson Lake, passes through Teslin and Whitehorse, and proceeds northwestward to Fairbanks in Alaska. The Haines cutoff connects with Skagway. The Alaska Highway was built by the United States government for defense purposes, and has been turned over to the Canadian government for administration and general upkeep.

Climate.—The climate of Yukon Territory is extremely variable. To the south lies the Pacific Ocean, which is warm; to the north, the Arctic Ocean, which is cold. The climate varies with the outcome of struggle between these two large air masses. There has been recorded a temperature of 81.4°F. below zero, and one of 95°F. above zero. February has had averages of 40°F. below. From mid-June to mid-August, frosts are rare. Rainfall is abnormally small; annual total precipitation is from 9 to 13 inches, about half of which is in rain. The volume of water in the Yukon is not so large as might be expected, for the central Yukon Plateau has very small precipitation. This is apparently not a recent climatic change. A large part of Yukon is unglaciated. It would appear that in Pleistocene time the precipitation was so limited that ice sheets did not form. Had they done so, much of the placer deposits with their gold would have been swept away by the icecap as it moved forward. In June, Dawson has 24 hours of daylight in a day; Whitehorse, 20. In midwinter there are only 5 or 6 hours of daylight.

Resources.—Minerals, furs, fish, forests and waterpower are the resources that contribute to the national revenue. The fur trade was the early attraction; over 100 years ago, Hudson's Bay Company officers came into the territory from the southeast and the northeast and established forts on the Yukon River for the purpose of trading in furs. In 1950 there was still a yield of $250,000 a year in furs. Fur farming gives very little to this total, which comes almost entirely from trapped animals. Sawn lumber is used in the Yukon for building and general construction purposes, and in value is a little over $20,000. Fishing is even smaller, giving a yield of $5,000. These figures are for 1946 and 1945, respectively. Waterpower is as yet practically untapped, though water as such is extensively used for hydraulicizing the frozen gravels preliminary to being scooped up by giant dredges.

As in Alaska, so too in the Yukon big game has become an attraction for hunters from far

Two- and three-story log homes are a striking feature of house construction at White Horse.

afield. Black and grizzly bears, wolf, moose, caribou, mountain sheep and goats abound. Canadian nonresidents pay $75 for a hunting license. Alien hunters pay $100. This brings in some revenue, for the Yukon has become reasonably accessible. But these animals are pale shadows of the former denizens of the land. During mining operations, bones and tusks of mastodon and mammoth, relics of a bygone age, have been scooped up with the gravel. The tusks form useful material for carved mementos for visitors to the Yukon.

The development of placer mining is an integral part of the history of the Yukon. The old method of hand mining with fire softening and sluice-box separation gave place in 1905 to dredging on a large scale. But the old method was responsible in the one year of 1900 for a recovery of $22,000,000 worth of gold in the Yukon. The day of the poor man has now gone, for dredging outfits require much capital. They can work over ground much too poor for sluice-box operations. The romance, such as it was, has also gone. Now mining is big business.

Lode mining has become important in the Mayo district, on the Stewart River 200 miles by Yukon and Stewart rivers from Dawson, and available by large river-boat transportation. The silver lead deposits at Mayo have been worked since 1913, and the ore, some of which is very rich, is concentrated and sent out by boats and train, to the smelter. Copper ore was worked intermittently in the Whitehorse district until 1920, when the mines were closed. Native copper in nugget form has been found in the Kluane Lake district; tungsten and tin at Mayo. Coal was mined for 30 years near Carmacks in the Lewes River to the extent of 10,000 tons a year. It served a local market.

Agriculture.—Probably half a million acres are capable of cultivation, half of which are possibly better classed as forest land. The major economic crop is grass, used as feed for livestock which supply the local market with milk, butter, and beef. It is planned that the agricultural station at Pine Creek will assist in the wise development of the agricultural possibilities of the area.

Government.—The territorial government consists of a commissioner (J. E. Gibben in 1949), and an elective Legislative Council of three members having a three-year term. The territory is represented in the Dominion Parliament by one member (J. A. Simmons, elected in 1949).

Finance.—Revenue for the fiscal year ending March 31, 1949, amounted to $636,982.37; expenditures were $704,522.11.

Education.—In 1948, the territory had 13 schools, enrolling 500 pupils and employing 20 teachers. Expenditure for education amounted to $114,858.20.

History.—It was the old route that was taken by Robert Campbell of the Hudson's Bay Company in 1840; he crossed the divide from the Liard and discovered a large river flowing west, which he named the Pelly. Another Hudson's Bay Company man, John Bell, crossed from the lower Mackenzie to the Porcupine in 1842, followed down to the Yukon, and established Fort Yukon at the junction of the Porcupine and the Yukon, now in Alaskan territory. Campbell reached the same spot in 1850, having already established Fort Selkirk at the junction of the Pelly and the Lewes. It was known in the 1860's that there was gold in the river gravels, and by 1873 many miners had come north from California and from the Cariboo and the Cassiar gold camps. In 1896 the famous gold strike was made at Bonanza Creek in the Klondike region, and gold seekers poured in from all quarters of the globe and by half a dozen routes. From 1897 until 1904 over $100,000,000 in gold was washed out of the gravels. From 1904 until the mid-20th century almost the same amount has been obtained. Dawson became a city overnight. It is now a shell of its former self, while Whitehorse, at the foot of the rapids and at the head of the railway, is the chief city of the Yukon, with a population (1950) of over 4,000 and the largest airport in the Northwest. The commissioner sits in Dawson, still the capital of the Yukon Territory.

ROBERT C. WALLACE,
Principal and Vice Chancellor, Queens University, Kingston, Ontario.

YULAN, a Chinese tree. See MAGNOLIA.

YULE, yōōl, SIR **Henry,** British geographer and Orientalist: b. Inveresk, Midlothian, Scotland, May 1, 1820; d. London, Dec. 30, 1889. He was educated at Addiscombe and in 1840 was appointed to the Bengal Engineers, serving in both Sikh wars. He retired from the army with rank of colonel in 1862, and in 1864 took up his residence at Palermo, Sicily, in order to continue and extend the researches which led to the publication of his great work, *The Book of Ser Marco Polo, the Venetian* (1871), which gained him the Founder's Medal of the Royal Geological Society. In 1875 he returned to England, and from that year until 1889 was a member of the Indian Council. His other works include *Narrative of a Mission to the Court of Ava in 1855* (1858); *Cathay and the Way Thither* (1866); *Notes on Hwen Thsang's Account of the Principalities of Tokharistan* (1872); *Hobson-Jobson: a Glossary of Anglo-Indian Colloquial Words and Phrases, and of Kindred Terms,* (1886), with A. C. Burnell; *The Diary of William Hedges* (1887), edited for the Hakluyt Society, of which he was for many years president.

YULE, the old English name for Christmas, still used provincially and in poetry or poetic phrases. See also CHRISTMAS.

YULE LOG, a log burned with traditional ceremonies during the medieval celebrations of Christmas, perhaps a survival of an ancient pagan festival of the winter solstice, in which fire represented the sun. The log was often lighted with a fragment of the last year's log, and remnants of it were believed to have magic powers. The yule log survived long after the Middle Ages in many parts of Europe.

YULEE, David Levy, American politician: b. St. Thomas, West Indies, June 12, 1810; d. New York, Oct. 10, 1886. In boyhood he came with his father, whose name was Levy, to Richmond, Va., where he was educated. Sent to Florida in 1824, he there studied law, became a planter, and being elected to Congress, served from 1841 to 1845, changing his name at this time from David Levy to David Yulee. He was United States senator from Florida 1845–1851, taking a prominent part

in senatorial debates, and again 1855–1861, when he resigned on account of the Civil War. He was then made a member of the Confederate Congress. After the war he became president of the Atlantic and Gulf Railroad and was interested in the commercial development of Fernandina and Cedar Keys, Florida.

YUMA, city, Arizona, seat of Yuma County, on the Colorado River, at the mouth of the Gila River, 160 miles southwest of Phoenix. It is served by the Southern Pacific Railway and Western Airlines, and is on a main highway.

Yuma is the center of a vast irrigation project which under the federal reclamation service and the All-American Canal System has turned what was once desert area into rich fertile land. The principal crops are lettuce, carrots, pecans, citrus fruits, cantaloupes, alfalfa, bermuda grass seed, flax, and small grains.

Early missionaries to the area were Fathers Eusebio Francesco Kino and F. T. H. Garcés but there was no white settlement until Fort Yuma was built in 1850. Platted in 1854 as Colorado City, it was renamed Arizona City in 1862 and Yuma in 1873. The city was incorporated in 1871. It has mayor and council government. Pop. (1950) 9,145.

YUMAN STOCK, an important family or linguistic stock of North American Indians, the tribes composing it being scattered from the Colorado River region of Northern Arizona to the southern extremity of Lower California and even into the Mexican state of Sonora. The most important tribes of the stock are the Cochimi, Cocopa, Comeya, Cuchan, Diegueño, Havesupai, Maricopa, Mojave, Yavapai, Pericu, Seri, Tonto, Waikuru and Walapai. Of these, the Maricopa, or Coco-Maricopa, formerly inhabited the region around the confluence of the Gila and Colorado rivers. Their descendants and the Pimas, with whom they subsequently confederated, are now to be found in the Gila River Reservation to the number of about 400. They were an agricultural people and raised large crops by irrigation. Under missionary influence they have been civilized and are now noted for their industry, their efforts at self-improvement, and their manufactures of cotton cloth, baskets and pottery.

The Seri Indians (Opata, "Spry") speak a distinct language and live on Tiburon Island, in the Gulf of California, and the adjacent mainland of Sonora, Mexico. Their houses are flimsy bowers of cactus and shrubbery, sometimes rudely shingled with turtle shells and sponges. They make graceful balsas of canes lashed together for use in navigating the strait between their island and the mainland. They also manufacture a very light pottery and some basketry. The modern Seris are loosely organized into a number of maternal groups or clans in which polygamy prevails. They manifest implacable hatred toward aliens whether Caucasian or Indian and regard the shedding of alien blood as a great virtue. The population of the tribe was several thousands but by constant warfare this number was greatly reduced.

The name Tonto (Spanish, "foolish") has been inappropriately applied by the Spanish colonists of Arizona in the 19th century to a number of Indian tribes, namely: (1) To the Tulkepaia, a tribe of the Yuman stock settled in 1875 on San Carlos Reservation, Arizona. (2) To the Eoyotero Apaches, an Athapascan tribe. (3) To the Pinal Apaches of the same stock. (4) To a mixture of Yavapai (Yuman) men and Pinal women who have intermarried. The name has been especially applied to the last-mentioned body, who formerly occupied Tonto Basin and the Pinal Mountains of central Arizona, whence some 500 of them were removed to the Rio Verde Reservation and later to the San Carlos Reservation. They number about 700, and speak a mixed Yuman-Athapascan language.

The Mojave Indians reside in Arizona and California in the region of the Colorado River. There were in 1896 upward of 2,000 Mojaves remaining, 600 of whom live on the Colorado River Reservation in Arizona. They are an agricultural people, rank high physically and are expert makers of pottery and baskets. They practised tattooing and cremated their dead. The Yuma reside in the valley of the lower Colorado River in Arizona and California. Pop. about 655. The Cochimi were formerly the most populous of the tribes of Lower California but only a few are now extant. They live mainly about Loreto Mission. The Cocopa formerly occupied the valley of the Colorado River up to the Gila junction, but the remaining members now live mostly in Mexican territory. The Havesupai occupy the gorge of Cataract Creek, a branch of the Colorado River, in northwestern Arizona. The Mojave Yavapai left the main tribe in the Colorado valley and migrating to the Rio Santa María district in 1873 were removed to the Camp Verde agency; but since 1875 they have been under the San Carlos agency. The Walapai originally occupied the territory above the Mojaves on the Colorado River. The total number, 20,000, who originally inhabited the United States, has been greatly depleted and at present there are not more than 6,000 living within the limits of the United States on reservations.

YUNG LO, yo͝ong′ lŭ′ (dynastic name CH'ENG TSU), Chinese emperor, third of the Ming dynasty: b. 1359; d. 1424. He was the eldest son of Emperor Hung Wu, but was absent at the time of the emperor's death in 1398 and was superseded on the throne by a nephew Kien Wên. He conquered Cochinchina and Tongking, and made successful war against Tartary. He was a famous patron of literature, particularly as sponsor of the *Lo lo Ta Tien—The Standard of Yung Lo,* a collection of all the literary work known to the Chinese down to that period. It was completed under the supervision of three scholars who were assisted by 2,166 literary workers, and when finished there were 22,877 books with a table of contents filling 60 books. The work was never printed, but three complete copies were made. Of these all have perished except about 11,000 books of one set.

YUNG WING, yŭng′ wĭng′, Chinese diplomatist and scholar: b. Nanping, Province of Kwangtung, Nov. 17, 1828; d. April 21, 1912. After graduation from Yale in 1854, he was in the silk and tea trade until 1864, and then entered the governmental service of China. The China Steam Navigation Company was established on his initiative, as was also the Chinese Educational Mission, for the education of Chi-

nese in America. Yung Wing was made chief commissioner of this enterprise, for which an appropriation of $1,500,000 was made by the Chinese government. He was granted the rank of mandarin of the second grade, and appointed intendant of Kiangsu Province; and was for four years associate resident minister to the United States, where he took up his residence in 1902. He is the author of *My Life in China and America* (1909).

YUNGKI, yŏŏng'jē', city and treaty port, Manchuria, the Japanese official name of which was Kirin (q.v.).

YUNGKIA, yŏŏng'jĭ'ä (formerly WENCHOW), city and treaty port, China, in the southwestern part of Chekiang Province, at the mouth of the Wu River, 160 miles south of Hangchow and 150 miles north by northeast of Minhow. It was founded in the 4th century and has many old buildings.

It is a shipping point for timber and bamboo. Manufactures include leather goods, straw mats, paper umbrellas.

The city was opened to foreign trade in 1876 by the Chefoo Convention. During World War II it was occupied by the Japanese but was retaken by the Chinese in 1945. In 1949 it came under Communist control. Pop. (1949) 732,447.

YUNNAN, yün-nän', province, China, bounded on the north by Sikiang and Szechwan, on the east by Kweichow and Kwangsi, on the south by Indochina and Burma, and on the west by Burma. Its area is 123,539 square miles. It is very mountainous in the north and west, and has a general slope toward the southeast. The central part is a plateau about 6,500 feet above sea level, dotted with lakes and diversified by hills of red sandstone. In the south the elevation of the land is much less.

The province is traversed by several large rivers—the Yangtze, Mekong, Salween, Si, and the Songkoi (Coi or Red River). The north course of the first three flow through great gorges.

The chief occupation is agriculture. The principal crops are rice, maize, wheat, tea, sugar, and cotton. The chief wealth of the province, however, lies in its immense mineral resources which include iron, coal, copper, gold, silver, lead, tin, zinc, cinnabar, and precious stones.

A large part of the population consists of Miaos, Lolos, Shans, and other non-Chinese elements. Mohammedanism has many adherents.

The capital is Kunming, in the eastern part of the province, a trade center for the province. Other towns of importance are Tali, Mengtsz, Szemao, Likiang.

History.—The history of Yunnan can be traced back to the 3d century B.C. Owing to its distance from the seat of the central authority and its mountainous character this province long remained practically independent. It was conquered by Kublai Khan but was not incorporated in the empire until the 17th century. It was the scene of the great Panthay (Mohammedan) revolt of 1855, which was not suppressed by the Chinese authorities until 1873; and from the effects of which the province was long in recovering. Trade routes through the province were long sought by the British but the physical features delayed this objective until the Burma Road was opened in 1939. Part of the Burma Road and the southern section of the province were seized by the Japanese in 1942. The province passed to the Communists in 1950. Pop. (1940 est.) 10,000,000.

YUPANQUI PACHECUTEC, yōō-päng'-kē pä-chä-kōō-tĕk', ninth Inca sovereign: b. about 1380; d. about 1440. He was one of the greatest of the Inca rulers. He was the second son of the Inca Viracocha and after deposing or superseding his imbecile elder brother, Urco, he defeated the Chancas in a great battle, annexed their territory to his own and continued his successful career till the Inca kingdom included nearly all of what is now the republic of Peru. In order to relieve the congested condition of Peru he developed a system of colonies called mitimaes. Yupanqui figures largely in Quechuca tradition and various national institutions have been traced to him. He was grandfather to Stahualpa, ruler of Peru at the time of its conquest by Pizarro.

YUROK. See WEITSPEKAN INDIANS.

YURUARI, river, Venezuela, Bolívar State, rising in the north outliers of the Guiana Highlands. It flows 145 miles east and south to a minor affluent of the Cuyuni River, three miles west of El Dorado. There are important gold placers along its course.

YURUCARE, yōō-rōō-kä-rē', or **YURUCARI**, Indians of Bolivia occupying the forest plains on the eastern slope of the Andes between the rivers Mamoré and Beni. They include several tribes, are tall and shapely, and are almost white. They plant maize and manioc but are hunters and warriors for the most part. They are said to give complete liberty to their children, never punishing them but sometimes killing them in order to be rid of them. They dress in a bark cloth which they print with figures by means of engraved blocks; engage in duelling with bows and arrows; and make an intoxicating liquor from maize which is imbibed freely in their festivities. Their mythology is intricate and confused.

YUSUF, yōō'sŏŏf, or **YUSSUF, Abu Amru,** Arabic historian: b. Cordova, about 976; d. Xativa, 1070. He was profoundly versed in the traditions of the Oriental Mussulman countries and wrote *Behedjet-Almodjalisyn,* a collection of tales relating to Mohammed; *Tamhyd,* a commentary on one of the chief Mussulman works of religious and civil law; *History of the Opinions and Doctrines of the Principal Mussulman Sects; History of the Wars Against the Christians.*

YUSUF, or **YUSUF IBN-TASHFIN,** Moorish prince: b. Velad, Sahara; d. 1106. He was the second prince of the Almoravide line and in 1086 aided the emir of Seville, Al-Mo'tamid, to gain the victory over Alfonso VI at Zalaca near Badajoz. In 1090 he again invaded Spain, at the call of the emir of Seville, and taking advantage of Mohammedan dissensions, gradually acquired the sovereignty of the kingdoms of Malaga, Grenada, Murcia, Cordova, Seville, Almeria, Badajoz and Valencia, which he united to the kingdom of Morocco. Notwithstanding his power, Yusuf never assumed a higher title than that of emir, and in 1103 his son Ali was acknowledged heir of both

his Spanish and Moorish possessions. Consult Freeman, 'History and Conquests of the Saracens' (1856); Yonge, 'Story of the Christians and Moors in Spain' (1878); Coppée, 'History of the Conquest of Spain by the Arab-Moors' (1881).

YÜTERBOG, yu-tĕr bōg, a town and district capital in Brandenburg, Prussia, about 26 miles south of Potsdam. Commercially and industrially it is of some local importance, possessing woolen mills, cigar factories and an export business in wines, wool, flax and constituting itself an excellent market centre for a considerable extent of country. It possesses a number of interesting old buildings, dating back to the 15th century. Pop. about 8,000.

YVERDON, ē-vĕr'dôṅ (German, *Ifferten*), Switzerland, a town in the canton of Vaud, at the southwestern extremity of Lake Neuchâtel and an outlet of the Orbe, 17 miles north of Lausanne. Its castle, built in 1135, was used by Pestalozzi (q.v.) as an educational establishment in 1805–25, and now contains a library and museum, devoted to Roman and Celtic antiquities. The town has also an excellent townhouse, a hospital and a memorial of Pestalozzi. Among the manufactures are railway wagons and materials, beer, etc. The town has also an extensive system of wharves. Yverdon was the *Eburodunum* of the Romans, and there are remains of the ancient walls. Its residents are mostly French-speaking Protestants. Pop. about 8,600.

YVES D'EVREUX, ēv dāv-re, **Pierre,** Franco-Brazilian historian: b. Evreux, Normandy, France, about 1577; d. after 1620. He became a member of the Capuchin order in 1595 and was sent in 1612 with four missionaries as their superior, to Maranhao, Brazil, where a French colony had been established. He returned in 1614 and wrote 'History of the Most Memorable Things that Happened at Maranhao in the Years 1613 and 1614' (Paris, 1615; 2d ed. 1864), a continuation of the history of Claude d'Abbeville, a work of great historical value.

YVETOT, ēv-tō, France, a town in the department of Seine-Inférieure, on an elevated plain, 23 miles northwest of Rouen. It has manufactures of calico, hosiery, linen, leather and baskets. Antiquaries have been much puzzled by an ancient chronicle, and still earlier edict, which gave the title of king to the lords of Yvetot. This edict was formally abrogated in 1681. 'Le Roi d'Yvetot,' the well-known song by Béranger, translated by Thackeray, was a satire on Napoleon, which has immortalized the ancient dignity. It was the scene of the defeat of the troops of the League by Henry IV in 1592. Pop. about 7,133.

YVON, ē-vōṅ, **Adolphe,** French historical painter: b. Eschwiller, Moselle, 1, Feb. 1817; d. Paris, 11 Sept. 1893. He studied under Paul Delaroche, traveled in Russia in 1843, and brought back with him a series of designs exhibited in Paris in 1847–48. He obtained the medal of honor at the Salon of 1857; 10 years later he became an officer of the Legion of Honor. In 1855 he was commissioned by the French government to accompany the army to the Crimea. Among his most important works are 'The Remorse of Judas' (1846); 'The Battle of Kolikova' (1850); 'The First Consul Descending the Alps' (1853); 'Marshal Ney Supporting the Rear Guard in Russia' (1855); 'The Seven Deadly Sins,' designed after Dante (1855); The Capture of the Malakoff' (1859); 'Battle of Solferino' (1861); and an allegorical picture of 'The United States of America' (1870), executed for A. T. Stewart. He was an artist of remarkable power and holds a prominent place among the historical and religious painters of France.

Z the twenty-sixth of the letters of the English alphabet, is a vocal or sonant consonant, as distinguished from *s*, which is the corresponding fricative sibilant. It was adopted into the Latin from the Greek alphabet in the time of Cicero: in the Latin alphabet, as in our own, it holds the last place; but in the Greek its place is sixth, and in the Phœnician, Hebrew and other Semitic alphabets seventh. Its earliest Phœnician and Greek form was I. The name of the Greek letter is Zeta, that of the Phœnician Zayin. The Greek name is either derived from that of the Phœnician letter Zade, or has been assimilated to Eta and Theta. In German and Italian it represents the sound of *ts;* in our language and in French it represents one simple sound. In Latin it was used only in words derived from the Greek. The exact value of zeta in Greek is not known with certainty; but beyond any question it stood for a double sound, not a simple sound like our *z;* this is conclusively inferred from Aristotle's remark that *xi* (ξ), *psi* (ψ), and *zeta* (ζ) are like in sound; and the inference is strengthened by the fact that in Greek prosody a vowel short by nature is made long by position when it occurs next before the zeta. The sound of the zeta, however, is in doubt — whether it was *dz* or *zd* or both. The name of Z in Great Britain is *zed,* in the United States *zee. Z* is often related to palatal sounds as *zealous, jealous,* etc. Though *z* is the alphabetic representative of the sonant sibilant, the special *z*-sound is in English and many other languages oftener represented by *s* than by *z*. In *azure* and some other words *z* is the sonant corresponding to *sh*. See ALPHABET.

Z-BARS. See RAILS AND STRUCTURAL SHAPES.

ZABERN, or **SAVERNE** (anc. *Tres Tabernæ*), Alsace, a town in lower Alsace, on the Rhine-Marne Canal, at the foot of a pass over the Vosges Mountains, 24 miles northwest of Strassburg, and on the railway to Avricourt. There is an episcopal palace, rebuilt in 1779, and under German rule used as a barracks; a church dating from the 15th century, and many ruined castles. The town was of importance in the time of the Romans, was destroyed by the Alemanni in 357, and was rebuilt by the Emperor Julian. It suffered greatly in the Thirty Years' War. It came prominently into public notice in 1913 through the "Zabern Incident." The 99th Infantry was garrisoned there and it was said that the soldiers were encouraged by their officers in maltreating the Alsatians. Affairs came to a climax when a young nobleman of the German army. Lieutenant von Forstner, offered 10 marks to any soldier who would bayonet an Alsatian, then further compromised himself by striking with his sword a lame shoemaker. The incident aroused a furore of indignation, not only in the French press, but in Germany. In the Reichstag it reached such importance that a vote of no confidence was passed against the government, 293 to 54. This, however, had no result except as an expression of disapproval, the chancellor announcing that he held his office through imperial appointment and subject to no other control. Von Forstner was upheld by his superior officers, and although subjected to the form of a court-martial was acquitted. The emperor's decision regarding the matter was that the honor of the army must be upheld with neither compromise nor apology. Pop. 8,643.

ZABIANS, a term not identical with Sabæans, but properly meaning certain non-Christian Gnostics, predecessors of the peculiar sect called Mandæans, still surviving in South Babylonia. The Cyrian Zabians were the survivors of the ancient Syrian heathen who, being under Mohammedan rule, took the name of Zabians in order to share the toleration which the followers of Mohammed extended to the real Zabians. This sect became extinct about the 12th century. See MANDÆANS.

ZACATECAS, tzä-kä-tā'käs, a Mexican city and a state of the same name bounded by Coahuila, San Luis Potosi, Aguascalientes and Durango. The city of Zacatecas is 439 miles from Mexico City and 785 miles from El Paso, Tex., and is situated at an elevation of 8,044 feet above sea-level. It lies in a narrow and deep ravine, and is surrounded and closely abutted on three sides by mountains or high hills. It possesses a chain of mines many of which are among the oldest in the Republic and have produced enormous quantities of precious metals. Not all these are now worked, a number having seemingly become exhausted in so far as satisfactory returns are concerned. A public library containing some 20,000 volumes is maintained by the local government. The most notable buildings are the historic old Cathedral, with its front wall a mass of artistic carving, and the Theatre, a very imposing structure of modern design. In the heart of the city is the Market House, an iron building admirably adapted to its uses and of pleasing appearance. A few minutes' ride southward toward a broad valley is the little village of Guadalupe, where there was a Chapel of Gold, built by a devout woman and ornamented throughout in solid gold gilt at great cost, estimated at not less than $1,000,000. Here, also, is located the State Industrial School for poor boys, in which shoe-making, tailoring, cabinet-making, and other trades are taught, together with the rudiments of a common school

education. Other outstanding institutions are the School of Arts, the Benito Juárez School, and the Civil Hospital. There are two theaters, the González and the Calderón. Pop. city (1940) 21,846; state (1950) 664,394.

ZACCHEUS, zăk-kē'ŭs, in the New Testament, a tax gatherer at Jericho when Jesus entered and passed through that town (Luke 19:1-10). A rich man and chief among the publicans, "he was little of stature." In order to see Jesus, surrounded by a great throng, he climbed a sycamore tree along the way. Jesus approaching bade him "come down; for to-day I must abide at thy house." This evoked murmurs that Jesus had accepted the hospitality of a "sinner," publicans being so regarded in the strict caste system of the Jews. Tradition states that Zaccheus gave up his riches, became a companion of Peter, and eventually was appointed bishop of Caesarea in Palestine.

ZACHARIA, tsä'kä-rē'ä, **Just Friedrich Wilhelm**, German poet: b. (Bad) Frankenhausen, Thuringia, Germany, May 1, 1726; d. Brunswick, Germany, Jan. 30, 1777. After studying at the universities of Leipzig and Göttingen, he became professor of belles-lettres in the Carolinum, Brunswick. He achieved a reputation for his *Der Rennomist* (*The Brawler*, 1744), the first burlesque heroic poem that had appeared in German.

ZACHARIA VON LINGENTHAL, tsä-kä-rē'ä fŏn lĭng'ĕn-täl, **Karl Salomo**, German jurist: b. Meissen, Saxony, Germany, Sept. 14, 1769; d. Heidelberg, March 27, 1843. After studying jurisprudence at Leipzig and Wittenberg, he was appointed professor of law at the latter university, teaching there from 1797 to 1807, and holding the same position at Heidelberg from 1807 to 1843. He was active politically as a conservative member of the Baden Parliament in the years 1820 to 1829. His writings covered practically every branch of jurisprudence, dealing with Roman, Canon, German, English, and French law and opening up new fields in juristic literature. Among his works are *Einheit des Staates und der Kirche mit Rücksicht auf die Deutsche Reichsverfassung* (1797); *Vierzig Bücher vom Staate* (1839–1842); and *Handbuch des französischen Zivilrechts* (8th ed., 1894–1895).

His son, Karl Eduard Zachariä von Lingenthal (1812–1894), was also a prominent jurist, who traveled widely in Europe and the East, making exhaustive researches in Roman and Byzantine law.

ZACHARIAS, zăk-à-rī'ăs, spelling in the Douay Bible for Zechariah (q.v.), minor Hebrew prophet.

ZACHARIAS or **ZACHARY**, zăk'à-rĭ, **Saint**, pope: b. of Greek extraction in Calabria, Italy; d. Rome, Italy, March 14, 752. Succeeding St. Gregory III in the papal chair in 741, he was followed at his death by Stephen II. He exercised a powerful influence over several of the Lombard kings, obtaining the restoration to the papacy of various cities and territories which had formerly been subject to it, and he gave his consent to the setting aside of the Merovingian Childeric III in favor of the elevation of Pepin the Short to the French throne at Soissons (752). His day is commemorated on March 15.

ZACHARIAS, father of St. John the Baptist and husband of St. Elizabeth. A priest of the temple of Jerusalem, he was stricken dumb on refusing to believe the announcement, made by the angel Gabriel, that a son should be born unto him; but he recovered his speech at the birth of St. John. Zacharias is supposed to have been put to death by Herod (Luke 1:5-79).

ZACHER, tsä'kĕr, **Ernst Julius August**, German philologist: b. Obernigk, Silesia (now Oborniki Slaskie, Poland), Feb. 15, 1816; d. Halle, Germany, March 23, 1887. Educated at the universities of Berlin and Breslau (now Wrocław), he was professor of German philology in Halle, 1856–1859 and 1863–1887. His scholarly works include *Die Deutschen Sprichwörter-Sammlungen* (1852); *Das Gotische Alphabet Vulfilas und das Runenalphabet* (1855); and *Pseudocallisthenes* (1867).

ZACYNTHUS. See Zante.

ZADAR, zä'där, seaport, Yugoslavia. See Zara.

ZADKIEL, zăd'kĭ-ĕl. (1) According to Jewish legend the angel of the planet Jupiter. (2) A pseudonym adopted by William Lilly (q.v.), the 17th century astrologer. (3) The name assumed by Richard James Morrison (b. June 15, 1795; d. Feb. 5, 1874), compiler of an astrological almanac, begun by him in 1830, and which reached an annual sale of from 100,000 to 200,000 copies.

ZADOK, zā'dŏk. (1) A high priest of Israel, contemporary with David, to whom he remained loyal when Absalom rebelled against his father. See also Sadducees. (2) A personage in John Dryden's *Absalom and Achitophel*, intended as a portrayal of Archbishop William Sancroft.

ZADOKITE FRAGMENTS, zā'dŏk-īt. The Zadokites are mentioned in the book of Ezekiel as the true upholders of the worship of Jehovah when Israel as a nation had deserted it. By some it is thought that their descendants settled in Damascus some time in the 1st century A.D. Some fragments discovered in the Cairo Genizah or Jewish Congregation, now in possession of Cambridge University Library, have been attributed to them with a date between 70 and 80 A.D. Considerable controversy arose concerning them among scholars in regard to their interpretation and implication. Rabbi Solomon Schechter published them under the title *Documents of Jewish Sectaries*, 2 vols. (Cambridge 1910). The best account of the history of the manuscripts and sect is in an article in *The Biblical World*, December 1911, by James A. Montgomery entitled "A Lost Jewish Sect."

ZAFARIN ISLANDS, an alternate name for the island group, Chafarinas (q.v.).

ZAFFER or **ZAFFRE**, zăf'ĕr, in chemistry, an impure oxide of cobalt containing some arsenic and made by roasting speiss cobalt. The residuum consists of a grayish oxide of cobalt, usually mingled with sand and other impurities. It is used in the manufacture of smalt and in other ways, but its importance in furnishing "cobalt blue" has been lessened by the discovery of methods of making artificial blue.

ZAGAZIG, zăg'ə-zĭg, (Arab. ZAQAZÎQ), city, Egypt, the capital of the Province of Sharqîya, in the delta of the Nile, and on the Ismailia Canal, is in southeastern Lower Egypt. It is connected by rail with Cairo, Alexandria, and Suez, and lies 40 miles north-northeast of Cairo. Zagazig is a rail and canal center with an important cotton and grain market, nearly all of the cotton ginning being done here. Two miles southeast of here are the ruins of the ancient city of Bubastis, now called Tell Basta. Pop. (1947) 82,912.

ZAGHLUL PASHA, zăg-lo͞ol' pä'shä, **Saad,** Egyptian statesman: b. Gharbiya Province, Egypt, ?1860; d. Cairo, Egypt, Aug. 23, 1927. He was educated at the University of al Azhar. In 1882 he was arrested for taking part in the rebellion of Arabi Pasha (Ahmed Arabi), but was shortly released and in 1884 commenced to practice law. He became a judge in the native court of appeal, 1893, and was appointed minister of public instruction, 1906, and of justice, 1910. Compelled to resign from the last post on failing to prove charges of corruption which he had brought against the khedive, Abbas Hilmi Pasha, he began to show anti-British tendencies. He became the leader of the Nationalist Party, and after World War I led the movement for Egyptian independence. Rioting resulted in his deportation to Malta in 1919, and recurred after his release and return to Cairo in 1921. Arrested once more, he was sent to Aden and thence to the Seychelles, from which islands he was transferred to Gibraltar. He was permitted to return to Egypt in 1923, and following victory for the Nationalists at the general election in January 1924 he became prime minister. The assassination in Cairo, the following November, of Sir Lee Stack, governor general of the Anglo-Egyptian Sudan, forced his resignation from office; thereafter he served as president of the Chamber of Deputies.

ZAGOSKIN, zŭ-gô'skyĭn, **Mikhail Nikolayevich,** Russian novelist and dramatist: b. in Penza Region, Russia, 1789; d. 1852. He became director of the Imperial Theatre in St. Petersburg in 1817, and three years later was made director of a Moscow theater; in 1831 he was appointed director of the Court Theatre in Moscow. Many of his own plays were lacking in originality, though his comedy, *The Scapegrace,* won considerable praise. He wrote several volumes of essays, notably *The Muscovites,* and historical fiction.

ZAGREB, zä'grĕb, city, Yugoslavia, capital of the Peoples Republic of Croatia, near the river Sava, 230 miles west-northwest of Belgrade; the German name for the city is Agram. Notable buildings in the older part of Zagreb include a 17th century Gothic cathedral and an 18th century archiepiscopal palace. It is an important cultural center, and contains a university founded in 1669. Industries include the manufacture of carpets, tobacco, leather, linen, chemicals, and machinery. Of Roman origin, Zagreb was made the see of a bishop in 1093. It was ravaged by the Mongols in 1242, but after their expulsion it was rebuilt and created a royal free city; it was made the capital of Croatia in 1867. Earthquakes in 1880 and 1901 did considerable damage. It is the second largest city of Yugoslavia and has an airport. Pop. (1953) 354,000.

ZAHAROFF, zŭ-kä'rôf, SIR **Basil,** international armament contractor: b. Muğla, Turkey, Oct. 6, 1849; d. Monte Carlo, Monaco, Nov. 27, 1936. The son, supposedly, of a Russian father and Greek mother, he was surrounded by considerable mystery during his early years. He was educated in London and Paris and about 1875 he became associated with the Anglo-Swedish munitions firm of Nordenfeldt. In the late 1880's, he was appointed agent in Spain of Vickers-Armstrong, a British firm manufacturing munitions, and eventually rose to become chairman of the company. It was rumored that he was also associated with the Krupps in Germany, with Schneider-Creusot in France, and with Skoda in Austria-Hungary, and he had large interests in petroleum, shipping, banking, and other concerns. Critics attributed his great wealth to the conduct of international intrigue and the warfare which followed; an inquiry by the United States Senate in 1934 linked Zaharoff with the activities of an American firm of armament manufacturers. In 1919 he was decorated in Great Britain with the Grand Cross of the Order of the Bath, and from France he received the Grand Cross of the Legion of Honor. He endowed at Oxford University the Foch chair of French literature and at Paris the Haig chair of English literature; and he founded professorships of aviation at the universities of Paris, Leningrad, and London.

ZAHM, zäm', **John Augustine,** American Roman Catholic priest, scientist, and author: b. New Lexington, Ohio, June 14, 1851; d. Munich, Germany, Nov. 11, 1921. After graduating from the University of Notre Dame, Ind., he joined in 1871 the Congregation of the Holy Cross. Continuing to study and teach, he was appointed to the chair of physics at Notre Dame. He entered the priesthood in 1875. Besides writing copiously on scientific subjects and the relation of science, particularly the theory of evolution, to faith and dogma, he took a keen interest in South America, thus gaining the friendship of Theodore Roosevelt, whom he accompanied on an expedition. Other voyages took him to Alaska, Hawaii, and Europe. Zahm served for years as the curator of the Notre Dame Museum and lectured widely. Several of his travel books, such as *Along the Andes and Down the Amazon* (1911), as well as the volume, *Women in Science* (1913), were published under the pseudonym J. H. Mozans.

ZAHN, tsän', **Ernst,** German-Swiss novelist: b. Zurich, Switzerland, Jan. 24, 1867. He inherited from his father the railroad restaurant at Göschenen, at the entrance to the St. Gotthard Tunnel, and managed it for many years. The town of Göschenen made him a town councilor, and one of his first acts in office was to cause the erection of a monument for the constructor of the St. Gotthard Tunnel and for the many laborers who met their death during its construction. In 1902 he became judge of the Uri Criminal Court, in 1904 a member of the cantonal Council of Uri, and in 1908 its president. He received the honorary degree of Ph.D. from the University of Geneva in 1909. He has written an unusual quantity of stories of Swiss local life, which are very attractive in form and correct in technique. Some of his short stories seem like faultless works of art, especially *Stephan der Schmied* and *Verena Stadler.* In his larger works, however, he has not devoted his atten-

tion chiefly to the difficult task of analyzing serious conflicts of character but rather to superficial problems. Consult 'Gesammelte Werke' (10 vols., Stuttgart 1910); 'Herzenskämpfe' (1893); 'Die Clari-Marie' (1904); 'Die Helden des Alltags' (1905; 20th ed., 1912); 'Firnwind' (1906); 'Der Apotheker von Klein Weltwil' (Stuttgart 1913). A translation of 'Stephan der Schmied' is given in 'German Classics' (Vol. XIX, New York 1914); 'Der Sinkende Tag' (1920); 'Die da Kommen und Gehen' (1922); 'Die Frauen von Tanno' (1922); 'Das Licht' (1922); 'Was das Leben Zerbricht' (1922); 'Die Hochzeit des Gaudenz Orell' (1927). JACOB WITTMER HARTMANN.

ZAHN, Johann Karl Wilhelm, German architect, painter and art critic: b. Rodenberg, Schaumburg, 21 Aug. 1800; d. Berlin, 22 Aug. 1871. He became professor in the Academy of Arts, Berlin, 1829. He superintended excavations at Herculaneum and Pompeii; cast the finest bronzes and silver vases for the Museum Borbonico; and was architect of many fine houses and villas in Pompeiian style in England and America. Author of 'The Most Beautiful Ornaments and the Most Notable Pictures from Pompeii, Herculaneum and Stabiæ' (1828–30); 'Ornaments of All Classical Periods of Art' (1832–39).

ZAHN, Theodor, German theologian: b. Mörs, Prussia, 10 Oct. 1838. After studying at Basel, Erlangen and Berlin he became professor of theology in the University of Göttingen in 1871. He filled a similar chair at Kiel in 1877, at Erlangen in 1878, at Leipzig in 1888 and in 1892 returned to Erlangen. He became a foremost authority on the New Testament. Among his works may be named 'Marcellus of Ancyra' (1867); 'The Shepherd of Hermas' (1868); 'Ignatius of Antioch' (1873); 'The Acts of Saint John' (1880); 'Cyprian of Antioch and the German Story of Faust' (1882); 'Researches Into the History of the New Testament Canon' (1881–93); 'The Gospel of Peter' (1893); 'Introduction to the New Testament' (1897); 'Das Evangelium des Lucas' (1913), etc. He died 15 March 1933.

ZÄHRINGEN, tsā'rĭng-ĕn, the house from which the former grand-ducal family of Baden (q.v.), Germany, took its origin. The name is derived from the castle of Zähringen, now in ruins, in the village of that name, about two miles north of Freiburg in Baden. The founders of the family were from the 8th to the 10th century Counts of Breisgau, but the history of the house really began with Duke Bertold I, "the Bearded," d. 1078, who began to rule in the first third of the 11th century. Bertold II took the title of Duke of Zähringen in 1090. The main line of the family became extinct in 1218 and their territories, which included lands in Burgundy and Switzerland as well as Baden, were divided. A portion passed through a younger branch of the house to the Counts of Kyburg and thence to the Hapsburgs, to whom they are related. The remaining lands descended to the former reigning family of Baden.

ZAIMIS, Alexander, Greek statesman: b. Athens, 1855. He was educated at the universities of Athens, Leipzig, Berlin, Heidelberg and Paris. He was elected to the Chamber of Deputies in 1885; served as Minister of Justice in 1890–92, and was president of the Chamber of Deputies in 1895–97. He was Premier in 1897–99, under King George, and again in 1901–02. He was High Commissioner of the Powers in Crete in 1906–11 and was successful in securing the annexation of that island to Greece. He was appointed Premier to succeed Venizelos in October 1915, but resigned a month later when his government failed to receive a vote of confidence. He was again appointed Premier in June 1916, but was succeeded by Lambros before the end of the year, only to succeed Lambros in May 1917. Upon the abdication of King Constantine, however, he was asked to resign, and was succeeded by Venizelos 25 June 1917. He was generally supposed to favor neutrality for Greece in the World War. He was president of Greece in 1929–35. D. Vienna, 15 Sept. 1936.

ZAIRE, zä-ē'rā, Africa (a Portuguese variant of the Bantu word, *nzari*), the name by which the Kongo River was known before the possession of the banks of its lower course by the Kongo tribe, and still much used until the last quarter of the 19th century.

ZAKAZIK, zä-kä-zēk', Egypt. See ZAGAZIG.

ZALESKI, zä-lĕs'kĭ, **Bohdan,** Polish poet: b. Bohaterka, in the Ukraine, 14 Feb. 1802; d. Villepreux, near Paris, 31 March 1886. He studied at Warsaw and being obliged to leave his country after the revolution of 1830, he went to France. Many of his poems depict in the most vivid manner the scenery of Poland, as well as its history and legends, in which he was well-versed. His chief works are 'The Spirit of the Steppes' (1842); 'The Most Holy Family' (1851), and collections of shorter poems.

ZALEUCUS, zä-lū'kŭs, the legendary lawgiver to the Epizephyrian Locrians, the Greeks who colonized Magna Græcia, the southwest extremity of Italy. He is supposed to have flourished in the middle of the 7th century B.C. and his code is said to have comprised the first written laws of the Greeks. According to tradition his laws were exceedingly severe.

ZALINSKI, zä-lĭn'skĭ, **Edmund,** American soldier and inventor: b. Kurnich, Prussian Poland, 13 Dec. 1849; d. 10 March 1909. Coming to the United States in 1853 with his parents, who settled at Seneca Falls, N. Y., he was educated at the Syracuse High School, and entered the army in 1864 as volunteer aid on the staff of Gen. N. A. Miles. He was appointed second lieutenant Fifth United States Artillery in 1866, and captain in 1887. He was professor of military science at the Massachusetts Institute of Technology 1872–76, and was appointed second lieutenant Fifth United States Artillery School at Fort Monroe and the School of Submarine Mining at Willett's Point, N. Y. From 1883 to 1889 he devoted himself to the development and perfecting of a pneumatic dynamite torpedo gun. Among his inventions are an intrenching tool, a ramrod bayonet, a telescopic sight for artillery and a system of range and position finding for sea-coast and artillery firing. He retired from active service in 1894 and was promoted major in 1904. See ORDNANCE.

ZALINSKI GUN. See ORDNANCE.

ZALOKOSTAS, Georgios, Greek poet: b. Syrrhako, Epirus, 17 April 1805; d. Athens, 3 Sept. 1858. An ardent patriot, at 16 he fought in the insurrection at Missolonghi. Greek children are taught his songs, and among his best-known poems are 'Missolonghi'; 'Armatoles and Klepts'; 'The Entrance of Prevesa'; 'Hours of Leisure'; 'Marco Bozzaris,' etc. Several of his verses have been translated into Italian, Spanish, English, German, French and Russian. His 'Poetical Works' were published at Athens in 1860.

ZALUSKI, zä-loos'kē, **Josef Andrezei,** Polish prelate and scholar: b. Poland, 1702; d. 9 Jan. 1774. After serving for three years at Rome as ambassador to Pope Clement XII he was made bishop of Kiev, but was banished to Kaluga and imprisoned there in 1766–73 for his opposition to the Dissidents. He is chiefly remembered for the service he did in awakening Polish literature. He spent his fortune in collecting a great library, which he bequeathed to Poland, but which was taken by Russia after the partition, and formed the nucleus of the Imperial Public Library. He was a great scholar and while in prison wrote from memory a versified account of the Polish histories in his collection. He was not a great writer but his works have a high historical and bibliographical value. Author of 'Biblioteka historyków' (1832); 'Specimen historiæ Poloniæ criticæ (1733).

ZAMA, zā'mą, North Africa, the name of two ancient cities about 30 miles apart, 100 miles southwest of Carthage, now represented by Djiama and Sidi Amor-Djedidi. Both claim to be the scene of the victory of Scipio Africanus over Hannibal, which decided the fate of Carthage 202 B.C. It led to an ignominious peace which closed the Second Punic War 201 B.C. The Romans lost about 2,000 killed and wounded, while the Carthaginians lost in killed and prisoners over 40,000.

ZAMACOIS, thä-mä-kō'ēs, **Eduardo,** Spanish artist: b. Bilbao, Vizcaya, 1842; d. Madrid, 14 Jan. 1871. He was a pupil in Madrid of Balaca, Federico de Madrazo, and the Academy; in Paris, of Meissonier and the Beaux-Arts; and has been ranked as second to only Fortuny among Spanish genre-painters of the 19th century. His subjects were drawn largely from the 16th and 17th centuries, and were frequently treated in a satirical vein. His technical finish has been described as «almost as perfect as Meissonier's.» Among his paintings are 'The Hunchback'; 'Spanish Recruits'; 'The Bull Fighters'; 'Indirect Taxes'; 'A Court Jester of the 16th Century'; 'The King's Favorite' (1867); 'Cervantes as a Recruit'; 'The Rival Confessors' (1868); 'Return to the Convent' (1869); 'The Education of a Prince' (1870); 'The Puzzled Musician.' Many of his works are in private collections in the United States.

ZAMBALES, thäm-bä'lās, Philippines, a province of Luzon, in the southwestern part of northern Luzon; bounded on the west by the China Sea; on the north by the province of Pangasinán: on the east by the provinces of Pangasinán, Tárlac, and Pampanga; and on the south by Bataan and Subig Bay; length, 80 miles; width, 28 miles in the southern part, 25 miles in the nortern part, and 12 miles in the central part; area, about 1,650 square miles. The Zambales Mountain range near the eastern boundary parallels the coast, and has several points of high elevation, High Peak being 6,683 feet in height, Mount Pinalobo, 5,524 feet and Mount Guadradro 5.443 feet; there are also two groups of peaks but a few miles inland from the coast. There are numerous short rivers, and several thermal springs in the province. The chief industry of the province is agriculture; rice and wheat of superior quality are the special products; sugar, cotton, tobacco and coffee are also extensively cultivated. Next to agriculture in importance is the raising of cattle, horses, carabaos and hogs. The mechanical industries are very limited and primitive; copper and coal are mined; and there are indications of iron. The forest products are valuable, and amber is collected in considerable quantities on the coast. There are but few roads, and these are mostly impassable in the rainy season; a road and telegraph line parallel the coast for the greater part of the distance. Civil government was established in August 1901, and the provincial governor reported the province in a peaceful and prosperous condition in January 1902. The chief town and capital is Iba, a seaport (Pop. 4,482). Until 1904 the province extended north to Lingayen Gulf, but a re-division of territory then gave the territory north from Dasol Bay to the province of Pangasinán. Pop. 83,620.

ZAMBESI, zăm-bē'zē, or **ZAMBEZI,** South Africa, a river rising in Portuguese West Africa, in lat. 11° 21′ 3″ S., and long. 24° 22′ E., and reaching the Indian Ocean at Chinde and Conceiçao in Portuguese East Africa, opposite Madagascar, after a total course of 2,200 miles, of which the middle part belongs wholly to Rhodesia. The Victoria Falls and the Kebrabasa Rapids, the former in the west of Rhodesia and the latter in Portuguese East Africa, above Tete, are regarded as dividing the river into three sections, the Upper, Middle and Lower Zambesi. The neighborhood of the source has an altitude of about 5,000 feet, and the river has its origin in a deep depression at the base of steep undulations, where the water oozes from a black marshy bog and quickly collects into a well-defined stream. Another head-stream of the Zambesi is the Kabompo, which rises in the northwest of Rhodesia, about lat. 11° 34′ S., and long. 25° 17′ E., also at an altitude of 5,000 feet, and in a region of open grassy downs. The former stream, at first known as Yambeshe and then as Liambai (Liambeshe), flows at first west with a southward trend, and then turns south-southeast. Ten miles of rapids precede the Sapuma cataracts (13° 7′ S.), where the river flows «through a narrow rocky fissure into a pool of considerable extent.» At about 14° S. it is joined by the Kabompo from the northeast, and the remaining course of the Upper Zambesi has a south and southeasterly direction through the low-lying, grassy Marotse country, and is marked by various cataracts and rapids. Sesheki is a place of some importance on the left bank, near where the river begins to be wholly in British territory; and a short distance farther down, opposite Kazungula, it receives

from the west the waters of the large tributary Kuanda. In about 18° S. there are the celebrated Victoria Falls (q.v.), discovered by Livingstone in 1855. Here the broad river suddenly plunges into a transverse chasm 400 feet deep amidst a scene of tremendous grandeur. The gorge just below (eight miles long) and in full view of the falls is spanned since 1904 by a lofty bridge on the Cape to Cairo Railway. The Middle Zambesi, whose direction is east, northeast and again east, receives the Guay-Shangani and Sanyati from the south; the Kafukwe and Loangwa from the north, the latter at Zumbo, where the river leaves British territory; and is interrupted by various rapids and rocks, especially at low water, the Kebrabasa Rapids being the first impassable obstacle to navigation from the mouth. The remaining course of the river (Lower Zambesi) has been described as, except for the Lupata Gorge, «merely a broad expanse of sand, three to five miles wide, with low, reed-fringed banks, and intersected by numerous shallow streams.» It passes the town of Tete, below which it is joined on the right by the Mazoe, and after passing Sena it receives from the left the Shiré from Lake Nyassa, the waterway to British Central Africa. It enters the Indian Ocean by several mouths, of which the Chinde one is the most practicable. The delta covers an area of about 25,000 square miles, and begins about 90 miles from the coast, a little below the confluence of the main stream with the Shiré. The river drains an area estimated at 600,000 square miles. Its basin is separated from that of the Orange River on the southwest by a slight watershed, and from that of the Limpopo on the south by a mountain range. The valley of the Zambesi is capable of immense development in the way of trade. The Portuguese government has long exercised sway for 300 miles from the mouths of the river, and by the international arrangement of June 1891 the river from the coast to the confluence of the Loangwa is recognized as being in Portuguese territory. The Zambesi and its affluents are now free to the flags of all nations. The Upper Zambesi was first explored by Livingstone, who reached the Liambai in 1851. Consult Coillard, 'On the Threshold of Central Africa' (1897); Gibbons, 'Africa from South to North' (1904); Livingstone, 'Narrative of an Expedition to the Zambezi and its Tributaries' (1865).

ZAMBESIA, zăm-bē'zhĭ-ą, one of the three districts of Portuguese East Africa, divided into the sub-districts Quilimane and Tete; also a name popularly applied to the regions in Rhodesia divided by the Zambesi, known respectively as North and South Zambesia, and sometimes called British Zambesia. See East Africa, Portuguese; Rhodesia.

ZAMBOANGA, thăm-bō-ăn'gä, Philippines, (1) town, seaport and capital of the District of Zamboanga, Mindanao Is., 600 miles south of Manila. It was founded in 1635 as a base of operations against Moro pirates; shortly before the American occupancy of the islands it was almost entirely destroyed by fire, partly by the Spaniards and partly by the Filipinos; since then it has been rebuilt. Many of the houses are of stone, and the town contains a fort, the Castle of San Felipe, a cathedral, a public hospital, the provincial capitol, completed in 1908, and a customs house. Since the American occupation the streets have been improved, public parks established and docking facilities have been extended. It is connected with Manila by steamer, and is the chief market in the southern part of the archipelago for hemp, copra and gutta percha. Pop. 43,832. (2) A District of Moro province, forming the western peninsula of the island of Mindanao, bounded on the north by Dapitan and Misamis, on the south by the Celebes Sea and Basilan Strait, on the east by Lanao and on the west by the Sulu Sea; area, with dependent islands, 6,085 square miles. The district was increased in size by the act of the Philippine Commission 1 June 1903. The main mountain range extends west and then southwest from the northeastern boundary; another range traverses the Bañganinan or Flecha peninsula. The climate is the best in the Philippines, the temperature varying but a few degrees. Agriculture and stock raising are the more important industries; rice, hemp, cotton, coffee, sugar, cocoanuts are cultivated; and cloves and nutmegs and vegetables are also among the valuable products of this province. Cattle, horses and hogs are raised. There is an abundance of valuable woods, particularly teak and juniper; deposits of coal at the head of Sibuguey Bay and at other places, and gold also is found in the western portion. Pop. 147,991.

ZAMBONI'S DRY PILE, *in electricity,* a dry voltaic pile or battery invented by Zamboni. Paper silvered on one side is damped and coated on the other with manganese dioxide; half a dozen of these sheets being superimposed to save time, discs are punched out, and 1,000 to 2,000 single sheets are compressed in a glass tube with metal caps and knobs at the ends. Such a pile will charge a Leyden jar, though it will not give shocks or sparks.

ZAMIA, a genus of plants of the family *Cycadaceæ.* (See Cycadales). In aspect the species partly resemble palms, and partly tree ferns; in affinity they are nearer the latter than the former, but rise considerably above them in organization. They are natives of tropical America, tropical Asia, the Cape of Good Hope and Australia. The stems of *Z. tenuis* and *Z. furfuracea,* and the seeds of *Z. pumila,* in the West Indies, yield arrowroot. The Florida Indians call the last «coontie,» and manufacture flour from the rhizomes. It grows in the everglades of Florida, and has large tubers of the shape and size of parsnips, which are rough and gray on the outside, but are white internally. The tubers are pounded to a pulp, in a log mortar, and washed in a straining cloth, the abundant starch of the coontie passing through and settling in a deerhide. This process rids the plant of an acrid poisonous principle which is carried away by the water. The Federal armies lost a number of men during the Civil War, who ate the root in its crude poisonous state. The sediment, or starch left in the deerskin after straining, is fermented and dried, and becomes a yellowish-white flour ready for use, which has long been a staple food of the Seminoles. The coontie starch, when extracted in proper mills, is finer and whiter than the

Indian product, and is called Florida arrow-root. It is nutritious, and makes excellent puddings, and the like.

ZAMOJSKI, zä-moi'skē, **ZAMOYSKI**, or **ZAMOSC**, an ancient family of Poland, whose most distinguished members have been JAN ZAMOJSKI, statesman and general: b. Skokow, palatinate of Chelm, 1 April 1541; d. near Skokow, 3 July 1605. He was educated at Paris, Strassburg and Padua, and in 1564 was elected rector of the university at Padua. In 1565 he returned to Poland, and upon the death of King Sigismund Augustus in 1572, succeeded in so organizing the equestrian order, that in the diet of 1573, held at Warsaw, Henry of Anjou (afterward Henry III of France) was chosen king of Poland. Upon the abandonment of Poland by Henry, a party of nobles elected Maximilian II of Austria, and he was proclaimed king by the primate; but the party hostile to the house of Austria, led by Zamojski, chose Stephen Bathory (q.v.), who marched rapidly to Cracow, and was there crowned. Zamojski was made grand chancellor of the kingdom and became a power in Polish affairs. He was afterward married to Griselda, a niece of the king. In 1580, during the war with Russia, Báthori appointed him commander of the principal army, with the title of hetman; and in 1582 he negotiated the peace by which Livonia, Esthonia and Novgorod were ceded to Poland. After the death of Báthori in 1586, he might have secured the crown for himself; but he used his influence in favor of Sigismund III, son of the king of Sweden, defeated the army of the opposing claimant, the Archduke Maximilian, at Cracow, pursued him into Silesia, and took him and his forces prisoners. From 1590 to 1597 he was engaged in a constant series of wars; and while often at variance with Sigismund, with whom he was no favorite, he remained a dominant figure in the state. fighting successfully against the Turks, Tartars and Cossacks, and oftentimes supporting the army from his private fortune. Zamojski was not only a great statesman and general, but a munificent patron of literature and the sciences. He founded New Zamosc, which came to be regarded as one of the strongest fortresses of Poland, and established there a university and a famous printing press. He wrote 'Testamentum Joannis Zamori' (1606), and many letters of his are to be found in Lunig's 'Literæ Procerum Europæ.' JAN ZAMOJSKI, general, grandson of the preceding: b. 1626; d. Warsaw, 2 April 1665. He participated in the campaign of 1651 against the Cossacks, was made palatine of Sandomir, and was conspicuous in the wars that followed. In 1659 he was at the head of the army which acted in the Ukraine against the tsar of Russia. ANDRZEJ ZAMOJSKI, statesman: b. Biezun, 1716; d. Zamosc, 10 Feb. 1792. He entered the military service of Saxony, returned to Poland in 1754 and was made marshal of the palatinate of Smolensk. In 1760 he emancipated his serfs, and on the accession of Stanislas, Augustus was appointed grand chancellor in 1764, an office he resigned rather than sign the partition treaty. In 1776, at the request of the diet, he drew up a code of laws, which was printed under the title of 'Zbiór praw sadowych' (1778). The liberal character of the code, especially its provision for a general measure of emancipation, aroused against it so great a hostility, that in the diet of 1780 it was not permitted to be read, but it was adopted in 1791. ANDRZEJ ZAMOJSKI, statesman, grandson of the preceding: b. 2 April 1800; d. Cracow, 29 Oct. 1874. He studied at Geneva and Edinburgh, entered the Polish civil service in 1823 and was Minister of the Interior of the revolutionary government in 1831. He later introduced steam navigation on the Vistula, but as the head of an important agricultural association incurred the suspicion of the Russian government. The association was suppressed in 1862. At the request of the viceroy, Grand Duke Constantine, Zamojski drew up a statement of the claims of Poland, a document which displeased the Russian government and caused Zamojski's banishment.

ZAMORA, thä-mō'rä, **Antonio de**, Spanish dramatist: b. Madrid, about 1660; d. there, before 1744. He was a court officer during the reign of Philip V and also held a secretaryship in the department of Indian affairs. He wrote many dramas which were highly esteemed by his contemporaries, some 40 of which are extant. He imitated the style of Calderon, but rarely attained the poetic beauty of that author. To modern taste his plays are slow and over-loaded with stage directions which were probably necessary in their day, and they lack the brilliant invention of the dramas of Calderon and Lope de Vega. Yet they are the best of their age. The best of his dramas, however, show skilful development of character. Among the most noteworthy are 'Mazariegos y Monsalves'; 'Cada uno es Linaje Aparte'; 'El hechizado por fuerza,' a comedy produced in Spain in modern times; and 'El Convidado de Piedra,' on which is based the libretto of the opera of 'Don Juan.'

ZAMORA, Spain, a city and capital of a province of the same name, 140 miles northwest of Madrid, on a rocky hill on the right bank of the Douro which is here crossed by a fine bridge. It has interesting mediæval buildings, and is the see of a bishop; the cathedral is a Gothic structure, completed about 1174, but partially modernized in the Corinthian and Doric styles. Zamora as a fortified town played an important part in early Spanish history, and it is renowned for the successful defense which it made against the Moors in 939 A.D. Pop. 16,447. The province of Zamora is divided into eight departments and has a population of about 280,000.

ZAMORA, Venezuela, an interior northwestern state bounded by Lara, Miranda, Bolivar and Los Andes. It has not been very much developed and possesses many natural resources. The capital is Barinas. Pop. 57,341. Area of province, 25,212 square miles. Pop. 246,676.

ZAMORA Y CORONADO, ē kō-rō-nä'thō, **José Mariá**, Central American jurist: b. Cartago, Costa Rica, 1785; d. Cuba, after 1846. He was educated in Spain and on his return from there held important judicial and civil posts in both Porto Rico and Cuba. He published 'Registro de la legislación ultramarina' (6 vols., 1844–48), a work of much historical value on account of its being a collection of laws and regulations pertaining to the Spanish-American colonies. For this reason it has been

largely consulted by students of Latin American law and institutions.

ZAMORA Y TORRES, Niceto Alcala, president of the Spanish Republic: b. Priego, Spain, July 7, 1877; d. Buenos Aires, Argentina, Feb. 18, 1949. Following his father in the legal profession, he obtained his doctorate at 20. A deputy in Parliament, at the age of 40 he became minister of public works, and later was minister of war. In 1930 with other opponents of Primo de Rivera he began working for a republic, was imprisoned briefly before his trial in 1931 and, though sentenced to a six-month term, was paroled. Alfonso XIII yielding the throne quitted Spain, and Zamora was immediately installed as provisional president, soon after being elected first constitutional president of the second republic. In April 1936 he was removed from office on a Socialist motion, charged with having illegally dissolved Parliament the previous January. A Roman Catholic, his downfall was due to the enmity of the Leftists, especially the Communists, disgruntled at his moderate policy. He soon left Spain, eventually settling in Argentina. In 1941 the Franco government confiscated his property, fined him $2,000,000 and sentenced him to 15 years exile. He never returned to Spain.

ZAMOSC, zä'môshch (Zamostye, in Russian), city, Poland, in the province of Lublin, on the Wieprz, 45 miles southeast of Lublin. Founded in 1579 by Jan Zamoski on an Italian model, and reconstructed similarly in 1937, all its houses have arcades. Its fine castle, the four churches, the arsenal, and the town house are the chief buildings. Furniture manufacture is the principal industry. It has an airport. Pop. (1946) 20,899.

ZAMPA, zän-pä, **Ou la Fiancée de Marbre,** an opera comique by the French composer, Louis Joseph Ferdinand Hérold (q.v.), first produced in 1831.

ZANARDELLI, dzä-när-dĕl'ē, **Giuseppe,** Italian statesman: b. Brescia, Oct. 29, 1826; d. Modena, Dec. 20, 1903. After study at Pavia, he was a volunteer in the war of 1848, then was for a time a journalist and lecturer on law. Elected deputy in 1859, he held various administrative posts, in 1876 became minister of public works, and in 1878 of the interior. From 1881 to 1883 he was minister of justice, and from 1887 to 1891 again held that portfolio. During the latter period of service he issued the penal code and began a reform in the magistracy. He was president of the Chamber of Deputies in 1894, in 1896 was again chosen, in December 1897 accepted the portfolio of justice for a third time, but withdrew in 1898 to resume the presidency of the Chamber. This post, too, he relinquished, to identify himself with the opposition. On the fall of the Saracco cabinet in February 1901, he formed an administration with the aid of the extreme left. A brilliant orator, he was a steadfast Liberal and the recognized leader of the constitutional left.

ZANDEH. See Nyam-Nyam.

ZANE, zān, **Ebenezer,** American pioneer: b. Berkeley County, Va., Oct. 7, 1747; d. Martin's Ferry, Ohio, Nov. 19, 1812. Of Pennsylvania Quaker stock, he and his brothers Silas and Jonathan founded Wheeling, W. Va., in 1770. Their settlement, called Zanesburg, became the Ohio River terminus of the road from Cumberland, Md., used by many Ohio settlers. During the revolution, as a Virginia militia colonel Zane helped repel British-Indian besiegers of Fort Fincastle (renamed Fort Henry) at Zanesburg, in 1777 and 1782. In 1796 Congress granted him in the Ohio county three lots, each a mile square, under stipulations of payments of United States bounty warrants, provision of roads, ferrys, and surveys of the tracts at his expense, and that he also blaze a road from Zanesburg to Limestone, Ky. before Jan. 1, 1797. On one of these tracts Zanesville was platted in 1799 and on another Lancaster in 1800.

ZANELLA, dzä-nĕl'lä, **Giacomo,** Italian poet: b. Chiampo (Vicenza), Sept. 9, 1820; d. Vicenza, May 17, 1888. After studying for the priesthood at the Vicenza Seminary, he became professor there of philosophy and Italian literature. Having held posts in lyceums at Venice, Vicenza, and Padua, he was made professor of Italian literature in the University of Padua in 1866, and in 1871–1872 was rector of the university. Zanella's work is noted for beauty of style and mastery of form; his most popular poem is *La Conchiglia Fossile* (*The Fossil Shell*).

ZANESVILLE, city, Ohio, Muskingum County seat; altitude 720 feet; at the confluence of the Licking and Muskingum rivers; about 50 miles east of Columbus; on the Baltimore and Ohio; New York Central; Pennsylvania; and Nickel Plate railroads. It has river connections and a municipal airport. Local industries specialize in pottery and glass, but there are also iron and steel works, shoe and electrical apparatus factories. With a well-stocked public library and a handsomely housed art museum, Zanesville is satisfactorily equipped in the cultural field of community life. The art institute includes collections of historical objects and specimens of wares locally produced.

The history of Zanesville begins in 1799, when Ebenezer Zane (q.v.), marked out the site, in fulfillment of his part of the agreement by which the federal government permitted him to build Zane's Trace, a highway to Kentucky originating at Wheeling, W. Va. In 1804 Zanesville became county seat, and in 1810 it was named capital of the state, a distinction it lost to Columbus two years later. Incorporated in 1800, it became a city in 1850. Pop. (1950) 40,517.

ZANGWILL, Israel, British author: b. London, Eng., Feb. 14, 1864; d. Sussex, Eng., Aug. 1, 1926. Educated at the Jews' Free School, Spitalfields, and the University of London, in 1888 he published *The Premier and the Painter,* and in 1890 established *Ariel,* or the London *Puck,* a brilliant but short-lived periodical. However, he soon achieved note by his essays, works in fiction, and plays. His department of literary causerie, "Without Prejudice," in the *Pall Mall Magazine,* became well known in Great Britain for its able critiques. Some of these essays were gathered into a volume of that title in 1896. Some of Zangwill's best fiction deals with Jewish types and subjects, as in *Dreamers of the Ghetto* (1898), with its semihistorical pictures of Heine, Spinoza, Uriel (Gabriel) Acosta and others. He lectured in Great Britain, Ireland,

Palestine, Holland and the United States, and, as a prominent Zionist, gave addresses in connection with that movement and the application to it of the Baron de Hirsch millions; and is president of the Jewish International Territorial Association. His literary work is in a style of much distinction, with frequent touches of irony. He is author of 'Children of the Ghetto' (1892); 'Ghetto Tragedies' (1893); 'They That Walk in Darkness' (1889); 'The Mantle of Elijah' (1900); 'Ghetto Comedies' (1907); 'Italian Fantasies' (1910); 'The War for the World' (1916); 'The Principle of Nationalities' (1917); 'Chosen Peoples' (1918); 'Jimmy the Carrier' (1919); 'The Voice of Jerusalem' (1920); 'Ibn Gabriol's Poems from the Hebrews' (1923). A play which he constructed (under the same title) from his 'Merely Mary Ann' (1893), was more successful (1904) than the dramatization (1899) of 'Children of the Ghetto' or the one-act 'The Moment of Death' (1900). 'Six Persons' (1892) was well received in England and later plays include 'Plaster Saints' (1914); 'Too Much Money' (1918); 'The Cockpit' (1921); 'The Forcing House' (1922); 'We Moderns' (1923).

ZANGWILL, Louis, English author, brother of I. Zangwill (q.v.): b. Bristol, 25 July 1869. At first a journalist he later took up literature as a profession, using for a while the pseudonym «ZZ.» He published 'A Drama in Dutch' (1894); 'The Beautiful Miss Brooke' (1897); 'One's Womankind' (1902); 'An Engagement of Convenience' (1908); 'Monograph on Richard Cumberland' (1911); 'Quest of Spiritual Truth' (1926). Died, 31 May 1938.

ZANKOFF, zän'kŏf, **Dragan,** Bulgarian politician: b. Sistova, 1827; d. Sofia, 24 March 1911. He studied at the universities of Odessa, Kiev and Vienna, and entering the service of Turkey, became secretary to the Pasha of Rustchuk, Bulgaria. In 1880 he was made Premier of Bulgaria and Minister of Foreign Affairs by Prince Alexander, and again held the post of Premier 1883–84. Later he became the enemy of Alexander and the head of the pro-Russian party. On the night of 20 Aug. 1886 Zankoff with a party of fellow-revolutionists broke in Prince Alexander's palace and forced him to resign. Zankoff then became a member of the provisional government. Upon the restoration of the prince he was banished, but was subsequently permitted to return. He again became the leader of the Russophile party and in 1902–03 he was president of the Sobranje.

ZANOTTI, dzä-nōt'tē, or **CAVAZZONI ZANOTTI, Giovanni Pietro,** jō-vän'nē pē-ā'-trō, Italian artist: b. Paris, 1674; d. Cortona, 1765. He was a pupil of Lorenzo Pasinelli at Bologna, and became a good designer and colorist, and an adept in chiaroscuro. For churches at Bologna he executed several altar-pieces, among the chief that of 'The Incredulity of Saint Thomas' in the church of that saint. There is also in the Palazzo Pubblico a large picture by him of 'The Ambassadors of Rome Swearing Fidelity to the Bolognese.' At Cortona, where he long resided, he distinguished himself by such pictures for churches as 'Christ Appearing to Mary Magdalene' and 'Christ Carrying His Cross.' He was a careful writer on art, the most important of his works being the 'Storia dell' Accademia Clementina di Bologna' (2 vols., 1739).

ZANTE, zän'tĕ, Greece (anc. *Zacynthus*), one of the Ionian Islands, in the Mediterranean, between eight and 10 miles south of Cephalonia and 15 miles from the nearest point of Greece. It is about 24 miles long, 12 miles broad, and 60 miles in circuit; area, 277 square miles. It has the form of an irregular oblong, indented with a deep bay at its southeast extremity. The western half is hilly, rising to 2,500 feet, and the west coast exhibits limestone cliffs. The east coast has a harbor, within which is situated the town of Zante (pop. about 13,501), a thriving and well-built place, the see of a Greek protopapas, and of a Roman Catholic bishop. Part of the island consists of an extensive fertile plain, having the appearance of one continuous vineyard, with a few parcels under cereals or pasture. The prevailing rocks are calcareous; gypsum appears in various parts, and its pitch-wells are famous. Earthquakes frequently occur. The staple export of Zante is the dried «currant» of commerce, the fruit of a dwarf grape. The other chief exports are oil, soap and a little wine; pomegranates, melons, peaches, oranges, citrons and other fruits are also grown, but the corn raised scarcely supplies three months' consumption. Goats are the only livestock. The island forms a department of the kingdom of Greece since 1864; it is mentioned by Homer, and was formerly an independent state which successively came under Macedonian, Roman, and finally Greek rule. Pop. 42,502.

ZANTHOXYLUM, a genus of the family *Rutaceæ,* composed of erect or climbing shrubs or trees, often with prickly branches. The leaves are compound, pinnate, sometimes reduced to three, or rarely, to one, leaflet, usually pellucid-dotted. The flowers are small, in axillary or terminal panicles, and are from three- to five-parted. The fruits split in two. with one or two shining black seeds. *Zanthoxylum* is a large genus, found in both the Eastern and Western hemispheres, especially in their warmer parts. The species are so aromatic and pungent that in the countries where they exist they are popularly called peppers, specially *Z. piperitum,* called Japan pepper, which is regarded as an antidote for poison. *Z. rhetsa,* an Indian species, has small yellow flowers and small round berries, which, when unripe, taste like the skin of a fresh orange. Its fruit, and the seeds and bark of *Z. alatum,* which grows near the base of the Himalayas, and those of *Z. budrunga,* also Indian, are given as aromatic tonics in fever, diarrhœa, dysentery and cholera. They are used as a condiment in India and as a fish-poison. The small branches are employed to make walking-sticks, and the twigs as toothbrushes. The seeds of the latter are as fragrant as lemon peel. *Z. clava-herculis* and *Z. americanum* applied externally to the gums or taken internally, are powerful sudorifics and diaphoretics used in toothache, paralysis of the muscles of the mouth and rheumatism. The root of *Z. nitidum* is sudorific, emmenagogue, etc. The powdered bark of *Z. hiemale* is given in Brazil in earache; and the capsules and seeds of *Z. hastile* are employed in northern India to intoxicate fish. The West Indian species of

Zanthoxylum is called yellow-wood, *Z. cariboeum* being differentiated as the prickly yellow-wood. It is a tree, 20 to 50 feet high, whose prickly young stems are made into walking-sticks. The wood is used for inlaying and for furniture. *Z. cribrosum* is the satin-wood of the West Indies, which when first cut has the odor of the veritable satin-wood. *Z. fagara* is a small tree common in the same region, and tropical America, producing a hard, heavy, reddish-brown wood, known as savin or iron-wood or as the wild lime. Still another species is *Z. emarginatum,* a shrub with coriaceous foliage, exported under the name of rose-wood, but called licca-tree or lignumvorum at home. The commonest species of the northern United States and the hardiest is *Z. americanum,* a shrub or small tree with odd-pinnate leaves, and twigs which are generally prickly. The cymose flowers are axillary and sessile, without calyx, and they are greenish-white. The capsules are black and ellipsoidal. It is called prickly-ash or toothache-tree, because both Indians and country people used the hot, acrid bark of both this species and *Z. clava-herculis,* which when chewed produces a stinging sensation, for aching teeth.

ZANZIBAR, zăn-zĭ-bär′, East African sultanate; the islands of Zanzibar and Pemba, with adjacent islets, constitute the British protectorate of Zanzibar, and mainland territories form the Kenya Protectorate, the latter leased by the British government and administered with Kenya Colony. Zanzibar Protectorate has an area of 1,020 square miles (Zanzibar island, 640 square miles; Pemba, 380 square miles), and the population is estimated to number 250,000, of whom 100,000 live on Pemba. The island of Zanzibar is situated in 6° south latitude, off the coast of Tanganyika Territory, and separated from it by a channel 22½ miles wide at the narrowest place; the largest coralline island on the East African coast, it is 53 miles long and 24 miles wide. Pemba, 25 miles northeast of Zanzibar, is 42 miles long by 14 miles wide. The west of the island of Zanzibar is fertile and well cultivated, chiefly for cloves, coconuts, sugar, and manioc; this coast is well indented and accessible, but the east coast is steep and forbidding. The mean temperature is 80°F., and the average annual rainfall amounts to 58.59 inches. On the west coast is Zanzibar (pop. 45,276) capital and seaport of the island. Its harbor is one of the finest in Africa. The population of the capital and surrounding districts consists principally of full blooded or half-caste Arabs, Indians of several races, and Negroes of many tribal stocks, most of them professing Islam; Bantu Negroes inhabit the western part of the island. The sultan of Zanzibar is ruler in name only, for though he issues decrees they have legal effect only when countersigned by a British Resident heading the civil administration; the sultan presides over meetings of an Executive Council, and the Resident is chairman of the Legislative Council, an advisory body having official and nominated unofficial membership. The government conducts primary schools for Moslems and secondary schools open to all children, and gives financial assistance to schools administered by Indian communities and Christian missionary bodies. The clove industry is the most important, the islands of Zanzibar and Pemba yielding the bulk of the world's supply. Coconuts are exported principally in the form of copra (the sun dried kernel) and coir rope, and coconut oil is also manufactured. Prior to construction of the Uganda Railway into the interior from the mainland port of Mombasa, the seaport of Zanzibar conducted most of the transshipment trade of eastern Africa. Through Zanzibar also passed thousands of African natives seized by Arab traders in the hinterland and shipped into slavery in Arabia. Slavery in the sultanate of Zanzibar, principally for agricultural work, was not abolished until 1897.

Arab influence predominated in Zanzibar and the adjacent mainland until the Portuguese appeared in the 16th century. Subsequently the territory was part of the domains of the Arabian sultanate of Muscat down to 1856, when it became independent. In 1890 a British protectorate was declared over the islands, and the sultan's domains on the mainland were divided (from north to south) between Italy, Great Britain, and Germany; the sultan's rights were purchased by Italy and Germany, those areas being incorporated, respectively, into Italian Somaliland and German East Africa (later Tanganyika Territory), and Britain leasing its sphere (in 1920 restyled Kenya Protectorate). Consult Pearce, F. B., *Zanzibar, the Island Metropolis of Eastern Africa* (London 1921); Ingrams, W. H., *Zanzibar: Its History and Its People* (London 1931); *A Guide to Zanzibar* (Zanzibar 1939).

ZAPOLYA, zä′pô-lyŏ, or **SZAPOLYAI,** sŏ′pô-lyoi, **John,** king of Hungary: b. 1487; d. 1540. He was voivode (governor) of Transylvania, 1511–1526, and when young Louis II ascended the throne in 1516 was named regent. After the death of the king at the Battle of Mohacs in 1526 he secured the crown for himself. Thereby involved in war with Ferdinand I of Germany, Holy Roman emperor, he was forced to seek refuge in the Carpathians until 1529 when, with Turkish assistance, he regained much of his kingdom. Strife was terminated in 1538 by the Treaty of Grosswardien between Ferdinand and Zapolya.

ZARA, zä′rä, (Slav Zadar, zä′där), seaport on the Croatian coast, former capital of the Austrian province of Dalmatia, and transferred after World War I to the Italian Department of Venezia Guilia e Zara. Captured from the Axis forces by the Yugoslav National Army of Liberation before the German collapse in World War II, it was declared annexed to Yugoslavia by the Yugoslav National Assembly, and in the summer of 1946 remained in Yugoslav hands pending the peace settlement. The city's original name was Jadro (the Sail). The Romans called it Jadera, and the Byzantines Diadera. In 1202 it played an important role when it was occupied by the Crusaders, on behalf of Venice. When in 1390 the whole of Dalmatia recognized King Tvrtko (r. 1377–1391) of Bosnia as its ruler, Zadar was the only city which remained loyal to the king of Hungary. It joined the Republic of St. Mark in 1409, and remained part of it until the republic fell in 1797. In 1500 and 1570 the city was besieged and badly damaged by the Turks. The basilica of St. Anastasia (13th century) is decorated with paintings by the younger Di Palma (Jacopo, Palma II Giovane, 1544–1628). The church of St. Donato, dating from the 9th century, is used in modern times as a museum. It has steep and narrow streets; and a very

interesting cathedral, in the Lombard style, dating from the 13th century; several other churches; a town-house; a lyceum, gymnasium, archiepiscopal seminary, normal and other schools; a civil and a military hospital; and a capacious but somewhat shallow harbor admitting warships of medium size. It has manufactures of rosoglio, maraschino, and glass, and a considerable coasting trade. Zara has stood many sieges, particularly one in 1202, when it was taken by the Venetian doge Dandolo, with the assistance of the French crusaders; and another in 1346, when it was taken by Marino Faliero in the face of a large Hungarian army. It was under Venetian control from 1409 passed into Austrian possession in 1797 and to Italy in 1919. It was under French rule in 1805–13. Pop. 19,752.

ZARATE, thär-ä'tā, **Antonio Gil y,** Spanish dramatic poet: b. San Lorenzo de l'Escurial, Spain, 1795; d. 1860. He was educated in Paris; and on his return to Spain became professor of physics in Granda. He afterward wrote dramas notable for striking situations, lively dialogue and elegant versification; among them are 'Blanca de Bourbon' (1835); 'Guzmán il Bravo'; 'El Czar Demetrius.' He also published a history of Spanish literature and other prose and poetic work including good literary criticism.

ZARATE, Augustin de, Spanish historian: b. about 1492; d. Madrid, about 1560. After holding for 15 years the office of comptroller of Castile he accompanied Nuñez Vela, viceroy of Peru, to South America in 1543, and while there was not only an eyewitness of many historical events of importance, but made a close study of Peru and its annals. On the fall of Gonzalo Pizarro he returned to Spain and in 1555 published 'Historia del descubrimento y conquista de la provincia del Perú' (History of the Discovery and Conquest of the Province of Peru). There have been many later editions of this most valuable work, and it has been translated into French, English, German, Portuguese and Italian.

ZARATHUSHTRA, zä-rä-thoosh'trạ, the name by which Zoroaster is known in the 'Avesta.' See ZOROASTER.

ZARATITE, an emerald-green incrustation usually on chromite. It is a hydrous basic carbonate of nickel. Its best known locality is at Texas, Pa. It is often called "emerald nickel."

ZAREEBA, the general name of all the African striped species of the horse family. See ZEBRA.

ZARITZIN, Russia. See TSARITSYN.

ZARLINO, tzär-lē'nō, **Giuseppe,** Italian composer: b. Chioggia, near Venice, 1517; d. Venice, 14 Feb. 1590. He became a Franciscan in 1537 and in 1541 went to Venice to study music with Willaert. In 1565 he was appointed choir master of Saint Mark's, Venice, and continued in that position till his death. He was especially famous for the music he composed to be performed on the occasion of the victory of Lepanto. He determined the relations of the tones and semitones more precisely than had previously been done, and on this subject wrote 'Instituzioni armoniche' (1562–73). Other works of his are 'Dimostrazioni harmoniche (1571); 'Sopplementi musicali' (1588). Among his musical compositions may be named 'Modulationes' (1566); 'Lectiones pro Mortuis' (1563).

ZARNCKE, tsärn'kĕ, **Friedrich,** German scholar: b. Zahrenstorf, near Brüel, Mecklenburg-Schwerin, 7 July 1825; d. Leipzig, 15 Oct. 1891. After study at Rostock, Leipzig and Berlin, he founded the *Litterarisches Zentralblatt für Deutschland* at Leipzig in 1850, and in 1858 became professor at the university there. His work in connection with mediæval literature was of particular importance, and his chief publications were his edition of Brant's 'Narrenschiff' (1854), and joint-edition of Benecke's 'Middle High German Lexicon' (1863). His valuable library was acquired by Cornell University. Among his further writings were a study of Christian Reuter (1884) and 'Kurzgefasstes Verzeichniss der Originalaufnahmen von Goethes Bildniss' (1888).

ZARSKOJE-SELO, zär-skō'ĭ-sā'lō, Russia. See TSARSKOYE-SELO.

ZASULITCH, Viera Ivanovna, Russian revolutionist: b. 1851; d. 1919. She was arrested for her part in a revolutionary plot in 1869, imprisoned for two years and was later under police surveillance in Eastern Russia, but was freed in 1876. On 5 Feb. 1878 she shot, but did not kill, General Trepov, head of the secret police, because of his ordering the flogging of a student who had failed to salute him. She was acquitted by the jury at her trial and the verdict was favorably received. General Trepov, in deference to public opinion, was transferred to the cavalry. Later, her acquittal was annulled by the Supreme Court of Appeals, and Mme. Zasulitch fled to Switzerland, remaining there until the Tsar's amnesty of 1905 permitted her return to Russia. Her works were published (2 vols., 1906).

ZAUBERFLÖTE, tsow'bĕ-flē"tĕ, **Die** ("The Magic Flute"), an opera by Mozart, first produced at Vienna in September 1791, under the direction of the composer. A French version of the opera bears the title 'Les Mystères d'Isis.'

ZAVALA, thä-vä'lä, **Joaquin,** Nicaraguan politician: b. Nicaragua, about 1839. He entered the army, became prominent in political affairs and was president of Nicaragua 1879–83. He was afterward Minister to the United States and in 1893 headed the insurrection which secured the deposition of President Sacaza in May 1893. On 17 July of that year he was declared provisional president, but only to lose his position through another revolt a fortnight later.

ZBYLITOWSKI, zbĭ-lĭ-tow'skē, **Andre,** Polish writer, philosopher and poet: b. Galicia, 1732; d. 1813. He was doctor of philosophy for a time at Cracow and later made extensive travels through South America and Europe. Author of 'Rhythms in Polish Verse' (1763); 'The Marshal'; 'A Beard,' etc.

ZBYLITOWSKI, Pierre, Polish writer and poet: b. in the palatine of Lubein 1684; d. Warsaw 1757. He was educated at the Uni-

versity of Warsaw and after leaving there traveled extensively through Europe and North America. He has published 'Porydia' (1734); 'Epigrams' (1735); 'Lucie,' a poem (1739), etc.

ZEA, thā'ä, **Francisco Antonio,** Colombian naturalist and statesman: b. Medellin, New Granada (Colombia), 21 Oct. 1772; d. Bath, England, 28 Nov. 1822. After study at the College of Popayan, he was connected with the botanical expeditions of Mutis, in 1795 was sent to Spain under arrest on the charge of circulating republican literature, and though acquitted in 1799 was forbidden to return to New Granada. He carried on botanical researches in Europe, but in 1815 joined Bolivar at Jamaica. In 1819 he was chosen vice-president of Colombia by the congress of Angostura, and in 1820 went to Europe as envoy of the Colombian republic to France and England. He has sometimes been styled the «Franklin of Colombia.» Among his published works are 'Memoria sobre la Quina según los Principios de Mutis' (1800), and a 'Historia de Colombia' (1821).

ZEA, zē'ạ. See Ceos.

ZEALAND, zē'land, or **SJELLAND,** Denmark, the largest island of the kingdom, between the Cattegat and the Baltic, separated from Sweden by the Sound and from Funen by the Great Belt; it is 82 miles long by 68 miles wide and very irregular, its area being 2,636 square miles, including the two islands Möen and Samsöe, 2,793 square miles; it is three miles from Sweden and 11 miles from Fünen. It has no mountains; but the surface is finely variegated, having small hills and fields of a fertile soil, intersected by canals. It produces large crops of corn, and has excellent pasture. Besides several other towns of considerable importance, it contains the fortress of Elsinore or Helsingör, and the capital and royal residence, Copenhagen. Pop. about 960,250.

ZEALAND, or **ZEELAND,** Netherlands, a province bounded south by Belgium, west by the North Sea, east by North Brabant and northeast by South Holland; area, 690 square miles. The capital is Middleburg, in the island of Walcheren; principal seaport town, Flushing. The province consists of a low-lying tract of land on the frontiers of Belgium and on the southern shore of the estuary of the Schelde, and of the islands of Walcheren, North and South Beveland, Schouwen, Tholen, etc., separated from each other and from the mainland by arms of the Schelde, from which and from the North Sea it is protected by dikes. As a whole the province is flat and fertile, producing excellent crops of the ordinary cereals, a considerable quantity of clover, rape and madder, and a superabundance of excellent fruit. The grass lands also are rich and extensive. The climate is rather moist, but comparatively healthful. Large tracts partially covered by the sea have in recent times been successfully reclaimed. Pop. (1936) 253,857.

ZEALOTS (Greek, *zelotes,* enthusiasts, followers and strong supporters), a sect of the Jews, composed of the more fanatical elements opposed to Roman rule. They led a revolt against the Romans in 6 A.D., and after that frequently robbed and murdered those whom they knew to be supporters of or sympathizers with the Romans. Felix tried to suppress them by crucifying all of the sect whom he could capture, but this only caused an increase in the number of their acts of violence. They continually stirred up the Jews against the Romans, and were largely influential in bringing on the Jewish War of 66–70, which resulted in the overthrow of Jerusalem.

ZEBALLOS, thā-bäl'yōs, or **CEBALLOS, Pedro** (Zeballos Cortes y Calderon), Spanish general: b. Cadiz, 29 June 1715; d. Cordova, 26 Dec. 1778. Entering the army as a cavalry captain in 1738, he became a lieutenant-general in 1755 and was dispatched to Buenos Aires as governor the next year. On the outbreak of the war with Portugal and England in 1762, Zeballos besieged the Portuguese port of Colonia de Sacramento, near the entrance of the Uruguay River, forcing its surrender 2 Nov. 1762, and capturing 26 English ships in its harbor. He returned to Spain in 1767 and in 1777 was made viceroy of the newly established viceroyalty of La Plata. On his way thither he wrested Santa Catharina from the Portuguese and retaking Colonia de Sacramento, which had reverted to Portugal since its former capture, destroyed it. He was relieved of his duties in 1778 and returned to Spain where he died shortly after his arrival.

ZEBID, zĕ-bēd', Arabia, a town in Yemen, on the inland route from Hodeida to Mokha, 60 miles north of the latter. It was formerly the seat of a long line of princes, and was famous for its commerce and learning. In the neighborhood are ruins of ancient cities. The population has dwindled to 9,000 inhabitants.

ZEBRA, the name of several animals, natives of Africa, belonging to the family of the horses. The zebra belongs to the same general type as the ass, distinguished from *Equus* (the horse) proper by smaller size and by having the body more or less banded black upon yellowish. The forelegs only possess the «warts,» seen in both fore- and hind-legs in the horses; and the tail is «tufted.» The typical or mountain zebra (*Equus zebra*) inhabits South Africa, but it is now almost extinct. A few specimens, however, are strictly preserved in the mountainous districts of eastern Cape Colony, where, until about 1875, they abounded in herds on the plains. The body is cream-colored, its characteristic bands being deep black. The stripes are drawn at right angles to the axis of the body. The legs are striped right down to the hoof, but the under part of the body has no stripes. The neck bears a faint development of skin or dew-lap, and the mane is very short. The animal was long considered untamable, but experiments made since 1872 have shown that with proper treatment it can be made to work well in harness. Any general utilization and improvement of it, however, seems impracticable. The dauw, or Burchell's zebra (*Equus burchelli*), is higher and more graceful than the true zebra and is the one commonly seen in menageries. Its stripes are narrower and somewhat differently disposed from those of the true zebra, and extend under the belly, but are absent from the lower part of the legs. It has been

driven northward, and is now rare even in the Transvaal. Chapmann's zebra (*E. chapmanni*) is another variety, found from Bechuanaland north to the Sudan. Grévy's zebra (*E. grevyi*) is restricted to Abyssinia and Somaliland. The quagga (q.v.) is a near ally of the zebras. Consult Lydekker, 'Royal Natural History' (Vol. II, London 1895); Tegetmeier and Sutherland, 'Horses, Zebras, Mules and Mule-breeding' (London 1895).

ZEBRA PARRAKEET, an Australian or East Indian parrot. See BUDGERIGAR.

ZEBRA-SHARK. See TIGER-SHARKS.

ZEBRA WOLF, an early colonial name for the wolf-like, striped, predatory marsupial of Tasmania. See DASYURE.

ZEBRA WOOD, *in botany* and commerce: (1) A kind of wood imported from South America, and used by cabinet makers, produced by *Connarus guianensis* (*Omphalobium lamberti*), a large tree belonging to the natural order *Connaraceæ,* and growing in Guiana. Its colors consist of brown on a white ground, clouded with black, and each strongly contrasted, thus somewhat resembling the skin of a zebra. It is also called pigeon wood, and is used for furniture. (2) The wood of *Eugenia fragrans,* variety *cuneata.* It is a shrub about eight feet high, growing in Jamaica. (3) The wood of *Guettarda speciosa,* an evergreen tree 25 feet high, with scarlet-colored flowers, growing in the East Indies.

ZEBU, zĕ-boo′ or thā-boo,′ Philippines. See CEBU.

ZEBU. See INDIAN HUMPED CATTLE.

ZEBULUN, zĕb′ū-lŭn, or **ZEBULON,** the 10th of Jacob's 12 sons, and the sixth and last by his wife Leah (Gen. xxx, 19–20). Of his individual history nothing is related in the Scriptures, but his name was given to one of the 12 tribes of Israel, and to a region of Palestine. At the time of the exodus from Egypt the tribe of Zebulon moved in the van, following the tribes of Judah and Issacher. The territory of the tribe lay in the fertile hilly country to the north of the plain of Jezreel, and included Nazareth. The tribe of Zebulon was inferior in importance to several of the other tribes and its tribal existence closed when Tiglath-Pileser carried its principal members, with the northern tribes, into captivity (2 Kings xv, 29).

ZECH, Frederick, Jr., American pianist and composer: b. Philadelphia, Pa., 10 May 1858. Taken to San Francisco when very young, he began to study music there and afterward studied in Berlin, 1877–82. Since the year last named he resided in San Francisco, where he was conductor of the symphony orchestra and gave many piano recitals. Among his many compositions are four symphonies, four concertos for piano and orchestra, a concerto for violin, one for 'cello; two string quartettes; three sonatas for violin and piano; two for clarinet and piano, one sonata for 'cello and piano, one for flute and piano; several symphonic poems: 'The Eve of Saint Agnes,' 'The Raven'; 'Lamia' after Keats, and 'The Wreck of the Hesperus' after Longfellow; operas 'The Cruise of the Excelsior' and 'Wakinyon,' a North American Indian Opera, sonatas and songs. He died, 25 Oct. 1926.

ZECHARIAH, zĕk-ą-rī′ą, the 11th in order of the Hebrew writers known as minor prophets. Little is known of his personal history, but he first publicly discharged his office as priest in the second year of Darius 519 B.C. He is called in his prophecy the son of Berechiah and the grandson of Iddo, but in the Book of Ezra (v, 1; vi, 14) he is termed "the son of Iddo." He was priest as well as prophet and is associated with the prophet Haggai. Tradition states that Zechariah had much to do in furnishing the liturgical services of the temple, and in the Septuagint and Vulgate versions several psalms are attributed to him. He deals in his prophecy with the same objects as occupied the mind of the prophet Haggai. His style is characterized by symbolic vision and dramatic action. It is distinctly Apocalyptic. This form of prophecy never predominated until after the Exile and seems to have constituted an element in the last and most powerful appeal made by the mouthpieces of Jehovah to the heart and conscience of His people.

Contents of the Prophecy.— The great portion of the Book consists of a series of visions intended to represent grounds for national confidence and to encourage national effort. The prophecy opens with an exhortation to repentance and a warning against neglect of the prophet's word. The remainder of the book consists of two sections. The first section runs from chapters i to vi.

Ch. i, 15, contains nine symbols, mostly visions, accompanied by their interpretations.

Ch. i, 8–17, a vision of the horses of Jehovah, which, as His messengers, report to Him; along with His reply.

Ch. i, 18–21, four horns, representing the opponents of Israel, are broken.

Ch. ii, a man with a measuring-line lays out the restored Jerusalem.

Ch. iii, Joshua, the high priest, is accused by Satan, and acquitted, and is honored with commissions and revelations from Jehovah.

Ch. iv, the beautiful symbol of the golden candlestick and two olive trees, with the practical application of encouragement to Zerubbabel.

Ch. v, 1–4, a flying roll recording a curse upon immoral actions.

Ch. v, 5–11, an ephah measure containing a woman is seen carried away to Babylon.

Ch. vi, 1–8, four chariots, each having horses of a particular color, are the four heavenly spirits charged to carry out God's purposes in the earth.

Ch. vi, 9–15, the symbolical action of crowns of silver and gold being made and placed upon the head of Joshua the high-priest, who thus represents the Messiah-priest upon His throne.

The second section runs from chapters vii to xiv. In ch. vii the prophet, in answer to a question as to observance of a certain fast replies that the true fast is justice, mercy and piety, which had been so much neglected in earlier generations. This suggests, in ch. viii, the coming Messianic time, when the city shall be populous and happy under the renewed protection of Jehovah, and the fasts shall be joyful

feasts, attended by multitude of strangers seeking His favor.

There is so much that is matter of dispute in ch. ix–xiv, as regards their date and immediate application, that we shall have to content ourselves with a summary and a few general remarks. The contents are largely symbolical and figurative. Ch. ix–xi, form a division by themselves, perhaps written by the Zechariah of Isa. viii, 2. It has an entirely different historical setting from that of ch. i, 8. Here we are transported back to the 8th century B.C. Ch. ix, 1–8, refers to conquests made by Tiglath-pileser III (745–727 B.C.). Northern Israel is still in existence, and Assyria is still in its "pride" (x, 10ff). These allusions form part of the very texture of the prophecy, and are assumed by some to be old fragments embedded in a post-Exilic work.

Ch. ix, 1–8, Syria, Phœnicia and Philistia are to be brought low. Yet a remnant of the Philistines shall be united with Judah, and both shall be under the protection of Jehovah. Ch. ix, 9–17, the Messiah shall come as the Prince of Peace to restore the dispersed of Israel, and save them from their enemies. Ch. x, the people are entreated to turn to Jehovah in their troubles, and not to diviners and images. Jehovah will be the defender alike of Judah and Israel, restoring and strengthening them and bringing low their oppressors. Ch. xi announces the shock of war which appals the rulers of Judah (ver. 1–3). The rest of the chapter is allegorical. It represents Jehovah as rejected by His people, they being in turn rejected by Him, their true Shepherd. By an expressive figure, the brotherhood of Judah and Israel is declared to be broken. Ch. xii, 1 to xiii, 6, the nations come against Jerusalem; but Jehovah defends and saves it. The conflict is shown to be spiritual, for a spirit of grace and supplication is to be poured upon Judah and Jerusalem. Also a fountain is to be opened for the cleansing of guilt, and the idols and false prophets are to be banished. Ch. xiv — Again Jerusalem is besieged, and this time it is taken, half the people going into exile; but the residue are saved. After various figurative illustrations of the processes and results of the Messianic reign, it is declared that the survivors among the nations shall go up to worship in Jerusalem, which shall be wholly consecrated to Jehovah.

ZECHARIAH, Book of. One of the generally accepted results of Biblical criticism is the conclusion that Zechariah i–viii are the work of the prophet whose name they bear, but that the remainder of the book, chapters ix–xiv, was written by another author or authors. The reasons for this conclusion will be given later. The first part, chapters i–viii, will be discussed by themselves, followed by a consideration of the remaining chapters.

Zechariah the prophet is doubtless to be identified with Zechariah the priest of Nehemiah xii, 16, see also xii, 4. He was probably the son rather than the grandson of Iddo, see Ezra v, 1, vi, 14, the phrase "the son of Berechiah" in Zechariah i, 1 being a later addition, resulting from a confusion with Zechariah the son of Jeberechiah mentioned in Isaiah viii, 2. The evident interest of Zechariah in the temple is in accord with his priestly descent. But his general outlook is more prophetic than priestly, as in the case of the other priest-prophets, Jeremiah and Ezekiel. Zechariah doubtless returned from the exile in the company of Zerubbabel along with his father, Iddo, Nehemiah xii, 1–4.

These chapters are given precise dates, in the years 520–518 B.C. The historical circumstances of that time are well known. The return from the Babylonian exile under Zerubbabel had taken place some 16 years before. A beginning of the rebuilding of the temple had been made at that time, if the data are historical, but it is evident that little progress had been made. The people became discouraged, they were few in numbers, surrounded by enemies, with precarious conditions of existence. The attempt to rebuild the temple was soon given up, and the people resigned themselves to a discouraged selfish life. Haggai began his prophetic ministry in 520, endeavoring to encourage the people to rebuild the temple. His message centred about this thought, accompanied by denunciation of the people for their sins and indifference. About two months later came the first message of Zechariah. Both prophets speak as if there had been no return from the exile in any true sense. The return announced in prediction, especially by Deutero-Isaiah, was to be a glorious return, accompanied by signal manifestations of the power of Yahweh. Such a return had not taken place. Zechariah speaks of the people, therefore, as still in captivity, and the return as yet of the future. Zechariah continues and amplifies the work of Haggai. His specific object is the rebuilding of the temple, but he seeks the attainment of this end by a presentation of the glorious future in store for the nation.

There are probably no important later additions in these chapters. iv, 6b–10a is probably by Zechariah, but does not belong in its present position where it interrupts the connection. The meaning in vi, 11–13 has been obscured by textual corruption, which will be considered later.

Chap. i, 1–6 is a hortatory introduction, dated in 520. The main part of the collection consists of i, 7–vi, 15, bearing the date of 519. This is made up of eight visions and their interpretations, with an appendix. The interpreter is an angel, a feature original with Zechariah. The first three visions, i, 7–ii, 13, present various features in the coming return from the captivity; iii–iv, except iv, 6b–10a, deal with the two leaders of the people, Joshua the priest and Zerubbabel the Davidic prince, teaching the removal of the guilt of Joshua and of the nation and the divine favor which will attend both these leaders; v, 1–vi, 8 contain three visions, dealing with the purification from sin of the restored people. vi, 9–15 contains a historical appendix to the visions. This predicts, in accord with Haggai, that Zerubbabel is to be manifested as the Messiah, rebuilding the temple and bringing deliverance to the people, while Joshua is to be closely associated with him. The principal place, however, is occupied by Zerubbabel. Verse 11 doubtless originally mentioned only one crown, for Zerubbabel, this being required by the con-

text. How the verse originally read is a question; perhaps the latter part should be omitted. In verse 13 the phrase «and he shall be a priest upon his throne» should be read «and there shall be a priest upon his right hand,» with the Septuagint. The changes in the text as it now is were doubtless intentional, introduced later when it was seen that Zerubbabel was not the Messiah. For the interpretation here given compare verse 13 with iv, 8. Chaps. vii–viii give an account of the visit of men of Bethel to the prophet with inquiries concerning fasting, with special reference to the fast commemorating the destruction of Jerusalem. The prophet answers that the future will be a time of joy and rejoicing rather than of fasting and sadness.

The thought of Zechariah shows much similarity to that of the earlier prophets, with which he is evidently familiar, and his phraseology also shows the impress of their influence. He demands faithfulness to Yahweh and the observance of ethical standards, in accord with the highest teaching of the pre-exilic prophets.

The activity of angels is specially prominent in these messages of Zechariah. The superhuman adversary, Satan, also appears here for the first time, iii, 1–2.

There are practically no resemblances between chapters ix–xiv and i–viii, while there are many differences. The first chapters, those of Zechariah, are precisely dated, the second part has no dates; the first part has visions, the second not; the first part makes the temple especially prominent, it is hardly alluded to in the second part; the first part reflects the Persian period, the second part has no certain references to it; and the peaceful outlook of the first part has become warlike in the second part, and is characterized, in certain portions, by a bitterness of feeling toward other nations hardly paralleled elsewhere, see ix, 1ff, 13ff, xii, 1ff, etc. The nations mentioned are not those of the Persian period, Hadrach and Damascus, ix, 1, Hamath, ix, 2, Greece, if the text is correct, ix, 13, and Assyria and Egypt, x, 10. The Messianic picture of the second part, ix, 9–10, is the ordinary one of a Messianic king of the future, his reign in this case to be preceded by the destruction of enemy nations, in contrast with Zechariah's conception of Zerubbabel, the prince already present, as the Messianic king, himself bringing deliverance.

The question to what period chapters ix–xiv belong has been much disputed, which is also true of the further question whether they are the work of one author, or of more than one.

The following features are claimed to be references to a pre-exilic situation. The northern kingdom, it is said, is still in existence, ix, 10, 13; xi, 14; Egypt and Assyria are contemporary nations of the writer, x, 10f; idolatrous conditions, 10, 1f, are thought to indicate this period; and the nations mentioned with threats, ix, 1–7, are said to be those of this time, see Amos i, 3–10. The pre-exilic date usually assigned is about the time of Amos.

There is a growing tendency, however, to assign these chapters to the time after the exile, and usually to the Greek period. Little dependence can be placed on the mention of the Greeks as a present power, ix, 13, for there is considerable reason to think that these words may be an addition. The nations which are here denounced were prominent during the time of conflict between the Seleucidæ of Syria and the Ptolemies of Egypt. Egypt and Assyria, on this view, designate the Ptolemies and the Seleucidæ; such a usage probably has parallels elsewhere, as in Micah v, 5f, which at least uses the term Assyria after Assyria had passed away. These chapters contain evident allusions to the captivity, ix, 11f, x, 6–9. There is no reference to a Davidic king as reigning in Jerusalem, the Davidic family being like the other noble families, xii, 7, 12ff. The general character of the message is not like that of pre-exilic prophecy, it has characteristics which are usually called apocalyptic, found in Ezekiel xxxviii–xxxix, Joel iii, Isaiah xxiv–xxvii, etc. These characteristics are partly vagueness and obscurity; in part the form of presentation of the future, the nations are to attack Israel and Yahweh is to destroy them; and especially the great extravagance of representation, found particularly in chapter xiv. The priestly tone, manifesting itself in the great emphasis upon the externals of worship and upon holiness, is also a mark of the later time.

The inconclusiveness of some of the arguments given above for a pre-exiiic date has already been noted. Further, the mention of the northern kingdom is not out of harmony with the postexilic period, for a return of Ephraim along with Judah was a part of the prophetic expectation, see Ezekiel xxxvii, 16ff. Idolatry is not unknown after the exile, contrary to the view often maintained, see Malachi iii, 5.

The indications which have been mentioned point to the Greek period for chapters ix–xiv. There are many obscurities in these chapters, so that the interpretation is not always certain. But there are variations in the representation which make it probable that these chapters are not entirely the work of one author, or of entirely the same period. Especially to be noted is the optimistic tone in ix, 11–xi, 3, in which the restoration of the people from captivity under favorable national conditions is indicated. In xi, 4–17, xiii, 7–9, however, the tone is one of pessimism. Here severe oppression by their captors has aroused intense bitterness toward them. Such oppression seems to have characterized the reign of Ptolemy Philopator, 222–205 B.C., after the battle of Raphia, 217 B.C. These portions, therefore, seem to have been written after 217 B.C., while the more optimistic portions are somewhat earlier under more favorable conditions. It may be that the earlier portion includes all of ix, 1–xi, 3, and the later xi, 4–xiv, 21. But it is also quite possible that there are more than two authors.

In the whole of chapters ix–xiv the principal thought is the future expectation of the nation. In the first part it is a message of hope and national restoration, accompanied by punishment of the enemies. In the second part there is a note of discouragement, finding expression in bitterness against the oppressors. The destruction of these oppressors is portrayed with expressions of hate in chapter xiv. The ethical teaching concerning the present-day conditions, so characteristic of the earlier prophets and of Zechariah himself, is not found here. The hope for the future of

the nation is principally in Yahweh's manifestation of his power against the nations, rather than in the cooperation of the nation with God.

GEORGE RICKER BERRY.

Late Professor Emeritus of Old Testament Interpretation and Semitic Languages, Colgate University.

ZEDEKIAH, zĕd-ē-kī'ȧ, the last king of Judah of the line of David: r. 598–587 B.C. A younger son of Josiah and Hamutal, he succeeded his brothers Jehoahaz II and Jehoiakim and his nephew Jehoiachim, who was deposed by Nebuchadnezzar II in 598 B.C. He was appointed regent of Judah by Nebuchadnezzar, who also changed his name from Mattaniah to Zedekiah. As regent, Zedekiah swore allegiance to Nebuchadnezzar, but he entered into intrigues with Egypt, contrary to the command of the prophet Jeremiah.

Nebuchadnezzar sent a punitive expedition to Jerusalem in 589 B.C., and the city underwent a terrible siege. After a year and a half, famine drove Zedekiah and his people into the countryside, and Zedekiah was captured in the plains of Jericho. He was compelled to see his sons executed; his eyes were put out; and he was taken to Babylon, where he remained a prisoner until his death.

Consult II Kings 24, 25; Jeremiah 27, 37, 38, 39, 52; II Chronicles 36; Ezekiel 12, 17.

ZEDLITZ, tsā'dlĭts, BARON **Joseph Christian, von**, Austrian poet and official: b. Johannisberg Castle, Austrian Silesia, Feb. 28, 1790; d. Vienna, Austria, March 16, 1862. After serving in the Austrian army in the Napoleonic wars, he settled at Vienna and devoted himself to literary work. Of romantic, Catholic, and liberal-monarchic outlook, he entered the Austrian chancellery under Prince Metternich in 1836 and subsequently became increasingly attached to conservatism. He was the author of romantic lyrics and dramas, notably *Totenkränze* (1828), elegies on the vanity of human greatness, and *Waldfraülein* (1843), a verse fantasia of mystical and sentimental tendency. He was also the author of a celebrated translation (1836) of Lord Byron's narrative poem *Childe Harold's Pilgrimage*.

ZEDLITZ, BARON **Karl Abraham, von**, Prussian official: b. Schwarzwaldau, Prussia, Jan. 4, 1731; d. Kapsdorf, March 18, 1793. He served in the Prussian ministry of justice after 1755 and became a minister of state in 1770. He had charge of the Prussian department of religion and education between 1771 and 1788.

ZEDLITZ-NEUKIRCH, tsā'dlĭtz noi'kĭrĸ, BARON **Octavio Athanis, von**, German politician: b. Glatz (Kłodzko), Prussia, Dec. 6, 1840; d. Berlin, March 31, 1919. He led a conservative faction in the Prussian diet between 1877 and 1918.

ZEDOARY, zĕ'dō-ĕ-rĭ,-ē-rĭ, an herb (*Curcuma zedoaria*) of the ginger family, native to Asia, and used in India as a flavoring and a medicine. Its rhizomes, or rootstocks, are aromatic, bitter, and pungent. Zedoary promotes sweating and acts as a stimulant.

ZEEBRUGGE, zā'brüg-ĕ, seaport, Belgium; in West Flanders province; on the North Sea, nine miles from Brugge (Bruges). It is connected with Brugge by a ship canal. It was developed as a port between 1895 and 1907, when extensive docking and storage facilities were constructed. A German submarine base in World War I, it was attacked, April 22, 1918, by a British naval force that destroyed the harbor mole and scuttled blockships at the entrance to the Brugge canal. Zeebrugge is the terminal of the train ferry to Harwich.

ZEELAND, zā'länt, **Paul van**, Belgian economist and statesman: b. Soignies, Belgium, Nov. 11, 1893. He was educated at Louvain and Princeton universities, and was subsequently on the faculty of Louvain University (1928–1940; 1945–) and a vice governor of the national bank of Belgium. As prime minister of Belgium between 1935 and 1937, he instituted a program of social and fiscal reform, devaluating the currency and suppressing the Rexists, a Belgian fascist party. Long an advocate of international economic cooperation, he was foreign minister of Belgium between 1949 and 1954 and was a member of the Belgian delegation to the Council of Europe. He is the author of numerous publications, notably *Réflexions sur le plan Quinquennal* (1931), *Regards sur l'Europe 1932* (1933), and *Economics or Politics?* (1939).

ZEELAND, Denmark. See ZEALAND or SJELLAND.

ZEELAND or **ZEALAND**, zē'länd, Du. zā'länt, province, Netherlands. It comprises part of the mainland bordering the North Sea south of the Schelde estuary, and several offshore islands, notably Walcheren, North and South Beveland, Schouwen-Duiveland, and Tholen. The province is mostly below sea level and is protected by dikes. It produces cereals, vegetables, flax, and fruit. In addition to agriculture and dairying, the principal occupations of the population are mussel and shrimp fishing and processing, oyster culture, and flax spinning. Coke production and associated coal-tar chemical industries are important at Terneuzen and Sluiskil.

The principal towns are Middelburg (1947 pop., 20,605), the capital; Vlissingen (Flushing, 20,217), Goes (12,762), Terneuzen (9,492), and Sas van Gent (3,512). Most of the population are scattered in small villages or isolated homesteads. About 25 per cent are Roman Catholic.

In 1303, Zeeland was annexed to Holland by Count William III. It was joined to the United Provinces of the Netherlands during the reign of Stadholder William III (1672–1702). Area 651 square miles; pop. (1953) 275,148.

ZEEMAN, zā'män, **Pieter**, Dutch physicist: b. Zonnemaire, Zeeland, May 25, 1865; d. Amsterdam, Oct. 9, 1943. From 1897 to 1900 he was lecturer at the University of Leyden; afterwards professor of physics at the University of Amsterdam and director of the Physical Institute there from 1908. In 1896 he discovered the spectroscopic phenomenon known as the Zeeman Effect (q.v.) and was awarded the Baumgartner prize at Vienna; the Wilde prize at Paris, and (with Hendrik A. Lorentz) one half of the Nobel prize in physics in 1902. He wrote *Messungen über das kerrsche Magneto-optische Phänomen* (1893); *Experimentaluntersuchungen über Teile die kleiner als Atome Sind* (1900); *Researches in Magneto-Optics* (1913).

ZEEMAN EFFECT, a phenomenon of physics in which spectrum lines are broadened, or split into two or more components, in the presence

of a strong magnetic field. The effect was discovered by Pieter Zeeman (q.v.) in 1896.

Any substance, when heated to incandescence and viewed through a spectroscope, exhibits a spectrum pattern characteristic of the chemical elements or compounds of which it is composed. (See SPECTROSCOPY.) A glowing gas or superficially vaporized solid or liquid at low pressure emits a spectrum of bright lines. Modern chemistry assigns a "discrete" origin to each spectrum line, with its emitted light being produced by a single vibrating electron.

If such a luminous source is placed between the poles of a powerful electromagnet, and the magnet current is turned on, while the source is viewed through a spectroscope, the Zeeman Effect is apparent in the line-splitting which results. A high spectroscopic resolving power is required in order for the phenomenon to be observed. Light radiation, being formed of transverse waves, is subject to the phenomenon of polarization. (See article on POLARIZED LIGHT.) The effect of an electromagnetic field is to cause the spectrum-emitting radiation to be either plane- or circularly polarized, or both simultaneously, depending upon the angle from which the phenomenon is seen.

When the light source is viewed through a hole in one of the magnetic poles, along an axis in the same plane as the magnetic field, the emitted light is circularly polarized, and a spectrum "doublet" is formed. The original single line is split into two components, circularly polarized in opposite directions, with each line possessing a slightly different wavelength from the original. The doublet lines are equally spaced on opposite sides of the previous position of the single line, and each of the constituent lines has only one half the intensity of the original. The line whose light-emitting electron is polarized in the same direction as the field existing around the core of the magnet will have the shorter wavelength of the two. The original central line is not seen, since the electron producing it is vibrating directly along the axis of sight. The separation of the lines is directly proportional to the magnetic field strength and is constant for any chosen wavelength.

When the light source is viewed at right angles to the magnetic lines of force, the original single spectrum line becomes three, the two new lines being displaced at equal distances on either side of the still visible original line. This group of lines is known as a "normal triplet." The central component is polarized with its electrical displacement parallel to the plane of the magnetic field; the two side components are plane-polarized at right angles to this field. The wavelengths of the outside lines of the triplet are the same as those of the previously mentioned doublet lines. More complex patterns of multiplet lines are also sometimes formed.

One of the most useful modern applications of the Zeeman Effect is in the study of the electromagnetic nature of sunspots. (See SUN.) Being composed of incandescent gas at relatively low pressure, a sunspot produces a bright-line spectrum. But sunspots also act as huge rotating vortices of gas, displaying strong electromagnetic activity. Accordingly, the line-splitting of the Zeeman Effect is prominently displayed in spectroheliograms of sunspots. From the direction and amount of shifting of the lines, the polarity of the spot may be determined, as well as its magnetic intensity. In the same manner as in the laboratory experiment, a spot near the center of the sun viewed face-on shows two circularly polarized spectrum lines; a spot near the limb (circumference) of the sun viewed edge-on reveals three plane-polarized components. Hence the magnetic field of the spot is shown to be perpendicular to the sun's surface.

The Zeeman Effect also provides an effective means of determining the ratio of the charge of an electron to its rest-mass, a basic proportion of physics.

Science Editor, "The Encyclopedia Americana."

ZEGHERS, SEGERS, or **SEGHERS,** zā'gĕrz, **Daniel,** Flemish painter: b. Antwerp, Spanish Netherlands (now Belgium), Dec. 5, 1590; d. Nov. 2, 1661. A pupil of Jan Brueghel the Elder, he entered the Jesuit order in 1614 and subsequently painted numerous works for the church of the Jesuit college at Antwerp. He specialized in pictures of flowers, but also produced many studies of religious subjects, generally represented as being framed within stone niches adorned with garlands. He had many imitators. Works by Zeghers are in the collections of museums at Amsterdam, Antwerp, Berlin, Brussels, Dresden, Stockholm, and Vienna.

ZEHDENICK, tsā'dĕ-nĭk, town Germany, on the Havel River, 30 miles north of Berlin. It is a chemical and flour-milling center, and the northern terminus of the Voss Canal. A 16th century convent and the ruins of a 13th century Cistercian monastery are in the town. After World War II, Zehdenick was included in the German Democratic Republic (East Germany). Pop. (1946) 13,246.

ZEILA, ZEILAH, or **ZEYLAH,** port town, British Somaliland, on the Gulf of Aden, 25 miles southeast of Djibouti, French Somaliland. It is located on a small peninsula between two shallow bays, and large ships are compelled to anchor some distance offshore. The surrounding region is desolate, but Zeila is astride the most direct trade route between Harar, Ethiopia, and Aden. It exports coffee, hides, sheep, and mother-of-pearl; it imports rice, cotton, dates, and silks. The population, which fluctuates with the seasons, varies between 3,000 and 7,000.

ZEISBERGER, tsīs'bĕr-gĕr, Eng. zīs'bûr-gĕr, **David,** American Moravian missionary among the Indians: b. Zanchtenthal, Moravia, April 11, 1721; d. Goshen, Ohio, Nov. 17, 1808. Educated in Saxony, he emigrated to Georgia in 1738 and in 1740 went to Pennsylvania, where he was one of the founders of the towns of Bethlehem and Nazareth. In 1743 he became a missionary to the Indians, and labored until the breaking out of the Indian war in 1755 among the Delawares at Shamokin (Sunbury, Pa.), and the Iroquois at Onondaga. In the time of the Pontiac conspiracy, he assisted in ministering to the Christian Indians for whom the governor of Pennsylvania had provided a refuge at the barracks at Philadelphia. Peace having been concluded, he led the remnant of these Indians

to Wyalusing, on the Susquehanna, in Bradford County, Pa. In 1767 he penetrated through the wilderness to Goshgoshunk, on the Allegheny, in Venango County, and established a church among the Monseys. He removed with his flock in 1770 to the Beaver Creek, and began another station, called Friedenstadt, in what is now Lawrence County; two years later he explored the Muskingum region, in the present State of Ohio, and laid out an Indian town, Schoenbrunn, on the Tuscarawas. After a time he was joined by all the Moravian Indians of Pennsylvania, whom the march of civilization drove westward. Two more towns were built, a number of other missionaries entered the field, and many new converts were added. In 1782 the Wyandots fell upon the settlement of the Christian Indians at Gnadenhutten and massacred many of them. This was a death blow to the Moravian mission among the Indians. With a small remnant Zeisberger built an Indian town, in what is now the State of Michigan, but in 1786, at the head of a small band of followers, he returned to Ohio, and in the following year commenced a new settlement, which he called New Salem, in Huron County. In 1791 the hostility of other Indians obliged them to emigrate to Canada, where they founded Fairfield, on the river Thames. In 1798 the United States Congress having granted to the Moravian Indians the tract of land in Ohio upon which they had formerly been settled, Zeisberger returned to that country with some of his converts, and near the ruins of their once flourishing towns established a new station, to which he gave the name of Goshen. There he preached the remaining 10 years of his life. His published works are a 'Delaware and English Spelling Book' (1776); 'A Collection of Hymns in Delaware' (1803); 'Sermons to Children,' in Delaware (1803). In recent years have appeared his 'Dictionary in German and Delaware' (1887); 'Diary of David Zeisberger 1781–98' (1888); and 'Essay toward an Onondaga Grammar' (1888). Consult Schweinitz, 'Life and Times of David Zeisberger' (1870).

ZEISING, tsī'sĭng, **Adolf,** German writer on æsthetics: b. Ballenstedt (Anhalt), 24 Sept. 1810; d. Munich, 27 April 1876. He wrote 'Neue Lehre von den Proportionen des menschlichen Körpers' (1854); 'Æsthetische Forschungen' (1855); 'Religion und Wissenschaft' (1873); and several works of fiction. For a time he held a professorship in the Bernburg (Anhalt) gymnasium, but after 1853 devoted himself to letters, residing generally in Munich.

ZEISLER, Fannie Bloomfield, American pianist: b. Bielitz, Austria, 1865. When she was two years of age, her family emigrated to the United States and settled at Chicago, where she showed an early aptitude for the piano. Her first teacher was Bernard Ziehn of Chicago, and she studied later under Carl Wolfsohn in this country. In 1878, she went to Vienna where she studied for five years under Leschetizky, and also made her début in 1883. In 1885 she married Sigmund Zeisler, a Chicago lawyer. Until 1893 she played in concerts in the United States; then toured Germany (1893–95), England in 1898, and returned to America for an extended tour in that year. In 1902, she was again in Europe, touring Germany, Austria and France. After 1903 she remained in the United States, with the exception of one concert tour in Europe in 1912. She was a prominent member of literary and musical clubs in Chicago. Mrs. Zeisler's playing met with the greatest praise. Her interpretation was of much intellectual depth. She founded Fannie Bloomfield Zeisler Musician's Relief Fund, Chicago, in 1925. Died 20 Aug. 1927.

ZEISS, tsīs', **Carl,** German optician: b. Weimar, 11 Sept. 1816; d. Jena, 3 Dec. 1888. He was educated for the medical profession. In 1846 he founded the Carl-Zeiss factory at Jena, which made his name famous the world over as a manufacturer of all sorts of optical instruments. Consult Auerbach, 'Das Zeisswerk und die Karl Zeiss Stiftung in Jena' (3d ed., Jena, 1907).

ZEISSBERG, tsīs'berk, **Heinrich von,** Austrian historian: b. Vienna, 8 July 1839; d. 27 March 1899. He received his education at the University of Vienna and was professor at Lemberg 1865–71. He was professor at Innsbruck 1871–72 and at Vienna 1872–97. He was head of the Institute for Research in Austrian History from 1891 to 1896 and after 1896 was director of the Imperial Literary. Among his works may be mentioned 'Die polnische Geschichtschreibung des Mittel alters' (1873); 'Der osterreichische Erbfol gestreit 1457–1458' (1879); 'Belgien unter der Generalstalthalterschaft Erzherzog Karls' (1893–94).

ZEITUN, zā-toon', or **ZEITAN,** Asiatic Turkey, a town in the vilayet of Marash, 25 miles northwest of Marash, in an iron-mining district, inhabited chiefly by Armenian Christians. The district is fertile but mountainous. The people, distinguished by their martial spirit and their immunity from crimes of violence, are descendants of the Armenian kingdom which existed in Cilicia from the 11th to the 14th century. A sanguinary conflict with Turkish troops soon after the Crimean War drew European attention to the community, and it was stopped by the intervention of the British and French consuls. In 1878, 1890 and 1895 they defended themselves successfully from Turkish oppression, securing favorable conditions of peace. The population suffered greatly from massacres during the European War. Pop. about 20,000.

ZEITZ, tsīts, Germany, a town in the province of Saxony, Prussia, on the Weisse Elster, 23 miles by rail southwest of Leipzig. A gymnasium, and a library in a former Franciscan monastery are among its educational institutions. It is a busy industrial centre with manufactures of woolens, cottons, calicoes, leather, hoisery, mineral oil, sugar, pianofortes, cycles, etc. Pop. 28,000.

ZELA, zē'lą, an ancient town of Asia Minor, in the Pontus, where Julius Cæsar defeated Pharnaces, king of Pontus and son of Mithridates, and announced his victory to the Roman Senate, in the famous brief dispatch, *Veni, vidi, vici* — «I came, I saw, I conquered.» This battle ended the war; Pharnaces escaped into Bosporus, where he was slain by his lieutenant, Asander; Pontus was made a Roman province, and Bosporus was given to Mithridates of Pergamus, 47 B.C.

ZELAYA, sâ-lä'yä, **José Santos,** Nicaraguan politician: b. Managua, Nicaragua, 1853; d. New York, N. Y., May 17, 1919, in exile. As a Liberal leader he engineered a revolution in 1893 against President Roberto Sacaza, who stood for a United States of Central America, and ruled as a dictator, though nominally president, from then until 1909. He took over the Mosquito Indian territory, which had been under British protection. His continual plots led him into conflict with the United States and Great Britain, and resulted in the Washington Conference of 1907. The expulsion of a British consul brought a demand for indemnity, and the execution of two American soldiers of fortune roused the United States to sever diplomatic relations. In 1909 an insurrection put Juan Estrada in power, and Zelaya went into exile. See also NICARAGUA—*History.*

ZELENY, John, American physicist: b. Racine, Wis., March 26, 1872; d. New Haven, Conn., June 19, 1951. Graduating from the University of Minnesota in 1892, he took his Ph.D. there in 1906, meanwhile having studied at the University of Berlin and at Cambridge University. Professor of physics at Minnesota from 1892–1915, he took that position at the Sheffield Scientific School, Yale University, in 1915 and retired as emeritus professor in 1940. He was the author of various papers on physics, particularly on the conduction of electricity through gases, and on kindred subjects.

ZELKOVA, zĕl'kō-vä, an elm-like tree. Five species are found in the Near East, in Crete, the Caucasus, and eastern Asia, and several in Korea, North China, and Japan. Of the family of Ulmaceae, the *Z. serrata* is used widely for timber, the Japanese prizing it especially for building. It makes fine furniture, the old wood being dark and having a beautiful grain. It is a graceful round-headed tree, and looks well in avenues or alone on a lawn. Other varieties are also grown for ornament in the United States, south of New England.

ZELL, tsĕl, **Karl,** German philologist and statesman: b. Mannheim, Baden, Germany, April 8, 1793; d. Freiburg-im-Breisgau, Jan. 24, 1873. A student in Heidelberg, Göttingen, and Breslau, he was made professor of philology at Freiburg in 1821, and as representative of the university in the first Baden chamber in 1831–1835, secured a reorganization of the system of higher education in the grand duchy. He was made a member of the council for higher studies, with the title of ministerial councilor. From 1848 until his retirement in 1855, he was professor of archaeology at Heidelberg. His scholarship is amply shown by his studies of Aristotle and the Aristotelian philosophy. From 1848–1855 he served in the lower chamber of the Diet of Baden, and was noted for his defense of the Roman Catholic Church against its enemies in that body. He was president of the assemblies of the Catholic Union in 1852 and 1853. He wrote books on Aristotle, Calderón, and Shakespeare, and the history of Baden.

ZELLER, tsĕl'lĕr, **Eduard,** German philosopher and theologian: b. Kleinbottwar, Württemberg, Germany, Jan. 22, 1814; d. Stuttgart, March 19, 1908. After studying at Tübingen and Berlin, he became professor of theology at Bern in 1847, and at Marburg in 1849, though opposed by the more orthodox. He forsook theology and the teachings of Hegel, returning to Kant, but after teaching philosophy at Heidelberg and Berlin, he retired to devote himself to historical studies. He founded the *Theologische Jahrbücher,* an important periodical which stressed the historical method in philosophy. Zeller's chief contribution to philosophical thought was in his work on the Greeks.

He published *Platonische Studien* (1839); his most important work, *Die Philosophie der Griechen* (1844–1852; new editions 1921–1923), which became a standard textbook; *Staat und Kirche* (1873); *Geschichte der deutschen Philosophie seit Leibniz* (1873, 1875); and works translated into English, notably *Socrates and the Socratic Schools* (1868); *Stoics, Epicureans and Sceptics* (1870); *Plato and the Older Academy* (1876); *The Pre-Socratic Philosophy* (1881); *The Eclectics* (1883); and *Aristotle* (1897).

ZELLER, zĕl-lâr, **Jules Sylvain,** French historian: b. Paris, France, April 23, 1820; d. there, July 25, 1900. A student in Paris and in Germany, he afterward held the chair of history successively in the lycées of Rennes, Bordeaux, and Strasbourg, in the faculty of Aix and in the Paris Normal School. In 1863 he was made professor of history in the École Polytechnique; in 1874 a member of the Academy of Moral and Political Sciences, and from 1867–1888 was inspector general of higher education. His works include *Les Empereurs Romains* (1863); *Entretiens sur l'histoire du moyen âge,* 4 vols. (1884–1888); *Pie IX et Victor Emmanuel II* (1879); and *Histoire de l'Allemagne* (1872–1894).

ZEMSTVO, zĕmst'vō, or **ZEMSKIYA UCHREJDERIYA** (district institutions), a Russian political body, originally designating the country people, but later used for the governments and their representative bodies, comparing with the state and provincial legislatures in the United States and Canada. The Zemstvo was first mentioned by Czar Alexander II in an imperial edict of 1859, and was officially recognized by him in January, 1864, as a governing institution. Its original intent was the greatest possible development of local home rule, the members of the district assemblies or zemstvos being elected by three different electoral classes—the landowners, the city people, and the country inhabitants—thereby introducing for trial a sort of constitutional representation.

Before long, however, dissensions arose, the central government accusing the zemstvos of assuming too much authority, of becoming too liberal, and by several edicts the orderly development of these districts was checked. Finally by the edict of June 1890, the zemstvo representation was limited to two classes of citizens—the hereditary and personal nobility and the burghers of the cities—thus depriving the peasants entirely of their briefly held elective franchise, their representatives afterward being selected by the governors and by members of the volost assemblies.

ZENANA MISSION, a mission founded in 1852 under the auspices of the Protestant missionary societies in India, with the object

of Christianizing women of the higher classes in the zenanas (harems) to which women missionaries had access. Most of the Anglican members seceded in 1880 to form the Church of England Zenana Missionary Society, later renamed Zenana, Bible, and Medical Mission. Cooperating with Anglican and Presbyterian missions it developed important medical work.

ZEND, more correctly **AVESTAN,** an ancient Iranian language, in which the Zend-Avesta is composed. This language was first introduced to notice by Anquetil Duperron, and the accurate knowledge of it has been developed among others by Rask, Burnouf, Bopp and Haug. It is now recognized to be a coeval and cognate dialect with the Vedic Sanskrit. It embraces two dialects called Bactrian, in contradistinction to the ancient languages of Media and Persia, which are called the Western Iranian, while the Zend or Bactrian dialects are called the Eastern Iranian dialects. The two Zend dialects consist of an earlier and a later, analogous to the Vedic and classic Sanskrit or to the Homeric and classic Greek. The period of transition between them is perhaps from 100 to 200 years. The earlier dialect is called the Gâtha, from the Gâthas or sacred songs which form the only remains of it; the later is that in which the greater part of the Zend-Avesta or Zoroastrian sacred writings are found. They differ both in grammar and pronunciation, they are both highly cultivated languages and rich in inflections, but the earlier is richer in inflections and the later in compounds. The earlier is distinguished by long vowel terminations, probably produced by transcribing the singing pronunciation of the gâthas. The present alphabet is comparatively modern and is probably derived from the Syriac. There are 12 simple vowels, 14 diphthongs and 29 consonants, represented by separate characters. The roots are mostly monosyllabic, some consisting only of a single vowel, others of a vowel and consonant or a vowel between two consonants. These primitive roots are modified by articulate additions, which extend or limit their meaning after the manner of prefixes and suffixes, thus *dâ,* to make, with the addition of *th,* becomes *dath,* to place. Verbal roots undergo modifications producing three distinct forms, the causal, the desiderative and the intensive. Verbs have three voices, active, middle (reflective) and passive; and four moods, indicative, subjunctive, potential and imperative. Some of these moods are double. The tenses include one for the present, four for the past and two for the future. Nouns are formed from roots by means of suffixes. There are three genders, masculine, feminine and neuter. There are also three numbers, singular, dual and plural, with eight inflections in the first and last and five in the middle number. The forms of the declensions closely resemble those of Sanskrit; and there are many other analogies between the Gâtha dialect and the Vedic Sanskrit. See also AVESTA.

ZENGER, John Peter, American printer and journalist: b. Germany 1697; d. New York July 28, 1746. His family was one of many Palatines sent to New York in 1710 by Queen Anne. A year later the 14-year-old boy was apprenticed to the printer William Bradford (q.v.) for an eight-year term. After expiration of his indenture he moved to Chestertown, Md., but soon returned to New York and in 1723 was made a freeman of the city. In 1725 he formed a partnership with Bradford which lasted but a year. In 1730 he printed Peter Venema's *Arithmetica,* the first arithmetic text printed in New York. He began the publication of the *New-York Weekly Journal* on Nov. 5, 1733, an organ opposed to the governor but supported by Chief Justice Lewis Morris and other leading men who undoubtedly contributed its major articles. The paper greatly influenced public opinion against the government, and Zenger was arrested Nov. 17, 1734 on a charge of publishing seditious libels. He was imprisoned for nearly ten months before his trial, at which he was defended by Andrew Hamilton (q.v.) of Philadelphia. His acquittal by the jury in August 1735 was regarded as the first important victory for the freedom of the press in the English colonies. His newspaper reported the trial verbatim, and a year later (1736) he published separately *A Brief Narrative of the Case and Tryal of John Peter Zenger* which went through numerous editions. After his death the *Journal* was published by his widow until December 1748, then by John Zenger, a son by his first marriage, until 1751 when it ceased publication.

ZENITH, the vertical point of the celestial sphere at any place, where the plumbline, extended upwards, would pierce it. A plane passed perpendicular to the plumbline, through the observer's eye, cuts the celestial sphere in the true horizon, hence the zenith is everywhere 90° from that plane.

ZENITH SECTOR, an astronomical instrument consisting of a telescope swinging upon pivots and having attached to it an arc graduated into degrees and minutes. It is used for the same purpose as the mural circle, namely, to ascertain the zenith distance of the several stars.

ZENITH TELESCOPE, an instrument used in both field astronomy and at fixed observatories for the accurate determination of latitude. The instrument consists essentially of a telescope which is mounted to the side of a vertical, fixed pillar, being supported at one end of a horizontal axis, perpendicular to the vertical pillar. The axis has a counter weight at the other end and in its middle a pivot attached to the pillar, which permits it to revolve in azimuth. The telescope itself can rotate in a vertical plane, and a circle attached to the axis permits it to be pointed to any altitude or zenith distance. A very sensitive level is also attached.

The instrument is used in the following manner. The latitude of the place must be approximately known already, either from sextant or other type of observation. Two stars, whose declinations are accurately known, are chosen so that one crosses the meridian about as far north of the zenith as the other does south. They should *not* differ by more than fifteen minutes in right ascension. Their actual zenith distances will then be $Z_1 = \delta_1 - \phi$ and $Z_2 = \phi - \delta_2$ respectively, where δ_1 is the declination of the northern star, δ_2 that of the southern star, and ϕ the desired latitude. The telescope is then set and clamped at such a zenith distance that both stars will cross its field not more than about half

a radius from the central horizontal wire. The telescope is provided with a good filar micrometer. With this, the distance of the first star as it crosses the meridian is measured from the central wire. Without disturbing the angle the telescope makes with the vertical, it is then rotated 180° and the second star is similarly observed. Combining the two equations above we then get

$$\phi = \tfrac{1}{2}\ (\delta_1 + \delta_2) + \tfrac{1}{2}\ (Z_2 - Z_1)$$

In this the declinations are known from the star catalogues, the zenith distances have just been determined, hence we solve at once for ϕ, the latitude. As at large zenith distances refraction errors become greater, the method is most accurate for stars within 15° ± of the zenith, while 30° would be about the limit. The method just described is known as Talcott's Method because first practically employed in 1832–1836 by Capt. Andrew Talcott of the United States Engineers in the Ohio-Michigan boundary survey.

A zenith telescope, in which the whole instrument floats in a basin of mercury, has been devised by B. Cookson and used at the Greenwich Observatory. The observations are made photographically by allowing the stars to trail across the field. The reductions are of the same type as with the visual type of instrument. Older methods of latitude determination, which employed the prime vertical instrument, are no longer in general use.

CHARLES P. OLIVIER.

ZENITH TUBE, an instrument designed for very accurate determinations of latitude by observing stars which transit the meridian close to the observer's zenith, or (when the latitude is known) for determining the declinations of such stars. It consists of a rigid, immovable telescope tube so mounted as to point always to the zenith; the plane of the telescope lens is thus horizontal. Within the tube, at a distance below the lens of slightly less than one-half of the focal length, there is a basin of mercury; the rays from a zenith star after passing through the objective are reflected from the mercury surface and finally come to a focus and form the image a short distance above the lens, a hole being drilled through the center of this to allow of their passage. The micrometer wires are adjusted above the lens in this focal plane, both they and the image being reflected horizontally from a prism placed at this point into the eyepieces, of which there are two on the sides of the main tube, one to the east and one to the west of it.

The great advantage possessed by the instrument consists in the fact that the observer's horizon (and, therefore, his zenith) is determined wholly by the surface of the mercury; the more usual level tubes, which always present irregular and annoying anomalies when employed for work of the highest accuracy, are wholly dispensed with. Only stars which enter the fixed field of the telescope, and hence pass within a few minutes of the zenith, can, however, be observed with it.

In 1904 a large zenith tube with an eight-inch aperture was installed in Flower Observatory at the University of Pennsylvania in Philadelphia in order to find out if certain sudden changes of local latitude, sometimes amounting to several feet, had real existence or arose from undetected changes in the zenith telescope previously used for determining latitudes. Both instruments agreed in their indications, and the cause of the changes in latitude is not yet known.

ZENJAN, zĕn-jän′, or **ZINJAN,** zĭn-, town, Iran, in First Province (former Khamseh Province), on the Zenjan River, 180 miles northwest of Teheran. An agricultural center, it has manufactures of cutlery, rugs, and cotton goods. The population is mainly Turkic. Pop. (1941) 39,450.

ZENKER, Friedrich Albert von, German pathologist: b. Dresden, March 13, 1825; d. Reppentin, Mecklenburg, June 13, 1898. From 1851 he was connected with the city hospital of Dresden. Professor of pathological anatomy and pharmacology at Erlangen in 1862, in 1865 he became joint editor of the *Deutsche Archiv für klinische Medizin.* In 1860 he discovered that the parasite *Trichina spiralis,* detected by Dr. Sir James Paget in 1835, was the cause of the sometimes fatal disease, trichinosis.

ZENO, zē′nō, emperor of the East (Byzantine empire) from 474 to 491 A.D. An Isaurian by birth and named Trascalisseus he changed his name to Zeno upon his marriage to the daughter of Leo I. He commanded the imperial guards and armies, and was elevated to the consulship in 469; procured the assassination of Aspar, the minister of Leo, in 471, and usurped the crown on the death of Leo in 474. He was driven out of his capital by Basilicus, who was proclaimed emperor in 475, but regained Constantinople in 477 by buying over Harmatius, the nephew and general of Basilicus, who was deposed and died shortly afterward. In 478 a Gothic invasion was bought off; in 479 a revolt in Constantinople was put down by corrupting the troops engaged; a second Gothic invasion was bought off, and a third was repelled by purchasing the aid of an opposing party among the Goths, one of whose chieftains, afterward Theodoric the Great, was made consul in 484. Having quarreled with Theodoric, Zeno in 488, anxious to save himself and his capital, persuaded him to invade Italy, and expel Odoacer and the Heruli. Among the more important events of his reign was the publication of the so-called *Henoticon* (482), or *Decree of Union,* intended to adjust the controversy between the Monophysites (q.v.) and the Orthodox Church.

ZENO, Apostolo, Italian dramatist and literary historian: b. Venice, Dec. 11, 1668; d. there, Nov. 11, 1750. He was a cofounder (1710) of the critical periodical *Giornale dei Letterati d'Italia,* in 1718–1729 was court-poet and historiographer to the Holy Roman Emperor Charles VI at Vienna, and made his reputation in Italian literature by libretti for the musical drama, which in his work attained real literary rank. For many years he was Italy's leading dramatic poet. He was also a scholar, antiquary and well-known numismatist. His collected dramas appeared in 1744. Among his further writings is the *Dissertazioni Istorico-Critiche e Letterarie* (1752–1753).

Consult the *Life* by Negri (1816); Fehr, M., *Apostolo Zeno und seine Reform des Operntextes* (1912).

ZENO, Nicolò and **Antonio,** Venetian navigators of the late 14th and early 15th centuries. Antonio about 1390 fitted a ship with which he sailed northward on the Atlantic. He was

wrecked on one of the Faroe islands. Here he would have been killed by the Scandinavian natives had he not been opportunely rescued by Earl Sinclair, whom Haakon VI of Norway had invested with the Orkneys and Caithness. He was made commander of the earl's small fleet, and in 1393 or 1394 sailed with three ships to Greenland, where he spent some time. He died in the Faroes about 1395. Antonio went out to the Faroes in 1391, and was in Sinclair's service for 14 years, dying at Venice in 1406. After Nicolò's death he was commander of the fleet; and on one occasion, to verify fishermen's reports of land some 1,000 miles westward, he undertook a voyage of discovery in the Atlantic. He described his adventures in a letter, and on this letter and some others and a sailing-chart, probably made by Antonio, is based a work containing matter of some interest in connection with pre-Columbian discovery in the New World. The letters were worked into a narrative, and, with a copy of the map, appeared in book-form in 1558. The narrative says that a fisherman, returning to the Faroes after a 26 years' absence, told of a land called Estotiland, where there was much gold and forest. The people built small boats and traded with Greenland. The description of Estotiland is vague, and contains little to suggest North America. But a voyage was undertaken from Estotiland to a region southward, called Drogio. There, said the fishermen, the people were cannibals. «They have no kind of metal. They live by hunting, and carry lances of wood, sharpened at the point.» Farther south, «they have cities and temples,» as well as «some knowledge and use of gold and silver.» The honesty of the Zeno narrative has been sufficiently well established; but whether or not the fisherman had the experiences he narrated in Drogio, and whether that may be identified with North America, are questions that have been much debated. The map, drawn from hearsay, and necessarily of the vaguest character, was accepted as authentic and caused trouble for mariners and geographers for more than a century. Consult Major, 'The Voyages of Nicolò and Antonio Zeno' (Hakluyt Society, 1873), with a translation of the narrative and a copy of the map; and Fiske, 'The Discovery of America' (Vol. I, 1892).

ZENO (zē'nō) (Gk. Ζήνων) **OF CITIUM**, ancient Greek philosopher: b. Citium, island of Cyprus. He flourished in the late 4th and early 3d century B.C., and was the founder of the Stoic school of philosophy (see STOICISM). The circumstances of his life are not well known. Tradition says that after suffering shipwreck near the Peiræus, and according to one account losing his all, while by another his wealth amounted to 1,000 talents, he settled at Athens. There he early made himself remarked for the virtues of moderation and contentment, and during his long life he so acquired the esteem of the citizens that they voted him a crown of gold and a public burial in the Ceramicus. He is said to have declined the citizenship of Athens from fidelity to his native country. He first resorted to the teaching of the Cynic Crater, and by this school his own views, especially in the earlier period of his career, were much influenced. It may seem surprising that Zeno, who rejected both the contempt for established usages and for general knowledge which distinguished the Cynics, should have attached himself to that school, but the central point of every true system of philosophy is its ethics, and he was attracted to the Cynics by their doctrines of moral obligation, which he made the foundation of his own system. Contrary to the advice of Crater he afterward studied under Stilpo the Megarian. Among his subsequent advisers or teachers are enumerated the Megarians, Cronus and Philon, and the Academics, Xenocrates and Polemon. Of the last two he is said to have been a pupil. He maintained a friendship with Antogonus Gonatas, king of Macedon, of whom his disciples Persæus and Philonides were companions. About 310 B.C. he opened his school in the Ποικλη Στοά (*Stoa*), or «Painted Porch.» This place, which was adorned with paintings by Polygnotus, had formerly been the resort of a school of poets, who were from this circumstance called Stoics, and the name was now transferred from them to the disciples of Zeno, who at first had been called Zenonians. All the works of Zeno are lost. They were numerous, and include treatises 'On the State' (early and of cynical tendencies); 'On the Ethics of Crater'; 'On Life According to Nature'; 'On Impulse'; 'On the Nature of Man'; 'On the Affections'; 'On the Becoming' (or Fitting); 'On Law,' and 'On Grecian Education'; various treaties on physics, logic and poetry, and a work on the Pythagorean doctrine. Concerning the doctrines of Zeno, which employed very largely the ethics of the Cynic school, as well as the physics of Heraclitus and Pythagoras, see STOICISM; and consult also Zeller, 'Stoics, Epicureans, and Skeptics' (1870); Ueberweg, 'History of Philosophy' (Eng. trans., 1887); and Ritter and Preller, 'Historia Philosophiæ Græcæ' (8th ed., 1898).

ZENO OF ELEA, ancient Greek philosopher: b. Ele (Velia), Lucania, southern Italy, about 488 B.C. He was the favorite disciple of Parmenides, whose opinions he defended, and whose ethico-political schemes he shared. He appears to have lived for a considerable time in Athens, where he taught for remunerations, and had distinguished pupils, as Pericles and Callias. He is said, on unsatisfactory evidence, to have engaged in an enterprise on behalf of his native land against the tyrant Nearchus. Whether he perished in this attempt or survived is not known. None of his writings are extant, but his opinions are referred to by Aristotle, who attempted to confute some of them, and who had distinguished him as the inventor of dialectic. As a defender of the Eleatic doctrine of the unity of the existent, he was the first to lay down the problems of skepticism in regard to the real existence of the phenomenal world, and has thus exercised an important influence on philosophy. He is said to have directed four arguments against the reality of motion. These all are very similar to one another; the two most famous are those of the flying arrow and of Achilles and the tortoise. The first finds a contradiction in the properties of the arrow, which cannot be where it is not, but is at rest if it remain where it is. That is, al-

though a body in motion is in motion throughout its course, if any instant of the existence of the body be considered in itself, there is no distinguishable property of the body which can be called motion. Bergson considers that the paradox, which was stated by Zeno in order to prove the specious character of motion and change, is insoluble on any view which analyzes motion into a series of states. An answer to the paradox which is more in favor among scientists follows outlines that had already been indicated by Aristotle, and depends upon the fact that the velocity or measure of motion of a body is a limit — the limit of the ratio of the distance traversed by a body, divided by the time which it takes the body to traverse the distance, as this time grows smaller and smaller. The distinction between a property of a body at an instant, and the limit of a property of a body in the neighborhood of that instant, is all-essential for the explanation of the paradox. This distinction was only rendered clear in the last century by the development of the theories of assemblages and of the functions of a real variable, which made clear the nature of continua and of continuous functions. It will be seen, then, how incorrect is the often-repeated statement that the paradoxes of Zeno were dialectical puerilities which were completely refuted by Aristotle.

The other famous paradox of Zeno is that of Achilles and the tortoise. Achilles, the swiftest of mortals, can never catch up with the tortoise, because when he reaches the tortoise's former position, the animal is no longer there, so that he has to traverse an infinite number of distances to overtake it. This argument is completely dependent on a clear distinction between the measure of an interval and the number of points it contains — a distinction whose true import has only been understood within the past 50 years. Zeno, in his arguments against motion, exhibits a truer appreciation of the nature of this process than is evinced by many moderns in their support of it.

In another argument, designed to establish the fallacious nature of sense-perception, Zeno shows his knowledge of the existence of sensory limina (see WEBER'S LAW). He points out the difficulty of understanding how, if the fall of one grain of wheat makes no audible noise, the fall of a bushel can be heard. See TIME; SPACE; ASSEMBLAGES, GENERAL THEORY OF; REAL VARIABLE, THEORY OF FUNCTIONS OF THE.

Bibliography.— Bergson, H., 'Time and Free Will' (tr., London 1910); Burnet, J., 'Greek Philosophy (part i, London 1914); Diels H., 'Die Fragmente der Vorsokratiker' (Berlin 1906–07); Russell, B. A. W., 'Principles of Mathematics' (Cambridge 1903).

ZENO OF SIDON, Epicurean philosopher: b. about 150 B.C.; d. about 80 B.C. He was a contemporary and instructor of Cicero, who refers to him in 'De Natura Deorum' (i, 34), as an accurate and highly cultivated thinker, but one who was scornful of other philosophers. His works are not in existence, but a treatise by Posidonius gives a summary of his beliefs and teachings.

ZENOBIA, zĕ-nō'bĭ-ạ, queen of Palmyra (q.v.). Her native name was Septimia Bathzabbai, and she was instructed in the sciences by the celebrated Longinus, and made such progress that besides her native tongue she spoke the Latin, Greek, Coptic and Syrian languages. She also patronized learned men, and herself formed an epitome of Egyptian history. She was married to Odenathus, king of Palmyra, accompanied him both in the war and the chase, and the success of his military expedition against the Persians is, in a great degree, attributed to her prudence and courage. Gallienus, in return for services which tended to preserve the East to the Romans after the capture of Valerian by Sapor, king of Persia, acknowledged Odenathus as emperor, and on his death, 267 A.D., Zenobia assumed the sovereignty, under the title of Queen of the East. She preserved the provinces which had been ruled by Odenathus, and was preparing to make other conquests, when the succession of Aurelian to the purple led to a remarkable change of fortune. That martial prince, disgusted at the usurpation of the richest provinces of the East by a female, determined to make war upon her: and having gained two battles, Antioch and Emesa, beseiged her in Palmyra, where she defended herself with great bravery. At length, finding that the city would be obliged to surrender, she quitted it privately; but the emperor, having notice of her escape, caused her to be pursued with such diligence that she was overtaken just as she got into a boat to cross the Euphrates, in 272. Aurelian spared her life, but made her serve to grace his triumph. The Roman soldiers demanded her life, and according to Zosimus she purchased her safety by sacrificing her ministers, among whom was the distinguished scholar, Longinus. She was allowed to pass the remainder of her life as a Roman matron, and her daughters were married by Aurelian into families of distinction. Her only surviving son retired into Armenia, where the emperor bestowed on him a small principality. Consult Gibbon, 'Decline and Fall' (ed. Bury, 1896–1900); 'Life of Aurelian' by Vopiscus in 'Augustæ Historiæ Scriptores' (Eng. trans., Bernard 1740); Ware, 'Zenobia, or The Fall of Palmyra' (1837).

ZENOBIA, or THE FALL OF PALMYRA, a noted historical novel, by William Ware, first issued in 1837 in the *Knickerbocker Magazine,* and then entitled 'Letters from Palmyra.' It was shortly afterward published in book form, and later editions were issued from time to time for more than 50 years.

ZENOS, zē'nŏs, **Andrew C.,** American theologian: b. Constantinople (Istanbul), Turkey, 13 Aug. 1855; d. Chicago, Ill., 25 Jan. 1942. After being graduated from Robert College, Constantinople, in 1872, he came to the United States and was graduated from Princeton Theological Seminary in 1880. Ordained to the Presbyterian ministry in 1881, he was pastor at Brandt, Pa., 1881–83; professor of Greek, Lake Forest University, 1883–88; professor of New Testament exegesis, Hartford Theological Seminary, 1888–91; professor of church history, 1891–94; professor of historical theology, after 1894, and dean after 1920 of Presbyterian (formerly McCormick) Theological Seminary. His writings include 'Compendium of Church History'; 'Elements of Higher Criticism'; 'Teachings of Jesus Concerning Christian Conduct';

'The Son of Man'; and 'Presbyterianism in America.' He also edited (with Francis W. Kelsey) Xenophon's Anabasis (1889–98).

ZENTA, or SENTA, Jugoslavia, a town in Bács-Bodrog, on the Theiss, 120 miles southeast of Budapest. Here, 11 Sept. 1697, the Germans under Prince Eugene of Savoy, defeated the Turks, a victory which led to the Peace of Carlowitz, ratified January 1699. Pop. about 30,000.

ZEOLITE, a name given to a group of hydrated silicate minerals commonly found in cavities n igneous rocks, from which they are derived through secondary alteration. They include thompsonite, natrolite, scolecite, analcite, chabazite, gmelinite, phillipsite, harmotome, stillite and heulandite. The name is derived from the boiling reaction before the blowpipe.

ZEPHANIAH, zĕf-ą-nī'ą, the ninth in order of the Scriptural writers known as the minor prophets. His pedigree is traced back for four generations. He is the son of Cushi, the son of Gedaliah, the son of Amariah, the son of Hezekiah and he is supposed to have been of noble, if not of royal, ancestry. His brief but pregnant prophecy was delivered just after the time of the first appearance of Jeremiah (626 B.C.)—that is, in the first half of the reign of Josiah. The next preceding prophet was Micah, who died in the early part of the reign of Manasseh. But the condition of the whole of western Asia, including Palestine, portended a speedy upheaval. Above all, Nineveh was beginning its memorable decline after the death of its king. Assur-banipal (668–626 B.C.). Morally and religiously the Jewish nation had improved but little since the degeneracy that had followed the death of Hezekiah, and Josiah's reform (621 B.C.) had not yet begun, if we may judge the invectives of the prophet against idolatrous practices. Zephaniah was apparently a descendant of King Hezekiah.

The Prophet's Message.—Zephaniah spoke and wrote primarily for the correction and warning of Judah and Jerusalem, though he draws illustrations from the sins and fates of other peoples. The culmination of these is found in the iniquities, the pride and the speedy fall of Nineveh. His prophecy extends to three chapters in the Bible. A division into four parts is as follows:

The threatening: ch. i (1), the whole world—that is, the Semitic world—is to undergo exemplary punishment, particularly Jerusalem and its apostates from Jehovah (ver. 1–6). (2) The classes of people who are to be thus visited—the royal house, the nobles, the wealthy traders, the careless and defiant generally—are characterized, and their chastisement set forth in language largely figurative (ver. 7–18).

The lessons from the nations: ch. ii. God's own people are warned to repent in time (ver. 1–3), and so avoid the doom that is about to fall upon the Philistines (ver. 4–7), Moab (ver. 8–11), Egypt, under the name of Ethiopia (ver. 12), and finally Assyria and Nineveh (ver. 13–15).

The remonstrance: ch. iii, 1–7. Rebellious and obstinate Jerusalem is urged to repent by the righteous and reasonable God, in view of coming woes; for the lesson of the fate of other nations has so far been unheeded.

The promised redemption: ch. iii, 8–20. (1) The faithful remnant is bidden to wait and trust. It shall survive the ruin of the nations, be joined by exiled brethren from far and near, and rest in quiet content (ver. 8–13). (2) Joyous thanksgiving is now in place, for Jehovah is in the midst of Jerusalem, to comfort and bless his people. Their reproach is taken away; dispersion and captivity are at an end.

ZEPHANIAH, Book of. The title of the book of Zephaniah says that the prophetic message was given in the days of Josiah, king of Judah, 639–608 B.C. Since that time is appropriate for the book, the title is usually considered to rest upon an historical basis, although other suitable times for these utterances might be found. In the title Zephaniah is said to have been the great-great-grandson of Hezekiah, by whom the king of that name is doubtless meant. This also is generally accepted, since the book contains nothing out of harmony with the royal descent.

It is evident that the message of Zephaniah must have preceded the introduction of the Deuteronomic law in 621. This is because the conditions here reflected are such as doubtless belonged to the early part of the reign of Josiah, but were somewhat changed, perhaps only temporarily, by the Deuteronomic reform. The characteristic features are religious syncretism, astral worship, imitation of foreign customs, and scepticism, i, 4–6, 8, 9, 12. Since the book shows no clear influence of Jeremiah it is probably to be dated not later than the beginning of his work. That indicates a date of about 627 B.C.

The background of the book is some great invasion affecting many lands. At the time mentioned that must have been the Scythian invasion, alluded to in Jeremiah i, as a danger from the north. The invasion cannot have come from Egypt or Assyria, since both are mentioned as affected by it, ii, 12. This Scythian invasion, it is known, affected Assyria and extended to the borders of Egypt, overrunning also several of the intermediate countries. It lasted for a considerable number of years, and, while its limits cannot be determined with entire certainty, the year mentioned, 627, was quite evidently near the beginning of its course.

The theme of the book is the coming of the day of Yahweh. This is probably not to be regarded as identified with the Scythian invasion, but the latter is an introductory movement indicating that it is at hand. The day of Yahweh is first mentioned by Amos, and then as a familiar idea. As here presented the destruction of that day is to engulf Judah, Philistia, Moab, Ammon, Ethiopia (Egypt) and Assyria; but the mention of Moab and Ammon is often considered a later addition. That day, while regularly a day of world-judgment in some real sense, is here presented in unusually vivid terms as a day of universal judgment and destruction. The judgment upon Judah has an ethical basis, a point which does not appear in the condemnation of the other nations.

Zephaniah, like Amos whom he resembles, is distinctly a prophet of judgment. Most of the book gives little suggestion of mercy. At the end, however, are several verses of a different tenor which, as in the parallel case in Amos, are to be regarded as a later addition.

This applies most clearly to iii, 14-20. Here is a message of restoration of the people now scattered among the nations. This belongs to the exile or, more probably, after the exile. iii, 9–10 is probably also a later addition because its attitude toward the nations is out of harmony with most of the book. Other passages sometimes considered to be later are less certainly so; most prominent among these is ii, 8–11, which has suggestions of the exile.

While Zephaniah adds nothing of fundamental importance to the messages of the line of prophets who have preceded him, yet his utterance is characterized by a zeal for righteousness and a vigor of presentation not unworthy of that goodly fellowship. Historically, his testimony to the conditions in the time shortly before the reform of Josiah is of much value.

GEORGE RICKER BERRY,
Professor Emeritus of Old Testament Interpretation and Semitic Languages Colgate Univ.

ZEPHYR, a soft, cool, agreeable wind; in Greece the west, or rather west-southwest wind, typified in Greek mythology by the god of the west wind Zephyrus (q.v.). The Greek name, according to the etymology, signifies life-bringing, because at the time when this wind begins to blow, the plants are restored to life by the balmy spring air.

ZEPHYRANTHES, a genus of *Liliaceæ,* indigenous to the warmer regions of America, and most commonly represented by the atamasco lily. The species are bulbous, and are not hardy in the Northern States, but make charming summer-blooming window and greenhouse plants, resting in the winter. The foliage is linear, springing from the bulb, and a scape, appearing at the same time, is crowned by a regular, three-parted corolla which is nearly, or quite, erect, from one to three inches across, and red, yellow or white. *Z. candida* is one of the white-flowered species, and is also one of the hardiest and thriftiest. It is a lovely, crocus-like plant, with pure-white blossoms, opening out flat in the sunshine, and evergreen foliage.

ZEPHYRUS, zĕf'ĭ-rŭs, in Greek mythology, the god of the west-wind, a son of Æolus, or of Astræus and of Aurora. He was married to Chloris, goddess of fruits and flowers, their son being Carpus, god of fruit. By the harpy Podarge he was the sire of the swift horses of Achilles, Xanthos and Balios. His love being rejected by Hyacinthus, he was the cause of his death by blowing Apollo's quoit against his head. Some make him the husband of one of the Hours. Flowers and fruits are under his protection. He is represented as a gentle beautiful youth, naked, with a wreath on his head or flowers in the fold of his mantle. According to Homer he was brother to Boreas, with whom he lived in a palace in Thrace. The Romans identified him as Favonius, and his wife, Chlris, as Flora.

ZEPPELIN, tsĕp'pĕ-lĭn, **Ferdinand,** COUNT VON, German airship builder: b. Constance, Baden, 8 July 1838; d. Charlottenburg, Prussia, 8 March 1917. His father was Count Friedrich von Zeppelin, a Württemberg court official. After studies at the Stuttgart Polytechnicum, the Ludwigsburg Military Academy and the University of Tübingen, he entered on a military career and as a lieutenant was one of the German military observers in 1863 attached to the Army of the Potomac during the Civil War in the United States. His first ascent in a balloon made at Saint Paul, Minn., during this visit, is said to have been the incentive of his later experiments in aeronautics. He took part in the Seven Weeks' War of 1866, fighting for Württemberg against Prussia, and was an officer of cavalry in the Franco-German War 1871–72. He rose to the rank of lieutenant-general in the German army and in 1891 at the age of 53 retired and devoted his time and wealth to experiments in connection with dirigible balloons. While increasing proofs of success encouraged him to continue his efforts, a record of failures which reduced him to poverty marked his experiments for several years. Imperial patronage and public subscriptions, however, enabled him at last to conquer all difficulties, and in 1908–09 dirigibles of the type constructed with his name were making successful journeys ranging from 350 to 1,000 miles. Thirteen Zeppelins, however, had been destroyed and numerous lives sacrificed during the experiments up to 1914. During the European War, Zeppelins were used mostly for raids over Belgium and England, and over 40 were reported as destroyed. Their failure as warships is said to have been a great disappointment to Count Zeppelin. (See AERONAUTICS; DIRIGIBLE). Consult Hearne, R. P., 'Zeppelins and Super-Zeppelins' (New York 1916).

ZERAFSHAN, zĕr-äf-shän', Uzbekistan, a river rising in a valley at the junction of the Hissar and Turkestan Mountain chains, and after a westerly by north course of about 400 miles, passing the towns of Penjakent, Samarkand, Katakurgan, Kerminch and Bokhara, dispersing itself in the desert sands, between Karakul and the Oxus River. A railway line traverses the valley from Karakul to near Penjakent.

ZERAH, (Heb. *Zarach*), king of Ethiopia, known to the Egyptians as Azech Amen, who flourished in southern Egypt about 900 B.C. He conquered Egypt and invaded Palestine, where he was defeated by Asa, king of Judah. Zerah then abandoned not only Palestine, but also Egypt (2 Chron. xiv).

ZERBI, or DE ZARBIS, Gabriel, Italian physician and anatomist: b. Verona in the 15th century; d. there, 1505. He lectured for some time at Rome, and became professor of medicine at Padua in 1495. His chief work is 'Anatomy of the Human Body' ('Liber Anatomiæ Corporis humani'), published about 1490, a work remarkable for its keen insight and deductions confirmed by later discoveries in anatomy.

ZERBONI DI SPOSETTI, Joseph, German philosopher: b. Breslau, 1760; d. 1831. In 1796 he wrote to the governor of Silesia a letter in which he set forth the absurdity of granting to the nobility exalted privileges through

right of birth. Knowledge of the letter reaching Frederick William III, he was imprisoned for three years on a charge of high treason. When his case was brought to trial he was freed, with no political disability, and later received various official appointments.

ZERBST, tsĕrpst, Germany, a town in the State of Anhalt, on the Nuthe, a small tributary of the Elbe, 70 miles southwest of Berlin, and 27 miles southeast of Magdeburg, on the Dessau-Leipzig Railway. The chief buildings are the great Schloss in a fine park; the 15th century Nikolaikirche, and the stately 15th century Rathhaus on the market place where are the Roland column (1445) and the Butterjungter, a slender column bearing a female figure. The chief educational institution is the Francisceum, a gymnasium of high repute. The town has manufactures of noted bitter beer, of silks, plush, cloth, leather, machinery, musical instruments, etc. Zerbst was founded in 1007. From 1603 to 1793 it was the capital of a principality of the same name, which in 1797 was absorbed in Anhalt-Dessau. Pop. of commune about 19,210.

ZERFFI, George Gustavus, English author: b. Hungary, 1821; d. Chiswick, England, 28 Jan. 1892. He edited a newspaper at Budapest, and in 1848 served as a captain in the revolutionary army. He also acted for a time as Kossuth's private secretary. On the failure of the revolution in 1849 he went to England and was naturalized, and some years later was engaged as a lecturer in the department of art at South Kensington. Throughout his career Zerffi gave much attention to the subjects of decoration and history, and wrote many works treating these themes in a comprehensive manner. He asserted that history should be studied as a whole on philosophical principles. He planned a general work on these lines entitled 'Studies in the Science of General History,' of which two volumes were issued, dealing with ancient and mediæval history respectively. Among his other publications are 'A Manual of the Historical Development of Art, with Special Reference to Architecture, Sculpture, Painting and Ornament' (1876); an English version of Goethe's 'Faust' with critical and explanatory notes (1859); he also published a number of his lectures.

ZERIBA, or **ZAREEBA,** a temporary military enclosure, the sides of which are formed of prickly brush wood, sheltered by which a force may camp comparatively safe from sudden surprise. The term came into prominent use during the Anglo-Egyptian campaign of 1884. The protection is also used against wild animals.

ZERMATT, tsĕr-mät', or zĕr-mät' (formerly called **PRABORGNE**), Switzerland, a mountain village and tourist-resort in the canton of Valais, at the foot of the Matterhorn and near the head of the Visp Valley, 22½ miles by rail southwest of Visp. It stands 5,315 feet above sea-level, having to the south the great Théodule glacier, above which tower the Breithorn on the east, and beyond the Monte Rosa group, and on the west the rocky cone of the Matterhorn. An electric mountain railway connects with the Riffelberg and the summit of the Gornergrat (10,290 feet). The Théodule Pass or Matterjoch (10,899 feet) leads to Aosta in Italy. Its scenery compares in grandeur with that of Grundewald and Chamonix. In the village churchyard are the graves of many victims of mountaineering. Pop. about 750.

ZERO, *in mathematics,* the absence of magnitude; the remainder that is obtained when any quantity is subtracted from itself; nothing, considered as a quantity; that which separates real positive quantities from real negative quantities. Zero is denoted by the symbol 0 ("cipher"), and this symbol itself is often called "zero." In the theory of functions, any value of a variable which reduces a given function of that variable to zero is called a "zero" of the given function. In infinitesimal analysis, infinitesimal quantities are sometimes called zeros. This usage is incorrect, and it leads to confusion of thought. An "infinitesimal" has an actual magnitude, and although that magnitude is smaller than any quantity that can be definitely stated or assigned, the fact that it exists distinguishes the infinitesimal from zero, properly so-called.

In physical measurement, the "zero" of any scale is the starting point from which measurements on that scale are reckoned. In thermometry (q.v.) it is customary to distinguish three different kinds of zeros. These are, respectively, (1) the arbitrary zero, (2) the "natural" zero and (3) the "absolute" zero. The arbitrary zero on such a scale is a zero that is selected arbitrarily, as a convenient point of reference; the selection being governed by practical considerations of convenience, or by the facility with which the point can be experimentally determined. (See THERMOMETER). The "natural" zero is employed chiefly in connection with the gas thermometer. In a gas thermometer in which the temperature is indicated by the expansion of a given volume of gas at constant pressure, the "natural" zero is the temperature at which the volume of the gas would just vanish, if the contraction of the gas were to follow, at very low temperatures, the law of variation with temperature that prevails between the freezing and boiling points of water. Similarly, in a gas thermometer in which temperature is measured by the change in pressure of a mass of gas that is confined at constant volume, the "natural" zero is the temperature at which the pressure of the gas would just vanish, if the law of variation of pressure were the same, at very low temperatures, as it is between the freezing and boiling points of water. The "natural" zeros of the various gas thermometers that are in actual use are not identical, but their positions differ only by a few degrees, at the most.

The "absolute" zero of temperature is the temperature that a body would have, if it were absolutely deprived of heat; and this "absolute" zero is identically the same for all substances. It happens that the "absolute" zero has nearly the same position on the thermometer scale as the "natural" zeros of the various gas thermometers that are in use, and this fact has led to a great deal of confusion in popular and semi-scientific writings upon the subject of temperature, the "natural" and "absolute" zeros being

very commonly confounded with one another. The "absolute" zero is slightly lower than the "natural" zero of any gas thermometer that we know of, with the possible exception of the "natural" zero of the hydrogen thermometer. There is some reason for believing that the "natural" zero of the normal hydrogen thermometer (whether at constant volume or at constant pressure) is a few hundredths of a centigrade degree lower than the true "absolute" zero. If further research bears out this opinion, then it is plain that the "natural" zero of the hydrogen thermometer can never be attained; for the "absolute" zero, being the temperature corresponding to absolute cold, is the lowest temperature that can possibly have a real existence. On the absolute centigrade scale, the temperature of the "absolute" zero is approximately 273.10° below the freezing point of water. This estimate is probably in error by a few hundredths of a degree. There is no theoretical reason why the position of the "absolute" zero cannot be determined to the thousandth of a degree; but the experimental data required for such a determination are not yet available. See THERMODYNAMICS.

ZERRAHN, Carl, American musical conductor: b. Malchow, Mecklenburg, 28 July 1826; d. Milton, Mass., 29 Dec. 1909. In 1848 he came to America as flute-player with the Germanica Orchestra, and six years later became director of the Handel and Haydn Society of Boston, a position he held for 42 years. He was conductor of the Harvard Symphony concerts 1861–82, and for several years was a successful director of famous musical festivals throughout New England, among them being those at Worcester, Mass., which he conducted in 1866–97. He retired in 1898.

ZERUBBABEL, zĕ-rŭb'ą-bĕl, leader of the first band of Israelitish exiles returning from Babylon. His name in the Captivity was Sheshbazzar. He was the recognized prince of Judah, son of Shealtiel, governor of Judah (Hag. i, 12, 14), and on arrival at Jerusalem, with Jeshua, the high-priest, directed the renewal of public daily worship and of festival days, and in the second month of the second year of the return, the reconstruction of the Temple. This last work was stopped by their foes and revived only after 16 years, when it was again undertaken and finally completed by Zerubbabel and Jeshua.

ZETA, zē'tą, (1) the Greek equivalent of the English letter Z, and sixth in the Greek alphabet. (2) a small closet or chamber; applied by some authorities to the room over the porch of a Christian church, where were kept the documents of the church and also containing quarters of the sexton.

ZETLAND ISLANDS. See SHETLAND.

ZEUGLODON, zū'glō-dŏn, a gigantic fossil cetacean mammal, found in the Eocene and Miocene strata of the southern United States and Europe, so named by Owen from the yoke-like character displayed by a section of the molar teeth. Its remains were first discovered in 1834 in the Tertiary of Louisiana, and were supposed to belong to some reptile, to which Dr. Harlan gave the name of *Basilosaurus;* but Owen showed that it was a mammal, and belonged among cetaceans. A few years later a German collector named Koch collected great quantities of the bones and stringing them together in some semblance of a natural skeleton, constructed a "sea-serpent," mostly neck and tail, no less than 114 feet long, which was exhibited widely in America and Europe, and required the exertions of eminent men (for example, Wyman, 'Proc. Boston Soc. Nat. Hist.,' November 1845) to expose as a humbug. The form was probably cetacean, though slender, elongated and more snake-like, with small anterior limbs in the shape of paddles, and no hind limbs; the length about 70 feet; the skin was supplied with an armor consisting of small irregular bony plates more or less fused together. The skull in some specimens was nearly a yard in length. It is well constructed, the blow-hole in the middle of the face, and the brain-cavity. The teeth are limited in number and disposed in three series as incisors, canines and molars; the molars are double-rooted, and have serrated crowns. Much discussion has occurred as to the affinities of this great sea-beast, whose characters are so generalized, and period of existence so early that it is now agreed to be a representative of the most primitive *Cetacea,* and is set apart as a family, *Zeuglodontidæ* constituting a primitive order *Archæocæti.* Consult Woodward, 'Vertebrate Palæontology' (New York 1898); Zittel-Eastman, 'Text-Book of Palæonotology' (Part III); Lucas, F. A., 'Animals in the Past' (1901), and 'The Pelvic Girdle of the Zeuglodon' (1901).

ZEUGMA, zūg'mą, the connection of one word with two words or with two clauses, to both of which it does not equally apply; so that, for one of them, another word (to be gathered from the sense of the passage) must be mentally supplied. Zeugma is, therefore, a species of ellipsis; both abbreviate discourse. Where the word to be supplied is a form of another in the sentence, as "I love you, and you [love] me,' the construction is elliptical; where the sense requires a different word, as "The sun shall not smite thee by day, nor the moon [injure thee] by night" (Ps. cxxi, 6) (Prayer Book), it is zeugma.

ZEUNERITE, a hydrous copper-uranium arsenate, $Cu(UO_2)_2As_2O_8.H_2O$. Minute yellowish-green crystals with barite in ores of the Tintic district, Utah. A possible source of uranium.

ZEUS, zūs (Greek Ζεύς), in Greek mythology, the chief of the gods. He was the son of Cronus and Rhæa. According to the myth Cronus was in the habit of swallowing his children immediately after their birth. When Zeus was about to be born Rhæa consulted Uranus and Gæa as to how he might be saved, and they sent her to Crete (the Trojan Ida and other places are mentioned in other accounts) to be delivered. She concealed Zeus in a cave in Mount Ida, and gave Cronus a stone wrapped up in a cloth to swallow. The infant Zeus was tended by the nymphs Ida and Adrastea. He was supplied with milk by the goat Amalthea, and the bees gathered honey for him. When he had reached manhood, by the aid of Gæa or Metis he persuaded his father to restore to the light the children he had swallowed. Zeus now united with his brothers to dethrone his father. This led to a war with the Titans, a struggle

not terminated until Zeus delivered the Cyclopes, sons of Uranus and Gæa, who had been bound by Cronus, and who in return provided him with thunder and lightning, and also liberated the hundred-handed beings Briareus, Cottus and Gyes, who likewise lent him their aid. Having vanquished the Titans, the other children of Uranus and Gæa, he shut them up in Tartarus. Tartarus and Gæa now begot another monster, Typhœus, who engaged in a fearful struggle with Zeus, but was finally vanquished by a thunderbolt. Zeus now obtained the dominion of the world, which he divided by lot with his brothers Poseidon (Neptune), who obtained the sea, and Hades (Pluto), who received the lower world. Zeus retained for himself the heavens and the upper regions, while the earth was held as common property. Another dreadful war was now waged against the Olympian gods by the giants sprung from the blood of Uranus. In this struggle the gods were assisted by Athene, Apollo, Heracles and other children of Zeus, and the giants were completely vanquished. Zeus had three sisters and three brothers, Hestia (Vesta), Demeter (Ceres) and Hera (Juno). He first married Metis, a daughter of Oceanus and Tethys; but as Fate had prophesied that she should bear a son who should rule the world, Zeus swallowed her when she was with child, and Athene subsequently sprang from his head. As his second wife he took, for a time, Themis, daughter of Uranus and Gæa, but his final and best-beloved consort was his sister Hera, by whom he had Hebe, Ares and Hephæstus. Zeus was regarded at the height of the organization of the Roman pantheon, as the founder of law, order and authority, the avenger of wrongs, the punisher of crime, the rewarder of good actions, the source of prophetic power, the author of all good things and the omnipotent, all-wise and benevolent ruler of the universe. He was especially looked upon as the controller of all the phenomena of the heavens, and was constantly spoken of as the «Cloud-gatherer» or the «Thunderer.» Notwithstanding his general character of wisdom and benevolence, his conduct was anything but immaculate. The incongruity struck some of the ancients themselves, and led to protest against such stories being believed. There appear to have been various local gods of the same name, with various attributes and legendary histories, who were finally merged in the national Hellenic Zeus. Traces of the original traditions, however, remained in the local rites of particular places. An Arcadian and a Cretan Zeus are particularly distinguished. The former had a temple at Mount Lycæus, so sacred that if any one entered it he died within 12 months, while intentional trespassers were stoned to death. In Crete there were many places sacred to Zeus, who had passed his early life there, particularly Mount Ida and the district around it. Zeus, according to tradition, also landed on the island at Gortyn in the shape of a bull, when he carried off Europa, and was worshipped there by the surname of Hecatombæus. The national god was worshipped by sacrifices of bulls, cows and goats. Two of the principal localities where his worship was carried on in Greece were Athens and Olympia. At the latter place the Olympic games, the most splendid festival in Greece, were held in his honor. (See Olympic Games). Here there was a magnificent temple and a gold and ivory statue of the god, the work of Phidias, and reckoned one of the seven wonders of the world. In representations of Zeus his attributes are the eagle, the sceptre and the thunderbolt. See Roman Religion. Consult Preller-Robert 'Griechische Mythologie' (1887).

ZEUSS, tsois, **Johann Kaspar,** German philologist and historical scholar: b. Vogtendorf, near Kronach, in Upper Franconia, 22 July 1806; d. there, 10 Nov. 1856. He was educated in Munich, and became professor of history in the lycée at Bamberg, Upper Franconia. He wrote several valuable books—'Die Deutschen und die Nachbarstämme' (1837); 'Die Herkunft der Bayern von den Markomannen' (1839); 'Traditiones Possessionesque Witzenburgenses' (1842); 'Die Freie Reichstadt Speier vor ihrer Zerstörung' (1843). But his greatest work was 'Grammatica Celtica' (1853; 2d ed., by Ebel, 1868–71), a pattern of scholarship and thorough method, in which he really founded the science of Celtic philology. Consult Kuhn, E., 'Johann Kaspar Zeuss' (1906).

ZEUXIPPUS, zūk-sĭp'ŭs, one of the eight successors of Ænesidemus (q.v.) in the last school of Greek skeptics. Of him, as of all the others with the exception of Sextus Empiricus (q.v.), nothing further is known. Consult Zeller, E., 'Outlines of the History of Greek Philosophy' (trans. Alleyne and Abbott, 1886).

ZEUXIS, zūk'sĭs (Greek Ζεῦξις), ancient Greek painter. He was a native of Heracleia, but which town of that name was his birthplace is not certain. He was born about the middle of the 5th century before Christ, and flourished about the end of the 4th century B.C. He is said by some authorities to have studied under Demophilus of Himera, by others under Neseas of Thasos. He also studied at Ephesus, where he eventually settled, although he worked at times at Athens and other cities. Aristotle says that an elevated conception of character was wanting in his work, while Cicero praises him along with Polygnotus and Timanthes for *formæ et lineamenta.* He learned from Apollodorus the treatment of light and shade, which he greatly developed, and from Phidias to take Homer's descriptions of his heroes as ideal models and to paint them with limbs larger than the ordinary human proportion. One of his most famous works was a picture of Helen for the temple of Hera at Croton. The rivalry of Zeuxis and Parrhasius is represented in a well-known story about a contest in which Zeuxis painted grapes at which the birds pecked, and Parrhasius a curtain which Zeuxis wished to have raised in order to see the picture. Some of his later works he gave away as being valuable beyond any fixed price. As far as may be judged from extant accounts, he painted small works on panels in contrast to the large mural paintings of Polygnotus. It is, of course, now impossible to form a correct idea of his art, though more ancedotes are told of him than of any other painter of antiquity. These are to he found in Lucian, Cicero, and especially the 'Historia Naturalis' of Pliny. Among his other works were 'Zeus on His Throne Sur-

rounded by Deities; Eros Crowned with Roses; Centaur Family; The Infant Hercules Strangling the Serpent; Penelope; Menelaus Weeping; Boy with Grapes.

ZEYER, tsī'ĕr, **Jules,** Czech author: b. Prague, April 26, 1841; d. Jan. 29, 1901. After travel in France, Germany, Italy, Greece, and Russia, he became an instructor in the last, and published a number of volumes highly rated in literature. In prose, these included *Count Xavier* and *Andrew Cernysev,* the period of which was that of Catherine II; in verse, *vysehrad,* a series of epic poems, the subject of which was derived from the early history of Bohemia.

ZHITOMIR, zhê-tô'mêr, USSR, city of the Ukrainian Soviet Socialist Republic, capital of the Zhitomir Region. It is situated on the Teterev, and affluent of the Dnieper River, 80 miles southwest of Kiev. The principal industries are iron-smelting, brewing, sawmilling, and foodstuffs manufacture; tobacco, soap, candles, and dyes are also made; and there is a considerable trade in grain. Public institutions include a teachers' college, museum, and valuable libraries. Zhitomir rose to importance in the 9th century, when it became a center of caravan trade. The city changed hands several times, at various periods being in the possession of the Tatars, and being annexed by both Lithuania and Poland. In 1793, when Poland was partitioned for the second time, it passed under Russian sovereignty. Pop. (1939) 95,090.

ZHOB, zhōb, a river of India, in British Baluchistan. It rises in the western foothills of the Sulaiman mountain range and flows parallel to the frontier of Afghanistan until its junction with the Gomal River at Khajuri Kach; with the latter, it empties into the Indus near Dehra Ismail Khan. The valley of the Zhob first became known to white men in 1884, when it was visited by a British military expedition. The valley and the adjacent Gomal Pass, which gives access to Afghanistan, were annexed by Great Britain in 1889. The most direct route from the North West Frontier Province to Quetta, capital of British Baluchistan, lies through the valley of the Zhob.

ZHUKOV, zhōō'kôf, **Georgi Konstantinovich,** Russian army officer: b. 1895. He entered the Russian Imperial Army as a private in 1915, during World War I, and on outbreak of the October Revolution of 1917 he joined the Bolsheviks. Gaining a commission during the fighting with the White Russian counterrevolutionists, he continued army service after the Soviet Union was firmly established and, in 1932, entered the famed Frunze Military Academy. There he specialized in armored warfare, studying under Marshal Boris Mikhailovich Shaposhnikov (b. 1882), chief of the Red Army's general staff; he put these precepts into practice during the Spanish Civil War of 1937–1938, where he advised the Loyalist government on tank tactics. He saw more fighting in Outer Mongolia during 1938–1939, commanding tank detachments against the Japanese in the region of the Amur River. His reputation as a skillful commander was firmly established in the brief Russo-Finnish War of 1939–1940, and in February 1941, he was appointed chief of the general staff of the Red Army, vice-commissar for defense, and an alternate member of the Political Bureau of the Central Committee of the Communist Party. He co-operated with Marshal Semyon Konstantinovich Timoshenko (q.v.) in the reorganization and training of the Soviet armies, and this bore fruit the following summer when, in the midst of World War II, the Germans suddenly invaded Russia. In October 1941 he took over command of the forces defending Moscow, succeeding Timoshenko (who was transferred to the southern front), and in a series of hammering blows brought the Germans to a halt when they were only 20 miles from the capital. Late in 1942, in cooperation with Marshal Alexander M. Vasilevski (q.v.), he directed the counteroffensive at Stalingrad, and for saving the city he received the personal congratulations of Generalissimo Joseph Stalin; and he was awarded the Order of Suvorov, first class, for brilliant leadership in raising the 17-month siege of Leningrad in January 1943. He was also promoted to the rank of marshal of the Soviet Union, and in March 1944, appointed to command of the First Ukrainian Army in succession to Gen. Nikolai Vatutin, he launched a drive across the southwestern Ukraine which continued without a pause until April 8, when he had reached the borders of Czechoslovakia. In July 1944 he was relieved from this command in order to become Stalin's deputy commander in chief, in Moscow, but before the year ended he was once more in the field, being given command of the First White Russian Army. After careful preparation he launched a great attack upon the Germans on Jan. 12, 1945, along an 800-mile front from East Prussia to the Carpathians. By the end of the month his forces were 12 miles within Germany proper, northwest of encircled Poznan (Posen) and by mid-April his armored divisions were poised before Berlin. His troops, together with those of the First Ukrainian Army, then under Marshal Ivan Stepanovich Konev (q.v.), effected the occupation of the German capital on May 2, 1945, thus concluding one of the most brilliant campaigns in military history. Russia's greatest soldier of World War II, Zhukov received the Order of Victory, the Soviet's highest award, and received the title of Hero of the Soviet Union. In Berlin, on May 8, 1945, he signed the terms of surrender imposed upon the Germans, whose chief signatory was Field Marshal Wilhelm Keitel (q.v.), and in that city, on June 5, he was one of the Allied cosignatories of the proclamation of the assumption of the government of Germany by the victorious powers. With division of Germany into separate zones of administration for each nation, Zhukov was appointed administrator of the Russian Zone.

ZHUKOVSKI, zhōō-kôf'skû-ĭ, **Vasili Andreevich,** Russian poet: b. near Belev, government of Tula, Jan. 29, 1783; d. Baden-Baden, Germany, April 12, 1852. He served in the campaign of 1812 against Napoleon, later settled in Dorpat, and in 1816 obtained an imperial pension. In 1826 he became tutor to the czarevitch, later Alexander II. His most important service to Russian literature was to be found in his translations of the poems of Byron, Gray, Moore, Scott, Goethe, Schiller, Rückert and others; *Don Quixote;* the *Odyssey* and various further foreign classics. Among his original verses, *Liudmilla,* an imitation of Bürger's *Lenore,* and *The*

Minstrel in the Russian Camp were the most successful.

ZIEGFELD, zĭg'fĕld, **Florenz,** American theatrical producer: b. Chicago, Ill., March 21, 1869; d. Hollywood, Calif., July 22, 1932. At the age of 23 he went to Europe, whence he brought back to the United States a number of military bands for the Chicago World's Fair of 1893. His first stage production was made in 1896, starring a French girl who, as Anna Held, became a popular actress; his marriage to her, in 1897, ended in divorce in 1913. In June 1907 he made theatrical history by producing the *Follies of 1907,* first of a series of yearly revues, popularly known as *Ziegfeld's Follies,* which featured a chorus of girls with striking costumes and settings. He also staged numerous highly successful musical comedies, notably *Sally, Rio Rita, Kid Boots, Show Boat, Bitter Sweet,* and *Pink Lady.* The star in most of them was Billie Burke, whom he married in 1914.

ZIEGLER, zē'glĕr, **Theobald,** German philosopher, and writer on pedagogy and ethics: b. Göppingen, Württemberg, Feb. 9, 1846; d. 1918. He studied at Tübingen, and from 1871 he was instructor in various gymnasia. In 1884 he was appointed lecturer on philosophy and pedagogy in the University of Strassburg, and in 1886 he became professor there. He retired in 1911. His *Sittliches Sein und Sittliches Werden* (2d. ed., 1890; English 1892) was a substantial enrichment of the literature of moral philosophy, and the *Geschichte der Ethik* (2d. ed., 1892) was also a work of importance. His further volumes included *Religion und Religionen* (1893); and *Fr. Th. Vischer* (1893); *David Friedrich Strauss* (2 vols., 1908); *Menschen und Probleme* (1914); *Der Krieg als Erzieher* (1914); *Das offentliche Leben* (1914).

ZIEGLER, William, American manufacturer: b. Beaver County, Pa., Sept. 1, 1843; d. Stamford, Conn., May 24, 1905. He at first entered the printers' trade, and in 1868 the bakers' and confectioners' supplies business. In 1870 he organized the Royal Chemical Company, which he developed into the Royal Baking Powder Company, retiring from active business in 1886. He also operated largely in real estate. The Baldwin-Ziegler Polar expedition of 1901–1902, led by Evelyn Briggs Baldwin (q.v.), was financed by him. He also outfitted a Polar expedition named for him and conducted by Anthony Fiala (q.v.) during 1903–1905; leaving Vardö, Norway, on July 10, 1903, the ship was lost after a survey of Francis Joseph Archipelago, but the members of the expedition were rescued in July 1905.

ZIEM, zyĕm, **Félix François Georges Philibert,** French landscape and marine painter: b. Beaune, Feb. 25, 1821; d. Paris, Nov. 10, 1911. He studied in the art school of Dijon, traveled in southern France, Italy, and the Orient, and obtained a third-class medal at the Salon of 1851, and a first-class in 1852. He was well known for his landscapes, particularly for scenes of Venice. Among his many canvases were *View of Venice* (1852; Luxembourg); *The Bank of the Amstel* (Bordeaux Museum); *Quai Saint-Jean at Marseilles* (Marseille Museum); *The Doge's Palace* (Ravené Gallery, Berlin); *Venetian Fishing Boat* (Metropolitan Museum of Art, New York City).

ZIERIKZEE, zē'rĭk-zā, Netherlands, a town in the province of Zeeland, on the south side, and the chief town of, the island of Schouwen. It lies three miles from the Ooster Schelde, with which it is connected by two canal harbors, and 38 miles northwest of Antwerp. It has six churches, a fine townhouse dating from the 15th century, and a gymnasium; it manufactures madder, carries on brewing and oyster fishing, and has considerable trade and shipping. It is the oldest town of Zeeland.

ZIETEN, or **ZIETHEN,** tsē'tĕn, **Hans Joachim von,** German army officer: b. Wustrau, near Neuruppin, Brandenburg, May 14, 1699; d. Berlin, Jan. 26, 1786. He entered the Prussian Army in 1714, and distinguished himself as a colonel in the Silesian campaign of 1742, and as a major-general in that of 1745. In May 1745 he made a celebrated march through the enemy's country in Upper Silesia, in order to communicate with the Margrave Karl at Jägerndorf. In 1756 he was made lieutenant-general. He obtained his chief renown in the Seven Years' War (q.v.), winning the victories of Reichenberg, Prague and Leuthen, and deciding the day at Torgau by storming the heights of Süptitz.

ZIF, ZIV, ZIPH, IYAR, or **IYYAR,** in the Hebrew calendar, the second month of the year, always of 29 days. It falls between April 10 and June 8.

ZILBOORG, zĭl'bôrg, **Gregory,** American psychiatrist: b. Kiev, Russia, Dec. 25, 1890. His medical studies were interrupted for hospital service in the Russian Army during the early years of World War I. Obtaining his medical degree in 1917 at the St. Petersburg (later Leningrad) Psychoneurological Institute, he participated in the February Revolution of 1917 and became secretary to the minister of labor in the administrations of Prince Georgi Evgenievich Lvov (1861–1925) and Alexander Feodorovich Kerensky (q.v.). He then edited a daily paper in Kiev until southern Russia was occupied by the Germans, when he was forced to leave the country. In 1919 he reached the United States, where he was naturalized in 1925. During those first years in the country he lectured, engaged in journalism, and wrote *The Passing of the Old Order in Europe* (1920); he also made translations from the Russian, including *He Who Gets Slapped* (1921), by Leonid Nikolaevich Andreyev (q.v.), and *We* (1924), by Zamiatin. In 1926 he secured an M.D. degree at the College of Physicians and Surgeons, Columbia University, and in 1931, after serving on the staff of the Bloomingdale (N. Y.) Hospital, he entered private practice in New York City as a psychiatrist and psychoanalyst. He translated from the German *The Criminal, the Judge, and the Public* (1931) and *Outline of Clinical Psychoanalysis* (1934), and his own works include: *The Medical Man and the Witch During the Renaissance* (1935); *A History of Medical Psychology* (co-author, 1941); *Mind, Medicine, and Man* (1943).

ZILE (anc. Zela), Turkey, a town in the vilayet of Sivas, 25 miles south of Amasya. A modern castle occupies the site of an old

Byzantine fortress. Ancient Zela was a theocracy ruled by the priests of the temple of Anaitis. Here Mithridates won a victory over the Romans 67 B.C., and it was also the scene of Cæsar's victory over Pharnaces, 47 B.C., concerning which Cæsar wrote "*Veni, vidi, vici.*" Pop. 20,000.

ZILLER, tsĭl'lĕr, **Tuisken,** German educator: b. Wasungen, Saxe-Meiningen, 22 Dec. 1817; d. Leipzig, 20 April 1882. He was educated at Leipzig, where he was at first a lecturer in jurisprudence, but in 1854 became professor of philosophy and pedagogy. At his initiative the Verein für Wissenschaftliche Pädagogik was founded. Among his books are 'Einleitung in die Allgemeine Pädagogik' (1856; 2d ed., 1901) and 'Allgemeine Philosophische Ethik' (1880; 2d ed., 1886).

ZILLERTHAL, tsĭl'lĕr-täl, Austria, a valley of the Tyrol in the eastern Alps, about 25 miles below Innsbruck, famous for its scenic beauties. It is traversed by the Ziller, which joins the Inn River at the mouth of the valley. It is much frequented by tourists, a railway line connecting with Mairhofen in the valley.

ZIMBABWE, zēm-bäb'wā, or **ZIMBABYE** (Bantu for "here is a great kraal"), a name applied to numerous interesting South African ruins in Rhodesia and the Transvaal. They were discovered by Adam Benders in 1868. The best known and most important is the Great Zimbabwe, near the Sabi River, about 17 miles from Victoria in southern Rhodesia. There are two principal structures at Great Zimbabwe, one on the crest of a granite hill breaking down precipitously to the south, and the other on the level ground about a third of a mile to the south. The lower one is roughly circular or elliptical, enclosed by a wall of 30 or 40 feet high, 14 feet thick at the base, and from six to nine feet thick at the summit. The wall is composed of well-trimmed blocks of granite fitted together without mortar in regular courses and occasionally set angularly for ornamental purposes. An inner wall runs close to the outer for a considerable distance, forming a passage which leads to a sacred enclosure containing two conical solid towers, the larger of which is some 40 feet high. The rest of the enclosure is divided into irregular unroofed chambers. The building on the hill is very strongly built for defense and also contains a sacred enclosure. Emblems, believed by some to be phallic, many curious objects in soapstone, and undoubted remains of gold-working utensils have been found in the Zimbabwes. The nearest gold deposits and ancient gold workings are, however, some miles distant. Some theorists would locate here the Ophir of Solomon. It is also suggested that the lower building was a kind of town occupied by pre-Mohammedan Arabs who came here in search of gold, and that the ruin on the hill was a stronghold for defense. The signs of orientation reported by earlier visitors were disproved by scientific investigators who explored the ruins in 1905. The theories of Bent are now definitely discarded. Consult Randall-MacIver, D., 'Mediæval Rhodesia' (1906); for illustrations Bent, J. T., 'The Ruined Cities of Mashonaland' (1892); and Hall and Neal, 'The Ancient Ruins of Rhodesia' (1902).

ZIMMERMAN, Eugene ("Zim"), American caricaturist and illustrator: b. Basel, Switzerland, 25 May 1862. After a public school education in Paterson, N. J., and some time in various employments, he turned his attention to comic art, was on the staff of *Puck* in 1882–85 and then with *Judge* as a cartoonist (known as "Zim"). He also illustrated some of the works of J. W. Riley ("Bill Nye") and others. He later conducted Zim's Correspondence School of Cartooning, Comic Art and Caricature. Author of 'This and That About Cartooning' (1892–93). Died 26 March 1935.

ZIMMERMAN, Jeremiah, American clergyman and numismatist: b. Snydersburg, Md., 26 April 1848; d. 19 Feb. 1937. Graduated from Pennsylvania College, Gettysburg, in 1873, and the theological seminary there in 1876, he was pastor of the Lutheran Church at Valatie, N. Y., in 1877–78, and in 1879 organized at Syracuse, N. Y., the First English Lutheran Church, of which he was pastor until 1904. He then resigned to engage in foreign travel and literature, specializing on the Far East, archæology and history. He is also regarded as an authority on the historical branch of numismatics, and was professor of numismatics at Syracuse University 1911–17. Author of 'Spain and Her People' (1902); 'The Religious Character of Ancient Coins'; 'The Problem of Evil and Suffering—A Solution and the Antidote' (1927).

ZIMMERMANN, tsĭm'mĕr-män, **Albert,** German painter: b. Zittau, Saxony, 20 Sept. 1809; d. Munich, 18 Oct. 1888. He studied in Dresden and Munich and was made professor in the Milan Academy in 1857 and at the Vienna Academy in 1859 His works display admirable characterizations of mountainous scenery and excellent light-effects, and are represented in the museums at Leipzig, Munich, Stuttgart, Hanover, Dresden, Frankfort and in the R. L. Stuart Collection (New York Public Library). Among them are 'Rocky Landscape with Centaurs and Leopards'; 'Chiem Lake in Storm'; 'The High Göll'; 'Sunset on Hintersee'; and 'Lake Como.'

ZIMMERMANN, Johann Georg, Ritter von, Swiss philosopher and writer: b. at Brugg, canton of Aagau (then in Bern), 8 Dec. 1728; d. Hanover, 7 Oct. 1795. He studied medicine under Haller at Göttingen, and in 1754 was appointed public physician to his native town. He employed his leisure in the publication of pieces in prose and verse, including the first sketch of his popular work 'Ueber die Einsamkeit' (On Solitude, 1756; completely rewritten 1784–85). This was followed by his essay 'Vom Nationalstolz' (On National Pride 1758). In 1763 he composed his work 'Von der Erfahrung in der Arzneikunst' (1764), which he followed up by several other professional treatises; in consequence of which he received an offer of the post of physician to the king of England for Hanover, which he accepted, and removed in 1768 to that capital. In 1786 he attended Frederick the Great in his last illness, which afforded little room for medical skill, but enabled him to publish an account of his conversations with that celebrated sovereign, 'Ueber Friedrich den Grossen und meine Unterredung mit ihm' (1788), and 'Fragmente über Friedrich den Grossen' (1789), works of little value. His 'Solitude' was at one time very popular, and

was translated into almost every language of Europe. Consult the studies by Bodemann (1878) and Ischer (1893).

ZIMMERMANN, Wilhelm, German poet and historian: b. Stuttgart, 2 Jan. 1807; d. Mergentheim, Würtemberg, 22 Sept. 1878. After study at Tübingen, he was connected with carious journals at Stuttgart, from 1847 to 1850 was professor of history and of German language and literature in the Polytechnic Institute there, but lost the post through his liberal attitude as a member of the German National Assembly (1848) and the Würtemberg Parliament. Subsequently he was pastor of Evangelical churches at Leonbronn, Schnaitheim and Owen. He is best known for his 'Gedichte' (1832; 2d ed., 1839; 3d ed., 1854), which reveal the influence of Schiller and Uhland, but are never merely imitative. Others of his publications are 'Befreiungskämfke der Deutschen gegen Napoleon' (1836; 3d ed., 1859); 'Geschichte des Grossen Bauernkriegs' (3 vols., 1841–43; 3d ed., 1891), etc.

ZIMMERN, Helen, English author: b. Hamburg, Germany, 25 March 1846. She was taken to England when an infant and was naturalized as a British subject upon coming of age. After a secondary education at Bayswater, she became a contributor to *Once a Week, Old Merry's Monthly,* the *Press,* the *Examiner* and other periodicals, and in 1876 achieved a success with 'Schopenhauer, his Life and Philosophy.' From 1887 she resided at Florence, Italy, where she corresponded for Italian, English and American periodicals. She also lectured in Italy, England and Germany on Italian art. Among her further publications are 'Gotthold Ephriam Lessing, his Life and his Works' (1878); 'The Epic of Kings' (1882); a paraphrase from Firdusi; a 'Life of Maria Edgeworth' (1883); 'The Hansa Towns' (1889); 'Italy of the Italians' (1906); 'Tripoli and Young Italy' (1912); 'Italian Leaders of Today' (1915); 'New Italy' (1918), etc. She also translated from Nietzsche, and Lessing's prose; edited the comedies of Goldoni (1892); was joint translator of Ferrero's essays as 'Europe's Fateful Hour' (1918), and translated Enrico Castellani's 'Italy and Austria at War' (1918). Died 11 Jan. 1934.

ZIMRI, zĭm'rī, in the satire 'Absalom and Achitophel' (pt. i, 1681; pt. ii, 1682) by John Dryden (q.v.), a character representing Villiers, Duke of Buckingham:

> Some of the chiefs were princes in the land:
> In the front rank of these did Imri stand, etc.
> (Pt. i, 545 et seq.)

Buckingham was depicted as a factional leader, like Zimri who conspired against Asa, king of Judah (1 Kings xvi, 9).

ZINC. Zinc cast into slabs as it comes from the furnace is commercially known as spelter, but zinc recast into forms such as are used in galvanic batteries is known as battery zinc, and zinc rolled into sheets is known as sheet zinc. There is a growing movement, fostered by the American Zinc Institute, to avoid confusion by abandoning the use of the word spelter.

Properties.— Zinc is a bluish-white metal with a bright metallic lustre, an atomic weight of 65.37, a density of about seven, and a hardness, when cast, of 38 in the Brinell scale, as compared to a hardness of 40 for copper and 28 for silver. Both density and hardness are slightly increased by rolling. It is so hard that it can be filed with difficulty, and in a large mass it can be broken only with considerable force. Its texture as shown on a broken surface is prismatic crystalline, the crystals being six-sided and belonging to the hexagonal system. At different temperatures zinc has different properties. At ordinary temperatures it is fairly brittle, but at 100°–150°C. it can be rolled out into sheets or drawn into wire, though above 200° C. it becomes brittle again. It melts at 419.4° C. and boils at 920° C., the vapor burning in air with a characteristic brilliant bluish-green flame to zinc oxide, formerly known as "philosopher's wool" or "flowers of zinc." Zinc is not affected by dry air or by oxygen at ordinary temperatures, but under moist atmospheric conditions the surface becomes covered with a coating of grayish-white basic carbonate of zinc, which protects the metal from further corrosion. The industrial value of zinc for use as a protective coating for iron and steel and for use in exposed positions is due largely to this property.

Uses.— Zinc is used in metallic form in galvanizing iron and steel, in making sheet zinc, and in making brass and some other alloys. Iron and steel may be galvanized in several ways — by dipping the articles in a bath of molten zinc; by heating them to 425°–450° C. in a drum filled with zinc dust, a process known as "sherardizing," in which they are coated with zinc by the zinc vapor given off from the zinc dust; and by electroplating them with zinc. As only the last method employs the galvanic current, the others are miscalled "galvanizing," and an article protected by a coat of zinc would better be called "zinc-coated." In normal times about 60 per cent of the zinc output of the country is used in zinc-coating iron and steel. Metallic zinc may be rolled in plates an inch or so thick — "boiler plates," which, suspended in boilers, preserve them from the corrosion of sea water — or in thinner sheets for roofing, shingles, gutters, spouts, household utensils, zincographer's plates, dry batteries, buttons, shoe-lace tips, etc. Much sheet zinc was used during the European War to line packing cases filled with munitions and machined parts which needed protection from the sea air. Metallic zinc is alloyed with copper to form brass, some "bronzes" and other alloys. In normal times only about 20 per cent of the total consumption is used in making brass, but during the European War the greater part of the metallic zinc produced in the country was used for that purpose. A considerable quantity of metallic zinc is used annually in desilverizing lead by the Parkes process.

Zinc oxide is made under the French process by burning metallic zinc in an oxidizing atmosphere, and under the American process by burning oxidized or desulphurized zinc ores mixed with ground coal in an oxidizing atmosphere. The purity of the product depends on the purity of the metal and the ore. Chemically pure zinc oxide is used in pharmaceutical preparations. Zinc oxide of good grades free from lead is also used largely in making rubber, to increase its tensile strength, toughen it

and increase its wear-resisting properties. Zinc oxide of both good and common grades is used as a pigment in making paints. American process oxide, in which there is a considerable percentage of lead, i.e., leaded zinc oxide, is also used for pigment, as a combination of lead and zinc is held to be desirable in a paint.

Zinc dust, which consists of minute droplets of metallic zinc coated with a film of zinc oxide, is formed in the distillation of zinc, or is specially prepared. It is a very active chemical agent and is used to discharge the color of the pattern in calico printing. It is also used to precipitate gold in the cyanide process of gold recovery and to precipitate other metals and purify the solution in making lithopone and in the electrolytic deposition of zinc. Another use is in sherardizing as mentioned above. Lithopone, a chemical combination of zinc sulphide and barium sulphate, is a white pigment used for interior paints and forms the base of most white enamels. Several salts of zinc are employed in medicine and the arts. Zinc acetate and zinc sulphate are used in medicine as an emetic, astringent and antiseptic. They are used as a mordant in dyeing, and are also useful in wood preservation, but the chloride is generally employed for that purpose, as in the Burnett process. Zinc chloride is used as a caustic agent in the treatment of certain diseases, as a general disinfectant and preservative, and as a flux in soldering. Zinc sulphate is used in bleaching paper and as a dryer in varnishes and in fireproofing paints.

Sources.— The chief zinc minerals are zinc sulphide, sphalerite (zinc blende or "black jack"); zinc carbonates, smithsonite (calamine in Europe) and hydrozincite; zinc silicates, calamine (smithsonite in Europe) and willemite; zinc oxide, zincite ("red zinc ore"); and zinc-iron-manganese oxide, franklinite. The three minerals last named form the ore at Franklin Furnace mines, in New Jersey, where they occur more plentifully than anywhere else in the world. Zinc blende is the most common ore of zinc. It usually occurs as a complex ore in association with galena and with pyrite and other metallic sulphides, but in the Mascot mines of eastern Tennessee it is unassociated with either lead or iron. The upper parts of sulphide deposits containing zinc have usually been altered by oxidation, and the zinc minerals changed to the silicate and carbonate. The principal zinc-producing region in the United States is the Joplin-Miami district of southwestern Missouri, southeastern Kansas and northeastern Oklahoma, which in 1938 produced ores containing 196,174 short tons of recoverable zinc, about 40 per cent of the total production of the country. The Franklin Furnace mines produced 85,839 tons of recoverable zinc or 16 per cent of the total, the East Tennessee-Virginia district produced 56,766 tons, or 10 per cent, the Cœur d'Alene district of Idaho, 31,937 tons, and St. Lawrence County, N. Y. produced 29,896 tons. Other important zinc districts are the Bingham district in Utah, the Central and Willow Creek districts in New Mexico, the Warm Springs in Idaho and the Metaline district in Washington. The total recoverable zinc content of zinc ores mined in the country in 1917 was 710,972 short tons, a large increase in response to the demands of the war. The five-year average of 1925–29 was 724,720 tons. Output in 1938 was 516,699 short tons.

Imports of zinc ore in 1938 came from Peru and Mexico, and the latter country and Canada shipped zinc slabs to the United States. During the early years of the European War large imports of zinc concentrates were brought to the United States from Australia, where the extensive deposits of lead-zinc ores of the Broken Hill lode of New South Wales have been for years the main foreign dependence of the zinc smelters of Belgium, Germany and France. The zinc deposits of Rhodesia Broken Hill in Africa are extensive, and there are many deposits in Algeria and Tunis. The Bawdwin deposits of India are reckoned among the largest in the world, as are also those of the Ridder and adjoining concessions in the Irtysh region of southwestern Siberia. The chief zinc-producing regions of Europe are the Upper Silesia district, formerly a part of Prussia; the Rhine district of Germany; the island of Sardinia in Italy, and the Santander and Cartagena districts of Spain.

Before the complex ores, sulphides of zinc, lead, copper and other metals — the refractory ores of the metallurgist — are treated in the usual practice by smelting in the blast furnace, the zinc minerals must be separated from the others because zinc interferes so greatly with the reduction of the other minerals that a "fine" or "penalty" is placed by the smelter on ores containing zinc above a fixed limit, depending on circumstances. Moreover, the zinc is lost. Hence practically all zinc-bearing ores are subjected to milling, in which the zinc minerals are separated from the others and all are concentrated to workable richness. In the Joplin region ore of lower metallic content than anywhere else in the world is profitably mined. In one type of deposits, the "sheet ground," the ore mined in 1916–17 averaged 1.3 per cent of zinc and 0.3 per cent of lead, as shown by the metal content of the concentrates. The zinc concentrates average from 58 to 59 per cent of zinc. In the Broken Hill district of New South Wales in early years the zinc was separated as middlings and accumulated in huge stacks. By the flotation process, perfected in that region since 1903, the sulphide minerals are floated off in a froth while the gangue minerals sink to the bottom. The stocks of zincky middlings thus became available and have furnished the bulk of Broken Hill's large annual output of zinc concentrates in recent years. The flotation process has likewise made available large reserves of lead-zinc ores previously unworkable in various parts of the world.

Zinc Smelting.— The origin of the art of smelting is lost in the mists of antiquity. Brass was an article of commerce with the Orient from the earliest days of which there is record, but brass can be made by the "cementation" process in which granulated copper is melted with granulated "calamine" (oxidized zinc ore), and hence the existence of brass is not proof of the production of metallic zinc. However, metallic zinc was certainly known in India in the 14th century. Zinc ore may be reduced by burning off the zinc as oxide, and the oxide may be utilized as such or may be dissolved and the zinc content deposited

electrolytically; or the desulphurized ore may be leached with sulphuric or other acid and the zinc obtained by electrolysis. Both these methods are in commercial use, and other electrochemical processes are in a fair way to be established. Electrothermic reduction of zinc ores is practised in Sweden, but has not yet proved commercially feasible in the United States. The low volatilization point of zinc led to distillation as the first method for the reduction of zinc ores, and it is yet the chief method. The native Chinese method of making zinc, though primitive, nevertheless, involves all the essential principles of modern zinc distillation. Clay pots or crucibles are set in the flat top of the furnace so that the lower half is exposed to the heat of the furnace. The zinc ore and carbon are put into the pot, a sloping partition with a perforation at the upper edge is luted (sealed with clay) into position at the middle of the pot, and the cover is luted on. The zinc vapor comes up through the perforation, condenses in the cooler upper chamber and collects as liquid zinc on the lower portion of the sloping partition, whence it may be dipped and cast into cakes. In the modern retort furnace there may be 300 to 450 clay retorts set in three to five horizontal rows, each retort about 10 inches in diameter and about five feet long. Two such furnaces are joined back to back in a block. Only the mouth of the retort projects from the furnace, and to this is luted the condenser, a conical clay cylinder closed at the slightly lower front end, except for a small aperture, by a clay plug. The zinc vapor distills over and is liquefied in the condenser, from which it is «drawn» and cast into slabs four times during the «campaign,» which lasts 24 hours, the retorts being cleaned out and the charges renewed each morning.

Production.—On a smelter basis zinc production in the United States in 1938 was 20 per cent less than the year before, though most foreign countries registered gains. Total world production for 1938 was estimated at 1,558,000 metric tons as credited to the countries where smelted. The United States output was 404,912 metric tons or 26 per cent of the total. Belgium was second with 209,983 tons, closely followed by Germany which had greatly increased its output of zinc, reaching 192,000 tons in 1938. Canada produced 155,973 tons; Poland 108,071; Australia 70,941, and the Soviet about 70,000 metric tons.

In 1930 the output of primary metallic zinc from both domestic and foreign ores, in the United States, was 499,300 short tons, and in the year 1929 was 612,136 tons from domestic ores and 13,311 from foreign ores, or a total of 625,447 tons. Next to the United States, the other large consumers of zinc are Great Britain. Germany and Belgium. See table below for production and consumption of metallic zinc in the United States compared with pre-World War averages.

	1910–1913 (average)	1917	1923	1925–29 (5 year average)	1933	1938
Production of primary zinc*						
From domestic ore	296,315	584,597	508,334	589,645	306,010	436,007
From foreign ore	13,983	84,976	2,099	12,734	1,172	10,334
	310,298	669,573	510,434			
Production of secondary zinc*						
Redistilled	19,721	16,834	39,434	43,755	30,087	31,613
Remelted	26,302	14,565	25,776	21,624	18,013	10,657
	356,321	700,973	575,644	667,762	355,282	488,611
Apparent consumption of primary zinc	290,413	413,643	446,514	514,311	321,789	375,004

* "Primary zinc," which is produced from ore, is distinguished from "secondary zinc," which is obtained by refining zinc ashes, skimmings, drosses, and old metals and which has already been statistically counted as metal.

The first zinc was made in the United States in 1835 by Dr. F. R. Hassler, superintendent of the United States Coast Survey. Finding it impossible to obtain abroad brass or zinc of the requisite purity for the standard sets of weights and measures he set up a small zinc-distillation plant in the arsenal at Washington. The ore used was a mixture of blende from Perkiomen, Pa., and red zinc ore from Franklin Furnace, New Jersey. The first zinc smelting on a commercial scale was at the Lehigh works at South Bethlehem, Pa., in 1860. In the same year the Matthiessen and Hegeler works were opened at La Salle, Ill. These were the main eastern and western centres of zinc smelting until 1892, when smelters in the coal fields of Kansas assumed equal importance with Illinois plants. This importance was increased about 1896, when natural gas began to be used for smelting, and by 1899 Kansas had become the largest producer among the States. The waning of the gas fields caused Kansas to fall behind Illinois in 1913, but by 1919 and 1920 the natural-gas smelters of Oklahoma, which first smelted zinc in 1907, put that State in the front rank. Geologist, United States Geological Survey.

ZINC, Refining of. See ELECTROCHEMICAL INDUSTRIES.

ZINC WHITE. See WHITE COLORS.

ZINCITE, or KINKITE, a deep blood-red to orange-red mineral found quite abundantly in Sussex County, N. J. It is

usually in granular or foliated masses, associated with franklinite, willemite, tephroite and calcite. It rarely occurs in hexagonal, hemimorphic crystals, with perfect basal cleavage. Its hardness is 4 to 4.5 and specific gravity about 5.7. It is an oxide of zinc, ZnO, and is valuable as an ore of that metal. It is often called «red oxide of zinc» and «red zinc ore.»

ZINCOGRAPHY. See LITHOGRAPHY.

ZINGARELLI, dzēn-gä-rĕl'lē, **Nicolo Antonio,** Italian composer: b. Naples, 4 April 1752; d. Forre del Greco, 5 May 1837. He studied at the Conservatorio di Loreto and also under the Abbate Speranza, and on leaving the conservatory received the place of master of the chapel at Torre dell' Annunziata. In 1781 he composed for the Theatre San Carlos, in Naples, his opera 'Montezuma,' and in 1785 brought forward his 'Alzinda' in La Scala, Milan, with great success. In this work he adopted a more simple and easy style. His best operas are 'Pirro,' 'Artaserse' and 'Romeo e Giulietta.' In 1789 he brought out his 'Antigone,' from Marmontel in Paris; but the public events then occurring absorbed the attention of the public, and he soon returned to Italy, where he became director of the Vatican chapel in 1804. He refused to conduct the musical services rejoicing over the birth of Napoleon's son as the «King of Rome,» and by the order of Napoleon was arrested and taken to Paris. Napoleon, however, pardoned him because of his fondness for the composer's music. In 1813 he was appointed director of the musical academy of San Sebastiano, and in 1816 chapel-master in Saint Peter's, Naples, holding both positions while he lived. Zingarelli composed much church music, including more than 30 masses, and numerous cantatas and oratorios. His works are highly esteemed for their expression. From 1781 he wrote about 40 operas, many melodies from which have continued to be interpolated in modern Italian productions.

ZINGERLE (VON SOMMERSBERG) tsĭng'ĕr-lĕ, **Ignaz Vincenz,** Austrian Teutonic scholar: b. Meran, 6 June 1825; d. Innsbruck, 17 Sept. 1892. He was a nephew of Pius Zingerle (q.v.). He studied at Innsbruck, Trent and Brixen, and was for a time an inmate of a Benedictine monastery at Marienberg, but later abandoned theology. From 1859 until his retirement in 1890 was the professor of German language and literature at Innsbruck. Among his works are 'Sagen aus Tirol' (1850; 2d ed., 1891); 'Sitten Bräuche, und Meinungen des Trioler Volkes' (2d. ed., 1871).

ZINGERLE, Pius, Austrian Orientalist and Catholic theologian: b. Meran, 17 March 1801; d. Marienberg cloister, 10 Jan. 1881. He studied at Innsbruck, became in 1862 professor of Oriental languages in the Sapienza at Rome, and in 1867–71 was director of the gymnasium at Meran. Among his works are 'Ausgewählte Schriften des Heiligen Kirchenvaters Ephräm' (1830–37; 2d ed., 1845–46).

ZINJAN, zĭn-jän', Persia. See ZENJUN.

ZINNIA, a genus of annual and perennial herbs and sub-shrubby plants of the family *Astéraceæ.* The species, of which about 20 are known, are indigenous from southern Colorado to Chile, but are chiefly distributed in Mexico and Central America. They have opposite, generally entire leaves and terminal heads of very variously tinted flowers, for which some of the species have become popular in gardens. The best-known species is the garden zinnia or youth-and-old-age (*Z. elegans*), an erect annual usually about 18 inches tall and originally bearing yellow or orange flowers, but now exhibiting nearly every tint except blue and green in both single and double forms, which often exceed three inches in diameter. *Z. haageana* was introduced into cultivation in 1861, but being less showy and smaller than the former is of secondary importance. A hybrid race developed from these two species, and known as *Z. darwini,* has been evolved, but has not become widely popular in America. The plants are rather stiff, formal and coarse in habit, and their colors, although brilliant and metallic, lack the delicacy of the dahlia and the china aster, to which they are not distantly related. They are, however, among the most useful garden annuals, because they will thrive upon almost any kind of soil.

ZINNWALDITE, tsĭn'vält-īt, a silicate of the mica group, similar in form to biotite, but different in composition, in that it carries 3 to 4 per cent of lithia. It occurs at Zinnwald and Altenberg in the Erzgebirge of Germany, in Cornwall, England, and elsewhere, usually associated with tin deposits.

ZINZENDORF, tsĭn'tsĕn-dôrf, **Nicholas Ludwig,** COUNT VON, German religious leader, founder of the Society of United Brethren: b. Dresden, Saxony, 26 May 1700; d. Herrnhut, Upper Lusatia, 9 May 1760. From 1716 to 1719 he studied at the orthodox University of Wittenberg, and subsequently traveled in Holland and France, describing his journey in 'The Pilgrimage of Atticus Through the World.' In 1721 he received an appointment to the council of state from the Saxon government, which he held till 1727. He then completely withdrew from public affairs. He received at his estate in Upper Lusatia in 1722 the persecuted Moravian Brethren. This settlement received in 1724 the name of Herrnhut. With a view to founding the body called the United Brethren (q.v.), he published various projects, not in harmony with each other, which excited opposition, but he persevered in his plan and finally succeeded in establishing a religious order based on family instead of monastic conditions. In 1734 he passed a theological examination under an assumed name, and was ordained a clergyman of the Lutheran Church. After two years spent in traveling on behalf of his society, he was banished in 1736 from Saxony. The order of his banishment was repealed in 1747. In the meantime he had been consecrated bishop of the Moravian Church in Berlin, founded Moravian colonies in Holland, Esthonia and Livonia, and visited England. In 1739 he wrote a catechism which he styled the 'Good Word of the Lord,' and the same year visited the missions of the Brethren in the West Indies. In 1741 he visited the United States and founded the well-known Moravian colony at Bethlehem, Pa., and before returning to Germany in 1743 assisted in establishing missions among the Indian tribes. After returning to Europe he made a journey to Livonia, whence the Russian

government sent him back under a military escort to the frontier. He afterward visited Holland, spent several years in England, and obtained an act of Parliament for the protection of his followers in the British dominions. He wrote more than 100 works in prose and verse. His *Diary* was published in 1907.

G., *Leben des herrn Nicolaus Ludwig, grafen und herrn von Zinzindorf und Pottendorf* (Barby 1772–75; Eng. tr., abridged, London 1838); Römer, H., *Zinzindorfs Leben und Werken* (Gnaudau 1900); Langfelder, E. M., *Les séjours en Suisse, en France et en Belgique du comte Zinzindorf d'aprés son journal (1764–1770)* (Szeged, Hungary 1933).

ZION, zī'ŭn, city, Illinois, in Lake County, on the shore of Lake Michigan, five miles north of Waukegan, and served by the Chicago, North Western and the Chicago North Shore and Milwaukee railroads. It has manufactures of lace, candy, and bakery goods. Zion was founded in 1901 by John Alexander Dowie of the Christian Catholic Apostolic Church, and was governed theocratically by his successor, Wilbur Glenn Voliva, from 1907 until 1936, when a commission form of government was instituted. A passion play is produced here annually. Pop. (1950) 8,950.

ZION or **SION,** sī'ŭn, an elevated scarp of rock on one of the hills of Jerusalem, situated between the valleys of Kidron and Tyropoeon, called in modern times Temple Hill. The term Zion is often used in Biblical and other literature to designate the entire city of Jerusalem and, metaphorically, to designate the kingdom of God on earth and in heaven.

Zion was a stronghold of the Jebusites until conquered by David (II Samuel 5-7), who built there his palace and erected a tent for the Ark. The hill was known to the Jews as the "City of David" and became the center of Jewish religious and cultural life, and when Solomon built the Temple here, it became indeed the "habitation of the Lord" (Psalms 9:11, 76).

Zion, with the hills of Moriah and Ophel, was enclosed by the first wall of Jerusalem and here were built the palaces of Solomon and later of Herod. Newer walls around Jerusalem excluded Zion from the city, placing it entirely in what is now the Kingdom of Jordan. The Christian church erroneously assigned the name to another ridge southwest of the true Zion, although archaeological findings have asserted that Zion was indeed where the Old Testament placed it. The Christian Mount Zion is in the city of Jerusalem, and is a part of both Israel and Jordan.

ZION NATIONAL PARK, a government reservation in southwestern Utah, established in 1919. It has an area of 94,881 acres. It comprises the upper part of the valley of the Virgin River which here flows for eight miles in a narrow canyon, falling from 50 to 70 feet per mile, with walls in places 2,500 feet high, of brilliant colors and with great variety of gorgeous cliffs, towers, and pinnacles. Notable among these are two great monoliths known as the Great White Throne and the West Temple; they rise nearly 4,000 feet above the valley and consist of red sandstone. While the reservation is 50 miles from the nearest railroad at Cedar City, it is accessible by good auto roads.

ZIONISM. See Jewish History and Society—*Zionism.*

ZIPAQUIRA, sē-pä-kē-rä', town, Colombia, Department of Cundinamarca, 30 miles north of Bogotá. It is built on the site of an old Chibcha Indian town, and is especially noted for its valuable salt bed which is owned and operated by the government and supplies the greater part of the salt used in the republic. It is in a cattle raising district, and coal, lead, copper, and iron are mined in the vicinity. Pop. (1938) 6,955.

ZIPH. See Zif.

ZIRCON, zûr'kŏn, *in mineralogy,* the native zirconium silicate, $ZrSiO_4$. Its crystals are tetragonal and isomorphous with thorite, zenotime, cassiterite, and rutile. Though its crystal forms are extremely varied, they are usually prisms terminated by pyramids. Small crystals frequently show a wealth of faces, among which the "zirconoids" or ditetragonal pyramids are prominent. It is a heavy mineral, its specific gravity varying from 4.2 to 4.7, and it has a characteristic adamantine luster. Though often nearly or quite opaque, transparent crystals are not uncommon, and owing to its hardness, 7.5, strong double refraction, and the variety of rich colors in which it is found, zircon has long been prized as a gem. Its dispersive power is excelled only by the diamond. "Hyacinth" or "jacinth" includes reddish, orange, or brownish gem stones, which can be turned colorless by extreme heat and are marketed as "Matura diamonds." "Jargoon" or "jargon" is the name of the colorless, yellowish, grayish, or smoky varieties.

The finest zircon gems come from Ceylon and New South Wales, while excellent translucent to opaque crystals occur in Arendal, Norway; the Ural Mountains, USSR; Ontario and Quebec, Canada; Essex and Orange counties, New York; the Pikes Peak district, Colorado; and Henderson County, North Carolina. By far the most important locality is in the last named, where many tons of crystals occur loose in the soil. Zirconia, derived from this source, was used in the "Wellsbach" or "Auer" gas mantles, but has been superseded by thoria. The mineral is used as an abrasive and in refractories and enamels, as well as for gems. The bulk of zircon production comes from Australia, India, and Brazil.

ZIRCONIUM, zĕr-kō'nĭ-ŭm, a chemical element named after the mineral zircon in which Martin H. Klaproth discovered the oxide zirconia (1789), and obtained by Jöns Jakob Berzelius in 1824 as an iron-gray powder. Afterward it was found in many other minerals, some of the most important being eudialyte, hyacinth, and polymignite.

Its symbol is Zr; atomic number 40; atomic weight 91.22; specific gravity 6.44; with a valence of 4. It is in Group IV of the periodic table and has eight isotopes, of which five are stable. It has many physical and chemical properties resembling the element silicon. Like silicon and carbon it exists free in three allotropic forms: (1) amorphous, obtained by heating sodium zirconium chloride with metallic sodium potassium; (2) crystalline, as foliated leaves from heating sodium zirconium fluoride with metallic aluminum; (3) graphitoidal, obtained in scales of steel gray by action of iron on sodium zirconium. Insoluble in water, it is readily soluble in aqua regia or in hydrofluoric acid. When heated highly in the air it burns to the

oxide ZrO_2. This oxide, commonly known as zirconia, is prepared by fusing the mineral zircon ($ZrSiO_4$) with a mixture of sodium hydrate and sodium carbonate, treating with hydrochloric acid and heating to separate the silica, precipitating the solution so obtained with ammonia, and heating this white precipitate. Another method is now used by which the chloride is made by treating crushed zircon with chlorine, separating the silicon chloride by heat, precipitating the solution of zirconium chloride with ammonia, and heating the precipitate. Zirconia forms a white powder or amorphous lumps. It has both basic and acid properties. It dissolves slowly in hydrofluoric or sulphuric acids, the fluoride (ZrF_4) uniting with fluorides of other metals forming complex salts called zircofluorides, example K_2ZrF_6, potassium zircofluoride. With strong alkalies zirconia forms zirconates, example, K_4ZrO_4, potassium zirconate. Zirconium forms a long series of salts, in most of which it acts as a basic element.

Uses.—Zirconium in metal compounds and alloys has come into importance recently. A good copper alloy is made, also one for steel refining. The metal is used too as wire in radio tubes, and in sheet form for rayon spinneret cups, and the powdered metal goes into flashlight mixtures and ammunition primers. The sand finds use in the making of cast-steel molds, and as an insulating material in electrical appliances. But the main bulk consumption is in ceramics for enamel and glaze frits, and in coating welding rods.

ZIRKNITZ, tsĭrk'nĭts, or **ZIRKNITZER ZEE,** or **CZIRKNITZER SEE,** Yugoslavia, a phenomenal periodical lake in Carniola, 30 miles east-northeast of Trieste, in a deep valley surrounded by mountains, the principal of which are Javornik, Succhi, Slivinza and Sternitz. The lake takes its name from Zirknitz, situated at an elevation of 3,500 feet, and one of many villages in the neighborhood. Receiving the waters of six streams, and surrounded by mountains with no outlet, the characteristic feature of the lake is its internal drainage. The bottom of the lake partakes of the limestone formation of the district, which fissures readily, and has numerous subterranean caves and channels. Some of these caverns are of great depth, and in the dry season absorb the waters of the lake, leaving it sometimes completely dry, with only a few pools, in which the fish take refuge. A luxuriant natural vegetation covers the surface of the deserted lake, and when the drought is protracted grass, millet, or buckwheat is sown on it and the harvest reaped before the return of the water. In June the lake is frequented by wild ducks, which afford abundant sport, and when the water is decreasing fish are caught in great numbers. The lake is from six to seven miles long, nearly three broad and of an average depth of 11 feet, but there is no stated limit to its basin. It receives the drainage of a considerable country, and even when no rain falls in the immediate neighborhood its reservoirs are filled from the rainfall of more distant hills. In dry seasons the lake takes about 30 days to empty. When rain has been abundant and all its subterranean sources are in simultaneous activity, it reaches the average height in 72 hours, and when the rain has extended to all the tributary region it reaches its extreme level, which is about two feet above the average, in 196 hours. The natural outlets then no longer suffice to carry away the water, and it overflows the country, damaging or destroying the surrounding villages. The emptying and flooding of the lake depends upon the drought or moisture of the season, and is not strictly periodic. It has been known to empty and fill three times in one year. From 1707–14 it was only once dry, and from January 1834 to February 1835, it remained entirely without water, the longest drought on record. This lake was known to the ancients for the same phenomena, the Romans calling it *Lacus Lugens* or *Lugea Palus;* and it has been picturesquely described by Tasso in his 'Sette Giornate del Mondo.'

ZISKA, zĭs'kạ (properly **ZIŽKA,** zhīzh'kạ), **John,** Bohemian Hussite leader: b. Trocznov, near Budweis, about 1360 (by some authorities as late as 1380); d. Prbyslav 11 Oct. 1424. He was educated at the court of King Wenceslas at Prague, entered the profession of arms, joined the contingent that went from Bohemia and Hungary in 1410 to the assistance of the Teutonic Kinghts against the Poles and Lithuanians, and fought with great prowess in the fiercely contested battle of Tannenberg, 15 July 1410. Then he served in Hungary against the Turks, and with the English at Agincourt, 25 Oct. 1415. Soon after the execution of Huss (q.v.), he returned to Bohemia and became a leader of the Hussites. In 1419, when the Hussites broke into rebellion against the Emperor Sigismund, Ziska organized their military forces into a well-disciplined army of infantry, supplying the want of cavalry by means of the Waggenburgen, or "car-forts," constructed of the baggage-wagons. He took up his headquarters at a stronghold on the heights of Austie, in southern Bohemia, the fortress being known as Tabor (with reference, perhaps, both to *tabor,* Bohemian for "encampment," and to Mount Tabor in Palestine), and the extreme Hussites as "Taborites." Sigismund sent an army of 30,000 into the country, but Ziska, with a hasty levy of about 4,000, took up his position on Mount Vitkov, near Prague, and on 14 July 1420 defeated the enemy with great slaughter. The eminence has since been known as the Hill of Ziska. On 1 Nov. 1420, at Pankratz, he was again victorious over Sigismund, and on 2 November captured the fortress of Vysehrad, near Prague. He won a second great battle against Sigismund 8 Jan. 1422 at Deutschbrod, and penetrated into Moravia and Austria. He had long had but one eye, and lost the other by an arrow-wound at the siege of Raby castle in 1421. Notwithstanding his blindness he continued to direct his troops with great efficiency and almost unvarying success. Prague refused to recognize his authority, and he thoroughly subdued it in 1424. In that year, it is said, Sigismund, realizing the impossibility of conquering Bohemia, began negotiations toward a treaty, by the terms of which the Hussites were to have full religious liberty and Ziska was to be governor of Bohemia. Such negotiations, if undertaken, were interrupted by Ziska's death at the siege of Přbyslav.

Ziska became the hero of the Bohemian revolutionary party, and for this character he was well fitted by his zeal and military ability. He was frequently cruel in his method of warfare and conquest. Much fiction has been mingled with the facts of his career. Alfred Meissner's epic 'Ziska,' based on the leader's history, reached a 12th edition in 1884. Consult the German translation (1882) of Tomek's 'Life.'

ZITHER, or **CITHERN,** a modern development of the musical instrument known to the Greeks as cithara. In the early part of the 19th century it became a favorite with the peasantry of the Styrian and Bavarian Alps, and was introduced into England about 1850. The zither consists of a resonance box, with a large circular sound hole near the middle; the strings, 32 in number, in some cases increased to 40 and even 46, being made of steel, brass, catgut and silk covered with fine silver or copper wire, and tuned by pegs at one end. Five of the strings are stretched over a fretted keyboard, and are used to play the melody, the fingers of the left hand stopping the strings on the frets, the right-hand thumb, armed with a metal ring, striking the strings, which are tuned in fifths, and have a chromatic range from C in the second space of the bass staff to D in the sixth ledger line above the treble. The remainder, called the accompaniment strings, are struck by the first three fingers of the right hand. The viola zither, in which the resonance box is heart-shaped, is tuned like the violin, and is played with a bow.

ZITTAU, tsĭt'tow, Germany, a town of Saxony, on the Mandau, near the Austrian frontier, 49 miles by rail east-southeast of Dresden. The town was practically destroyed in the Seven Years' War, since which time most of its buildings have been erected. The chief public buildings are a splendid town-house, the churches of Saint Peter, Saint Paul, Saint John and Mary, hospitals, custom-house, gymnasium, a municipal museum, and a valuable library. Its principal manufactures are cotton-spinning, dress goods, iron-founding machinery, stained glass, cycles, ropes, paper, brewing and brick-making; and there is a trade in cotton and linen goods, chemicals, etc. There are a number of lignite mines in the neighborhood. Pop. (1925) 38,353.

ZITTEL, tsĭt'tĕl, **Karl Alfred von,** German palæontologist and geologist: b. Bahlingen, Baden, 25 Sept. 1839; d. Munich, Bavaria, 6 Jan. 1904. After study at Heidelberg and Paris, he entered the geological survey at Vienna, in 1863 became a lecturer in the university there, and later in the same year was appointed professor of mineralogy at Karlsruhe. In 1866 he was made professor of palæontology and geology at Munich; and from 1899 he was president of the Bavarian Academy of Sciences and curator-general of the scientific collections of Bavaria. The Rohlfs expedition, which he accompanied to Egypt and the Libyan desert in 1873–74, derived much of its value from his important labors. Among his publications are the 'Paläontologische Studien über die Grenzschichten der Jura- und Kreideformation' (1868–83); 'Aus der Urzeit' (1872; 2d ed., 1875); 'Handbuch der Paläontologie' (5 vols; 5th vol. with Schimper and Schenk, 1876–93), the most complete and authoritative work in that field; and 'Geschichte der Geologie und Paläontologie bis Ende des Neunzehnten Jahrhunderts' (1899). He edited the periodical *Palæontographica* from 1869.

ZIWET, Alexander, American mathematician: b. Breslau, Germany, 8 Feb. 1853. Graduated from the Polytechnical School of Karlsruhe in 1880, he came in that year to the United States, and for some time was connected with the United States lake survey (Detroit) and the coast and geodetic survey (Washington). Subsequently he became successively instructor in, and junior professor of, mathematics in the University of Michigan, professor in 1905. In 1892 he was made co-editor of the *Bulletin* of the American Mathematical Society. He died, 18 Nov. 1928. He published an 'Elementary Treatise on Theoretical Mechanics' in three parts, as follows: Pt. I, 'Kinematics' (1893); Pt. II, 'Introduction to Dynamics, Statics' (1893); Pt. III, 'Kinetics' (1894; revised ed., 1904). D. 1928.

ZIZANIA, a genus of grasses (q.v.) including the wild rice.

ZIZYPHUS, a genus of the family *Rhamnaceæ,* shrubs or small trees, with spiny stipules, alternate three-nerved leaves, a spreading five-cleft calyx, five hood-like petals, five stamens, a five-angled disc, adhering to the tube of the calyx, and having enclosed within it the two- or three-celled ovary. Fruit a drupe, which is sometimes edible and has a large stone or kernel containing from one to several flattened seeds. *Zizyphus* is widely distributed, but is chiefly indigenous to tropical Asia and America. The fruits of the cultivated *Z. jujuba,* and of *Z. sativa,* are of the size and shape of a small, oval plum. They ripen in September when they are gathered and stored in a dry place, the pulp becoming sweeter by the process. They have a dark-red skin, but are yellow within. If carefully dried, these fruits, called jujubes, will keep for a long time, and retain their acid flavor, which has made them a refreshing dessert fruit, in the Mediterranean countries and in China. They are nutritive and demulcent, a cough medicine having been prepared from them, and formerly the sweet-meat known as jujube paste was made from the evaporated juice of jujube, and of gum-arabic; but now the jujube is displaced by the gum and by gelatine. *Z. sativa* is a handsome arborescent shrub, with small, varnished, oval leaves and greenish inconspicuous flowers, succeeded by the bright drupes. It is sometimes cultivated in the United States, being hardy as far north as Washington. The bark, in its native countries, was used medicinally, for fever and for sores; and it is also employed for tanning and for a dye-stuff like that of *Z. xylopyra* which yields a black dye. Various parts of other species yield medicines, and the edible fruits of *Z. baclei* of Africa are used for a pleasant drink and are also made into bread. *Z. lotus* is by some believed to be the lotus-trees the fruit of which produced such indolence in those who ate them. It grows in Barbary,

where it is called sadr. *Z. spinachristi* is a small, prickly tree, which is reputed to have composed Christ's crown of thorns. Like other spiny species of *Zizyphus,* this is a good hedge plant. *Z. nummularia* of Persia and India is one of the camel's thorns, whose foliage forms a fodder, and which has edible fruits. The cog-wood of Jamaica, an important timber tree, is *Z. chloroxylon.*

ZLATOUST, zlä-tō-oost', Russia, a town in the province of Ufa, on the Ai, an affluent of the Ufa, near the Ural Mountains, 150 miles direct and 199 miles by railway northeast of Ufa. It has a cathedral and a meteorological and magnetical observatory. In the vicinity are rich iron and gold mines, and in the town are government works, manufacturing sword-blades, steel instruments and ammunition. Pop. about 34,245.

ZNAIM, tsnīm (formerly **ZNOIMO** or **ZNOJMO),** Czecho-Slovakia, a town of Moravia, on the Thaya, 50 miles northwest of Vienna. The chief buildings are a Rathhaus (1446), a circular church, said to have been a heathen temple, and the Gothic church of Saint Nicholas, dating from 1348. The old ducal castle crowns a neighboring height. The trade is largely agricultural. Mustard, wine and cucumbers are exported. Fine majolica, leather and chocolate are manufactured. New waterworks were opened in 1877. As Znoimo, it was the capital of Moravia, destroyed in 1145 by the Bohemian Prince Vladislav, and rebuilt in 1226. On 11 July 1809, the French under Massena and Marmont defeated the Austrians here, resulting in the armistice between Napoleon and Archduke Charles; it was captured by the Prussians 13 July 1866 and was occupied by them until 3 Sept. 1866. Pop. (1921) 21,197.

ZOANTHARIA, an order of *Actinozoa* (q.v.) characterized by the fact that the tentacles are simple and unbranched, that there are usually incomplete as well as complete mesenteries, and that the tentacles usually alternate in several circles. The mesenteries and tentacles are often arranged in multiples of the number six, but this is variable, and in some forms the number of mesenteries increases during the growth of the animal. The animal develops as a gastrula, the blastapore of which remains as the mouth. The larva is usually ciliated and free-swimming. The Zoantharia include the sea-anemones and corals (qq.v.); these do not represent natural divisions of the class, but merely modes of life of its members. A colonial Zoantharian with a calcareous exoskeleton is a coral; an isolated Zoantharian without an exoskeleton is a sea-anemone.

ZOAR, Palestine, an ancient city mentioned in the Bible, but whose exact location is unknown, although it probably stood at the southern end of the Dead Sea. It is spoken of as visible from Pisgah (Deut. xxxiv, 3). The Arabic historian Abulfeda speaks of a Zoara near the Dead Sea, and the Roman garrison, Zoara, mentioned by Jerome and Eusebius, is probably the same place. Mention of it occurs in Genesis xiv and xix; in Isaiah, xv, and in Jeremiah xlviii. Consult Smith, G. A., 'Historical Geography of the Holy Land' (16th ed., London 1910).

ZOAR, zō'ar, **Separatists Society of.** The Separatists Society of Zoar was a communistic religious organization located at Zoar, on the Tuscarawas River, Tuscarawas County, Ohio. They were German Protestant peasants, 225 in number, who emigrated from Württemberg in April 1817. Their chosen leader was Joseph Baumler, whose name was later changed, for the sake of euphony, to Bimeler. Bimeler was of humble origin, but a man of unusual ability and independence, well educated, a natural leader, and a fluent speaker; he purchased in his own name, in the locality named above, 5,000 acres of farm land, at an average value of $3 per acre, giving a mortgage at long time for the entire amount. This Separatist emigration had been primarily for the purpose of securing religious liberty; and for better opportunities in obtaining a livelihood. It was expected that each family would, by its industrious labor, secure separate ownership in a portion of the land held by Bimeler, but the colonists being diverse in age, strength, experience, education and enterprize, they soon realized that their personal inequality stood in the way of the collective success of the colony, and early in 1819 they decided to organize into a community of property and effort. Articles of agreement were signed by 159 adults — 53 males and 104 females. The articles created a community of interest, present and prospective, whereby all the property, movable and immovable, of the individual members, and their future earnings should become the common stock of the association, to be held and managed by chosen directors. Death of a member passed no property interest to his heirs, and withdrawal from the society, voluntary or compulsory, carried with it no claim upon a divided or undivided right in the association. Bimeler was to retain the realty in trust until the societey by its earnings could pay the mortgage and assume title.

In 1832 the society reached its highest membership of 500, and was incorporated under the then existing laws of Ohio by the name of "The Society of Separatists of Zoar." This conferred upon the society the ordinary powers of a corporation, with perpetual succession, power to hold property, purchase and sell, pass by-laws, etc. Under this reorganization the members were divided into two classes, known as the novitiates and the full associates; the novitiates were obliged to serve at least one year before admission to the second class, and this applied to the children of the members if, on becoming of age, they wished to join the society; the full associates must be of legal age — the males 21 and the females 18; all officers were elected by the whole society, the women voting as well as the men, all elections being by ballot and a majority vote; the government of the community vested solely in a board of three trustees (or directors) to serve three years each, one to be elected annually; these trustees had unlimited power over the custody and management of the property and all the temporalities of the society, but were bound to provide clothing, board and dwelling for each member "without respect to person," and use all means

confided to their charge for the best interests of the society; they directed the industries and detail of affairs of the society; assigned each member his especial work, and the portion of necessaries each should receive. Beside the board of trustees there was a standing committee, or council, of five, one member being elected each year. This council was the supreme judiciary, or board of arbitration, of the society, in cases of disagreement, dissension or complaint; it had power to excommunicate members or deprive them of participation in the affairs of the society. They also elected once in four years a cashier or treasurer who had custody of all moneys, kept the books, and had immediate oversight over the finances of the society. In addition there was an official known as the "agent general," who acted as the trader to buy and sell for the society in its dealings with the outside world, make and enforce contracts, etc. The office of agent general was regarded as the position of honor and influence, and to it Joseph Bimeler was elected for life; after his death the office remained vacant, its duties being performed by the cashier or the trustees.

The society, from its organization as a commune, steadily prospered, and in time built up a large number of enterprising and successful industries, having in the period of its height two large flour mills, saw mill, planing mill, machine shop, tannery, dyehouse, stove foundry, cooper shop, woolen mill, brewery, slaughter-house, blacksmith shop, tile works, pottery, etc. In all these concerns a high grade of goods was produced which found a ready market with foreign customers. The value of the Zoar property increased until about 1875, when their land, industrial plants and money accumulation were estimated at $1,500,000. From that time the enterprise began to decline. Bimeler died in 1853, and there was no leader or director his equal in sagacity or personality. The environment of the society slowly changed from that of a western pioneer frontier to a prosperous, cultivated section of country, and rival neighboring industries made inroads into the export business of Zoar; the Zoarites were not progressive and did not keep pace in their manufactures with modern methods and improvements, and in time found that they could purchase products for use and wear cheaper than they could make them; there were few accessions to the society; the original members became too old and feeble to conduct its affairs; outside laborers had to be employed; the younger members were inclined to leave and seek their fortunes where they could acquire independent property and freedom of action. This decline continued until in 1897, when, by a common consent, the organization decided to disband and place the property in the hands of a commission for equal division. The appraisement and distribution was completed in the fall of 1898. There were at this time 222 people, adults and children, in the society, of whom 136 were entitled to one equal share. They each received a few hundred dollars in cash and a portion of the farm land or village property.

The religious tenets of the Zoarites were few and simple. They confessed the doctrine of the Trinity; the fall of man, the return through Christ, the Holy Scriptures as the guide of their lives, all ceremonies were declared useless and injurious, marriages were contracted by mutual consent and before witnesses, they recognized no ordained minister, and engaged in no public prayer. Bimeler was their only preacher and teacher, he spoke each Sunday to the society, and after his death his published discourses were read in the public meetings by various members. The society did not seek additions and made no attempt to propagate its principles, either economic or religious. The life of the Zoarites was one of utmost simplicity, serenity and morality. There never was a divorce in the community and no member was ever charged with a crime or felony. Consult Nordhoff 'Communistic Societies in United States' (1875); and Randall, 'History Zoar Society' (1904).

ZOBEIR, or **ZUBAIR,** IBN **al Awam,** a relative of Mohammed, and one of the earliest converts to Islam: d. 656. He was one of the 10 predicted by Mohammed as certain to enter the Garden of Allah. Before his death, Omar, successor of Mohammed, appointed Zobeir one of a council of six who were to choose from their own number a new caliph. Zobeir opposed the election of Othman and was thereafter his enemy; he also opposed his successor, Ali, with whom he had been friendly before Ali's accession. Later Zobeir succeeded in raising a rebellion against Ali, and he was slain at the battle of the Camel, at Basra. For his son see ABD ALLAH IBN ZUBAIR. Consult Huart, C. I., 'Histoire des Arabes' (Paris 1912).

ZOBEIR, Rahama, Egyptian pasha and Sudanese governor: b. 1830. He came of a family claiming descent from an uncle of Mohammed. By 1860 he had established his leadership among the Arab ivory and slave traders on the White Nile and in the Bahr-el-Ghazal, and although nominally an Egyptian subject he maintained a great army of blacks and was the real ruler of the surrounding country. He defeated an expedition sent from Khartum to Bahr-el-Ghazal in 1869, but pleaded innocence in the matter, was pardoned and appointed governor of the district. In 1874 he conquered Darfur, and was made governor-general of the new province, but when he went to Cairo in 1876 the authorities prevented his return. His son assumed his place in Bahr-el-Ghazal, and under the instruction of Zobeir defied the forces of General Gordon, and in 1878 was subdued. In 1884, however, General Gordon, apprehensive of the Mahdist movement, vainly asked that Zobeir be permitted to return in order to check it. Zobeir was interned at Gibraltar in 1885–87, returned to Cairo in 1887, and after 1899 lived on his estates in his native country.

ZOCKLER, tsĕk'lĕr, **Otto,** German Lutheran theologian: b. Grünberg, Hesse, 27 May 1833; d. Greifswald, 9 Feb. 1906. He was educated in the universities of Giessen, Erlangen, Halle, Göttingen and Berlin, became a lecturer at the first-named in 1857, and in 1863 professor of theology. In 1866 he was appointed professor at Greifswald, and in 1885 consistorial councillor. He was one of the leaders of the movement toward the establishment of a state church in Prussia. In 1882 he became editor of the

Evangelische Kirchenzeitung. For the 'Kurzgefasstes Kommentar zum Alten und Neuen Testament und zu den Apokryphen' (1886 et seq.), which he edited with Strack, he prepared the commentaries on the Old Testament apocryphal books, the Acts, and the epistles to the Thessalonians and Galatians. Among his works are 'Hieronymus, sein Leben und Wirken' (1865); commentaries to Chronicles, Job, Proverbs, Ecclesiastes, Canticles and Daniel, in Lange's 'Bibelwerk' (1866–72; Eng. trans. 1870 et seq.); 'Das Kreuz Christi' (1875; Eng. trans. 1877); 'Gottes Zeugen im Reich der Natur' (1881; 4th ed., 1906; Eng. trans. 1886); 'Biblische und Kirchen-historische Studien' (1893); 'Die Tugendlehre des Christentums' (1904); 'Geschichte der Apologie des Christentums' (edited by H. J. and E. Schlapp, 1907), etc.

ZODIAC. The zodiac is a belt of the celestial sphere, extending 8° on each side of the ecliptic, or the path of the sun among the stars. "The name is derived from ζώον a living creature, because the constellations in it (except Libra) are all figures of animals. It was taken of that particular width by the ancients simply because the moon and the then known planets never go farther than 8° from the ecliptic" (Young's 'Astronomy'). The belt is divided into 12 parts, of 30° each, to which are given the following names: Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Pisces. This division into 12 parts was suggested by the 12 reappearances of the moon in a year. The idea seems to have originated with the Chaldæan astronomers, about 2100 B.C.

Owing to the fact that the earth is not a perfect sphere, the pole of the earth's equator describes a circle around the pole of the ecliptic, which causes a constant retrograde motion in equator with the point of intersection of the plane of the zodiac. The rate of this motion is 1° in 70 years, and has amounted to 30°, or one entire sign, up to the present time. "The sign of Aries, therefore, is now in the position of the constellation Pisces; each sign having backed so to speak into the constellation west of it." The constellations themselves bear no resemblance to the signs designated by them.

During the Middle Ages the signs of the zodiac were supposed to influence human life, and hence were distributed to different parts of the human body. Disease was supposed to be cured by the aid of the zodiacal power presiding over that part of the body. The remnant of this superstition is still seen in some almanacs.

The Egyptians are supposed to have adopted the 12-fold division of the Zodiac from the Greeks, but they changed the symbols of living creatures to others of their own. The Chinese divided the course of the sun into 12 parts, which they designated as the rat, the ox, the tiger, hare, dragon, serpent, horse, sheep, monkey, hen, dog and pig. This division is still found in some parts of Central Asia and Japan. It has also been found among the remains of the Aztec race in America. The original zodiacal constellations occupied unequal spaces in the heavens. Hipparchus was the first to divide the zodiac into equal spaces of 30° each, and give to them the names of the older constellations. His method of reckoning positions in the ecliptic was used until this century. Astronomers have now abandoned it for the more accurate measurement of degrees, beginning at the vernal equinox.

The origin of the names of the animals assigned to the zodiac by the ancients is unknown. Some have supposed that the spring signs: Aries, the Ram, Taurus, the Bull, and Gemini, the Twins, mark the time of the bringing forth of young by flocks and herds. Cancer, the Crab, marks the time when the sun appears to move backward. Leo, the Lion, symbolizes the fierce heat of summer, and Virgo, the Virgin, gleaning corn, symbolizes the harvest. In Libra, the Balance, the day and night balance each other. Scorpio is supposed to have marked the presence of venomous reptiles in October: while Sagittarius symbolizes the season of hunting. Capricornus marks the beginning of the return of the sun to the north, Aquarius symbolizes the winter rains, and Pisces the season of fishes. These are but fanciful representations, and have no foundation in fact.

ZODIACAL LIGHT. "The zodiacal light is a faint column of light rising from the western horizon after twilight in winter or spring evenings; and before daybreak in summer or autumn. It extends out on each side of the sun, and lies nearly in the plane of the ecliptic. Near the equator it can be seen all the year, and has been traced all the way across the heavens from east to west, forming a complete ring." In our latitudes it can seldom be traced more than 90° from the sun. Parts of the column near the sun are somewhat bright, but distant portions are extremely faint, and can only be seen on the very clearest nights; though the cause of the zodiacal light cannot be said to have been definitely proved, it is very probable that it is sunlight reflected by myriads of small meteoric bodies revolving around the sun, nearly in the plane of the ecliptic. This theory requires a thin flat ring of these meteors to extending beyond the orbit of the earth. The name zodiacal light was given to this phenomenon by Cassini in 1653, who described it as a flat luminous ring encircling the sun nearly in the plane of the ecliptic. Kepler supposed it to be the atmosphere of the sun; but Laplace showed that the atmosphere of the sun could not extend to anything like the distance from the sun which is reached by the zodiacal light. In 1853 an extended series of observations was made by Jones from different parts of the Pacific Ocean. From these observations he deduced the theory that the zodiacal light was caused by a ring of matter surrounding the earth, and not the sun.

Professor Wright, of Yale University, has determined that the spectrum of the light is continuous, and therefore is essentially reflected sunlight. He has also determined that the light is partially polarized in a plane passing through the sun, and that the amount of the polarization is between 15 and 20 per cent. The origin of the minute particles which reflect the light has been accounted for in many ways. By some they are believed to have been thrown out from the corona of the sun; by others to be composed of dust thrown out from the equatorial

regions of the sun; but by most they are believed to be an immense cloud of meteoroids filling the space between the earth and the sun. The meteoric theory of the sun's heat presupposes a multitude of these meteoric bodies constantly falling into the sun to supply the loss by radiation, as well as multitudes of others which never reach the surface. It is not probable, however, that these meteors if they exist play any part in the phenomena of the zodiacal light.

A most valuable and important contribution to our knowledge of the zodiacal light is due to a recent research of Seeliger. It has long been known that the slow, secular changes of some of the elements of the orbits of the planets of the solar system, when these are derived from observation, are not in exact agreement when these same changes are determined from a computation based upon the law of universal gravitation. In particular, it is found that the computed motions of the perihelia of the orbits of Mercury and Mars and of the node of Venus differ from the motions derived from observation by amounts far in excess of the uncertainties inherent in the observations themselves. Many attempts to account for the first discrepancy have been made. Thus, Leverrier assumed that it arose from the disturbing pull of a small planet near the sun, which for many years found its place in our astronomical books under the name of Vulcan. Other astronomers have supposed that the disturbance might be due to the pull of a ring of particles about the sun, to an unequal distribution of the material within the body of the sun itself, or even to an inexactness in the accepted statement of the law of gravity. Analysis shows, however, that none of these explanations are admissible, for all of them lead to disturbances in other directions, either of the planets or of the moon, which are in discordance with observation. But Seeliger has shown that if there be ascribed to the zodiacal light an even almost inconceivable tenuity, its gravitational pull will exactly account for the discrepancies observed, without at the same time introducing any new discrepancies. The densities to be assumed for the inner and outer portions of the zodiacal light in order that its attraction may be sufficient to balance the former discrepancies are as follows:

Average density of the inner portion, extending from the sun to 0.24×, the distance of the earth = $2.52 \times 10^{-11} \times$, the sun's density;

Average density of the outer portion, extending from the sun to 1.20×, the distance of the earth = $2.52 \times 10^{-11} \times$, the sun's density. Average density of the outer portion, extending from the sun to 1.20 ×, the distance of the earth = $0.0026 \times 10^{-11} \times$, the sun's density.

ZOE, zō'ē (Gr. Ζωή), empress of the East: b. about 978; d. 1050. She was the daughter of Constantine VIII, and became the wife of Romanus III in 1028. In 1034 Romanus was put to death by Zoe and Michael the Paphlagonian, whom she married and raised to the throne as Michael IV. The latter dying, was succeeded by his nephew, Michael V, who was deposed by the people in 1042. Zoë and her sister Theodora were then proclaimed joint sovereigns. She displayed great ability and firmness in the government, and in 1042 married Constantine IX, Monomachus, who supplanted Theodora. She reigned till her death.

ZOETROPE, an optical instrument used as a mechanical top, depending, for its interest, on the constancy of visual impressions. It consists of a rotating drum, open at the top, in which around its inner periphery are placed strips of paper, having figures of men, animals, etc., in varying positions. By turning the cylinder the images are seen through slots in its upper side, giving the effect of action to the figures.

ZOFFANY, tsŏf'fä-nĭ (properly **ZAUFELBY**), **Johann,** British painter: b. Ratisbon, 1733; d. London, 11 Nov. 1810. He was a pupil of Speer at Ratisbon, but at 13 ran away to Italy, where he studied for 12 years. In 1758 he went to England, where he first attracted attention by a portrait of Garrick, and soon won considerable reputation, becoming one of the original members of the Royal Academy on its foundation in 1769. He was sent by George III to Italy, where he remained in 1772–79, and among other paintings executed 'The Tribune of Florence,' one of his most celebrated works. In 1783–90 he engaged in painting in India; and the last 20 years of his life he spent in England. Among his further paintings are 'Earl of Barrymore'; 'Foote'; 'Weston'; 'Members of the Royal Academy'; 'Tiger Hunt'; and 'Embassy of Hyder Beg.'

ZOGBAUM, Rufus Fairchild, American artist: b. Charleston, S. C., 28 Aug. 1849; d. New York, 22 Oct. 1925. He studied at the Art Student's League 1878–79, and in Paris with Leon Bonnat in 1880–82, and made extensive study of European armies in field and garrison, and later became known as a leading delineator of military and naval subjects, which he renders with scrupulous fidelity to the various points of detail. His publications, written and illustrated by himself, are 'Horse, Foot and Dragoons' (1887); 'All Hands' (1897); and 'The Junior Officer of the Watch' (1908).

ZOHAR, zō'här, the Bible of the Kabbalists, long reverenced by Jewish mystics and regarded by some as higher than the Bible and the Talmud, but proved a clever forgery The secret science of the Kabbala received a marked development at the beginning of the 13th century, when a mystic, Ezra or Azriel (b. 1160; d. 1238), compiled a work called 'Brilliancy' ('*Bahir*'). In an atmosphere of reputed miracles and a new Messiah, there appeared some years later the most famous Kabbalistic book of the time — the 'Zohar,' or 'Splendor.' It was offered as the work of Simon ben Jochai, a sage of the 2d century, of whom many legends are told. He is said to have spent years in solitude, a hermit receiving special revelations. It was claimed that for over a thousand years the 'Zohar' had been concealed in a cave in Galilee and had been at last brought to light. The literary forger who "discovered" the 'Zohar' was Moses of Leon (b. Leon, about 1250; d. Arevalo, 1305), who employed an Aramaic idiom to give the book an air of antiquity, and with such skill that Jew and Christian alike were deceived and some even to-day attribute to it hoary age. Yet his widow declared that it was a forgery.

The character of the 'Zohar' can hardly

be dismissed as unique in literature, with its fantastic, imaginative and emotional elements. It is a medley of spirituality and coarseness, a strange combination of intellectuality and grossness, whose influence has been far-reaching and whose adherents have numbered hundreds of thousands. It is a work without method, a kind of impressionist commentary on the Pentateuch, half homily, half meditation, dwelling largely on the "higher" sense of Scripture and allowing every opportunity for vague and mystic interpretation. Hence the moral perversions that abound, the blasphemy and absurdity. The pre-existence of the soul is assumed — paradise and hell are alike depicted, the varieties of sin described with painful minuteness, Messianic speculations indulged in, and views favorable to the dogma of the Trinity uttered, while communion with departed spirits, celestial hosts and angels completes the farrago of nonsensical speculation. Such an aberration is rare in the history of Judaism and has been productive of much harm. Its soil has nourished gross superstitions and strengthened the belief in ghosts and evil spirits; its mode of interpretation has degraded the study of the Bible and spread the wildest fancies. At one time it was high in favor with the papacy when the Talmud was condemned to the flames, but it was later included in the Index Expurgatorius. Its occasional Christian tone was not overlooked by Christian scholars — Pico di Mirandola (1463–94) and Reuchlin (1455–1522) both made the 'Zohar' the basis of their vindication of Jewish literature. Its literary influence, however, was not long retained. It developed a few "saints" and "miracle workers," spurious Messiahs and the like, but it has had no successor. In absorbing the miasma of the earlier Kabbalistic literature, it left no germs for further development. (See JEWS AND JUDAISM). Consult Graetz's 'History of the Jews' (Vols. III and IV); Abrahams' 'Jewish Literature' (pp. 172–175).

ZOILUS, zō'ĭ-lŭs (Gr. Ζωΐλος): b. about 400 B.C.; d. about 320 B.C. Thracian rhetorician, chiefly remembered for the asperity of his criticisms on the poems of Homer. An account of his career is given by Vitruvius, which is not self-consistent, and states that he lived 385–247 B.C. He is said to have been a pupil of Polycrates, to have been eminent before the rise of Socrates, and to have continued to write until the reign of Alexander. Vitruvius represents him as seeking the patronage of Ptolemy Philadelphus. Heracleides says he was originally a Thracian slave. He is reported by Vitruvius to have died a violent death. The virulence of his attacks on Homer procured him the title of *Homeromastix* ("The Scourge of Homer"). He also attacked Plato and Isocrates. It is said he censored Homer principally for introducing fabulous and incredible stories into his poems. He has the reputation of a captious and unjust critic, so that his name became a synonym for such, but Dionysius of Halicarnassus places him in the highest rank. Consult Spindler, 'De Zoïlo' (1888–89).

ZOISITE, a mineral closely related to epidote named by Werner in 1805 in honor of Baron von Zois who discovered it. It is a basic ortho-silicate of calcium and aluminum, $HCa_2Al_3Si_3O_{13}$. The aluminum is sometimes partly replaced by iron, the mineral thus approaching epidote in composition. Though its crystals are orthorhombic, their form is very similar to the monoclinic epidote. Its hardness is 6 to 6.5 and specific gravity about 3.3. Its color is usually dull gray or brown, but in the variety "thulite," found in Norway, it is a beautiful rose pink. It is found in many European localities, also abundantly in the New England States, Pennsylvania, and North Carolina, and in exceptionally good crystals at Ducktown, Tenn.

ZOLA, zō'lą (Fr. *zō-lä*), **Emile Edouard Charles Antoine,** French novelist: b. Paris, 2 April 1840; d. there, 29 Sept. 1902. He was educated at the College of Aix, from which he went to the Lycée Saint Louis at Paris with a scholarship in 1858. His career there was undistinguished, and he left in 1860 after failing to take his degree owing to insufficiency in literature. After a brief experience as a clerk in a business house he was for more than a year compelled to sound the lowest depths of poverty in Paris, but in 1861 he obtained employment as a shopman with MM. Hachette, the publishers, at a salary of about five dollars a week. He devoted his spare time to literary work, contributing short stories to the *Petit Journal* and *La Vie Parisienne* and critical articles to the *Salut Public* of Lyons and afterward to Villemessant's journals, *L.Evènement* and the *Figaro*. Several of his stories were published separately in the volumes 'Contes à Ninon' (1864), which contain some of his best and purest work, and which were followed in 1874 by 'Nouveaux Contes à Ninon.' Some of his critical articles were collected under the title 'Mes Haines' (1866). In 'La Confession de Claude' (1865), a novel in which he utilized his early struggles, we find him already in full progress toward the characteristic work of his maturity, and this tendency became still more marked in the immediately succeeding novels: 'Le Vœu d'une Morte' (1866); 'Les Mystères de Marseille' (1867); 'Thérèse Raquin' (1867), a powerful study of the effects of remorse following on adultery and murder; and 'Madeleine Férat' (1868). Having by this time gained a secure footing in the world of letters, he conceived the plan of the series of novels known as 'Les Rougon-Macquart' (1871–93), which includes his best-known work and occupied him for nearly a quarter of a century. It is described as an 'histoire naturelle et sociale d'une famille sous le second empire,' and consists of 20 works dealing with different phases of modern life, not always strictly that of the Second Empire, but rather that of the Third Republic. The particular departments of life treated in the volumes were studied by Zola in the spirit of a scientific observer, but of one with a decided bias toward the portrayal of moral filth and disease; and the bond of connection which constitutes them a series is the persistence under various forms in all the members of the Rougon family of a moral taint which is transmitted in accordance with Zola's views of heredity. The series consists of the following works: 'La Fortune des Rougon' (1871); 'La Curée' (1874); 'La Conquête de Plassans' (1874); 'Le Ventre de Paris' (1874), treating of the Paris markets;

'La Faute de l'Abbé Mouret' (1875), whose subject is clerical celibacy; 'Son Excellence Eugène Rougon' (1876); 'L'Assommoir' (1877), a powerful but revolting study of the effects of drunkenness and idleness, the first great success of the series; 'Une page d'amour' (1878); 'Nana' (1880), a coarse picture of courtesan life; 'Pot-Bouille' (1882); 'Au Bonheur des Dames' (1883), dealing with the great shops of Paris; 'La Joie de Vivre' (1883); 'Germinal' (1885), treating of the life of French miners; 'L'Œuvre' (1886), in which he dissects literary and artistic decadents; 'La Terre' (1888), a study of the French peasantry in which prurient naturalism reaches the zenith of repulsiveness; 'Le Rêve' (1888); 'La Bête Humaine' (1890), treating of railways; 'L'Argent' (1891), dealing with stockbrokers and company promoters; 'La Débâcle' (1892), a powerfully realistic picture of military life in connection with the Franco-German war and the break-up of the Second Empire; and 'Le Docteur Pascal' (1893), in which the whole is brought to a conclusion. Immediately after completing this huge undertaking he started the 'Trois Villes' series, consisting of 'Lourdes' (1894), 'Rome' (1896), and 'Paris' (1898), in which he portrays the spiritual development of a priest, Pierre Froment, out of miraculous Christianity through a sort of social Catholicism into a creed of justice and labor. In the incomplete tetralogy entitled 'Les Quatres Evangiles' ('The Four Gospels') he proposed to formulate his social gospel. The first volume is 'Fécondité (1900), whose hero, Mathieu, is the son of the hero of the preceding series. The second volume, 'Travail' ('Labor,' 1901), has a hero named Luc; and of the remaining two, 'Vérité (Truth) and 'Justice,' whose heroes were to be named after the other two evangelists, the former was appearing at the time of his death. In the eyes of English readers Zola appears best in his short stories, of which, in addition to those already mentioned, collections entitled 'Le Capitaine Burle' (1882), and 'Naïs Micoulin' (1883) have been published. His famous story of 'L'Attaque du Moulin' forms part of the volume of 'Soirées de Médan' (1880), to which Maupassant and other friends also contributed. He defended his view of the nature and function of literary art and collected many critical articles in several works. Several of his novels were dramatized by himself and others, and he also wrote for the stage 'Les Héritiers Rabourdin' (1874), and 'Le Bouton de Rose' (1878), but none of them, except 'L'Assommoir' (1881), known in Charles Reade's English version as 'Drink' (1879), were at all successful. On 13 Jan. 1898, Zola, convinced of the innocence of Captain Dreyfus, (q.v.) went chivalrously to the defense of that officer in a letter 'J'Accuse' published in *L'Aurore*. In it he arraigned the government for the irregularities of Dreyfus's trial, making charges that practically forced the government to prosecute him, an expedient that achieved its purpose in reopening the Dreyfus case and led to the complete vindication of that officer. Zola was tried in February 1898 and a verdict imposing imprisonment and fine was brought against him. He appealed the case and the verdict was quashed by the Cour de Cassation, 2 April 1898. A second trial was called and Zola, his purpose accomplished, decided not to appear, but went to England where he remained until the amnesty for offenders connected with the Dreyfus case, 24 Dec. 1900, permitted his return to France. His account of his connection with the case is given in 'L'affaire Dreyfus: La vérité en marche' (1901). He was created a knight of the Legion of Honor in 1888 and an officer in 1893, but after his condemnation in 1898 his name was removed from the roll. He was president of the Société des Gens de Lettres in 1891–94, but he was repeatedly refused admission to the Academy. Zola was the recognized head of the naturalistic school in fiction, but his followers were latterly few in number. His novels belong rather to the domain of science than to that of art. They are studies, in the main faithful enough though not free from distortion and exaggeration, in moral and social pathology; but they are not true to life and nature in the fullest sense, in the only sense which would entitle them to rank as artistic creations. Translations of the most important have appeared, chiefly by Vizetelly. Consult Brunetière, 'Le Roman Naturaliste' (1883); R. H. Sherard's highly eulogistic biographical and critical study (1893); 'Le Procès Zola' (2 vols., 1898); Vizetelly, E. A., 'Emile Zola, Novelist and Reformer' (1904); and his 'Letters' (1908); Barbusse, 'Zola' (1933).

ZOLLARS, Ely Vaughan, American educator: b. near Lower Salem, Washington County, Ohio, 19 Sept. 1847; d. Warren, Ohio, 10 Feb. 1916 Graduated from Bethany College, West Virginia, in 1875, he was pastor of the church of the Disciples of Christ at Springfield, Ill., in 1885–88, and in 1888–1902 was president of Hiram College (Ohio). He was president of the Texas Christian Union in 1902–06; and from 1906 was president of Phillips University. His writings include 'Holy Book and Sacred Day' (1893); 'Bible Geography' (1894); 'Great Salvation' (1895); 'Hebrew Prophecy'; 'The King of Kings'; 'Word of Truth'; 'The Commission Executed'; 'Sermons,' etc.

ZOLLICOFFER, zŏl'ĭ-kŏf-ẽr, **Felix Kirk,** American soldier: b. Maury County, Tenn., 19 May 1812; d. near Mill Springs, Ky., 19 Jan. 1862. He entered the printer's trade, published a weekly newspaper at Paris, Tenn., for about a year, and afterward was editor of the *Observer* at Columbia, Tenn., his duties being temporarily interrupted by his service in the Seminole war, in which he rose to be a commissioned officer. At Columbia he also published and edited an agricultural weekly. He became editor of the Nashville *Banner,* the leading Whig organ of Tennessee, in 1841; in 1844–49 was State comptroller; and in 1853–59 was a representative in Congress. In 1861 he entered the Confederate army with brigadier's rank. He was in immediate command at the battle of Mill Springs, on the Cumberland, when Thomas drove the Confederates from the field, and achieved the first real victory for the National cause. Zollicoffer was killed within the Union lines, whither he had passed by mistake while on a tour of reconnaissance.

ZOLLNER, tsŏl'nẽr, **Johann Karl Friedrich,** German physicist and astronomer: b. Berlin, 8 Nov. 1834; d. Leipzig, 25 April 1882. Educated at Berlin and Basel, he became a

lecturer in the University of Leipzig in 1865, in 1866 professor extraordinary of physical astronomy, and in 1872 professor ordinary. He made numerous contributions to astronomical science. These included the determination of the reflective capacity (albedo) of many planets and a study of their thermal conditions; photometric investigations of the Mercurian phases; and a study, through observation, of the intensity of solar radiations at their source, of the solar temperature. His 'Grundzüge einer allegemeinen Photometrie des Himmels' (1861) contained the description of a new instrument, the astrophotometer, for the measurement of the light and color of stars. To the publications of the Royal Saxon Scientific Society he furnished many papers on the physical constitution of the sun and stars; and he constructed spectroscopic instruments. 'Ueber die Natur der Kometen' (1872; 3d ed. 1883) expounded the theory that the brightness of comets is due not to the fact that they are incandescent through heat but that they are glowing with electricity. Zöllner was latterly interested in spiritualism. Among his further volumes are 'Photometrische Untersuchungen' (1865), and 'Ueber die universelle Bedeutung der mechanischen Principien' (1867). 'Wissenschaftliche Abhandlungen' (4 vols., 1878–82). Consult the study by F. Körber (Berlin 1899), and Clerke, A. M., History of Astronomy in the 19th Century' (London 1908).

ZOLLVEREIN, tsōl'fĕr-īn («customs-union»). The feeble German Confederation formed in 1815 failed in many respects to meet the desire for union among the German people, or even to satisfy their practical requirements. The trade of Germany in particular suffered much from the obstructions caused by the different customs systems of so many petty states. In 1818 Prussia took the initiative of abolishing internal customs, but this policy excited much opposition among the other German states, and even on the part of the Bund itself, which was indeed to some extent justified by the coercive measures used by Prussia to enforce the adoption of its policy on the smaller German states within its bounds. Prussia offered to admit the other German states within its union, but many of them preferred to set up rival and antagonistic associations. Thus Bavaria and Würtemberg formed a customs league in 1827, and Hohenzollern joined these states in 1828. In the same year was formed the Middle German Union, including Saxony, Hanover, Hesse, Brunswick, Nassau, Oldenburg, Bremen, Frankfort-on-the-Main, etc., and in 1834 another union (Steuerverein) between Hanover, Brunswick, Schaumburg-Lippe, and which was joined by Oldenburg in 1836. But these hostile unions were not sufficiently extensive to have any great vitality, and they were gradually distintegrated by the desertion of their individual members to join the Prussian union. Electoral Hesse joined in 1831; Bavaria, Württemberg, Saxony, and other states in 1833; Hesse-Homburg, Baden, and Nassau in 1835; Frankfort in 1836; Luxemburg in 1842; Hanover, Oldenburg, etc., in 1851. During the treaty period of 1854–65 nearly all Germany, with the exception of Austria, the two Mecklenburgs and the Hansetowns, was included in the union. A difference of views between the various parties to the union began at this time to develop, which caused much tedious negotiation. In general the north of Germany was in favor of imposing import duties on foreign trade for purposes of revenue only, while the south favored protective duties. As each member of the Zollverein had an equal voice in the direction of a common policy it was impossible to adjust these differences so as to satisfy the more powerful states, particularly Prussia. Austria also wished either to be included in the union or to break it up. Matters continued substantially in the same state after the renewal of the treaty from 1 Jan. 1866 to 31 Dec 1867; but the war of 1866 put an end to this agreement and new arrangements were entered into according to the political combinations then formed, Prussia obtaining a preponderating influence in the union of 1867, which included the North German Bund, Bavaria, Würtemberg, Baden, Hesse (south of the Main) and Luxemburg. It was directed by a Zollbundesrath and a Zoll Parliament. The total number of votes in the Zollbundesrath was 58, of which Prussia had 17. This arrangement, formed for 12 years, was also brought to an end prematurely by the formation of the German Empire. By article 33 of the constitution of the empire the territory included in the Zollverein is to coincide with the territories of the empire, with a few exceptions noticed below. The powers of the Zollbundesrath and Zoll Parliament are transferred to the legislative bodies of the empire, and the affairs of the central bureau of the Zollverein are transferred to committees formed by the Federal Council of the empire. The territories of the free ports of Hamburg and Bremen were for some time excluded from the Zollverein and some communes of the grand duchy of Baden and a fragment of Hamburg were still excluded from it; while Luxemburg and the Austrian commune of Jungholz were included in it up to the fall of the empire in November 1918. Consult Ashley, W. L., 'Modern Tariff History: Germany, United States, France' (2d ed., London 1910); 'Cambridge Modern History' (Vols. X, XI, New York 1909); Dittmar, 'Der deutsche Zollverein' (Leipzig 1867); Worms, 'L'Allemagne économique et l'histoire du Zollverein allemand' (Paris 1874). See GERMANY; WAR, EUROPEAN.

ZOLNAY, George Julian, American sculptor: b. Pecs, Hungary, 4 July 1863. Although educated for the diplomatic service, he eventually entered the Royal Art Academy of Bucharest and later the Imperial Academy of Fine Arts of Vienna, graduating with highest honors from both institutions. In 1894, after his work at the Columbian Exposition of Chicago, he settled in New York City where he won national reputation through his Tympanum and Poe bust for the University of Virginia; the Winnie Davis Memorial (Richmond, Va.); decorative figures for the Nashville Centennial; the monuments to General Bartow and McLaws (Savannah, Ga.); the Soldier Monument for Owensboro, Ky.; the Duncan Jacob Memorial for Louisville, Ky., and a large number of portrait busts.

In 1903 he was appointed director of the sculpture exhibit at the World's Fair in Saint Louis and professor of sculpture and perspective at Washington University. He resigned in 1909 to become director of the new University City

Art Academy. There he produced the heroic size granite group for the United States Custom House in San Francisco; the Sam Davis and Soldier Monument for Nashville, Tenn.; the Hayes Memorial for Richmond, Va.; two colossal lions for University City; the Laclede Monument for Saint Louis; portrait busts of Emperor Francis Joseph, Victor Hugo, Gen. Stonewall Jackson, Major Rollins, Clara Hoffman, Walter Sheldon and others. In 1913 he transferred his studio to Washington, D. C., and thereafter produced the Saint Louis Confederate Monument; the great Industrial Monument for New Bedford, Mass.; a large educational frieze for the National Capitol's new high school; the Hoxie Memorial for Arlington Cemetery; and the statue of Sequoyah placed in the Statuary Hall of the Capitol in Washington. He also executed a number of portrait busts and the Dr. Still Monument for Kirksville, Mo. Besides winning numerous bronze, silver, and gold medals, he was decorated by the king of Rumania with the first class of the Ordre Pour le Mérite.

ZOMBA, east central Africa, capital of the Nyasaland Protectorate. It is situated on the lower slopes of Zomba Mountain, some 3,000 feet above sea level, 43 miles northeast of Blantyre. Besides being the headquarters of the administration, the town contains several large mission stations. In the vicinity tobacco, cotton, and other crops are cultivated on a considerable scale. Pop. 3,000.

ZOMBOR, Hungarian form of the name of the Yugoslav town of Sombor (q.v.).

ZONA LIBRE, sō'nä lē'brā, formerly the designation of a strip of country extending along the whole northern frontier of Mexico, 20 kilometers wide, where imported goods were admitted at 10 per cent of the ordinary duties for use within the zone. This zone was first established on the frontier of the state of Tamaulipas alone, in 1858, and was not extended across the whole frontier until 1885. At one time after the American Civil War, the United States authorities claimed that the privileges permitted within the zone encouraged smuggling; the Mexican government claimed that the conditions of retail trade made the zone a necessity; opposition to the zone, however, continued among competing manufacturers in the interior of Mexico, and the zone privileges were at length eliminated.

ZONARAS, zŏn'ä-răs, **Joannes,** Byzantine chronicler and theologian: flourished at Constantinople during the first half of the 12th century. He commanded the imperial guard and held other important offices under Alexius I Comnenus, but when John II Comnenus came to the throne he gave himself up to a religious life as a monk of Saint Basil. During his leisure hours at Mount Athos he employed himself in the compilation of a general history of the world from the creation down to the death of Alexius I Comnenus in 1118. In this work, comprising 18 books (of which an edition was published at Paris in 1686), he followed principally the narrative of Dio Cassius (155?– after 230 A.D.), the Roman historian of whose first 20 books (out of a total of 80) nothing is extant save Zonaras' abstract. As he approaches his own times Zonaras becomes more entitled to attention, as his mistakes arise evidently more from ignorance than design. There is also extant a commentary on the apostolic canons by him.

ZONE, the term applied to any portion of the earth's surface bounded by two parallels of latitude, but more particularly applied to five such zones, the position of which is marked by natural boundaries. These five zones are called the torrid, northern, and southern temperate, and northern and southern frigid zones. The torrid zone extends 23½° north and south of the equator; and twice a year the sun shines vertically on its inhabitants. This zone is bounded, on both sides of the equator, by the two tropics; that is, the circles in which the sun reaches its greatest distance from the equator. As the rays of the sun here are nearly vertical a perpetual summer reigns, and day and night under the equator are always equal; and even at the tropics the difference is scarcely an hour. Owing to the nature and situation, however, of the countries in this zone, the heat is not everywhere the same. The warmest portions are the sandy deserts of Africa and Arabia; in the regions nearer the equator where vegetation prevails the heat is less excessive; in the islands of the South Seas a milder climate prevails; and the highest mountains of Peru and equatorial Africa are covered with perpetual snow. The two temperate zones extend from the tropics to the polar circles. They contain the most populous countries, and the climate is varied. As the distance from the tropics increases the heat under similar conditions diminishes and the difference of the seasons becomes greater; and the days and nights become more unequal until we arrive at a point where once a year the sun does not appear above the horizon during the 24 hours, and once a year does not set for the same time. The circles passing through these points, parallel to the equator and the tropics, form the limits of the temperate zones, and are called the Arctic and Antarctic circles. The distance from the tropics to the polar circles, or the breadth of the temperate zones, both in the Northern and Southern hemispheres, is 43°. All beyond the polar circles to the poles is called the frigid zones. The distance from the polar circles to the poles is 23½°. The characteristic of the frigid zones is, that day and night are more and more unequal the nearer you approach the poles, and for days, weeks, and even months the sun is either constantly above or constantly below the horizon. At the poles the year consists of one day and one night each six months long.

ZONE OF FLOWAGE. See ROCK-FLOWAGE.

ZONE OF FRACTURE. See ROCK-FLOWAGE.

ZOOGEOGRAPHY, the science of mapping out the surface of the earth with reference to its fauna; the study of the distribution of animal life. It has always been obvious to travelers, and even the most superficial students of nature, that the various regions of the earth's surface were characterized, among other differences, by local peculiarities in animals and plants. It is a commonplace of knowledge that the animal life of the tropics is different from that of the Arctic regions; that the birds and mammals and small creatures of Africa differ

almost altogether from those of South America or Australia. Closer examination shows that such differences exist in a greater or less degree between lesser regions, as the east and west sides of a continent, groups of islands separated by a sea space, and so forth. On the other hand, there may be found striking resemblances in the fauna of certain separate regions, or a sameness over an extensive area, as Europe and Asia.

The importance and significance of these facts impressed themselves upon scientific men only within recent times. As long as it was held that each species must have been created, as a general rule, within the geographical area which it now occupies, the most curious facts of distribution could be regarded only with "sterile wonder." But when the idea came to be entertained that allied species have had a common origin, it was obviously implied that they or their ancestors must have had a common birthplace, and consequently, when we find members of a group severed from their nearest kindred, we feel bound to inquire how this came about. Thus, we have to explain how the tapirs are confined to the Malayan region and South America; the camels to the deserts of Asia and the Andes; marsupials to the Australian region and America; how the birds, mammals and reptiles of North America resemble those of Europe more than those of South America, and so on.

Means of Dispersal.—Accepting as a starting point the proposition that the various forms of life originated in some parent-stock or stocks at a particular place or places, the present distribution of their descendants as we know them, must depend mainly upon the powers of dispersion which each possessed, and the character of the physical influences and obstructions which acted as controlling factors or barriers in guiding their dispersal along certain lines and altogether prevented it elsewhere. Theoretically a new stock would spread equally in all directions from its point of origin; actually a very irregular and complicated kind of distribution has ensued in most or all cases. Hence an inquiry as to the means and limitations of dispersion possessed by animals and plants is of first importance.

It is scarcely necessary to draw attention to the facilities for diffusion possessed by animals endowed with great locomotive powers, and especially among land animals, by those having the power of flight (q.v.); but it is important to note that some animals, which in the adult state have only feeble powers of locomotion, are better endowed in this respect when young. Such, for example, is the case with echinoderms, marine mollusks and similar lowly aquatic forms, all of which develop from free-swimming and often far-drifting larvae. (See Deep-Sea Life.) But accidental modes of dispersal must also be taken into account. The carrying power of winds is known to be sufficient to bear along in the air fine dust across seas many hundreds of miles in width, and we have in that agency alone an adequate means of accounting for the dispersion of all plants propagated by minute spores. For that reason the distribution of most cryptogamic plants hardly enters into the problem, since these mosses, fungi, seaweeds and the like are almost universal. What part winds may have played in carrying the seeds of flowering plants is more doubtful; but observations show that even for such seeds, especially when provided with some kind of feathery appendage, winds may occasionally serve as a means of transport for very long distances. See Plant Geography; Plants, Migration of.

But in the case of animals also, winds are a more important means of transport than one might at first suppose. Birds and insects are often blown immense distances out of their course; and to this cause, for instance, is due the arrival every year of American birds on the coasts of Great Britain and France, while European birds almost never reach America—a fact plainly due to the prevalent easterly direction of the winds, and especially the gales in spring and autumn, when birds are migrating. Insects have been caught on ships more than 300 miles from land. Further, there are well-authenticated cases of even crabs, frogs and fishes being carried long distances by storms, and in this way it is possible to account for the transference of fish, etc., from one river system to another. Still more frequently, in all probability, are the eggs of such creatures transported by this means.

Next, marine currents also form, beyond doubt, a highly important means of dispersal both for plants and animals, and that in various ways. First, seeds may float on the surface of the ocean, and be carried by currents hundreds of miles, and become stranded on a distant shore still in a condition fit for germination. The experiments of Darwin to determine the vitality of seeds in sea water first enabled us to appreciate the importance of this factor. Further, marine currents often carry on their surface various kinds of natural rafts, which may transport both plants and animals. In the polar regions icebergs and icefloes may serve this purpose; and elsewhere trunks of trees, and even fragments torn from the land. Such fragments, forming small islands with erect trees upon them, have been seen at a distance of 100 miles from the mouth of the Ganges and other rivers. Wallace points out that ocean waifs of one kind or another are almost the only means we can imagine by which land shells can have acquired the wide distribution for which they are remarkable. Again, locomotive animals are very frequently the means of dispersing both plants and other animals. Seeds may be attached to the fleece or fur of mammals or the plumage of birds, or may be enclosed in clumps of earth clinging to the feet or some other part of bird or beast, even of insects. It seems probable that aquatic birds and water-beetles have been the means of distributing aquatic plants and freshwater mollusks, which are remarkable for their wide diffusion; and the spawn of amphibians and fresh-water fishes may be conveyed from one body of fresh water to another by the same means.

Lastly, man is often unintentionally the means of conveying both plants and animals from one region to another. The foreign plants found growing on ballast heaps near every civilized port are instances of this, and so, also, are the plants which have sprung from seeds introduced with imported grain and

merchandise. The whole coastal region of North America is overrun with European weeds. Whereever European ships have gone the rats and other vermin of the Old World have accompanied them, and hundreds of species of exotic injurious insects are known in all agricultural districts.

Obstacles to Diffusion of Animals.— For all land plants and land animals the most obvious and effective barrier is a wide expanse of ocean; and where the expanse is very wide it is seldom passable except with the aid of man. For land mammals the ocean is an absolutely impassable barrier, and hence native mammals are always absent from oceanic islands (that is, islands that have never been connected with the mainland); and this barrier is almost equally effective for serpents and amphibians, which also are nearly always wanting where there are no native mammals. Lizards are more frequently found indigenous on oceanic islands, though their means of transit from the mainland is unknown. Arms of the sea and broad rivers are likewise generally impassable for the creatures mentioned, though some of them have greater powers of swimming than is generally supposed. The tiger, the jaguar the bear and the bison are capable of swimming the widest rivers; pigs have been known to swim ashore when carried out to sea to a distance of several miles; and even a boa constrictor, it is said, has swum to the island of Saint Vincent from the South American coast — a distance of 200 miles.

Mountains, and especially high mountains, are also frequently effective barriers to the migration of land plants and animals; but in some cases they enable plants and animals of a cold climate to spread along their summits into latitudes where, in the plains, the climate is too hot for them. Again, deserts act as a barrier to the majority of plants and animals; forests are a barrier to the camel, hare, zebra, giraffe, etc.; treeless regions to apes, lemurs and many monkeys; plains to wild goats and sheep. Broad rivers also act occasionally as barriers to distribution, and that, strange to say, even in the case of some species of birds.

Another important barrier is that of climate; but climate merely limits the range of a species or group within a continuous area, for example, through limiting the food supply by restricting vegetation. The range of insects is peculiarly liable to be limited in this way, certain insects being attached to particular species of plants, or at least to genera or families; and for this reason insects, in spite of the exceptional facilities for dispersal which many of them enjoy, are remarkable, as a rule, rather for the restriction of their areas of distribution than for their wide diffusion. Various other minor factors might be mentioned.

But a more generally operative organic barrier consists in the fact of a region being already fully occupied by a native flora and fauna, so that there is no room for newcomers. Hence it happens that seeds may be wafted in plenty from one country to another without a single plant growing from these seeds being able to establish itself; and there may even be, as in South America, a free communication with another region while the fauna remains strikingly distinct, simply because that portion of the American continent is already completely stocked with a fauna perfectly adapted to the physical conditions there prevailing.

The barriers to the spread of marine creatures are not so numerous as in the case of terrestrial forms. The freedom of communication between one part of the ocean and another makes it impossible to mark out any marine zoogeographical regions, though many seas and coasts are distinguished by characteristic fishes and other marine creatures. There is also in the ocean a vertical distribution, the limits of which are determined by depth and its conditions. The principal barriers for fish are temperature and the intervention of land. Thus, the Isthmus of Panama is at present a complete barrier for fishes requiring warm seas.

Geological Evidence.— If all the barriers to migration had existed in all past time as they are now, it would be quite impossible to explain the present distribution of plants and animals on the supposition that kindred groups have had a common birthplace. But the solution of the problems of distribution is to be found in the fact that all the barriers are liable to change. Of changes of sea and land geology supplies us with abundant evidence. Portions of the mainland now continuous were at one time severed by arms of the sea; and islands have been formed by the severance of portions of land that once belonged to the mainland. Such islands are known as continental islands, and the study of their faunæ and floras is one of peculiar interest in connection with geographical distribution. These faunæ and floras show, as might be expected, a greater or less degree of correspondence with those of the mainland from which the islands have been cut off; and the resemblance is the closer the more recently the land connection has been destroyed. The relative date of the disunion is usually approximately indicated by the depth of the sea which now separates island and mainland, shallow seas dividing portions of land that have only recently been disconnected, and deeper seas separating those which have been longer apart.

The most remarkable case of isolation is presented by the Australian region, the fauna and flora of which are the most peculiar in the world. In the widest sense, this region includes not only the vast island of Australia itself, but also New Guinea and all the Malayan and Pacific islands to the east of a deep channel between the islands of Bali and Lombok — a channel the significance of which, as a boundary line for plants and animals, was first pointed out by A. R. Wallace, the great authority on animal distribution, and hence known as Wallace's Line. The great feature of this region (so far as animal distribution is concerned) is "the almost total absence of all the forms of mammalia which abound in the rest of the world, their place being taken by a great variety of marsupials." This presents one of the best examples of what are known as discontinuous areas of distribution, and offers an illustration of the mode in which such discontinuity is usually brought about. The early severance of the Australian region from the Asiatic continent (in the Mesozoic

Age) saved the Australian marsupials from the competition which almost extinguished the group elsewhere.

Changes in the climatic barrier have also had an important influence on geographical distribution; and it is by such changes, combined with changes in the continuity of land in the north polar regions, that the affinities between the floras of Japan and eastern North America must be explained. (See LAND-BRIDGES). When these affinities were first pointed out by Asa Gray, that distinguished botanist divined the true explanation — namely, that in former geological epochs, a genial climate must

The Zoogeographical Regions according to Sclater and Wallace:

Sub-regions of Palæarctic Region —
1. European.
2. Mediterranean.
3. Siberian.
4. Manchurian.

Sub-regions of Ethiopian Region —
1. East African.
2. West African.
3. South African.
4. Malagasy.

Sub-regions of Oriental Region —
1. Indian.
2. Ceylonese.
3. Indo-Chinese.
4. Indo-Malayan.

Sub-regions of Australian Region —
1. Austro-Malayan.
2. Australian.
3. Polynesian.
4. New Zealand.

Sub-regions of Neotropical Region —
1. Chilian.
2. Brazilian.
3. Mexican.
4. Antillean.

Sub-regions of Nearctic Region —
1. Californian.
2. Rocky Mountain.
3. Alleghanian.
4. Canadian.

have prevailed even within the polar circle, so as to allow of the existence of a remarkably uniform flora, suitable to such a climate, all round the pole in very high latitudes; and that as the climate became colder in the North this flora was driven southward, and became differentiated according to the differences of climate in the more southerly latitudes to which it advanced. Hence the eastern parts of America and Asia, as they correspond pretty much in climate, came to correspond also more closely than other tracts in the same latitude in the character of their floras. The soundness of this surmise was afterward confirmed by the discovery of abundant plant remains of the Miocene Age, indicating a warm climate in Greenland, Spitzbergen, and elsewhere. The effects on distribution of the changes of climate belonging to the Glacial Period or Ice Age may only be alluded to here.

Zoogeographical Regions.— As the result of all the processes of dispersal across the various barriers to migration, and of the changes in these barriers, we have the present distribution of plants and animals, which is such as to enable us to divide the terrestrial surface of the globe into more or less well-marked regions. For mammals, the regions adopted by Wallace are nearly the same as those first suggested by Sclater as applicable to the distribution of birds; for, in spite of the exceptional facility which birds have for crossing barriers impassable by mammals, Wallace finds that the distribution of mammals (which afford the best means of marking off zoogeographical regions) corresponds with that of birds to an extent that one would not perhaps have previously anticipated. But with regard to these regions it must be remembered (1) that it is impossible in most cases to draw any very clearly marked boundary line between one region and another; (2) that the degree of divergence between different regions is different in different cases; and (3) that, when any two regions are compared, we have not the same degree of divergence between different groups of the animal kingdom, or between animals and plants belonging to the two regions. Obviously, the degree of correspondence depends largely on the facilities for dispersal, and largely also on the geological age of different groups; and both of these are varying factors. These considerations being premised, we may now state briefly the limits of the six zoological regions adopted by Wallace, as given in his 'Island Life.' In the space to which the present article is necessarily restricted it is impossible to give even the most fragmentary sketch of the

characteristic life of the different regions, for which the reader must be referred to the works cited at the end of the article.

(1) Palæarctic Region, including Europe and north temperate Asia and Africa to the northern borders of the Sahara.

(2) Ethiopian or Palæotropical Region, consisting of all tropical and South Africa, together with Madagascar and the Mascarene Islands.

(3) Oriental Region, comprising all Asia south of the Palæarctic limits, and the Malay Islands as far as the Philippines, Borneo and Java.

(4) Australian Region, the Papuan Islands, Australia, New Zealand, and the islands of Oceanica. Celebes might be referred almost with equal right to this or the previous region. New Zealand is treated by Wallace as a highly peculiar sub-region of this great region.

(5) Nearctic Region, comprising all temperate and arctic North America, including Greenland, and extending on the south to an irregular line running from the Rio Grande del Norte on the east to a point nearly opposite Cape Saint Lucas on the west.

(6) Neotropical Region, the American continent south of this line, together with the West Indian Islands, sometimes called Neogæa.

Heilprin and others advocate the union of the Nearctic and Palæartic regions under the name of Holarctic, and introduce three transitional tracts (the Mediterranean, embracing southern Europe, northern Africa and western Asia, south of the Caspian and west of India, but exclusive of the southern half of Arabia; the Sonoran tract, embracing the northwest of Mexico; and the Austro-Malaysian tract, embracing Celebes and the smaller islands lying between it and New Guinea and Australia). Otherwise his major faunal divisions of the globe are similar to those of Wallace.

On plant distribution the most important German works are those of Engler and Drude. Engler attempts to trace the history of the vegetable kingdom since the Tertiary period, and comes to the conclusion that already in the Tertiary period four «floral elements» (*Florenelemente*) could be distinguished, namely:

(1) The Arcto-tertiary element, characterized by an abundance of conifers and numerous genera of trees and shrubs now prevalent in North America, or in extratropical eastern Asia and in Europe.

(2) The Palæotropical element, characterized by the presence of the families and subfamilies dominant in the tropics of the Old World; and still more by the absence of certain families, groups and genera found in the territory of the Arcto-tertiary element.

(3) The Neotropical or South American element, which, according to Engler, must have had in Tertiary times much the same character as that now possessed by tropical Brazil and the West Indies.

(4) The old Oceanic element, consisting of forms which possessed the power of traversing considerable stretches of ocean and developing further on islands.

The modern provinces of the vegetable kingdom are subordinated by Engler to these great divisions. Drude, in the first place, distinguishes the oceanic (marine) flora from the terrestrial forms, and the latter he divides into three great groups, and these again into 14 floral domains. See PLANT GEOGRAPHY.

ERNEST INGERSOLL.

ZOOLATRY, the worship of animals. This seems to have passed through three stages: (1) The animal was reverenceed and propitiated as possessing a power greater than that of man. (2) It was regarded as an incarnation of some deity or spirit. (3) It was raised to the position of a tribal ancestor. Zoölatry had its origin in the belief of primitive man that all nature was endowed with life and that many beings were possessed of great and magical powers. Animals were believed to be especially endowed with such powers. They were also thought to have their chiefs and tribal organizations just as man had, and their great magicians who were powerful enough to bring confusion upon their enemies. Hence primitive man attempted to conciliate all the mysterious forces and powers of nature, among them, those of the animal kingdom. Out of this, through successive stages, grew animal worship, with all its attendant ceremonies, forms and incantations. In the early history of the human race zoölatry of some kind was very prevalent. Traces of it appear in the Bible, as in the story of the Golden Calf made by the Israelites (Ex. xxxii). Zoölatry took deep root in the religious life of the ancient Egyptians, and all three forms flourished among that people. Juvenal opens his 15th satire with a scathing invective of Egyptian zoölatry, and detailed accounts of it occur in Herodotus, Plutarch, Strabo and Cicero. In the present day zoölatry survives chiefly in India and among the snake-worshippers of the west coast of Africa. See NATURE WORSHIP.

ZOOLOGICAL GARDENS, or PARKS, places for the keeping and attractive display of living animals, where they may live, as far as possible, in the open air and under natural conditions; a zoological garden thus differs from a menagerie, as that term is now understood, in that in the latter the animals are confined in narrow prison-cages, under cover, and are usually borne from place to place to be displayed for a fee. Collections of captive animals have always been kept by royal and eminent persons, and formed a large element in the sights and amusements of the populace in ancient and mediæval cities. The present conception of zoological collection, as a place where animals shall be maintained in the greatest practicable freedom for the sake of exhibiting their traits to the student, and shall be regarded only secondarily as objects of curiosity, is a modern idea, and one that has been

developed to its highest degree in the United States. Many large cities of the Old World and elsewhere have "zoos," as they are popularly called, notably London, Dublin, Berlin, Paris, Vienna, Amsterdam, Rotterdam, Antwerp, Hamburg, Copenhagen, Hanover, Cologne, Bombay, Calcutta, Tokio, Melbourne and several South American cities, especially Rio de Janeiro and Buenos Aires. All of these are the property of a society or private ownership of some sort except the garden in Berlin, and that attached to the Museum of Natural History at the Jardin des Plantes, in Paris and that in Vienna. They are sustained, therefore, partly by membership subscriptions and partly by gate-receipts, but most or all of them give free days. The sale of animals born and reared within their precincts is a source of revenue with some, as, for instance, the Dublin garden which has supplied a large proportion of all the lions now held in captivity by circus and traveling menageries. The Berlin "zoo" stands third in the number of its animals and general excellence of arrangements; that of London, founded in 1828, is second only to the New York Zoological Park, and the splendid series of volumes constituting the *Proceedings* and *Transactions* of the Zoological Society of London attest the admirable use which has been made of the collection by naturalists from many parts of the world.

Zoological gardens have long existed in the United States, among the oldest being those at Cincinnati and Philadelphia, both privately sustained, and each highly creditable. To these were added collections of living animals in the parks of various cities, maintained by municipal appropriation, among which those in Bronx Park, and Central Park, New York; Highland Park, Pittsburgh; Lincoln Park, Chicago; Belle Isle, Detroit, and Golden Gate Park, San Francisco, are important.

The National Zoological Park at Washington was established in 1889, in a large tract of hilly and forested land along Rock Creek in the outskirts of Washington. Its prime purpose was to gather a representative collection of American animals and possibly preserve from extinction species threatened with racial destruction. It has extensive and highly picturesque grounds, and its collection of animals has remarkably favorable surroundings and is kept in admirable condition. The support of this free park, one-half of which comes from Congress and one-half from the District of Columbia, has not been sufficiently liberal to make its development as rapid as its friends desire.

The latest and foremost American zoological park is that in the northern part of the city of New York, which is under the control of the New York Zoological Society, to which the city granted 264 acres of land in Bronx Park, police protection and various aids and immunities. It is largely financed out of municipal funds and is free to the public five days a week. A large herd of American bison is a notable feature of this park. This is the largest and most suitable space devoted to the care and exhibition of animals anywhere in the world, and since its opening in 1897 it has developed into a most prominent and useful position among the world's institutions of this kind. The society has about 2,000 members, and issues a series of important periodical publications. This park was developed by William T. Hornaday (1854–1937).

ZOOLOGY, the science that deals with animals. This science has quite naturally a number of subdivisions, since animals and groups of animals have many properties. Many of these properties are not restricted to animals, but are possessed in common with other living things. Hence, these subdivisions do not always find

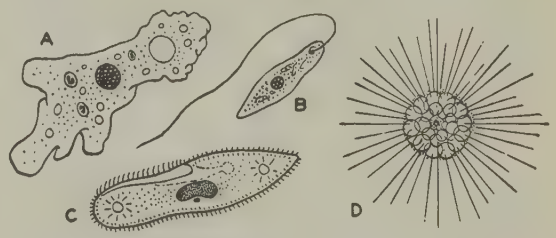

Fig. 1—Phylum Protozoa: A. *Amoeba.* B. *Euglena,* a green flagellate. C. *Paramecium.* D. *Thalassicola,* a "sun animalcule."

their limits within the science of zoology but are parts of the broader subject, biology. The science of genetics, for example, embodies concepts which apply alike to micro-organisms, plants, and animals. Yet a study of the genetics of bacteria is, properly speaking, microbiology; of the genetics

Fig. 2—Phylum Coelenterata: A. Portuguese man-of-war. B. *Obelia,* polyp stage. C. *Obelia,* medusa stage. D. *Hydra.* E. Sea anemone. F. Brain coral. Phylum Ctenophora: G. Sea gooseberry.

of corn, botany; and of the genetics of the fruit fly or of man, zoology.

The aim of zoology is to understand the lives of animals. By animal life is meant the sum total of all of the properties of animals and animal populations. For this reason the subdivisions of zoology overlap one another and serve, only in

the roughest way, to classify the activities of zoologists. The physiologist, for instance, may study the function of the kidney, but in so doing he cannot ignore its structure, which is the proper sphere of study for the anatomist. There is, however, general agreement about the major subdivisions. Morphology or anatomy deals with the form and structure of animals. Such a study may be carried out at a gross or at a microscopic level. In the latter case the investigation may be of groups of cells and be known as histology or may concern the structure of the cell itself, in which event it is called cytology. Physiology is concerned with function and behavior, with the mechanism of whatever processes can be recog-

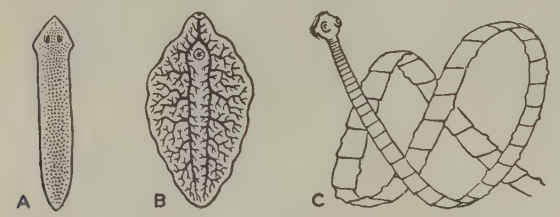

Fig. 3—Phylum Platyhelminthes: A. *Planaria.* B. Liver fluke. C. Tapeworm.

nized in animals. A physiological analysis often proceeds to a chemical or physical level. Investigations of behavior may sometimes properly be termed psychology. Embryology is the science of the development of individuals and may be anatomical or physiological. Genetics is the study of heredity and deals with the way in which characters are passed from individual to individual and, in populations, from generation to generation. Taxonomy or systematics deals with the classification of animals, their nomenclature and, on a broad basis, their family relationships. The study of fossil forms from all points of view is relegated to the science of paleontology. Ecology takes up the relationships existing among animals

and between animals and other organisms and their environment. So defined it includes parasitology or the study of animals that live at the expense of other organisms.

During the 19th century the whole of zoology was unified by the theory of evolution. This conception allowed an understanding of how the various animals of present times, with their structures, functions, and interrelationships, may have come about and it offered an explanation of the patterns of similarity. Since that time a main objective of zoologists has been, not only to study how animals maintain themselves, reproduce and develop, but to analyze the historical or evolutionary background of such existing systems. Initially studies on evolution were descriptive in nature and used the observational approach. Especially when such studies involved living animals in their usual habitats they were considered a part of Natural History. Although natural historical investigations continue at the present and have scientific worth and an aesthetic value

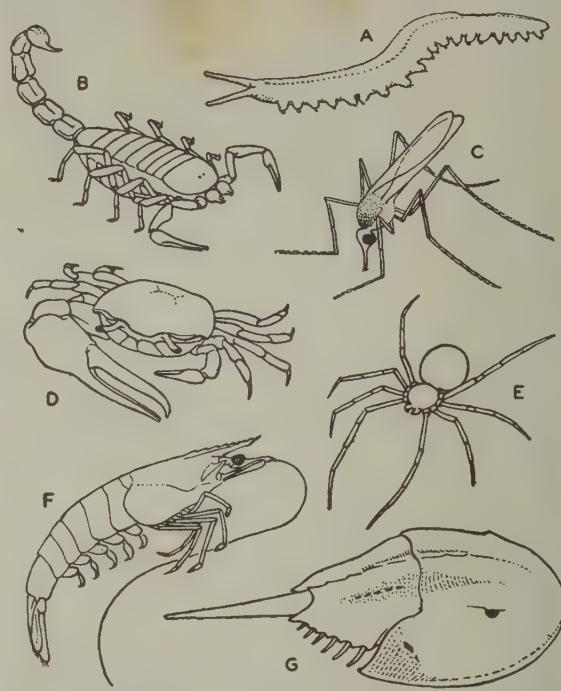

Fig. 5—A. *Peripatus.* Phylum Arthropoda: B. Scorpion. C. Mosquito. D. Fiddler crab. E. Spider. F. Shrimp. G. Horseshoe crab.

of their own, the beginning of the 20th century saw an upsurge of a special type of experimental investigation. These investigations often utilize chemical, physical, and mathematical methods and are usually referred to under the headings of biochemistry, biophysics, and biometrics. These subjects also overlap among themselves and with those already mentioned; there is a biochemistry

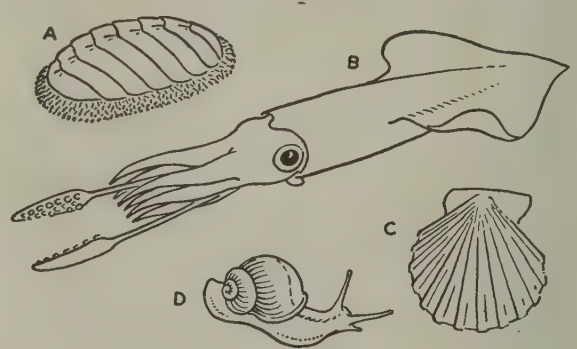

Fig. 6—Phylum Mollusca: A. *Chiton.* B. Squid. C. Scallop. D. Snail.

of development just as there is a biochemistry of muscle function.

The subject matter of zoology is also divisible in terms of the animals being studied. For example, vertebrate zoology is the study of animals with backbones; invertebrate zoology, the study of the remainder of the animal kingdom; ornithology, the study of birds; protozoology, the study of protozoa; etc. It is sometimes hard

to decide whether a protozoan belongs to the animal kingdom, the difficulty residing in the fact that plants and animals were first defined at a time when microorganisms were unknown. Perhaps it is preferable to relegate the protozoa and the protophyta to a separate kingdom, Protista

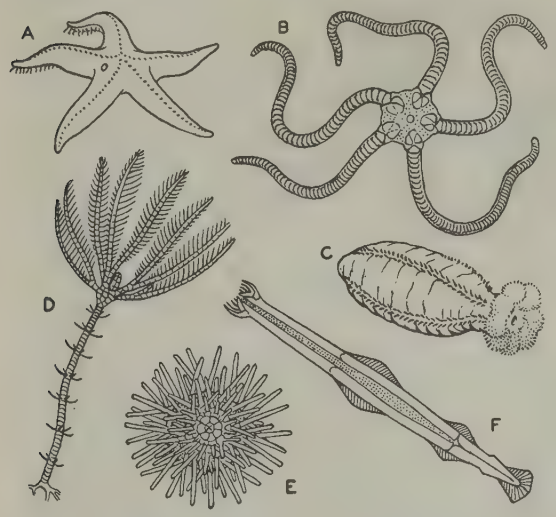

Fig. 7—Phylum Echinodermata: A. Starfish. B. Brittle star. C. Sea cucumber. D. Sea lily. E. Sea urchin. Phylum Chaetognata: F. Arrow worm.

(or Protoctista). Both botanists and zoologists, however, consider these organisms their legitimate subject material.

Historical.—Our knowledge of animals surely had its origin in prehistoric times. The first attempt at a comprehensive classification of animals and their properties, however, was made by Aristotle (384–322 B.C.). Classical antiquity saw many other efforts, the major one probably being Pliny the Elder's (23–79 A.D.) voluminous work on natural history. Galen (131–200 A.D.) was another early authority of great influence. He dissected animals for his works on human anatomy which were in standard use in medicine throughout the Middle Ages. During the Renaissance, Konrad Gesner (1516–1565) compiled an encyclopedic natural history that was characterized by an attitude of scientific scepticism. Leonardo da Vinci (1452–1519) and Andreas Vesalius (1514–1564), imbued with the new spirit of investigation, accumulated through dissection a knowledge of human anatomy far more exact than that which had hithertofore existed. The ideas of Francis Bacon (1516–1565) spread throughout these times and an increasing emphasis was placed on direct observation and experiment.

Fig. 8—Phylum Chordata: A. Man. B. Coyote. C. Duck hawk. D. Lamprey. E. Frog. F. Shark. G. Salmon. H. Snake.

One of the most successful users of the experimental method was William Harvey (1578–1657) who demonstrated the circulation of the blood and the function of the heart, arteries and veins. The invention of the microscope introduced a series of investigations into the fine structure of animals especially by such men as Anton van Leeuwenhoek (1632–1723), Jan Swammerdam (1637–1680) and Marcello Malpighi (1628–1694) who discovered capillary circulation. The researches of Kaspar Friedrich Wolff (1733–1794) in embryology established the fact that the organs of the embryo develop from the relatively indifferent material of the egg and are not preformed in an infinite series. Lazzaro Spallanzani (1729–1799) experimented on the question of spontaneous generation and correctly recognized the basic continuity of life.

A real advance in the classification of animals was made by John Ray (1628–1705) who was consistent in employing structural similarity as a criterion. His work was brought to a culmination by Carolus Linnaeus (1707–1778) who introduced the binomial system of nomenclature (genus and species, e.g. *Homo sapiens*) and whose *Systema Naturae* of 1758 marks the beginning of the modern system of classification. Comparative anatomy and natural history developed rapidly during the 18th century under the impetus of such scholars as Georges Buffon (1707–1788) and Johann Wolfgang von Goethe (1749–1832). The fact of evolution became clear to Erasmus Darwin (1731–1802), Jean Baptiste Lamarck (1744–1829), and others who believed, but could not experimentally demonstrate, that evolution occurred by the inheritance of characters acquired through use or disuse. The great French tradition was carried forward by Georges Cuvier (1769–1832) who extended his morphological studies to fossil forms. Investigations that were to help make Germany the center of zoological research in the 19th century were carried out especially by Karl Ernst von Baer (1792–1876) in comparative embryology and by Karl Gegenbaur (1826–1903) in comparative anatomy.

The seeds of evolutionary theory had been planted and were nourished by the exploration and collection on the part of great naturalists like Alexander von Humboldt (1769–1859) and by Charles Lyell's (1797–1875) demonstration of the principles of geological succession. It was in the intellectual climate thus created that Alfred R. Wallace (1822–1913) and Charles Darwin (1809–1882), themselves competent and traveled naturalists, simultaneously in 1858 proposed theories of evolution based on natural selection. The impact on zoology and other fields of learning was immediate and explosive. General acceptance of the new interpretation was not equally rapid. For example, Richard Owen (1804–1892) and Louis

Agassiz (1807–1873), whose researches in comparative anatomy and in paleontology were later to be of such value to evolutionary theory, rejected it. Nonetheless an intensive period of research into the course of evolution ensued and the great popularizers of this knowledge were Herbert Spencer (1820–1903), Ernst Haeckel (1834–1919) and Thomas H. Huxley (1825–1895). The new spirit spread and vigorous programs in paleontology were initiated in Europe and in the rich collecting areas of western America.

Although the evolutionists of this period were satisfied to explain things in terms of their historical origin, a new group of workers demanded answers in terms of mechanism. For example, in embryology, the comparative approach was amplified by an experimental one, especially through the efforts of Wilhelm His (1831–1904), Wilhelm Roux (1850–1924) and Hans Spemann (1869–1941). This experimental philosophy has been vigorously applied to other fields of zoology throughout the 19th century. Friedrich Wöhler (1800–1882) in his synthesis of urea showed that organic compounds, previously found only in association with living organisms, could be made in the laboratory. Thus they were stripped of their aura of mystery. With similar modern spirit Johannes Müller (1801–1858), Hermann Helmholtz (1821–1894) and Claude Bernard (1813–1878) conducted their physiological researches.

The role of the cell as a unit of structure was recognized as early as 1838 by Matthias Schleiden (1804–1881) and Theodor Schwann (1810–1882) and detailed investigations into cell division, including the behavior of chromosomes, were conducted by Carl Nägeli (1817–1891) and Eduard Strasburger (1844–1912). During this era Virchow (1821–1907) established the science of cellular pathology. The role of the nucleus in fertilization, cell division, and sex determination progressively came to be understood through the efforts of Oskar Hertwig (1849–1922) and his brother Richard von Hertwig (1850–1937), Walther Flemming (1843–1905), Otto Bütschli (1848–1920), Edouard van Beneden (1845–1910), Theodor Boveri (1862–1915), and E. B. Wilson (1856–1939). August Weismann (1834–1914) combined this new cytological knowledge into a comprehensive theory of heredity and evolution based upon natural selection and emphasizing the continuity and independence of the germ plasm. Other important students of heredity and evolution included Francis Galton (1822–1911), who introduced statistical methods to the field, and Wilhelm Ludwig Johannsen (1857–1927), who clearly distinguished the hereditary composition (genotype) from the observable characters (phenotype) of an individual. A major advance in the study of inheritance came with the rediscovery in 1900 of the laws first recognized by Gregor Mendel (1822–1884) about 1865. These laws were further developed by Hugo De Vries (1848–1935), William Bateson (1861–1926), and T. H. Morgan (1866–1945) and his school, who, among other things, were able to show that the bulk of the hereditary units were aggregated in the chromosomes. The generalizations of Mendelian genetics offer the broadest opportunities for the accurate prediction of biological events. In this way they approach the laws of the more highly developed physical sciences.

Throughout the above historical treatment the names of individuals have been singled out for mention. Despite this it should be appreciated that zoology, like any other branch of knowledge, has grown through the concerted efforts of multitudes of unmentioned investigators, some of whose contributions may have been as great as those of the zoologists mentioned above.

In general, it could be stated that until the 20th century a strong emphasis was placed on differences in structure and function. Hence botany, zoology, and microbiology, and subdivisions within these fields, followed relatively separate developments. With the progressive accumulation of knowledge, especially in cytology, genetics, and biochemistry, the 20th century has seen a reversal of this emphasis. The fundamental similarity of all living things is now quite apparent and information secured about animals is often directly transferable to plants and vice versa. Of course there are differences, but in order to be alive, to maintain one's self and to reproduce, certain common features are required.

Groups of Animals.—Animals inhabit almost all parts of the earth from the equator to the poles, from the depths of the oceans to high mountain summits. They have invaded the soil, the water and the air, and have even become adapted to live within other organisms. Accordingly their diversification of form and function is great. About 800,000 different species of animals have been recognized and it is estimated that the total number might exceed 1,500,000. A species is a group of similar animals which ordinarily interbreed with one another and not with others. Similar species are grouped in a genus and similar genera in a family. Higher categories include, in turn, orders, classes and, finally, phyla which are the major subdivisions of a kingdom. There is not always universal accord among zoologists as to whether a group of animals should be considered one or more species and similar difficulties are encountered with higher categories. Such is a consequence of the fact that the array of animal life reflects the fundamental relationship of forms that have evolved with modification from common ancestors. Nevertheless, a generally satisfactory listing of the major groups of animals is as follows:

Kingdom	Animalia
Phylum	Protozoa
	Mesozoa
	Porifera
	Coelenterata
	Ctenophora
	Platyhelminthes
	Nemertinea
	Aschelminthes
	Sipunculoidea
	Priapuloidea
	Echiuroidea
	Annelida
	Arthropoda
	Mollusca
	Entoprocta
	Ectoprocta
	Phoronida
	Brachiopoda
	Chaetognatha
	Echinodermata
	Chordata

The Protozoa are distinguished by the fact that their bodies are unicellular. Nevertheless they can be exceedingly complex in structure. This is not surprising when one reflects that their microscopic bodies are adapted to carry out all of life's functions. Their organs, like the locomotor apparatus, food canal, nervous, and excretory systems, are differentiations of their protoplasm and not, as in other animals, com-

In the lion compound, Bronx Zoo, New York City, the animals roam in the open under conditions simulating their native habitat. A deep, dry moat keeps them separated from the spectators

posed of cells, each with its own nucleus. There is a nucleus in the protozoan body (sometimes there are several) and its experimental removal and transplantation has demonstrated that it is required for the continued normal function of the protoplasm. In asexual reproduction the nucleus divides as does that of the cells of metazoa (animals whose bodies are composed of cells). Some protozoa undergo sexual reproduction, and, when they do so, nuclear changes take place that are not unlike those occurring in the formation of sperms and eggs and in fertilization of metazoa. As a consequence inheritance in protozoa is fundamentally like that in metazoa for in both cases the majority of the hereditary factors or genes are on the chromosomes of the nucleus. Protozoa have been shown, in some cases, to require the same types of food as does man, that is, amino acids, vitamins, and minerals. In fact the chemistry by which they secure building material and energy from proteins, carbohydrates and fats is not fundamentally different from that of other organisms.

Undoubtedly one of the very earliest states of life on earth consisted of animals built on the protozoan plan. From the Proterozoic era (perhaps a billion years ago) onwards the protozoa have retained this basic plan while modifying it in some respects. In this group there are forms that possess chlorophyll and manufacture their own food from carbon dioxide and water with the energy of sunlight. But even this does not make us sure that they are plants for under certain conditions they can be made to lose their chlorophyll and, provided they are given certain foods, they move about and reproduce like other protozoa. Nevertheless, it seems certain that the plants in evolution arose from green flagellates. Some protozoa live in aggregations, suggesting that from similar aggregates the many-celled plants and animals arose long ago. Others are shelled forms, especially prolific in the seas where their skeletons fall as a constant rain to the ocean floor. In the past similar deposits have been transformed into stone, and since the populations of shelled protozoa varied with time, the microscopic analysis of shale containing protozoan skeletons is a guide to geologists in their search for oil. The largest of these shelled protozoa is a fossil form that was sometimes more than an inch in diameter. Many protozoa have complex life cycles and are parasitic in other organisms. *Plasmodium,* which causes human malaria, passes part of its life in the body of a mosquito.

The bodies of unicellular organisms are nearly always small while the metazoa, or many-celled animals, may grow large. Whenever size is great, the problem of transport of food, waste products and oxygen in and out of the depths of the body becomes increasingly difficult. This problem arises because as size increases there is a proportionately greater increase of volume than of surface. The metazoa solve this problem either by forming thin-branched colonies, or by developing enlarged body cavities, or systems of circulatory vessels. They must also, in growing large, develop some type of skeletal support.

To the phylum Mesozoa belong some microscopic parasitic animals that are interesting phylogenetically because of the primitive aggregation of their cells into a solid body consisting of two layers.

The Porifera or sponges, like the Mesozoa, possess bodies with two layers of cells, but some relatively unorganized cells are located in between. This organization is in fact so plastic that when the cells of a sponge are separated by being squeezed through fine cloth they are able to aggregate to form a new sponge. The body of a sponge is riddled with numerous canals lined by flagellated cells which create a current of water and ingest food particles thus carried in. As sponges increase in size many of them form spicules in the middle layer which afford a type of skeletal support. The siliceous spicules of some fossil sponges form a rock known as flint.

The Coelenterata, or jellyfish, anemones and corals, have a better developed middle layer. They have a mouth but no anus, waste material being ejected through the same opening it entered as food. Some forms increase in size by branching, the result being a colony of zooids connected by a series of stems through which the gut passes. Such polyps or hydroids may have an alternation of generations whereby a jellyfish stage is budded off. These free-swimming medusae form eggs and sperm and the fertilized eggs develop once again into hydroids. Some jellyfish have lost the hydroid generation and their fertilized eggs develop directly into medusae again, while others have only the hydroid stage. Food and oxygen are brought into the thick bodies of jellyfish by canals. Some of these forms possess special stinging cells that are dangerous even for man. Although sea-anemones may also become large their bodies are relatively thin-walled and the gut is divided by septa. The corals are mostly colonial sea-anemones that secrete different sorts of skeletons. They are exclusively marine and sometimes form massive coral reefs and coral atolls, as in the Pacific. Much limestone is composed of fossil coral. All of the coelenterata have bodies that are symmetrical around a central axis. This is called radial symmetry and is also characteristic of the phylum Ctenophora, or the comb-jellies. The latter forms are constructed somewhat like the Coelenterata but have eight rows of paddle-like plates by means of which they swim. Many of them can carry out chemical reactions that produce light and so are luminous when the sea is disturbed on a summer night.

The remaining animals are bilaterally symmetrical or have evolved from such forms. Bilateral symmetry means that division in the vertical plane through the long axis of the body results in halves that are essentially mirror images of one another. Most primitive is the phylum Platyhelminthes which includes free living flatworms and the parasitic flukes and tapeworms. When a gut is present, it is a blind sac opening only through the mouth. The middle layer or mesoderm is well-developed and there is a system of excretory canals whose fluid contents are agitated by cells possessed of a motile bundle of fibers. There is also a well-developed nervous system with some centralization in a ganglion at the head. The Platyhelminthes are usually hermaphroditic. The free living forms, like Planaria, have considerable regenerative power; whole animals can be reformed from small parts. They can also reduce their bodies to a small fraction of original size when starved. The parasitic forms ordinarily have complex life cycles that sometimes involve several intermediate hosts. They are of great medical importance, especially in tropical regions. The

Nemertinea are in some respects like the Platyhelminthes but they have an anus, an eversible proboscis and a rudimentary circulatory system.

The Aschelminthes consist of the rotifers or "wheel animalcules" and the free living and parasitic roundworms. These forms have an anus and spaces in the mesoderm which may represent a primitive body cavity. The nematodes or roundworms are of great medical importance, causing such diseases as hookworm and elephantiasis. The Sipunculoidea, Priapuloidea, and Echiuroidea are worms related to the segmented Annelida. One of the Echiuroids shows an unusually plastic mode of sex determination. The larva, if attracted to and settled on a female, develops into a male. If, however, it settles free on the ocean bottom, it differentiates into a female. The Annelida, a group which includes the earthworm and the leech, have contractile blood vessels and well-formed body cavities from which the excretory organs lead as tubes to the outside. Most of the structures of the body, such as the appendages, muscles, excretory organs, ganglia on the nerve cord, and lateral nerves, and blood vessels, occur in a repeated pattern along its length. This segmentation, commonly called serial homology, is not present in the early embryo, such as the ciliated larva of marine annelids, but segments are added during posterior growth.

The Annelida are believed to be related to the Arthropoda through the existence of an intermediate primitive form known as *Peripatus*. All of these forms are also similar in a number of embryological ways. To the arthropods, or joint-legged animals, belong the crabs, shrimps, barnacles, centipedes, insects, scorpions, spiders, etc. that have been so successful in their invasion of the land, sea, and air. All possess a horny exoskeleton of chitin and, like the annelids, are segmented. The appendages occur as a pair per segment and vary in number among the different groups. The appendages may be modified into walking, swimming or flying structures and, on the anterior segments of the body, become mouth parts. The aquatic crustacea breathe by means of gills but land forms like the insects have a special system of branched tubes (tracheae) that lead air into the deepest tissues. The structure of these animals is extremely complex, the circulatory system may possess a heart, there are glands controlling color, molting, metamorphosis, etc., the nervous system is highly organized and there are specialized sense organs such as compound eyes. This complexity of structure is reflected in the behavior of the arthropods and some groups of insects like the ants and bees have evolved a highly integrated social life. Arthropods are obviously important to man, not only as food, but as agencies for the fertilization of plants, as pests of food crops and as vectors of human disease.

The phylum Mollusca includes the clams, oysters, chitons, snails, whelks, slugs, squids, and octopuses. Usually there is present a calcareous shell and a prominent feature of the body is a muscular locomotory organ known as the foot. In the squid and octopus this has been modified into a series of tentacles with sucking discs. The latter forms are adapted for rapid swimming by the ejection of water from a mantle cavity. In the other mollusca locomotion is achieved by creeping or burrowing. Breathing is by means of gills and there are well-developed, but unsegmented circulatory, excretory, reproductive and nervous systems.

The phyla Entoprocta, Ectoprocta, Phoronida and Brachiopoda consist of tentacled animals (the last mentioned group with a pair of clam-like shells and well represented in fossil fauna) that are of interest as problems for the specialist.

The remaining three phyla of animals are related. The Chaetognatha consist of some marine arrow worms, the Echinodermata of the star fishes, brittle stars, sea urchins, feather stars and sea cucumbers, and the Chordata of animals with a backbone or the stiff rod, the notochord, that precedes it in development. The echinoderms are characterized by the possession of a skeleton of calcareous plates and of a water vascular system that is used for respiration and sometimes adapted to locomotion. The condition of many organs, such as the nervous system, is complex. Echinoderms are unsegmented and show radial symmetry. Their ciliated larvae, however, are bilateral and like those of some primitive chordates. The mode of formation of the body cavities as pouches from the gut is remarkably similar in the two groups. For these and other reasons it is believed that the chordates arose in evolution by diversion of the development of the larva of some animals ancestral to both echinoderms and chordates.

Like the echinoderms, the primitive chordates —sea squirts, sea pork, salps, acorn worms and lancets—are marine organisms. They do not possess vertebrae as a backbone but have in its place a gelatinous rod that stiffens the body but allows the bending movements used in swimming. This rod is found, at least in the embryo, in all chordates including man. When vertebrae form, they do so by growing around and displacing the notochord. All chordates also possess, at least as embryos, gill arches and a dorsal hollow nerve tube. The most primitive living vertebrates, the cyclostomes, have no lower jaws and no paired fins. The cartilaginous and bony fishes have both jaws and paired fins and, in addition, either small sharp toothlike or bony scales. All fishes breathe by means of gills but some also gulp air and breathe with lungs. Amphibia usually breathe with lungs in adult life but a great deal of respiration occurs through their moist skin. Although their four limbs enable them to crawl or hop about on land, amphibia, like the frogs, toads, newts and salamanders, must, with very few exceptions, return to water to breed. Their eggs develop into tadpoles with gills and after variable times these larval forms metamorphose into adults. The reptiles, having a moisture-retaining scaly skin, better lungs, and shelled eggs that will develop on land, are better adapted to land life. The birds are very similar in structure to reptiles, the obvious differences being associated with their adaptation to flight. Like the mammals they have a highly developed nervous system and a constant high body temperature. Some primitive mammals, like the duck-billed platypus, evidence their relation to reptiles not only in many structural features but especially since they lay eggs. Nevertheless, they have hair, feed their young with milk and have many mammalian structural characteristics such as the possession of three ear bones. In other mammals, mostly of the Australian region, the young are born when only a fraction of an inch in length and are nursed in a marsupial pouch on the mother's belly. In the remaining mammals, to which group man belongs, the young, attached

by means of a placenta and an umbilical cord, are retained until birth in the uterus of the mother.

Evolutionary Zoology.—The mammals are at the present time the foremost animals on the earth but this was not always so. In the Mesozoic period (some 60–180 million years ago) the reptiles were predominant. There then existed the dinosaurs and many land, aquatic and flying reptiles of an immense variety of type. The only mammals found in the fossil record of that time are a few small, insectivorous forms. Previous to the Mesozoic there were no mammals, no birds and only a few primitive reptiles. During these early times, about 250 million years ago, when there existed the great bogs and swamps that gave rise to today's oil and coal deposits, the amphibia had already appeared. The earliest of these were very similar in their structure to certain air-breathing fishes living in the ponds of these Carboniferous times. This similarity even extended to their primitive limbs which were not very different from the fins of their fish relatives. Before the Carboniferous there were no true land-living vertebrates and the fishes of the time were either primitive or, if highly specialized, are not represented among the present-day fish fauna. The earliest fishes existed between 300 and 400 million years ago and study of their fossil remains indicates that, although in most cases they had a heavy armor of bone, they were much like the present-day cyclostome fishes. Before the vertebrates appear in the fossil record only invertebrate remains are found and, even earlier, only the skeletons of protozoa.

This succession in the appearance of animal forms is a proof of the fact of evolution and confirms and amplifies the inferences about the course of evolution made from a study of living animals. Since all previously existing animals are not preserved in rock, and, since all so preserved have not yet been found, the fossil record is bound to have gaps. In certain cases, however, the seriation is quite complete. The fossil history of the horses is well known and it can be demonstrated how for about 50 million years there was a gradual increase in size with consequent improvement in speed and a gradual reduction in the number of toes until, at the present, only one remains functional on each foot. The fossil history of man is also quite well known and involves improvement in upright gait and an increase in the size of the brain. When the use of implements was learned man's influence on his environment increased explosively. In tracing such phylogenetic series it is necessary to be constantly on guard against the possibility that parallel evolution has occurred independently in several lines. This is known to have occurred in the evolution of the elephants and especially in the evolution of hoofed mammals.

The order of appearance of the vertebrates, from jawless fishes through the jawed fishes, amphibia and reptiles to birds and mammals, is the order of increasing specialization of many features, such as the nervous system. This order is in a general way followed in the development of certain organ systems such as the heart and blood vessels, or the kidneys and the urinogenital ducts. For example, in human embryonic development at early stages the plan of the circulatory system is fish-like even to the extent of there being vessels that pass through gill arches. Only after modification through further development does the circulatory system differentiate into something characteristically mammalian. In fact, the differences between the different vertebrates become less and less as earlier stages of embryology are compared.

Comparative embryology yields many clues concerning the course of evolution. For example, in the mammalian ear there are three bones, while in the ears of all other land living vertebrates there is only one. The two extra bones in the mammalian ear develop from the same structures as form the jaw articulation in other vertebrates. Thus, in the evolution of mammals a new jaw joint is formed and bones that were once parts of the jaw have come to lie within the ear and function in hearing. These two mammalian ear bones are said to be homologous with the related jaw bones in other vertebrates, the word homology referring to the evolutionary relationship existing among structures that are superficially different yet fundamentally alike. The single bone in the ear of the lower land living vertebrates is homologous with the third bone in the mammalian ear and these, in turn, are homologous with a bone that helps support the jaws of fishes. Again, the fins of fishes and the limbs of land living vertebrates are homologous, but the wings of an insect and a bird are only analogous, having a similar function but dissimilar structure and origin; they are not present in the two groups because of evolutionary relationship.

In the vertebrates developmental changes are brought about by the influence of one tissue on another. For instance, the nervous system is induced to form by the roof of the embryonic gut underlying it. Transplantation of this inducing gut tissue under the skin of a second embryo causes another nervous system to form. Similarly the lens of the eye is induced to form from skin by the embryonic eyeball. By influencing the conduct of these processes the hereditary constitution of various animals ensures development true to type. In some primitive chordates and in many invertebrates development does not involve such a stepwise determination of one tissue by another but the potentialities of the cells formed by cleavage of the egg are fixed at that time. In this case separation of the cleaving egg into two parts results in two incompletely formed monsters rather than in two perfectly formed but miniature embryos as is the case with amphibia. There is an even broader recapitulation of phylogeny to be observed in the progression from a single-celled egg to the cluster of cells formed by cleavage. This becomes a hollow sphere and, by the inward migration of some of the cells, a two-layered structure. The third, mesodermal layer then appears and within it there forms the body cavity.

Many evidences indicate that life arose in the sea. As the rivers bring salts from the eroding soil and rocks into the oceans where water is constantly evaporating, the salt concentration of the sea increases. At the time when animals arose, the sea was more dilute than it is now. The earliest known vertebrates lived in fresh water but had in their blood a concentration of salt similar to that of the sea at the time they left it and to this day roughly that concentration has been retained. The closed blood systems of animals provide watery internal environments for their cells and thereby allow a type of freedom from the outside that has reached its culmination in the higher vertebrates. Here this internal fluid is

well buffered against chemical change and carries antibodies which protect the cells against invading viruses and bacteria; the keynote is constancy. Blood possesses an efficient means of transporting oxygen in the hemoglobin of the red blood cells and carries carbon dioxide from the cells of the body to the lungs. It also transports food from the gut where it is dissolved by the action of enzymes formed in the digestive glands. The waste products secured by the blood from the tissue fluids around the cells are excreted as it passes through the capillaries of the kidney. The blood is moved by the muscular contraction of the heart and arteries and is given direction by the valves of the heart and veins. All of this activity is regulated by the action of the nervous system and the hormones secreted into the blood by the endocrine glands. These two systems control the metabolism of the body, the rate of heart beat and the contraction of skeletal and other muscles. These systems in turn respond to stimuli from within the body and from without as perceived by the sense organs. The entire physiology of the animal is adapted to preserve its pattern, but in time aging sets in which is eventually reflected in failure to function.

The pattern of animal organization is preserved, however, from generation to generation by the reproduction of new individuals, usually by sexual means. When eggs and sperm are formed the number of chromosomes is reduced to one-half of the number normal for the body cells; upon fusion of sperm with egg the normal number is reconstituted. Chromosomes consist of a complex chemical, nucleoprotein, which is capable of existing in an immense number of specific forms. The chromosomes are the hereditary determinants of the cell. For example, the members of one pair of chromosomes in the human male are structurally different from one another and known as X and Y. A human female has two X chromosomes. One of the X's is included in the egg when the chromosome number is halved; when the sperm is formed either the X or the Y is incorporated. An X bearing sperm, by combination with the X containing egg, will result in a female, while Y bearing sperm can only form males.

The chromosome is linearly differentiated into sites known as genes. These are the units of heredity that determine such characteristics as sex, eye color, susceptibility to disease, etc. They do so by influencing the chemical reactions that result in these phenotypic characters. The gene determines the response which the organism can make to the environment in expressing the character. Thus, there is no conflict between heredity and environment; the two mutually interact. Some characters like eye color or blood group type are rather rigidly determined; others like size and intelligence may vary according to the environment within rather broad limits set by heredity. The Mendelian laws governing the transmission of hereditary material are now clearly understood. As a consequence of them sexual reproduction results in recombinations of genes so that no two offspring (except derivatives of the same egg, like identical twins) are exactly alike. This variability is made possible by the fact that genes, although extremely stable, do mutate to new conditions at a rate of about once in a million reproductions. Such mutations occur under the influence of radiation and certain chemicals or for other unknown reasons.

This differentiation among genes, giving rise to variability among offspring, provides the raw material out of which new species are built. With the possible exception of man, who controls his environment more extensively than other animals, no animal species overpopulates the earth. And this despite a reproductive capacity that is frequently tremendous, as in the case of the codfish which lays millions of eggs in a single spawning. Predators, lack of food, disease and a multitude of other factors result in the survival of only a few offspring. The better fitted are those who have a greater chance of surviving and reproducing their kind; genes and combinations of genes having the greatest adaptive value are more likely to be spread in future generations. Thus evolution is brought about by the action of natural selection on hereditary variation. Man with his increasing control over the environment is in a position to influence his own evolution. It should be here borne in mind that, in addition to biological inheritance, social inheritance plays an important role.

There is a common explanation of evolution which is alternative to that involving spontaneous variation and natural selection. It is usually attributed to Jean Baptiste Lamark and states that the temporary adaptations made by an organism in the course of its life are somehow transmitted to the germ cells and eventually to its offspring. Repeated experimental tests of this explanation have disproved it; the inheritance of acquired characters is simply not a fact. An adaptive environmental modification of an individual's body is important for the individual but, since it is not transmitted to its offspring, it is not the cause of evolutionary change. Furthermore, the Lamarkian explanation is not theoretically sufficient, for it fails to account for the appearance of the ability to undergo temporary adaptations such as the browning of human skin in the sun. The only explanation consistent with all we know about evolution is that involving the action of selection on the variation in heritable traits observed in all families.

As the area occupied by a species increases, regional differentiation into races sets in, due both to the nature of the reproductive process and to adaptation to different ecological opportunities. This differentiation may become so extensive as to introduce biological barriers to reproduction between two geographically or ecologically separated races. Among such reproductively isolated groups an exchange of genes is impossible and as a consequence the two groups would be considered to have differentiated into species. From then on they follow genetically independent evolutionary pathways toward further radiation or to extinction in the face of drastic changes in environment or competition with more successful groups.

In such terms as these, which are subject to experimental verification, the high degree of adaptiveness of living things and the pattern of animal life can be understood.

Why should man concern himself with a study of animals? In the first place zoology, like all knowledge, has practical applications. Just as engineering is to physics and chemistry so veterinary medicine, animal breeding, fishery and wild life services, and the control of crop pests stand in relation to zoology. The kind of knowledge which zoologists are interested in discovering is basic knowledge, that is, knowledge that

Baboon in the New York Zoological Park

White-tailed gnu.

is generally applicable to many animal forms. As a consequence human medicine is especially dependent upon knowledge gained by zoologists. In recognition of this dependence three Nobel prizes in Physiology and Medicine have been given to zoologists, to the German embryologist, Hans Spemann and to the American geneticists, T. H. Morgan and H. J. Muller. But most important of all, we are interested in zoology because we, as animals, want to know ourselves, our relations and our past history.

Information beyond that in this summary can be found under the headings of specialties into which zoology is divided, such as BIOCHEMISTRY; EVOLUTION; RACES, NATURE AND ORIGIN OF; etc. Moreover, there are articles under the headings ANIMAL, and specific groups of animals such as INSECTS, VERTEBRATA, etc.

Bibliography.—The following books will serve as an introduction to the field of zoology: Wells, H. G., Huxley, J. S., and Wells, G. P., *The Science of Life* (New York 1934); Romer, A. S., *Man and the Vertebrates* (Chicago 1941); Buchsbaum, R. M., *Animals without Backbones*, 2d ed. (Chicago 1948); Parker, T. J., and Haswell, W. A., *A Textbook of Zoology*, 2 vols., 6th ed. (New York 1948); Simpson, G. G., *The Meaning of Evolution* (New Haven 1949).

FRANCIS J. RYAN,
Professor of Zoology, Columbia University.

ZOOMORPHIC, zō'ô-môr'fĭk, a word derived from the Greek for animal forms. In anthropology and comparative religion it refers to the representation of a god or other supernatural being under the form of one of the lower animals. The zoomorphic element is strong in classic mythology and appears e.g., in the metamorphoses of Jupiter. It predominates in primitive (animistic) religions, being particularly marked in the religion of ancient Egypt. Traces of it may be found among the Hebrews and in the Apocalypse.

ZOOPHYTE, zō'ô-fīt, a term meaning literally animal plants, borrowed from Aristotle by Cuvier, and used by him as a synonym of Radiata. It is often loosely applied as a designation for many plant-like invertebrate animals, as sponges, corals, and sea anemones.

ZORACH, zō'räk, **William**, American sculptor and painter: b. Eurburg, Lithuania (now Soviet Russia), Feb. 28, 1887. Brought as a child to the United States, he settled with his parents in Ohio and worked in a lithographic plant at Cleveland. Taking up art, he studied at New York and Paris, where he embraced cubism. Later he taught at the Art Students' League in New York. Besides doing fine water colors of New England landscapes, he achieved his best work in compact sculptures, which he began to carve of wood in 1922. Equally proficient in stone, his characteristic method is to "liberate" the figure or group from a block, retaining as much of the original form as possible. His works are exhibited in leading U. S. galleries, among them the Whitney Museum and Museum of Modern Art of New York, the Art Institute of Chicago, and the Phillips Memorial Gallery at Washington, D.C. His *Spirit of Dance*, cast of aluminum, is in Radio City Music Hall, New York.

Consult Wingert, P. S., *Sculpture of William Zorach* (New York 1938).

ZORGITE, zôr'gīt, a mineral from Zorge and Tilkerode in the Harz Mountains, Germany. It is a selenide of lead and copper in varying amounts. The color is lead or sometimes yellowish gray with a metallic luster. Its hardness is 2.5, the specific gravity 7–7.5.

ZORILLA or **ZORRILLA**, thôr-ré'lyä, **Manuel Ruiz**, Spanish statesman: b. Burgo de Osma, Soria, Spain, March 22, 1833(?); d. Burgos, Spain, June 13, 1895. An advocate at Madrid, he was chosen to the Cortes in 1856, identifying himself with the Progressive party and vigorously opposing the Conservatives and Carlists. In exile since 1866, he was appointed (1868) by Francisco Serrano, minister of education, commerce and public works. In 1869–1870 he was minister of justice, and later president of the Cortes. A supporter of Duke Amadeus of Aosta for the Spanish throne, he assumed in 1872 the head of a radical ministry, but after Amadeus' abdication retired. Upon the accession of Alfonso XII in 1875 he went to France and for 18 years was the leader of the Spanish Republicans. For his participation in the military revolt of March 1884, he was sentenced to death in absentia. But broken in health and spirits, he at length abandoned his leadership and was permitted to return to Spain in Feb., 1895.

ZORN, sorn, **Anders Leonard**, Swedish painter and etcher: b. Mora, Dalarna province, Sweden, Feb. 18, 1860; d. there, Aug. 22, 1920. After studying sculpture and painting at the Stockholm Academy, he rose to early fame and settled in 1882 in London, where he attained success as a fashionable portrait painter. When he went to Paris in 1889, he joined the impressionist movement. Zorn traveled widely on the Continent, North Africa, and Turkey, and visited also the United States, painting there portraits of Theodore Roosevelt, William Howard Taft and other notables of the period. Equally accurate are his portraits of Ernest Renan, Marcel Proust, and European royalties. During his lifetime he ranked among the leading Swedish artists and was, particularly, esteemed for his vivid landscapes and genre scenes of peasant life. Later he turned to the painting of female nudes. Among his sculptures is a statue of *Gustavus Vasa* at Mora. Though Zorn considered his etchings only a pastime, he is today chiefly remembered for these efforts, which are highly valued by collectors. Some of his canvases are in the great galleries of Europe and America.

ZORN, tsôrn, **Philipp**, German jurist: b. Bayreuth, Bavaria, Jan. 13, 1850; d. Ansbach, Bavaria, Jan. 4, 1928. After study at Munich and Leipzig, and lecturing at Munich, he went in 1875 as professor to Bern, Switzerland. From 1877 he was at Königsberg, and in 1900 took a chair in the law faculty at Bonn. He participated as an expert in the Peace Conference at The Hague (1899). Among his works are *Staat und Kirche in Norwegen bis zum Ende des 13ten Jahrhunderts* (1875); *Staat and Kirche in der Schweiz* (with Gareis, 1877–1878); *Die Beiden Haager Friedenskonferenzen von 1899 und 1907* (1920); *Die Staatsrechtliche Stellung der Handelskammern* (1923); and *Weltunionen* (1925).

ZORNDORF, tsôrn'dôrf (Pol. SARBINOWO, sär-bēn-ô'vô), western Poland, a village formerly of Brandenburg, Prussia, near Küstrin (Pol. Kostrzyn) and about 50 miles northeast of Berlin. It is celebrated for the Prussian victory won here by Frederick the Great over the

Russians under General Fermor, 25 Aug. 1758, the Russians losing 21,529 men and the Prussians about 11,000. See SEVEN YEARS' WAR. Pop. 988.

ZOROASTER, religious reformer of ancient Persia. Termed Zarathustra in the Avesta or primitive Iranian code, and in later Persian Zardusht, its meaning has been variously interpreted — one of its roots is undoubtedly «camel.» Its modern form Zoroaster was adopted from the Greek and Latin. The story of his birth and activities has little authentic basis, although his historic personality is admitted. All details are scanty, and it is impossible to distinguish between legend and fact, as is true in general of old time founders of religions, whose personality and exploits later ages have magnified out of all proportion to their real stature and deeds.

Greek and Roman writers make frequent mention of him as founder of the wisdom of the Magi and tell of his childhood and solitary life. Plato in his 'Alcibiades' (I, p. 122) makes one of the earliest references. Pliny, Plutarch, Dio Chrysostom are explicit in their accounts, which border on the miraculous. No mention is made, as might be expected, in the cuneiform inscriptions of the Achaemenidæ, the ancestral royal line of Persia, although 'Darius and his successors were loyal followers of the prophet. Darmesteter terms Zoroaster a myth, the incarnation of the storm-god. As Dr. Geldner states, however, the French scholar does not distinguish between the Zoroaster of the younger Avesta and of the Gathas, or «songs,» in which the very words of the sage are expressed, his authentic sayings, the last survivals of the sermons which he spoke at the court of King Vishtospa. In these psalms, hymns, or songs, he appears as a man on solid ground, like some later world-prophet, with his alternation of confidence and despair, but with his hold on God firmly retained in all changes of fortune. The Gathas, on the other hand, furnish no precise historical data, merely a number of verses that allude to personal events interwoven with sage reflections and counsel — a kind of modern pastoral admonition. A comparison to the Psalms of David will illustrate this point of literary content to a certain degree.

Admitting, then, his historical personality, what do the Persian traditions tell of his origin? His father bore the title Spitama, indicating a noble line; his mother's name, too, is mentioned. His birthplace was on the hill of the river Darga (Darya). Another legend traces his birth to Ragha in Media, the seat of the imperial hereditary church in Sassanian times. Like others of his type — Mohammed, for example — he had heavenly visions in early years and conversed with archangels and the Highest. At the age of 30 he had a celestial vision on the banks of the river. An angel invited him to a conference with Mazda, or the Highest, a symbol of the new era and religion which he was to found, abolishing the crude notions of his age and environment and developing a loftier ideal of the Supreme and humanity. Sent by Mazda to the court of King Vishtaspa, king of Bactria in epic legend, he suffered indignities at first and was thrown into prison — how familiar these points in the narrative! Then on gaining his liberty, he converted to the new faith the king himself, wife, brother and the two viziers, all of whom became ardent devotees and gave strength to the cause, despite the many severe trials it had to endure. Finally, on an invasion of the kingdom, Zoroaster was slain in his 77th year by a Turanian. His sons and daughters are frequently mentioned. As to the date of Zoroaster, the chronology is obscure. The time of his birth varies from the extravagance of Greek writers who place him 5,000 years before the Trojan War to the Parsee tradition, which puts his birth at 660 B.C. and his death at 583 B.C. Edward Meyer and Duncker give 1000 B.C. as date of his birth, after careful study of available sources.

While the doctrines in general of Zoroastrianism are discussed elsewhere, the personal declarations of its founder as expressed, as before stated, in the Gathas, are eminently quotable. His conviction of his mission and its sacred message is breathed in the words: «I am thy chosen one from the beginning; all others I consider my opponents.» «To thee I cry: Behold, O Lord, and grant me assistance, as a friend grants it to a dear friend,» so sounds his appeal. «Tell me right, O Lord — will the good deeds of men be rewarded already before the best life comes?» is his inspiring question. «Who sustains the earth here below, and the space above, that they do not fall? Who made the waters and the plants? Who has yoked to the winds the storm clouds, the two swiftest of things?» is in the spirit of Job's glorification of the Creator. Consult Jackson. A. V. W., 'Zoroaster, the Prophet of Ancient Iran' (New York 1899); Wadia, A. S. N., 'Message of Zoroaster' (2nd ed. 1930).

ZOROASTRIANISM, the religious system of ancient Persia as founded by Zoroaster, whose religious teachings are preserved in the Avesta, one of the world's oldest sacred books. The character of the Persian religion in pre-zoroastrian times has been a frequent subject of inquiry, but while nothing authentic is known, there is every reason to infer a certain similarity with the ancient faith of the Hindus. Iran and India were not so distant from each other as to make impossible communication one with the other. If we turn to Herodotus as informant (Hist. i, 31ff.) the Persians are said to have worshipped from antiquity the sun, moon and stars, the earth, the waters and the wind, the crassest polytheism. He intimates also that they borrowed some religious notions from Assyria and practised certain rites against which the prophet protested. His account too of the Magian ceremonies indicates that they were not inconsonant with Zoroastrianism. Ed Meyer in the *Reports* of the Prussian Academy (1908) shows how recently discovered Hittite inscriptions have a distinct bearing on the old creed of Iran, upon which the religion of the prophet was based, that Aryan folk-religion, polytheistic in its nature, many of whose divinities, Mitra and the rest, are not strangers in the Indian pantheon, while diversities as well as similarities abound in the theologies of both.

Dualism.— The first characteristic element of Zoroastrianism is its doctrine of dualism,

which personifies the opposing principles of good and evil, and recognizes the universal sway of these hostile forces. Briefly to describe this vital feature, the powers of good are led by Sharamazda or Ormuzd ("the Wise Lord"); those of evil by Ahriman ("the Spiritual Foe"). These opposing hosts, as if trained to combat and command by Oriental despots, have in their return an array of warriors, with the skill and persistency of actual armies. On one side are bands of angels and archangels; on the other companies of demons and archfiends. Under the general name of Amesha Spentas ("Immortal Holy Ones") are grouped the six archangels, who personify fundamental virtues and abstract ideas, and whose Persian names represent "Good Mind," "Perfect Righteousness," "Wished of a Kingdom," "Earthly Harmony," "Salvation," "Immortality." In addition, are a number of angels and lesser divinities, called "Worshipful Ones" who are more eminent than the rest, and include divine personifications of the planets, fire, air, water, the spirits of the righteous ("*fravashis*"), and some abstract notions like religion, glory, victory, Mithra, a divinity who incarnates light and truth. The opposing army, commanded by Ahriman, is less disciplined. Its chief archfiend is the demon Æshma (*Daeva*). A crowd of lesser fiends and demons ("*daeva,*" "*druy*") accompany the six archfiends.

The Millennium.— The world's history is nothing but the story of the contest between good and evil, light and darkness, which shall endure for 12,000 years, divided into four periods of 3,000 years each. The first period is one of spiritual existence. Conscious that Ahriman lives, Ormuzd makes the world a spiritual creation before it assumes the material form. When Ahriman discovers his enemy at work, he arouses to life his army of demons and fiends. In the second Epoch Ormuzd creates the material world, which is invaded by Ahriman and his cohorts. The third period marks the contest for mastery between the rivals and the battle for the human soul until Zoroaster is born. A new Epoch is now commenced, as the fourth and last 3,000 years begins. The prophet and his three sons, to be born in ages to come, the last being the Messiah, liberally "he who will benefit and save the world," preside over the final eon. This dualism is an approach to monotheism, as it teaches the ultimate sway of Ormuzd — its hopeful philosophy of the world's regeneration is not to be overlooked. Throughout the conflict, man is the chief factor, for all depends upon his choice as free agent, of the good. The final aim of Zoroaster's system is to assure world perfection by the individual's adoption of the right path. This will come to pass, with the setting up of the "Good Kingdom," the "Wished for Kingdom" or the "Kingdom of Desire," as the Avesta expresses it. As the world enters the stage of regeneration, Ahriman forms his hosts for a final battle. They are defeated, and good is to reign forever. Accompanying the advent of the Messiah (*Saoshayant*) occur the resurrection of the dead and the judgment of the world, to be.

Code of Ethics.— One sometimes overvalues old-time ethical codes, because we are apt to emphasize their good features. A study of the ethics of Zoroastrianism cannot but arouse admiration for their lofty qualities. They bear the stamp naturally of their environment, but in moral elevation do not yield to standards that we term modern and of which we are justly proud. A fair idea of their character can be gathered from the profession of faith required from converts and preserved in its entirety in the Avesta. These few paragraphs are condensed from Professor Jackson's translation in Ragozin's 'Media' (p. 111): "I forswear henceforth all robbing and stealing of cattle and the plundering and destruction of villages belonging to worshippers of Mazda. I promise householders that they may roam at will and abide unmolested, wherever dwelling with their herds; I swear this with uplifted hands. Nor will I bring plunder or destruction, not even or avenge life and limb. I confess myself a worshipper of Mazda, a follower of Zarathustra. I profess good thoughts, good words, good deeds" — which last phrase is the motto of the religion of Zoroaster and is found throughout his sayings and injunctions. Each day man must preserve the purity of body and soul. Earth, air and water are to be kept free from defilement. To speak the truth and act honestly are fundamental; to be kind and generous the highest duty. To till the field and raise cattle, are part of one's religious requirements. Marriage is insisted upon, even among kindred. The deed, the action, is the only source of salvation. God is manifested in virtuous thoughts, words, deeds.

Ritual.— In the Gathas, which, as before stated, is the scanty source of Zoroastrian personal teaching, there is little, if any, mention of ritual or ceremonials. He is less the lawgiver there than the prophet, it has been aptly stated. Yet a full ceremonial worship developed, the priesthood was at the head and its office was hereditary, with the Mobeds and Herveds, the Levites and Kohanim of Zoroastrianism. The Magi were of Median origin. Annual sacrifices were originally offered but were less and less insisted upon as praise and thanskgivings took their place with oblations of consecrated milk, water and bread. Lengthy litanies accompanied these rites, which were of special significance in connection with the preparation of "haoma," the sacred drink, like the Indian "Soma." A curious practice arose in the disposal of the dead. No bodies could be burnt, buried, or thrown into the water, as thereby defilement to the elements would be caused, they were consigned to high places, to be devoured by dogs and birds, a custom still in vogue among the Parsees and Gabars in their so-called "Towers of Silence." Practices of abstinence and asceticism, what is termed "mortification of the flesh" are not encouraged but are condemned as foolish and wicked and as strengthening the arch enemy's hands. The excessive reverence paid to Fire, which won for the Zoroastrians the name of "Fire-worshippers," was a later development as were numerous forms of incantation and purification.

Resemblances to Judaism and Christianity.— These are many and striking. Ahuramazda, supreme Ruler, with the attributes of

omniscience, omnipresence and eternity, with creative power which he employs through his Spenta Mainya, or "Holy Spirit," with the best of angels and archangels in his train, suggests unmistakably the Old Testament Yahveh, especially in certain books, written under later influences, and which appeared more magnified in the Gospels. So Ahriman, Ormuzd's adversary, reminds one of Satan in later epochs, and whose future end is similar; these, too, are almost parallel ideas as to the world's regeneration the Messiah, the resurrection of the dead and everlasting life. Zoroaster receives his law from Aheramazda on the "Mountain of the Two Holy Communing Ones," as does Moses on Sinai. There are six periods of creation in the Avesta like the six days in Genesis, and a single pair, Moshya and Moshyana, like Adam and Eve. The deluge of the Bible is paralleled by the devastating winter. Shem, Ham and Japhet are recalled by the three sons in the Avesta. Similarities in ritual details are many and have been studied at length. Here as is usual the critics disagree. The larger number trace these analogies to the influence exerted on Judiaism by Zoroastrianism during their period of the Exile, if not earlier. On the other hand, the contrary view, advocated by James Darmesteter, is held by some — that early Persian thought was influenced by Judaism, and that Neoplatonism, through Philo, left also its mark on the Avesta. It is impossible at present to decide definitely the point at issue; one must await fresh discoveries and identifications in the East, to give us more exact knowledge. Perhaps a common influence was at the root of both Jewish and Persian ideas.

Historical Growth.— While Zoroastrianism was the national religion of Persia, it was accepted by Turamans as well as Iromons, and spread to Armenia, Cappodocia and the entire near East. With the Sassanides, the national church was restored, and the priesthood became strongly organized with unlimited power and an authoritative religious lawbook. The head of the hierarchy, with his seat at Rai in Media, was next in power to the king. New sects now began to arise, but the Mohammedan onset in 636 with the persecutions that followed, spelled overthrow to the religion of Zoroaster. Today only a few followers of the prophet are found even in Persia. In and around Bombay the Parsees, limited in number, profess allegiance to him and his religion, but the creed has developed into a pure monotheism.

Bibliography.— In addition to Jackson and Ragozin as given above, consult Jackson, 'Grandriss der iranischen Philologie' (11.612ff Strassburg 1896–1904); Karaka, 'History of the Parsis' (London 1884); Lehmann, 'Zara thustra' (Copenhagen 1899–1900); Moffat, 'Zoroastrianism and Primitive Christianity' (in *Hibbert Journal,* 1903, 1768–80); Jackson, A. V. W., 'Zoroastrian Studies' (1928); Pavry, J. D. C., 'Zoroastrian Doctrine of a Future Life' (1929); Manekji, N. D., 'Our Perfecting World' (1930); Waterhouse, J. W., 'Zoroastrianism' (1934).

ZORRILLA Y MORAL, José, hō-sā' thōr-rēl'yä ē mō-räl', Spanish poet: b. Valladolid, 21 Feb. 1817; d. Madrid, 23 Jan. 1893. He studied for the law at Toledo and Valladolid, but turned to literature. His attempts in politics showed him to be unfitted for such a career. From 1855 to 1866 he was in Mexico, latterly at the court of Maximilian. His plays, of which 'Don Juan Tenorio' is now the best known and is still a great favorite in Spain. Others are 'El zapatera y el rey'; 'Traidor, inconfeso y mártir'; 'El Alcalde Rouquillo' and 'El Rey loco.' The plays were hastily written and are without finish, but have continued effective through their strong appeal to national patriotism, and their adaptability to theatrical requisites. His 'Leyenda de Alhamar,' 'Granada' and 'Leyenda del Cid' were picturesque presentations of national legends in the general manner of Scott, and very popular. Zorrilla was not a careful artist, but an improvisator of great readiness and skill, both lyrical and dramatic. He suffered bitter poverty in 1871–83, for, although his plays were still highly successful, they were not protected by copyright. He later received a government pension of 30,000 reales; was awarded the gold medal of the Spanish Academy in 1885, and in 1889 was crowned national laureate at Granada. A bronze memorial was erected to him in Madrid in 1900. An account of him may be found in the autobiographic 'Recuerdos del Tiempo Viejo' (Old-Time Memories, 1880–83), which work, however, is not wholly dependable. His collected works were published (Madrid, 4 vols., 1895; 1905).

ZOSIMUS, zŏs'ĭ-mŭs (Gr. Ζώσίμος), Greek historian of the 5th century A.D. He lived at Constantinople and wrote a history of the empire in six books, the 'New History,' which is frequently referred to by Gibbon. He begins with the change of constitution introduced by Augustus, and his first book brings him to the reign of Diocletian, 305 A.D.; in the second, third and fourth books the history of the 4th century is given with more detail; the fifth and sixth books are occupied with the period from 395 to 410. From internal evidence the work must have been written about 450–502. Zosimus was a pagan, and severely criticized the Christian emperors, making the change of religion largely responsible for the decline of the empire. His work is on the whole trustworthy, but his pagan bias in some instances leads him to various misinterpretations of the acts of the Christians. The best editions are those of Bekker (1837) and Mendelssohn (1887).

ZOSTERA, a genus of marine plants. See EEL-GRASS.

ZOTAL. See MESCAL.

ZOUAVE, zoo-äv, a soldier in the French army. Zouaves were organized in 1831 and were originally mercenaries belonging to a Kabyle tribe. The Zouaves in the pay of the dey of Algiers were, when Algeria became a French possession, incorporated with the French army there, preserving their Arab dress. Ultimately the native element was eliminated, and the Zouaves became French soldiers in the picturesque Arab costume. As such they distinguished themselves in the Crimea, which was their first European service, and the Franco-Italian War of 1859. There were several regiments of Zouaves among the volunteer Federal troops in the American Civil War, so-called because of their wearing an adaptation of the costume of the French Zouaves. The

Papal or Pontifical Zouaves were recruited from French soldiers at Rome in 1860 and under General Louis Christophe L. J. de Lamoricière, a former commander in Algeria, defended the temporal sovereignty of the pope. They were unsuccessful against the Italian troops at Rome in 1870, and after serving in France against the Germans and the Commune they were disbanded in 1871.

ZOUCHE, zo͞osh, **Richard,** English legal authority on civil law: b. Ansty, Wiltshire, England, 1590; d. London, March 1, 1661. He was educated at New College, Oxford; in 1617 he was admitted an advocate of Doctors' Commons, and in 1620 became regius professor of civil law at Oxford. In addition to his university duties he had a large practice in London. In 1641 he was made judge of the high court of admiralty. He was a Royalist, though not a pronounced one, at the civil war; and, although replaced in the judgeship in 1649, was nevertheless appointed by Oliver Cromwell to a special commission of oyer and terminer, and retained his academic appointments. He was regarded with some suspicion by both political parties; but after the Restoration he was appointed to the commission which reinstated the professors and fellows of Oxford who had been removed under the protectorate of Cromwell. On Feb. 4, 1661 he was restored to the bench.

His writings include a descriptive poem, *The Dove, or Passages of Cosmography* (1613); a comedy, *The Sophister* (1639), and many works of a professional sort, most important of which are *Elementa jurisprudentiae* (1629), a general system of legal science, and *Juris et Judicii Fecialis,... Explicatio* (1650), regarded by critics as the first treatise containing a systematized arrangement of what is now known as international law.

ZOUG. See Zug.

ZRENJANIN or **ZRENYANIN,** zrĕn'yä-nĭn, city, Yugoslavia, in Vojvodina, northern Serbia, 26 miles east-northeast of Novi Sad. It is a rail center on the Belgrade-Kikinda Railroad, and a port on the canalized Begej River. Manufactures include dried beet pulp, sugar, agricultural machinery, molasses, and dairy products. Other industries are flour milling, brewing, carpet making, and vegetable canning.

The city was called Veliki Beckerek or Veliki Bechkerek until the 1930's, and Petrovgrad until about 1947. Pop. (1948) 40,517.

ZRINYI, zrĭ'nyĭ, **Miklós** or **Nicholas,** Hungarian soldier: b. 1508; d. Szigetvár, Sept. 7, 1566. He distinguished himself in Charles V's siege of Vienna, and in the campaigns against John Zápolya and Sultan Suleiman I. As ban of Croatia from 1542, he defended that territory against the Turks, and became famous for his defense of Szigetvár (or Sziget) in 1566. His garrison of scarcely 3,000 was reduced to 600, and on September 5 the enemy succeeded in firing the outer fortifications. Zrinyi retreated to the inner fortress, but this also was soon on fire. He thereupon ordered the gates to be opened, and after firing a mortar filled with broken iron into the midst of the Turks, who were surging along a narrow approach to the castle, led a sally of the garrison. He fell, mortally wounded, and the defenders were forced back, but a slow match ignited 3,000 pounds of gunpowder stored within, and great carnage among the Turks ensued. The catastrophe was made the subject of *Zrinyi: Ein Trauerspiel* by Karl Theodor Körner.

ZSCHOKKE, chôk'ĕ, **Johann Heinrich Daniel,** German author: b. Magdeburg, Germany, March 22, 1771; d. Aarau, Switzerland, June 27, 1848. He left his native place in 1788, and for some time wandered about the country as playwriter to a strolling company of actors, but afterward studied at the University of Frankfort-on-the-Oder. In 1792 he began life there as a private teacher, and produced several pieces for the stage. He subsequently settled down in the canton of the Grisons and became director of an academy at Reichenau, where he wrote a history of the Grisons (1798). He then became head of the department of public instruction at Aarau, and was soon afterward sent by the Helvetic executive directory to Unterwalden as government commissioner, for the purpose of restoring tranquility. He acquitted himself so satisfactorily that his powers as commissioner were extended to the cantons of Uri, Schwyz and Zug. In 1800 he was appointed commissioner for the organization of the Italian territories of Switzerland. In 1804 he became a member of the board of mines and forests.

Through the greater part of his life Zschokke appeared as one of the most distinguished and energetic public men in Switzerland, but he found time to cultivate his favorite literary pursuits, and it is chiefly by his numerous writings, historical and fictitious, that he is known to the world at large. Among his works may be mentioned *Des Schweizerlandes Geschichte* (1822), one of the best of his works, and *Bilder aus der Schweiz*, 5 vols. (1825–26). As a writer of tales he possesses a European reputation, and among them we may refer more especially to *Der Creole, Alamontade,* and *Das Goldmacherdorf.* The work, however, which has had the most extended circulation is his *Stunden der Andacht* (*Hours of Meditation*), 8 vols. (1809–16; 27 editions in his lifetime), which, though rationalistic, has yet, from the pious feeling pervading it, found admirers among all classes of readers.

ZSIGMONDY, zhĭg'mŏn-dē, **Richard,** German chemist: b. Vienna, Austria, April 1, 1865; d. Göttingen, Germany, Sept. 24, 1929. A graduate of the University of Munich, he began researches on the colors produced by the presence of metallic oxides or metals in glass and this lead to his study of colloid chemistry. In 1903, in collaboration with Professor H. F. W. Siedentopf, he invented an ultramicroscope through which colloidal particles, previously invisible, could be seen. In 1908 he was appointed director of the Institute of Inorganic Chemistry, which, under his able direction, became a school for the study of colloid chemistry. In 1922 he invented the ultrafine filter. Zsigmondy was awarded the 1925 Nobel Prize for chemistry in recognition of his outstanding work in the field of colloid chemistry.

ZUBLY, John Joachim, American Independent Presbyterian clergyman: b. Saint Gall, Switzerland, 1725; d. Savannah, Ga., July 23, 1781. The date of his arrival in America is

unknown, but in 1760 he became the first regular pastor of the Independent Presbyterian Church in Savannah, coming thither, according to the church record, from Wando Neck, S. C., where he was located prior to 1758. In 1775, at the provincial congress of 4 July, he was one of five delegates elected to represent Georgia in the Continental Congress, and was selected to draft a petition to the king regarding the «unhappy situation of affairs.» In a letter of 3 Sept. 1775 to the Earl of Dartmouth, he denounced the suggestions made in England of arming the slaves to bring the Southern provinces to obedience. He took part in the adjourned session of the Continental Congress assembled 13 Sept. 1775. When he discovered the intention of the Congress to declare the independence of the United States, he revealed to Sir James Wright, royal governor of Georgia, the plans being made. One of the letters was seized, and Samuel Chase, of Maryland, referred to the fact on the floor of Congress. Zubly hastily withdrew, and in Georgia openly made common cause with the Tories. In 1777 he was banished, and half of his estate seized. He remained in South Carolina until the royal government was re-established in 1779. He then resumed his work as a pastor and continued it until his death, which occurred before the end of the war. He was an eloquent and learned preacher. Consult Jones, C. C., 'History of Georgia.' Vol. II (1883).

ZUCCARELLI, dzoo-kä-rĕl'lē, or **ZUCCHERELLI, Francesco,** Italian painter: b. Pitigliano, Tuscany, 1702; d. Florence, 30 Dec. 1788. He studied painting at Florence and Rome, and after gaining some success in decorative landscape, worked for five years in London decorating the Opera-House and executing views of the Thames. He returned to England in 1752 and became well known in London, where he was patronized by the royal family, especially the Prince of Wales, and the aristocracy. He was one of the original members of the Royal Academy in 1768. After 1773 he lived in his native country. He painted landscapes principally, his work inclining to the classic, the best examples of it ranking with that of his leading contemporaries; but he also executed much of an inferior quality. He frequently painted a tiny pumpkin as a signature, his name meaning «little pumpkin.» Numerous examples of his art are in Venice, the Palazzo Reale containing 21. A large number, too, are in Windsor Castle, and he is also represented in Glasgow, Edinburgh, Paris (Louvre), Petrograd (Hermitage), Milan (Brera), and other cities.

ZUCCARO, dzook-kä'rō, or **ZUCCHERO, Federigo,** Italian painter: b. Sant' Agnolo in Vado (Urbino) 1543; d. Ancona, 1609. He studied under his brother Taddeo in Rome, and was employed by Gregory XIII to paint the vault of the Cappella Paolina in the Vatican, but having quarreled with some papal officials and painted a scurrilous picture he fled to France and ultimately reached England in 1574. There he painted portraits of Queen Elizabeth, the Earl of Leicester and other distinguished persons (21 were exhibited in 1866), and afterward worked in Venice until he returned to Rome to complete his work in the Cappella Paolina. On the invitation of Philip II he went to Madrid in 1586 to paint for the Escorial, and on his return to Rome he founded the Accademia San Luca, of which he became the first president. Many portraits of English personages in the Elizabethan era are wrongly ascribed to him, but some genuine works from his brush are extant. He was also something of an architect and sculptor. His frescoes, painted on an enormous scale and crowded with figures, gave him a great reputation during his lifetime; but modern criticism places his easel paintings far above them. Among his easel-works are 'Deposition from the Cross' (Palazzo Borghese, Rome); 'Descent of Christ into Limbo' (Brera, Milan)); 'Sir Walter Raleigh' (Kensington Gallery); 'The Resurrection' (Borghese).

ZUCCHI, dzook'kē, **Antonio Pietro,** Italian painter: b. Venice, 1726; d. Rome, 25 Dec. 1795. In 1754 he accompanied the English architect Robert Adam on his journeys in Italy and Dalmatia, and on Adam's invitation he went to England in 1766. He decorated the interiors of several of the mansions built or altered by Adam, such as Caen Wood (Hampstead), Luton House (Bedfordshire), Osterley House (near Brentford), and Sion House (Middlesex). In 1770 he was elected an associate of the recently established Royal Academy. He married M. A. C. Kauffman (q.v.), better known as «Angelica Kauffman,» in 1781 and afterward lived in Rome.

ZUCHETTO, tsůk-kĕt'tŏ, or **ZUCHETTA,** the skull cap of a Roman Catholic ecclesiastic covering the tonsure. That of a priest is black, of a bishop or monsignor purple, of a cardinal red, and of the pope white.

ZUEBLIN, Charles, American sociologist: b. Pendleton, Ind., 4 May 1866. He studied at the University of Pennsylvania, was graduated at Northwestern University in 1887 and at Yale in 1889, later studying at Leipzig. He became an instructor in sociology at the University of Chicago in 1892; was assistant professor in 1895; associate professor from 1895 to 1902; and was professor of sociology there in 1902–08. He edited the *Twentieth Century Magazine* in 1911–12. He was well known as a lecturer and magazine contributor. Author of 'American Municipal Progress' (1902); 'A Decade of Civic Development' (1905); 'Religion and a Democrat' (1905); 'Democracy and the Overman' (1911), etc. He died, Switzerland, 14 Sept. 1924.

ZUG, tsoog or zoog, Switzerland; (1) The capital of the canton of the same name, on the northeast shore of Lake Zug, 12 miles by rail northeast of Lucerne. It is popular as a pleasure resort and has fine scenery although it is located in the hilly rather than the mountainous part of Switzerland. The earliest mention of the town is in 1240. It has splendid old mansions and strong watch-towers; several interesting churches; a Capuchin monastery and a convent; a cantonal government building in Renaissance style; a fine town-house in late Gothic style, with a museum of antiquities; an arsenal; manufactures of cottons, enamel-ware, metal goods, tobacco, cigars, soap, etc. In 1435, 1594 and 1887 portions of the town sank into the lake. Pop. about 10,000. (2) A central and the smallest undivided canton

of Switzerland, bounded by Zurich, Schwyz, Lucerne, and Aargau. The surface, which is generally mountainous in the southeast and south, where the Rossberg occupies the frontier, slopes gradually north and west till it becomes comparatively flat. The portion of Lake Zug (Zuger See) within its borders occupies 10 square miles; while Lake Ageri (Ageri See), wholly within its borders, is two and three-quarters square miles in area. The climate, rigorous in the mountainous districts, is mild on the lower southern slopes. The province has a total area of 93 square miles, of which some 75 square miles are under cultivation. The principal exports are cattle, dairy products, and fruit. The town of Zug and some of the neighboring districts were under Habsburg rule from 1273 till 1352, when they entered the Swiss Confederation, though the Habsburgs only formally renounced their claims in 1389. The inhabitants of the province, predominantly of German stock, adhere to the Roman Catholic faith. Pop. (1941) 36,643. (3) a lake (Zuger See) chiefly in the canton of Zug, but partly also in Lucerne and Schwyz. Situated 1,368 feet above sea level, it has an area of 15 square miles; the length, from north to south, is 12 miles, and the breadth varies from three miles to one mile at the center. The shores are low in all directions except the south and southeast. In the former direction the Rigi, with Mount Pilatus towering behind it, and in the latter the Rossberg (5,195 feet), rise in abrupt and lofty precipices, presenting scenery of the grandest description. At the foot of the Rossberg the depth of the lake is not less than 650 feet. Steamers ply upon it, and the fishing, principally of pike and carp, is very productive.

ZUIDER ZEE, zī′dĕr zā′ (Du. zoi′dĕr zā), or **IJSSELMEER,** īs′ĕl-mār, Netherlands, a large shallow gulf penetrating deeply between the provinces of Friesland, Overijssel, Gelderland, Utrecht, and Noord Holland. Until reclamation was undertaken, the length was about 80 miles and the greatest breadth 45 miles. The islands Texel, Vlieland, Terschelling, Ameland, and several smaller islands separate it from the North Sea, with which it communicates by several channels, the principal being Marsdiep (between Den Helder and Texel) and the Vlie Stroom (between Vlieland and Terschelling). Originally it contained the islands of Wieringen, Marken, Urk, and Schokland, and numerous sandbanks, especially in its northern portion. Generally shallow, and only navigable by vessels of small draft, much of its area was only three feet in depth; its maximum depth, in the southern portion, was only 19 feet. The Zuider Zee is of modern origin, having been formed chiefly during the 12–14th centuries by successive irruptions of the sea onto forested land. In earlier times there were here only a lake and marshes, the lake being called Flevo by Pliny and Tacitus. Reclamation of the greater portion of the Zuider Zee has long been a major project in The Netherlands, the first plans having been formulated in the 17th century. A vast scheme for expelling the sea water was drafted in 1886, but financial considerations stood in the way for many years. It was not until 1920, therefore, that work was commenced on a project to reclaim 523,000 acres comprised in four separate areas (termed polders) between which was to be a fresh-water lake known as Ijsselmeer. A short dike joining Noord Holland to Wieringen was constructed in 1925, and a longer one, Afsluit Dijk (18 miles long), was finished in 1933. The northwest and northeast polders were completed and, after draining, prepared for cultivation; and at the time of the German invasion of The Netherlands in 1940, during World War II, work was proceeding on the southwest and southeast polders. Much damage was wrought to the reclamation scheme in the last stages of the war when the Germans, in order to delay the Allied advance, breached the dikes and flooded much of the newly regained land.

ZULIA, sōōl′yä, Venezuela, the most northwestern state of the republic, surrounding Lake Maracaibo (q.v.), bounded on the west by Colombia and on the east by Falcón. It was formerly united with Falcón, but is now politically independent. Lake Maracaibo is surrounded by low lands, but a great part of the rest of the province is mountainous. Agriculture is the chief industry; coffee, sugar and cacao are raised. Area, 24,969 square miles; pop. (1941) 345,667. Zulia is also the name of a famous trade route connecting northeastern Colombia with the Venezuelan port of Maracaibo. The Zulia River forms a part of this route. The navigation of the latter river has often been the subject of international controversy between Colombia and Venezuela.

ZULOAGA, sōō′lō-ä′gä, **Félix,** Mexican soldier and statesman: b. Alamos, Chihuahua, 1814; d. Mexico, 1876. Having entered the national guard as a lieutenant, he fought against the Yucatan secessionists in 1842–43, on the conclusion of which he was promoted to the rank of lieutenant-colonel. In preparation for the war with the United States he directed the fortification of Monterey, Saltillo, and the southerly approaches of the capital. From 1848 to 1853 he was not in active service. In the latter year he was promoted colonel, and subsequently variously employed. On Dec. 17, 1857 he conspired against the Liberal government, and finally on Jan. 11, 1858 the brigade of which he was the commander declared Ignacio Comonfort (q.v.) deposed and Zuloaga president. Zuloaga entered on the office January 23, and the "War of Reform" began, the Liberals being under the leadership of Benito Pablo Juárez (q.v.). In December the garrison deposed Zuloaga, who finally resigned, and appointed as a successor Miguel Miramón (q.v.), who assumed office February 2. In 1860 Zuloaga published a manifesto proclaiming himself constitutional president, but subsequently he came to an agreement with Miramón. When the French invaded Mexico in 1862, he withdrew, but in 1864 he returned and submitted to the empire and promised fealty to Maximilian (q.v.). This promise he broke and attempted, in 1865, to overthrow Maximilian; but he was unsuccessful.

ZULOAGA, thōō′lō-ä′gä, **Ignacio,** Spanish painter: b. Eibar, Guipúzcoa, July 26, 1870; d. Madrid, Oct. 31, 1945. He was descended from a family of artistic craftsmen, his father, Placida Zuloaga, having been a noted damascener; his uncle, Daniel Zuloaga reviving the art potteries at Segovia; and his great-grandfather being the organizer and director of the royal armory at Madrid. Abandoning an early intention of becoming a mining engineer, with his father's per-

mission he went to Rome to study architecture, but stayed there only a few months. Turning to painting he spent five years in Paris, where he devoted himself to study of the old Spanish masters and, in 1890, exhibited his first original work at the Salon. Zuloaga then returned to his native country and, after a long struggle for recognition, rose to the foremost rank as a truly representative Spanish artist. A prolific painter, he was noted chiefly for his portraits and his realistic portrayals of such Spanish types as gypsies, beggars, and bull fighters. He modeled his work on the style of the old Spanish masters, painting directly without preliminary drawings, with strong sure lines and fine imagination. The colors used were generally somber, occasionally heightened by bright contrasting hues. His treatment of a subject was intensely realistic, often brutal in its impassioned sincerity. Yet his work always made, through its imaginative quality, a certain spiritual, almost mystic, esthetic appeal. The choice of detail was deliberate and careful; and the subject matter well conceived and arranged. Collections of his works were exhibited on several occasions in the United States, and at the time he visited that country in 1924 it was estimated that he had completed more than 500 paintings. The Hispanic Society, New York City, acquired *The Gypsy Bull Fighter's Family* and *Mlle. Lucienne Bréval as Carmen.* Zuloaga's notable works also include: *Daniel Zuloaga and His Daughters* and *Doña Mercedes* (in the Luxembourg, Paris); *Market Scene* (at Ghent); *Promenade After the Bull Fight* (at Leipzig); *Watching the Races* (at Brussels); and *Amies* (at Barcelona). An amateur bull fighter of note, he was an ardent admirer of all that was Spanish in life and thought.

ZULULAND, zōō'lōō-lănd, Union of South Africa, northeastern area of the province of Natal. The area of 10,427 square miles includes, besides the former Zulu kingdom, several small territories, including Amatongaland, 600 square miles in area, which, in 1898, was incorporated in the Ingwavuma District, a strip 65 miles long and 30 miles in width lying immediately south of Mozambique. From the Zululand coast at Cape St. Lucia the Lebombo range of mountains runs northward nearly parallel to the coast, separating the country into two regions. The coast region, averaging about 400 feet above sea level, is malarial during the summer but fertile, supporting large numbers of native cattle; the inland region, rising in a succession of plateaus to an elevation of 5,000 feet, is very productive. The principal rivers are the Tugela, on the boundary of Natal proper, with its left tributary the Buffalo; the Umfolozi, which flows into the Indian Ocean immediately north of Cape St. Lucia; and the Umkuzi, which enters Lake St. Lucia, further northward. Gold, asbestos, and nickel have been found in several places, and high quality zircons in alluvial deposits 15 miles north of Eshowe, administrative headquarters of Zululand. In limited areas of the country thrown open for white settlement sugarcane is grown on a considerable scale; stockraising is the principal industry in the native reserves. A railroad runs southward through Zululand from Ingwavuma to the Umfolozi River, thence following the coastline to the port of Durban.

The Zulus, who speak a language of Bantu (q.v.) origin, are well-proportioned, muscular, and warlike. Primarily a pastoral people, millet and other grains cultivated by the women constitute a staple of their diet. They live in beehive-shaped huts built of poles, and thatched and plastered, which surround a communal cattle pound; each group of such huts, termed a *kraal,* is presided over by a petty chief, or village headman. The Zulus are polygamous, wives being purchased in exchange for cattle. Under their terrible chief Chaka, the Zulus were most formidable early in the 19th century, when the first white men arrived in Natal (q.v.), great numbers of peaceful tribesmen being slaughtered in the constant Zulu raids west of the Tugela River. Chaka was assassinated in 1828 by his brother Dingaan (q.v.), who treacherously massacred some 600 Dutch migrants from Capetown and was himself killed soon after his signal defeat on Dec. 16, 1838. The next great Zulu chief was Mpande (or Panda), a relatively moderate man who ruled until his death in 1872. Cetewayo, his successor, became involved in boundary disputes with the Dutch administration in the Transvaal, and with the British, and troops of the latter invaded the country early in 1879. The Zulus overwhelmed the British forces at Isandhlwana on January 22, but were in turn defeated at Ulundi on July 4, 1879. Soon thereafter Cetewayo was captured and exiled, his kingdom being divided among a number of minor chieftains under British suzerainty. The British repatriated and reinstated Cetewayo in 1883, but his enemies rose against him and he died a fugitive the next year. Dinizulu, son of Cetewayo, was aided by Transvaalers in defeating his rivals and securing the throne for himself, and in reward the Dutchmen received cession of much of central Zululand, which they constituted the "New Republic." This short-lived state, much reduced in size, was absorbed into the South African Republic (Transvaal) in 1888, a year after Zululand had been annexed by Great Britain. Dinizulu rebelled and, in 1889, was exiled to St. Helena, but was allowed to return to his country in 1898. Meanwhile, in 1897, Zululand had been incorporated into the colony of Natal (q.v.), and thereafter its history was uneventful with the exception of a brief rising in 1906. Blame for this was attributed to Dinizulu, who was imprisoned until 1910; he died in the Transvaal in 1913. Consult Bird, J., *The Annals of Natal, 1495–1845,* 2 vols., (Maritzburg 1888); Stuart, J., *A History of the Zulu Rebellion* (London 1904, new ed. 1913); Walker, Eric A., *A History of South Africa* (London 1928); Krige, E. J., *Social System of the Zulus* (London 1936); Birkby, C., *Zulu Journey* (London 1937); De Kiewiet, Cornelius, *A History of South Africa* (New York 1941); Tatlow, A. H., *Natal Province* (London and Durham, published annually).

ZUMALACARREGUI, sōō'mä-läkär'rĕ-gē, **Tomás,** Spanish military officer: b. Ormaiztegui, Navarre, Dec. 29, 1788; d. Segama, Navarre, June 24, 1835. He fought against Napoleon in the war of independence, and subsequently reached the rank of colonel in the regular army. Ferdinand VII made him governor of El Ferrol, but the prime minister removed him in 1832 because of his suspected affiliation with Don Carlos de Bourbón (q.v.). Soon after the death of the king in 1833 Don Carlos appointed him commander of the forces of the Carlists (q.v.) in the Basque provinces and Navarre. With great

ability he organized these troops into a really formidable force, and wielded them with remarkable success against such generals as Valdés, Quesada and Rodil. Finally, when the constitutional army had been signally outfought Don Carlos, against Zumalacárregui's advice, determined to attack Bilboa. Zumalacárregui's plan was to march upon Madrid by way of Vitoria and Burgos, and he regarded the siege of Bilbao as a waste of time. It was during the operations there that he received the wound from which he eventually died. He was the most able figure of the first Carlist War. Consult Henningsen, 'Twelve Months of Campaign with Zumala-Cárreguy' (London 1836).

ZUMARRAGA, Juan de, thoo-mär'rä-gä, Spanish prelate in America: b. Durango (Biscay), 1468; d. Mexico, 3 June 1548. He was for many years guardian of the convent of Abrojo in Spain, and in December 1527 was appointed bishop of the newly established see of Mexico. He greatly developed the Mexican missions, but directed considerable misguided zeal against Aztec manuscripts, which he gathered together all over Mexico and publicly burned. Only comparatively few escaped this destruction. His see was elevated to an archbishopric in 1548. He left many letters and other literary remains. Consult 'Cartas de Indias' (Madrid 1877); Monograph of United States Catholic Historical Society (1928).

ZUMBO, South Africa, a town of Portuguese East Africa, near the confluence of the Loangwa with the Zambesi, and on the frontier line of North Rhodesia, 450 miles from the mouth of the Zambesi. It marks the western point of the Portuguese territories on the Zambesi, and was formerly the seat of an important trade, but its trade declined. In recent years the development of the territory adjacent and the general improvement of Portuguese East Africa has given a new impetus to Zumbo which has, in some measure, restored its commercial activity.

ZUMPT, tsoompt, **August Wilhelm,** German classical philologist: b. Königsberg, 4 Dec. 1815; d. Berlin, 23 April 1877. He was nephew of Karl Gottlob Zumpt (q.v.). He was a professor in the Friedrich-Wilhelms gymnasium of Berlin from 1851 to his death. Among his publicans are editions of 'Rutilius Namatianus' (1840) and the 'Monumentum Ancyranum' (1845); 'Commentationes Epigraphicæ ad Antiquitates Romanas Pertinentes' (1850–54); and 'Studia Romana' (1859); 'Das kriminalrecht der Römischen Republik (1865–69); 'De Monumento Ancyrano Supplendo' (1869); and 'Der kriminalprozess der römischen Republik' (1871). The larger part of the last two volumes of the German edition of Ihne's 'History of Rome' is the work of Zumpt.

ZUMPT, Karl Gottlob, German philologist: b. Berlin, 20 March 1792; d. Karlsbad, 25 June 1849. Educated at Heidelberg and Berlin, he was, in 1827, appointed professor at the latter, where he did much effective work toward the improvement of instruction in the Latin language. Among his writings were a Latin grammar (1818; 13th ed. 1874); editions of Quintilian (1831); Curtius (1826; 1846), Cicero's orations against Verres (1831) and the 'De Officiis' (1838); 'Ueber den Stand der Bevölkerung und die Volksvermehrung im Altertum (1841); 'Ueber die bauliche Einrichtung des römischen Wohnhauses' (1842); 'Ueber den Bestand der philosophischen Schulen in Athen und die Succession der Scholiarchen' (1843); and several treatises, such as 'Die Religion der Römer' (1845). An abbreviation of the grammar (1824) reached a 9th edition in 1866.

ZUÑI, zoo ñē, N. Mex., Pueblo village about 40 miles southeast of Fort Wingate, near the western boundary of the state. The residents constitute a distinct linguistic stock and call themselves Ashivi. They are the descendants of the people of Cibola, recorded by the Spaniards. The Spaniards first visited them in 1539 and were driven away, but Spanish missionaries later gained considerable influence among them. In 1680 the Pueblos revolted against the Spaniards, and for 12 years they remained free from their authority. The villagers retain their ancient beliefs and ceremonials and are peaceful agriculturalists, weavers and pottery makers. With the Hopi they are regarded as the most truly typical of the Pueblo tribes.

ZUÑI MOUNTAINS, a detached range in Valencia County, N. Mex. The general trend is from southeast to northwest; length, 45 miles. The mountains do not rise more than 10,000 feet above sea-level, and this is only from 3,000 to 4,000 feet above the surrounding plateau. The range is heavily timbered. It is of geological interest on account of its isolation and the simplicity of the stratification.

ZUÑI SALT LAKE. This lake is in a large crater-like cavity in the plain 40 miles south of the Zuñi Indian pueblo in western New Mexico. The lake is encrusted with salt which is an important source of local supply. The Indians have used the salt for many centuries and regard the lake as sacred. Its diameter is less than a half-mile and on its shores rise two recent volcanic cones, one with a deep crater. The hole in which these features occur is a mile in diameter, 200 feet deep and rimmed by a low encircling ridge of scoria and rock fragments ejected from the hole, doubtless by a volcanic explosion.

ZUNIAN, or **ZUNYAN,** a Pueblo Indian stock of the New Mexico-Arizona region. Their tribal emblem is "the sacred water-spider," from the Indian name of which they are often called Shi-wi-nas. They are of the greatest interest to the ethnographer and student because they still retain to a great extent their primitive condition and culture. They are skilled in pottery-burning. They cultivate the arid regions and plant wheat, barley and corn in fields. Cattle, horses, sheep and pigs are kept. The language has a superior grammatical structure and traces of an earlier language, now dead, are to be found. The dances, festivals and other tribal customs differ little from other Indians of the pueblos. They have always practised monogamy. The ravages of smallpox and other diseases have reduced their numbers to below 2,000. See PUEBLO INDIANS.

ZÚÑIGA, thoon-yē'gä, **Alvaro Manrique de,** Spanish viceroy of Mexico: b. Seville, about 1530; d. Madrid, about 1600. He entered Mexico in October 1585 as viceroy, and his adminis-

tration was, according to the historian, Juan de Torquemada, one of prudence and wisdom. A dispute with the audiencia of Guadalajara, however, on a point of jurisdiction, nearly precipitated civil war upon the colony. Philip II, on the basis of reports circulated by his foes, finally removed him in 1589, and directed Pedro Romano, the bishop of Tlaxcala, to investigate Zúñiga's government. Romano persecuted Zúñiga with great cruelty until 1596, when the latter sailed for Spain, where he was successful in getting revoked the sentence of confiscation pronounced against him.

ZÜÑIGA, Dionisio de, Central American missionary: b. Guatemala, about 1550; d. Chiapa (now in southern Mexico), about 1620. He became a Dominican in Chiapa province, and for the greater part of his life was a missionary among the Quiche Indians. He wrote a grammar of the Quiche language and prepared also in Quiche a volume of sermons and several religious treatises, besides translating Francisco Viana's works, originally written in the dialect of Vera Paz.

ZÜÑIGA Y AZEVEDO, ē ä-thā-vā'thō, **Gaspar de,** COUNT OF MONTEREY, Spanish viceroy in America: b. Andalusía, about 1540; d. Lima, Peru, 10 Feb. 1606. He took vice-royal charge of Mexico, 5 Nov. 1595, and in 1596 sent an expedition in command of Sebastian Vizcaino for the exploration and occupation of Lower California. Vizcaino was hampered by lack of provisions, and returned after accomplishing little. By royal order, he was again sent out by Zúñiga in 1602, when he explored the coast of Upper California. In 1597 Zúñiga drove out William Park, an English pirate who had taken possession of Campeche. Among other expeditions organized by him was one commanded by De Oñate (see ONATE, JUAN DE) and Zaldívar to take New Mexico. During his administration in Mexico he was a benefactor of the natives. In 1603 he became viceroy of Peru, though he did not enter Lima until 1604.

ZUNZ, tsunts, **Leopold,** German Jewish scholar: b. Detmold, Germany, 10 Aug. 1794; d. Berlin, 17 March 1886. He studied at the university, to 1839 he was in Prague as preacher at the synagogue of Berlin; and in 1824–32 was editor of the *Spenersche Zeitung*. From 1835 to 1839 he was in Prague as preacher at the synagogue there, but in 1839 returned to Berlin to become director of the normal seminary, a position he held until 1850. In 1845 he was made a member of the board of commissioners for the promotion of the educational interests of the Jews. His writings are remarkable, in their age, for their broad view, their grasp of the subject, their clearness of presentation and their charm of language. He was the first to take up the scientific study of the Jews' rabbinical literature in his 'Etwas über die rabbinische Litteratur,' published in 1818; and his 'Die gottesdienstlichen Vorträge der Juden' (1832) is considered the authoritative work on the biblical exegesis and the homiletics of the rabbinical writings. Among his other works are 'Die Namen der Juden' (1836); 'Die synagogale Poesie des Mittellaters'; and 'Litteraturgeschichte der synagogalen Poesie' (1865).

ZURBARAN, thoor-bä-rän', **Francisco de,** Spanish painter: b. Fuente de Cantos, Estremadura, 7 Nov. 1598; d. Seville, 1662. He was educated in the school of Juan de Roélas in Seville, and early formed his style on that of Caravaggio. He is thence frequently known as the Spanish Caravaggio. He first brought himself into notice by a series of pictures for the chapel of Saint Peter in the cathedral of Seville, illustrating the life of the titular apostle; and about 1625 he executed his celebrated picture of 'The Glory of Saint Thomas Aquinas' (Seville Museum), which is esteemed his masterpiece, and one of the finest works in Spain. Another famous series is his 11 pictures illustrative of the life of Saint Jerome painted for the monastery of Guadalupe. No less famous is his series of three pictures in the monastery of Santa Mariá de los Cuevas, in Seville, which were produced on his return from Guadalupe. These pictures, which are now in the Seville Museum, represent the "Virgin Extending her Mantel over a Group of Carthusian Monks'; 'Saint Hugo Surprising the Monks at a Secret Feast in the Refectory'; and 'Saint Bruno in Conversation with Pope Urban II.' His 'Crucifixion' (1527) in the church of San Pablo is a notable picture. As early as 1633 he signed himself painter to the king. In 1650 he executed for the palace of Buen Retiro the 'Labors of Hercules' in 10 pictures, now in the Madrid Museum. From this time on he seems to have been a great favorite at the court, though he continued to paint monks and church dignitaries with great spirit and faithfulness to truth, which have gained for him the position of one of the three greatest of Spanish painters. Though he painted several large compositions, he preferred small and simple ones, generally religious in subject. He especially made studies of the Spanish friar. His works are to be seen in some private collections, and in the galleries of Saint Petersburg, Pesth, Munich, Paris and London. Consult Bermudez, 'Diccionario de los más ilustres profesores' (1800); and Lefort, 'La peinture espagnole' (1894).

ZURICH, zoo'rĭk, Switzerland; (1) a city, capital of the canton of the same name, situated at the northeast extremity of the lake of the same name. It is divided by the Limmat into unequal parts, forming an upper and lower town, connected with their suburbs by several bridges. The streets in the oldest quarters are narrow, crooked and dark, but have undergone considerable improvement. The principal buildings are the cathedral or Grosse Münster, on a hill near the right bank of the Limmat, a heavy massive structure in the Byzantine style; the Fraumünster, on the left bank of the river; Saint Peter's Church, with a fine tower and clock; the town-house; the town library, containing 130,000 volumes; the museum, with a collection of home and foreign periodicals, and a rich library; the university; the new Swiss Polytechnic School; the arsenal; the music buildings; the railway station; the theatre and the post office. Two public promenades add to the attractions of the city, besides a botanical garden and many smaller parks and walks connected with a variety of institutions, public and private. Manufactures of silk and cotton, including dyeing and calico-printing, are

extensive; those of candles, soap, tobacco, paper, leather and machinery are also considerable. Besides the university, founded in 1832 and having a professional staff of 150, and over 1,300 students in theology, law, medicine and philosophy, there are the Polytechnic School which is maintained by the government and in 1917 had a teaching staff of 262, Schools of medicine and of arts, secondary and elementary schools of all kinds, deaf and dumb and blind asylums, orphan and several other hospitals. Learned and other societies of various descriptions abound. Zürich is of great antiquity and early became a Roman station. In 1219 it was declared a free imperial city. The preaching of Zwingli in the cathedral made it the centre of the Swiss Reformation. Here, in 1443, the Swiss defeated the Austrians, and here also, in 1799, the Russians were defeated by the French. The Treaty of Zürich, signed here 10 Nov. 1859 by the plenipotentiaries of France and Austria, closed the Franco-Italian war by Austria's abandonment of her right to Lombardy. Pop. (1933) estimated 312,600. (2) A northern canton bounded north by Schaffhausen and the grand duchy of Baden, west by Aargau, south by Zug and Schwyz, and east by Saint Gall and Thurgau; area, 666 square miles. Though not properly mountainous, it has on its south and southeast frontiers several lofty ridges, remarkable for their parallelism. Except the Lägern and adjoining heights, they have their longer axis from southeast to northwest and form a succession of terraces lowering gradually toward the north. The general slope is toward the left bank of the Hornli and the Schauenberg, both in the east. The general slope is toward the left bank of the Rhine, which drains part of it directly and part indirectly, by the Thur, Töss, Glatt and Limmat. Of the lakes, about 40 in all, the most important are those of Zürich, Greiffen, Pfeffikon, Türler and Katzen. The climate is on the whole temperate, but mists are prevalent, particularly on the lower grounds. In some parts the prevailing rock is the Jura limestone, but a more recent formation, consisting chiefly of marl and sandstone in almost horizontal strata, is still more largely developed. One remarkable feature is the immense number and magnitude of the granite boulders which cover the surface. The minerals are few and of little value. The soil, with the exception of a few favored spots, is far from fertile and hence, though the arable land is comparatively large and carefully cultivated, the corn produced falls short of the consumption. In some districts a wine of tolerable quality is produced. Wood seldom forms forests, but occupies many scattered patches and hedgerows. Game is scarce, fish almost superabundant. In no canton have manufactures made more progress. The great staples are silk and cotton goods. The inhabitants are almost all Protestants, and education is very generally diffused. Zürich was admitted into the Swiss Confederation in 1351 and readmitted in 1450, after a 10 years' alliance with Austria. The government, formerly somewhat aristocratic, became decidedly democratic in 1831. A new democratic constitution was adopted in 1869. Zürich holds the first place in the Swiss Confederation. Pop. about 625,000. (3) One of the principal lakes of Switzerland, chiefly in the canton of Zürich, but partly also in Schwyz. It forms a long irregular curve, bending round from southeast to northwest, convex on the south and concave on the north side; greatest length, about 27 miles; greatest breadth, two and one-half miles; greatest depth, 469 feet. Its scenery is distinguished not so much for grandeur as for beauty. The mountains around, nowhere exceeding 1,700 feet above the lake, which is itself 1,342 feet above sea-level, commence in wooded heights and descend to the water's edge in gentle slopes, covered with vineyards, orchards, gardens, cultivated fields and verdant meadows, and studded over with country-seats and smiling villages. A considerable traffic is carried on upon the lake by means of sailing vessels and numbers of steamers. It is well supplied with fish. Its chief feeder is the Linth Canal (completed in 1816), communicating with the Wallenstätter-see. It discharges itself at the town of Zürich by the Limmat.

ZURITA Y CASTRO, thoo-rē'tä ē kăs-trō, **Geronimo,** Spanish historian: b. Saragossa, 4 Dec. 1512; d. 3 Nov. 1580. He was educated at Alcalá, and in 1543, he was sent to Germany on a diplomatic mission to Charles V by the inquisitor-general of Aragón. Subsequently he was made councillor of state and secretary to Philip II. Appointed chronicler of Aragón, he traveled in quest of data through Spain, Sicily and Italy, and finally in 1562–80 published in six volumes his 'Anales de la Corona de Aragón' (continued by Argensola and Blasco-Lanuza 1622). He also made important corrections, in, and additions to, Lopez de Ayala's (see AYALA, LOPEZ DE) 'Crónicas de los Reyes de Castillas.' For a biographical sketch and some correspondence, consult Dormer, 'Progressos de la Historia en Aragon' (1860). The 'Anales' was looked upon as a work of very great importance during more than a century after its publication, and several editions of it have been issued, notably in 1558, 1610 and 1669, and annotated editions of it have been published within the past 25 years.

ZUTPHEN, züt'fĕn, Netherlands, a former fortified town in the province of Gelderland, 27 miles northeast of Arnhem on the right bank of the river Yssel, where it is joined by the Berkel. Its chief edifice is the 12th century church of Saint Walpurgis. The town was at one time a member of the Hanseatic League, and had a considerable foreign trade. It still has an active home trade, more especially in sending grain and timber, both rough and prepared, down the Yssel. Pop. about 21,000.

ZUYDER ZEE. See ZUIDER-ZEE.

ZWEIBRUCKEN, tsvī'brük-ĕn (Latin, *Bipontium;* French, *Deux-Ponts,* "Two Bridges"), Germany, a town in the Rhine-Palatinate, on the Schwarzbach River, 54 miles southwest of Mannheim. It was the capital of the mediæval Duchy of Zweibrüchen, until the end of the 18th century. It is well built and has Protestant and Roman Catholic churches and a synagogue; gymnasium, a *realschule* and several other schools; courts and public offices occupying the former ducal palace; an orphanage and hospitals; manufactories of silk plush, machinery, chicory, tacks, chains, leather etc.,

and a trade in corn and cattle. The edition of the classics known by the name of 'Bipont' was published here in 1779 and subsequent years. Pop. about 15,250.

ZWEMER, Samuel Marinus, American missionary: b. 12 Aug. 1867 at Vriesland, Mich. He graduated at Hope College, Holland, Mich., A.B. 1887; B.D., New Brunswick Theological Seminary 1890. He was ordained a minister of the Reformed Church in America 1890, and became a missionary at Basra, Bahrein and other stations in Arabia 1891–1912, afterward residing in Cairo, Egypt. He traveled extensively in Moslem lands. He became professor of religion and Christian missions, Princeton Theological Seminary. He is the author of 'Arabia the Cradle of Islam' (1892); 'Topsy Turvy Land' (1902); 'Raymond Lull' (1904); 'Influence of Animism on Islam' (1920); 'A Moslem Seeker After God' (1920); 'Call to Prayer' (1923); 'Law of Apostacy in Islam' (1924); 'The Unoccupied Mission Fields' (1910); 'Zig-zag Journeys in the Camel Country' (1912); 'Childhood in the Moslem World' (1915); 'Mohammed or Christ' (1915); 'Life of William Borden' (1916); 'Across the World of Islam' (1928). He is editor of *The Moslem World,* a quarterly review, New York.

ZWICKAU, tsvĭk'ow, Germany, a town of Saxony, on the west bank of the Mulde, 60 miles west-southwest of Dresden. It has several interesting churches, among them two ancient Gothic types recently restored, that of Saint Mary, dating from the 15th century; a gymnasium with a library; a town hall built in 1581, which has archives dating from the 13th century, and an old castle converted into a penitentiary. The chief source of its wealth is the rich coal beds in the vicinity, employing 8,000 miners, and yielding annually 2,500,000 tons of coal. The mines were known as early as 1348 but have been worked only since 1826. There are also manufactures of linen and cotton goods, dyes and chemical products, numerous tanneries, dye-works, bleach-fields, oil, saw and other mills, and a considerable transit and general trade. It was the birthplace of Robert Schumann, the composer. See ANABAPTISTS for the «Prophets of Zwickau.» Pop. (1933) 84,701.

ZWINGER, tsvĭng'ĕr, **Theodor,** Swiss scholar: b. Basel, 2 Aug. 1533; d. there, 10 March 1588. He studied at Basel and at Paris, and after a course in medicine at Padua, became a member of the Basel medical faculty. He lectured there on Greek in 1565–71 and subsequently on ethics, and from 1580 was professor of the theory of medicine. Zwinger was a type of the universal scholarship of that time, and wrote a 'Theatrum Vitæ Humanæ' (1565), a kind of general encyclopædia, then regarded as a marvel, but now having only a bibliographical interest. His 'Methodus Apodemica' (1578), contains material valuable for local history. Consult 'Athenæ Rauricæ' (1778), which contains a list of his writings.

ZWINGER, The, a public building in Dresden, containing a valuable collection of works of art and scientific treasures. The word Zwinger is a general name for a prison or any confined place.

ZWINGLI, zwĭng'lē, Ger. tsvĭng'lē, or **ZUINGLIUS ULRICH,** a celebrated Swiss reformer, was a contemporary of Luther (q.v.), and was born at Wildhaus, canton of Saint Gall, on 1 Jan. 1484; d. Kappel, 11 Oct. 1531. Ulrich was the third of eight sons of the bailiff of that place. He studied at an early age in Basel and Bern, and continued his studies in Vienna, where he occupied himself with philosophy, and again in Basel, where he devoted his attention to theology, under the direction of Wyttenbach. In 1506 Zwingli became parish priest at Glarus, and here employed his time, as Luther had done in the Augustine monastery at Erfurt, in the diligent reading of the Holy Scriptures. He copied the epistles of Saint Paul in the original Greek, and even learned them by heart —an acquisition which afterward proved of great service to him in his public discussions. He accompanied the forces of Glarus during the campaigns of 1512, 1513 and 1515, in Lombardy, in the cause of the Pope against the French, in the capacity of chaplain, and was rewarded for this service by the grant of a pension from the Pope. In 1516 he became preacher in the convent of Einsiedeln, then a celebrated place of pilgrimage. Here he began to make known publicly his ideas of reform, preaching against the pilgrimage of Einsiedeln, which he termed an abuse and a corruption of the doctrine of the Christian Church, and calling upon the bishops of Sion and Constance to promote a reformation of religious doctrines, upon those points in which Zwingli considered that the Church had departed from the primitive teaching. Up to this time, however, his ideas of innovation excited no rebuke upon the part of the authorities, and he was, not long after, invited to Zürich, and entered on his office of preacher in the cathedral 1 Jan. 1519, with a discourse in which he declared himself for the use of the simple Scriptures without regard to the prescribed texts and lessons. At Zürich Zwingli delivered a series of sermons on the Holy Scriptures; and these discourses in which he inveighed against what he declared to be the errors and superstition of the times, laid the foundation for his future work of reformation. The occasion which launched him on his career was similar to that which had aroused Luther. In 1518 Bernadin Samson, a Franciscan monk of Milan, appeared in Switzerland to preach the indulgence proclaimed by Leo X to all who should subscribe alms to the building of Saint Peter's Church at Rome. Zwingli, who was then preaching at Einsiedeln, opposed him there, and afterward in Zürich, with all the power of his eloquence, and brought the indulgences into so much odium that Samson was not even permitted to enter Zürich; and the Council of Zürich finally obtained from the Papal Nuncio the recall of Samson to render an account of his mission at Rome. From this time Zwingli gradually went further in his plans, supported by the Zürichers. In Zürich his innovations were so far promoted by the government that in 1520 a decree was issued ordering that the Holy Scriptures should be taught «without human additions.» In 1522 the reformation was extended to external ceremonies. In this year Zwingli was forbidden to preach by the bishop of Constance In it also he wrote his first work against the fasts of the Church and began the

study of Hebrew. In 1523 the government in Zürich invited all theologians to a public conference in Zürich, to convict, if possible, Zwingli of an error in doctrine. About 600 persons, clergy and laymen, were present at this disputation. Zwingli exhibited his opinions in the form of 67 propositions, which were to form the subject of discussion. The celebrated John Faber, the vicar-general of the bishop of Constance, refused to discuss any of Zwingli's propositions save the last one, which denied the supreme authority of the Church, whereupon the Council of Zürich decreed that Zwingli had not been convicted of error or heresy, and «might continue to freely announce the holy gospel and the Word of God according to the new order.» In a second dispute Zwingli urged his objections to images and the mass and the former were soon afterward removed from the churches by order of the council and the latter abolished. In 1524 Zwingli married Anna Reinhard, a widow, and the next year published his commentary on «True and False Religion.» The Reformation in Switzerland was now fixed upon a firm base; and Zwingli continued the work with undiminished zeal, warmly supported by the cantons which espoused the Protestant cause. The religious orders were suppressed and all questions of marriage were placed under the jurisdiction of the civil tribunals, as well as the administration of the Church revenues. In general, Zwingli agreed in his opinions with the German reformers; like them he assumed the Bible as the only rule of faith, rejected the Papacy, attacked the authority of the priesthood and declared that his object was to restore the Church to the simplicity of primitive times. His views differed on some points from those of Luther, particularly in regard to the real presence, and on some less important matters relative to the liturgy. In order to remove this wall of partition from between the two parties which adopted the new doctrines, a meeting between the Saxon and Swiss reformers was held at Marburg (1–3 Oct. 1529) at the suggestion of Philip, the Landgrave of Hesse. The former were represented by Luther and Melanchthon, the latter by Zwingli and Œcolampadius. Although a complete union was not effected, yet a convention was agreed upon, the first 13 articles of which, containing the most important matters of religious faith, were recognized by both parties; and the 14th declared that, though they could not agree as to the real presence of Christ in the eucharist, they would behave reciprocally in the spirit of Christian charity. In 1531 an open war broke out between Zürich on the one side and the Catholic cantons of Lucerne, Schwyz, Uri, Unterwalden and Zug on the other; and Zwingli was commanded to take the field, bearing the banner of the canton, which it had been usual for an ecclesiastic to support. A battle ensued at Kappel, on 11th October. But the enemy were more than twice as strong as the Zürichers and under better officers; the latter were, therefore, defeated and Zwingli was among the slain. The spot where he fell is marked by a monument. The Reformed Church in Switzerland afterward received from the hands of Calvin (q.v.) its present organization. The collected works of Zwingli were published at Zürich in 1545. A complete collection of Zwingli's writings was also published at Zürich in eight volumes in 1828. E. Zeller has attempted to deduce Zwingli's doctrines from his writings, 'Das theologische System Zwinglis dargestellt' (Tübingen 1853). There are numerous biographies of this reformer, for example, 'Huldreich Zwingli, sein Leben und Wirken' (1895–97) by Stähelin. Consult also Jannsen, 'History of the German People' (1903).

GEORGE E. RINES.

ZWOLLE, zwŏl'lĕ, Netherlands, capital of the province of Overyssel on the Zwarte Water, 60 miles northeast of Amsterdam. Formerly it was a member of the Hanseatic League and was a strong fortress with 11 bastions and three forts. It is a well-built city, with handsome boulevards on the site of its ancient ramparts, and three fine suburbs. Its corn market is one of the best in Holland. Its chief buildings are Saint Michael's Church, dating from the 15th century, a large and splendid building with a famous organ; the government buildings with the provincial archives; the town-hall, dating from 1448, but since remodeled; and the courts of justice. The town has a Latin school, a school of navigation, an industrial school, a public library with rare works on geography and local history, a museum of natural history, a theatre, etc. Zwolle has communication with the sea by means of the Willemsvaart Canal and is the centre of the northern and eastern canal systems of the Netherlands. It manufactures oil, spirits, iron goods and linens, carries on shipbuilding and a trade in corn and cattle. In a monastery in the neighborhood Thomas à Kempis lived and died. Pop. (1937) 43,458.

ZYLONITE, XYLONITE, same as celluloid. See CELLULOID.

ZYLONITE, a material made by treating cellulose or vegetable fibre with nitric and sulphuric acids, dissolving the resulting pulp in camphor and then drying it. In its liquid state, collodion, it was used in surgical operations as early as 1848; in 1855 zylonite was manufactured by Alexander Parkes of Birmingham, England, and put on the market as parkesine. About the same time several factories for the manufacture of zylonite were established in France and Germany, England and the United States. In 1869 celluloid (q.v.), a kind of zylonite, was first manufactured and has entirely superseded all other forms of zylonite.

ZYMOTIC DISEASE, any disease caused and continued by a living germ introduced from without into the body and there multiplied. The term was formerly applied to epidemic and endemic contagious diseases because they were supposed to be produced by some morbific principle acting on the system like a ferment (Greek *ζύμη*). The chief of such diseases include measles, scarlet fever, smallpox, typhus, diphtheria, whooping-cough, croup and erysipelas (qq.v.). With the development of present theories and scientific knowledge of infectious disease, the term zymotic has been almost abandoned. See BACTERIOLOGY; DISEASE, GERM THEORY OF; MALARIA; NOSOLOGY.
